In ulcers, Wiseman observes, there frequently arises a spongy, or *fungous* flesh, either from the too great afflux of humours, or through the surgeon's unskilfulness.

It must be suppressed, or taken off by drying medicines, or even by causticks: as lapis tutia, burnt allum, precipitate of mercury, Roman vitriol, &c.

FUNICULUS Umbilicalis, see the article **UMBILICALIS**.

FUNNEL of a Chimney, the shaft, or smallest part of the chimney, from the waist upwards.

Palladio orders, that the *Funnel* be raised three, four, or five foot at least above the roof, that it may carry the smoke clear from the house into the air.

Care too is to be taken, as to the width; for that if it be too wide, the wind will drive back the smoke into the room; and if too narrow, the smoke will not be able to make its way. Chamber-chimneys therefore are not to be made narrower than ten or eleven inches; nor broader than fifteen.

FUNNEL, see the article **TUNNEL**.

FURBISHER, a person who *furbishes*, or polishes arms, and gives them a brightness, and lustre.

In the general sense of the word, it includes what we now call *armours* and *sword cutlers*: in a more restrained sense, it is appropriated to those who clean, and scour up old swords, guns, and halberds, and put them in order.

Among the officers of the Tower, there is a *Furbisher* of small arms, and another of swords: and the like there is in most other armories of England; as at St. James's, Windsor, Chester, Plymouth, Hull, and Berwick.

FURBISHING*, the act of cleaning, scouring, and polishing arms; as guns, pistols, swords, &c.

* The word is formed of the French *Fourbissure*, which Hicks derives from *Furber*, which in the language of the ancient Franks signified to clean and polish. Though M. Huet chuses rather to derive the French *Furber* and *Fourbissure*, from the English *Furbish*, and *Furbishing*. Skinner observes, that some authors derive the English *Furbish*, from the Latin *Furvus*, and *furvor*; but for his part he rather derives it from the German *Farb*, colour, and *farben*, to dye or give a colour.

Furbishing is principally performed with emery.

FURCA, **FORK**, in antiquity, a kind of punishment, or rather instrument of punishment, among the Romans.

The form of the Roman *Furca* is very obscurely described by the antients, and much controverted by the moderns.

All we know for certain, is, that it was of wood, and resembled a fork; whence it is called in writers *ξύλον διπλουν, διπλουν, διδύμων*, that is, *lignum duplex, bicornutum, geminum*, a double-forked or horned timber. Plutarch, treating of the *Furca*, says, it is originally the piece of timber wherewith the beam of the waggon is upheld: he adds, that it is the same with what the Greeks call *Ασπίτης*, and *Στερίγμα*: and the *stergima* is described by Hesychius as the forked piece of timber put under the yoke of the waggon.

From these accounts, Godwyn takes the *Furca* to have been the beam of a waggon, to which the yokes were fastened.

The punishment of the *Furca* was of three kinds: the first, only *ignominious*, was when a master forced his servant for small offences to carry a *Furca*, or fork, on his shoulders, about the city; confessing his fault, and warning others to beware of the like: whence such servant came to be denominated *Furcifer*.

The second kind was *penal*; when the party having the *Furca* on his neck, was lead about the circus, or other place, and whipped all the way.

The third was *capital*; the malefactor having his head fastened to the *Furca*, and so being whipped to death.

In after-times of the empire, when this sort of punishment became interdicted, the form of the *Furca* was changed, and made like our gibbets or gallows. See the articles *Cross*, *GIBBET*, &c.

FURCA, and *Fossa*, in our antient customs, i. e. gallows and pit; denoted a right or jurisdiction of punishing felons; viz. men with hanging, women with drowning.

FURCHE, in heraldry, a cross in the form represented in *Tab. Herald. fig. 41*. See *Cross*.

FURCULA, in anatomy, the same with *Clavicula*; which see.

FURFUR, literally signifies bran; and is therefore used for the scurf, or dandriff, which grow upon the skin, having some likeness thereto. See *CUTICLE*. Hence,

FURFURATION, the falling off of furfures in combing.

FUR

FURIES, *Eumenides*, *Diræ*, in the heathen theology, and poetry, were infernal deities, supposed to enter, and possess men; to torment, and punish them.

The *Furies* were repared the ministers of Pluto; and the avengers of crimes. Strabo paints them clothed in long robes falling to their heels, but girt about the breast. They were three in number: *Tisiphone*, *Megera*, and *Alecto*.

Patin, Spanheim, &c. will have it to be them, which we see on a medal of the emperor Philip struck at Antioch, on whose reverse are represented three women dressed as above-mentioned, and armed with a key, and with burning torches, poniards, and serpents.

Struvius, *Antiq. Rom. Synt. c. i. p. 182.* adds, that the three *Furies* may probably be no other than the triple Hecate, whom the antients believed to pursue and torment the wicked in hell, on earth, and in heaven.

Some of the poets add a fourth *Fury*, called *Lyssa*; a Greek word, signifying madness, or rage.

They represent the *Furies* with eyes inflamed, their heads twisted round with snakes, and furnished with whips and burning torches in their hands to punish the guilty.

The daffodil was sacred to the *Furies*; and such as offered sacrifices to them, were crowned therewith. This we learn from Eustathius, on the first book of the *Iliad*, p. 87.

These *Furies* were also called *Παῖνες*, *Παῖνας*, by reason of the punishments they inflicted on criminals; as their denomination *Furies* arose from the rage and madness, which they threw into the conscience. *Voss de Idolol. l. viii. c. 18.*

The Greeks called them *Eumenides*; the origin of which name is much controverted among the learned: the etymology that seems best authorized, derives it from *εὐμενεις*, gentle, mild; which was applied to them on occasion of Orestes's being absolved of the murder committed by him on the person of his mother. Minerva, it seems, appeased and pacified the *Furies*; so that they ceased to pursue him: upon which the Athenians ever after denominated them *Eumenides*.

But it must be observ'd that in truth the Athenians called them by the same name, long before Orestes's time; as appears from the Oedipus of Sophocles. There was a temple in Athens, near the Areopagus, consecrated to the *Eumenides*, whom the Athenians called *Venerable Goddesses*. Aristides and the Scholiast of Thucydides speak of this temple as erected in memory of the judgment of Orestes.

FURLING *Lines*, are small lines made fast to the top-sails, top-gallant sails, and the mizen-yard arms; serving to *furl* up those sails.—The mizen has but one *furling* line, but all the rest have two, one at each end.

FURLONG, an English long measure, containing the eighth part of a mile.

The English *Furlong* is equal to forty poles, or perches; and the perch to 16; feet.—I found in an old law book, printed in Henry the VIII's time, we read, that six hundred foot, of five score to the hundred, make a *Furlong*.

Hercules is said to have run a stadium, or *Furlong*, at one breath.

FURLONG is also used for the eighth part of an acre, or half a rood.

FURLONG*, is sometimes also used for a piece of land, of more, or less acres.

* *Omnibus Christi Fidel. Johannes Blunt de Eye, Arm.—Dedit Thomas Croft & Francisco Lovel, Arm. unum Furlongum terræ arabilis continen. per assimationem quatuor acras, &c. Dat. 20. Jan. 3. Eliz.*

FURLOUGH, a licence granted by an officer to a soldier, to be absent for a while.

FURNACE, an utensil, or vessel, proper to contain fire; or to raise and maintain a vehement fire in; whether of coal, or wood.

There are divers kinds of *Furnaces*, of various forms, and for various uses.

The domestick *Furnace*, used in making confections, &c. is usually of iron, or earth.

Those used by the goldsmiths, refiners, &c. are much larger, and of a different structure.

Those wherein lime, bricks, &c. are burnt, are called *Kilns*.

FURNACE is particularly used for a kind of oven, wherein the ores of metals, after beating, washing, &c. are melted down, by a great coal or wood fire.

The structure and application of these *Furnaces* is somewhat different for the different metals. See *Supplement, article FURNACE*.

FURNACE is more strictly applied to those used in the melting of iron; which authors frequently confound with iron forges; though there is a considerable difference between them.

This *Furnace* is a brick structure, much in the shape of an egg set an-end, wherein the iron ore, after it has been burnt in a kiln, is put, intermixed with cinders and charcoal; and the whole melted, till it trickle down into a receiver underneath; where, the scum and dross being taken away, the metal is thrown into furrows made in a bed of sand, and thus is cast into sows or pigs of iron.

The forge is a place, where the pigs are heated, and fused a second, and even a third time, to prepare and fit them further for use. See **FORGE**.

Bellows-FURNACE, is one of the two kinds of *Furnaces* used in coinage, for the fusion of Metals. It consists of a flat hearth at bottom, into which the air may be admitted by a hole contrived therein.

On a level with the hearth is a second aperture, which gives passage to the pipe of the bellows, from which the *Furnace* is denominated. About a foot over this is a moveable grate, which may be taken off, and put on at pleasure. Lastly, over this is the place where the crucible is set: which is square, and made of the same earth with the crucible; of breadth sufficient to bear a range of coals around the crucible. To melt a metal in this *Furnace*, they lay a little plate of forged iron over the grate; and on this they set the crucible, which is likewise covered with an iron, or earthen lid. Then they fill the *Furnace* with charcoal; and when it is well lighted, and the crucible sufficiently hot, they stop the vent-hole. Lastly, throwing on fresh coals, they stop the *Furnace* with an iron lid: thus continuing to work the bellows, and supply fresh fuel, till the metal be in fusion.

Founders' FURNACE, is of divers kinds, according to the different kinds of work to be cast.

That used by the founders of small work, is much like the smiths forge, with this only difference, that the fire is made on a hearth, built in a cavity in the middle of the *Furnace*, to which the pipe of the bellows reaches.

This cavity goes to the bottom of the mass: across the middle of it is placed a grate, which holds the fire and the crucible: and below is the place for the ashes, &c.

The statuarys, or figure-makers, use two kinds of *Furnaces*; which see described under the article **FOUNDRY of Statues**.

Glass-blowers' FURNACE, is the place wherein the ingredients or materials of glass are fused, and vitrified.

There are three kinds of *Furnaces* used in the glass-works. — The first, called the *Calcar*, serves to prepare or calcine the Frit in. It is made in fashion of an oven, ten foot long, seven broad, and two deep. The fuel, which is sea-coal, is put in a trench, on one side of the *Furnace*; and the flame reverberates from the roof back upon the frit. The coals burn in an iron grate, and the ashes fall hence into a hole underneath.

The second, is the *working Furnace*, serving to melt the metal in, or make the glass. Its figure is round, three yards in diameter, and two high, being arched over. Round the inside there are eight or more pots placed, and piling pots on these. The number of pots is always double that of the boccas or mouths, or that of the workmen, that each may have one pot refined, to work out of, and another for metal, to refine in, while he works out of the former.

The *Furnace* has two partitions; the lower, separating the pots from the fire-place, has a circular hole in the centre, covered with a grate, through which the flame passes from the fire-place into the *Furnace*; from the arched sides and roof whereof it is reverberated into the melting-pots.

The second partition divides this from the leas, or annealing *Furnace*. Through the boccas, or working holes, the metal is taken out of the pots, and the pots put in the *Furnace*. These boccas are stopped with moveable covers, made of lute and brick, to screen the workmens eyes from the fire. On each side the bocca is a boccella, out of which, coloured glass, or the finer metal, is taken from the piling-pots. To the *Furnace* likewise belong ovens or holes near the leas, for the calcining of tartar, iron, &c.

The *Leas*, which serves to anneal, and cool the vessels, and which Agricola makes a particular *Furnace*, consists of a tower, besides the leas. The tower lies directly over the melting *Furnace*, with a partition betwixt them a foot thick; having an aperture, called *Oecbia*, or *Lumella*, through which the flame or heat ascends out of the *Furnace* into the tower: on the floor or bottom of this tower, the vessels, fashioned by the masters, are set to anneal. This has also two boccas, or mouths, by which the glasses are put in with a fork, and set on the floor.

The leas is an avenue, five or six yards long, continued to the tower; through this the glasses, when annealed, are drawn in iron pans, called *Fraches*; by which they come to cool by degrees; being quite cold, by that time they reach the mouth of the leas, which enters the sarcel, or room where the glasses are to be set.

The third, is the *green glass Furnace*, which is a kind of compound of all the former. It is made square (the two former being circular) having an arch at each angle thereof, for annealing and cooling the glasses. The metal is wrought on two opposite sides; and on the other two, they have their calcars, into which are made linnet holes for the fire to come from the *Furnaces*, to bake the frit; as also to discharge the smoke. Fires are made in the arches, to anneal the vessels; so that the whole process is done in one *Furnace*.

The stones wherewith the insides of these *Furnaces* are built, are not brick (which would soon melt down into glass, as also all the softer stones) but hard, and sandy kinds, by Imperatus called *Pyramethia*.

Glass-Painters FURNACE, is made of brick, nearly square, and about two foot and a half each way. It is cut horizontally in the middle by a grate, which sustains the pan or shovel the glass is baked in. This *Furnace* has two apertures; one below the grate, to put the fuel in at; the other above it, through which the workman spies how the coction of the colours goes on.

Hatters' FURNACES are of three kinds: a little one under the mould whereon they form their hats: a larger, in the fowering room, under a little copper full of water and lees: and a very large one under the great copper, when they dye their hats in.

Letter-Founders FURNACE is very small, not exceeding a foot and half in height, and a foot in diameter; being placed on a wooden stand, or bench, to raise it to a proper height, for the artist, who works standing. It is made of the same earth with crucibles.

Plumbers FURNACE is of three kinds: in the first, they melt the lead, whereof sheets are to be cast.

This is only a sort of large copper, or receptacle like a copper, made of free-stone, and coated well round with potters clay, having a little iron pan at bottom.

In the second, they melt the lead to be cast in moulds for pipes, &c. which are not to be folded.

The third, is the tinning *Furnace*, which is a square frame of wood, or sometimes a mass of stone work, with a brick hearth, whereon is made a charcoal fire, which serves them for the applying of thin tin leaves on their works.

Wind-FURNACE is the second *Furnace* used in the fusion of metals for coinage. At bottom it has a hearth made hollow, in manner of a cupel, with a vent-hole in the fore part thereof. Over the vent-hole is a grate sealed in the massive of the *Furnace*. Over the grate is the place for the crucible, which is usually of forged iron.

The fire being lighted, the crucible is set in, with a cover over it, and a capital or cover of earth or iron is laid likewise over the *Furnace*; and at the top of this capital is a hole, five or six inches in diameter.

It is called *Wind-furnace*, by reason the air entering through the vent-hole at bottom, which is always open, serves the same purpose as the bellows in other *Furnaces*.

Gold is usually melted in the *bellows-furnace*, as requiring an intenser heat before it fuses. — Silver and copper are commonly melted by the *Wind-furnace*.

FURNACE, in chemistry, is, a receptacle either of brick, iron, or stone, wherein the fire necessary for the several operations, is contained, determined, and directed.

The *Furnace* consists of several parts; as, a place for the vessel or body to be wrought on; a hearth, or hole for the ashes; a chimney; a grate; a door; a dome; and a fan, or else registers, whereby to let in air, to increase or abate the fire.

The perfection of a *Furnace* consists in its maintaining a constant, equable fire; and this easily tempered; and at an easy expence.

To have the expence easy, the whole action of the fire or fuel must be employed on the subject that is to undergo the operation.

It must be equable, since different degrees of fire have different effects; so that if any given degree would answer any given intention, an alteration of that degree will prevent the intention from taking place. And on these circumstances does all the variety of *Furnaces* depend.

Furnaces are either fixed and immoveable, called *Athanors*; or portable, called *Catholice*, i. e. universal, as being proper for all operations, where the body to be operated on is not too large.

The first species of *Athanor*, or fixed *Furnace*, is fitted to give a heat equal to that of a healthy man.

The second is the *Furnace* of the balneum Mariæ, fit for the distillation of the more subtle spirits.

The third is the digesting *Furnace*. See **DIGESTION**.

The fourth is the anemius, or *Wind-furnace*, called also melting *Furnace*, and metallic *Furnace*; used in the fusion of metals, minerals, and vitrifications.

It is called *Wind-furnace*, by reason the air drives forcibly in, to blow up the coals; its form is much like that of the reverberatory *Furnace*, only it is less.

For the reverberatory *Furnace*, see **REVERBERATORY**.

Almond FURNACE, see the article **ALMOND**.

Mortar for FURNACES, see the article **MORTAR**.

FURNACE of a Mine, in the art of war; see **CHAMBERS and MINE**.

FURNITURE, in dialling, certain additional points and lines drawn on a dial, by way of ornament.

Such are the signs of the zodiac, length of days, parallels of declination, azimuths, meridians of the principal cities, Babylonian and Italian hours, points of the compass, &c.

For drawing *Furniture* on dials, the analemma, or trigon of signs, is an instrument of principal use. See *ANALEMMA*.

FUROR Uterinus, a species of madness, peculiar to women, exciting them to a vehement desire of venery, and rendering them insatiate therewith.

It is owing, according to Sennertus, to a too great abundance of the humors of the part, and a præternatural heat and pungency thereof.

FURR*, the skins of divers kinds of wild beasts, dressed with the hair on; to be used as a lining, or doubling of garments, robes, &c. either for warmth, ornament, or distinction of rank and dignity.

* The word is formed of the French *Fourrure*, a lining; which Du Cange derives from *Furra*, used, in the barbarous Latin, for the same thing. We also meet with *Ferratura*, *federata*, *federatum*, and *federatura*, in the same sense.

The robes of kings, dukes, and peers, are lined with divers kinds of *Furri*, and in particular ermine, to render them more magnificent.

The same may be observed of several chief magistrates, judges, and doctors of different faculties in the universities.

The kinds of *Furri*, or skins chiefly dressed in alum, and with the hair on, are those of the ermine, sable, squirrel, coney, castor, otter, dog, fox, wolf, tiger, bear, &c.

Timber of FURRS, see the article *TIMBER*.

FURR, in heraldry, a representation of the skins of certain wild beasts, seen, both in the doublings of the mantles of coat-armour, and in the armour itself.

The heralds use two metals, five colours, and two *Furri*, or hairy skins, viz. ermine and vair.

The origin of these *Furri*, Mackenzy ascribes to the shield's being antiently covered with skins, which skins or coverings were afterwards represented in the shields: a more probable derivation, in our opinion, than to say they were placed on shields, because they had been wore in mantles and garments.

Furri either consist of one colour, which is white; or more than one; and these either two, or more than two.

Furri of two colours are either ermine, being white with black spots; ermines, black with white spots; erminois, whose ground is yellow; or pean, which is black powdered with yellow.

Furri of more than two colours are called *vair*. See *VAIR*, and *VAIRY*.

FURRIER, a person who trades, or works in *Furri*, or lines robes, &c. therewith.

FURRINGS, or **FURRS**, in architecture, the making good of the rafter-feet in the cornice.

When rafters are cut with a knee, these *Furrings* are pieces which go straight along with the rafter, from the top of the knee to the cornice.

When rafters are rotten, or sunk hollow in the middle, there are pieces cut thickest in the middle, and tapering towards each end, which are nailed upon them to make them straight.—Such pieces are called *Furrs*; and the putting them on, is called *Furring* the rafters.

FUSAROLE*, in architecture, a moulding, or ornament, placed immediately under the echinus, in the Doric, Ionic, and Composite capitals.

* The Italians call it *Fusciale*; and the French, from whom we borrow it, *Fusarole*.

The *Fusarole* is a round member, carved, in manner of a collar or chaplet, with oval beads. The *Fusarole* should always answer exactly under the eye of the volute in the Ionic capital.

FUSEE*, or **FUSY**, in watch-work, is that conical part, drawn by the spring, and about which the chain, or string is wound.

* The word is French, where it literally signifies a *Spindle*.

The spring of a watch is the first mover. It is rolled up in a cylindrical box, against which it acts, and which it turns round in unbending itself. The string, or little chain, which at one end is wound about the *Fusee*, and at the other fastened to the spring-box, disengages itself from the *Fusee*, in proportion as the box is turned. And hence the motion of all the other parts of the spring watch.

Now the effort, or action of the spring is continually diminishing from first to last; and of consequence, unless that inequality was rectified, it would draw the string with more force, and wind a greater quantity of it upon the box at one time than another; so that the movement would never keep equal time.

To correct this irregularity of the spring, nothing could be more happily contrived than to have the spring applied to the arms of levers which are continually longer as the force of the spring is weaker. This foreign assistance, always increasing as it is most needed, maintains the action, and effect of the spring in an equality.

It is for this reason, that the *Fusee* is made of a conical figure.

Its axis, which is immovable, is the series of the centres of all the unequal circumferences, which compose the surface of the *Fusee*. According as the part of a string which is untwisting, is applied to a larger circumference, it is at a greater distance from the fixed point in the axis corresponding thereto; and of consequence the power which draws by this string, viz. the spring, acts with the more advantage. The spring begins to draw from the vertex of the cone, the most disadvantageous part, by reason its own force is then the greatest.

If the action of the spring diminished equally, as the parallel bases of a triangle do; the cone, which is generated of a triangle, would be the precise figure required for the *Fusee*. But it is certain the weakening of the spring is not in that proportion; and of consequence the *Fusee* should not be conical.

In effect, experience shews, that it should not be strictly so; but that it be a little hollow toward the middle, i. e. the arm of the lever must be there a little shortened; by reason the action of the spring is not sufficiently diminished of itself.

It is a matter of inquiry among geometricians what the precise figure of the *Fusee* should be: that is, what the curve is, by whose revolution round its axis, the solid, whose figure the *Fusee* is to have, shall be produced.

M. Varignon has determined this curve. The axis of the *Fusee* is also the axis of the curve, which is convex on the side toward the axis, and of consequence concave all the way on the other, or outer side; and the ordinates are the different distances at which the string is to be, with regard to all the successive fixed points of the axis.

The force of the spring multiplied by the arm of the lever it is applied to, each moment, being always to make an equal product; it follows, that when the solid of the curve shall be formed, an ordinate multiplied by the surface of the solid comprised between that ordinate, and the greatest of all the ordinates, viz. that of the base, will always yield a product equal to that of any other ordinates multiplied in the same manner. For the ordinates are only arms of the lever; and the parts of the surface comprehended between them and the base are equal to the lengths of the string which cover them, i. e. to the correspondent forces of the spring: which is what constitutes the equation and the essence of the curve.

FUSEE*, **FUZE**, or **FUSE**, in war, an appendage of a bomb, or granado-shell, by which the powder or composition in the shell is set on fire, to do the designed execution.

* The word is French, and literally denotes a *Spindle*.

The *Fusee* is a wooden pipe or tap, filled with wild-fire, or the like composition; and is designed to burn so long, and no longer, as is the time of the motion of the bomb from the mouth of the mortar, to the place, where it is to fall: which time is about twenty-seven seconds: so that the *Fusee* must be contrived, either from the nature of the composition, or the length of the pipe which contains it, to burn just that time.

The usual composition of *Fusees* is two ounces of nitre, to one of sulphur, and three of gunpowder dust.

FUSIBILITY, that quality in metals, and minerals, which disposes them for fusion.

Gold is more fusible than iron, or copper; but less so than silver, tin, and lead.

Borax is frequently mixed with metals, to render them more fusible.

FUSILE Column, see the article *COLUMN*.

FUSIL, in heraldry, by the French called *Fusee*, q. d. spindle, is a bearing of a rhomboidal figure, more slender than the lozenge; its upper and lower angles being more acute than the two middle ones.—V. *Tab. Herald. fig. 42*.

FUSILIERS*, or **FUZILEERS**, in the military art, foot-soldiers armed with firelocks, which are generally hung. There is a regiment of *Fuzileers* for the guard of the artillery.

* The word is formed from the French *Fusil*, a *Fusee*, firelock.

FUSILY, or **FUSILE**, in heraldry, is when a field or ordinary is entirely covered over, or divided into *Fusils*.

FUSION*, the solution, or melting of metals, minerals, &c. by means of fire: or, the act of changing them from their solid state to a fluid.

* The word is derived from the Latin *Fusio*, of *fundo*, I pour out.

—Whence also, *Effusion*, *Infusion*, *Insuffusion*, and *Transfusion*.

Which see.

To give the ore its metallic form, they *fuse* it; when it is in *Fusion*, the metalline substance, being the heaviest, sinks to the bottom of the furnace; the other terrestrial matters rising in form of scoria to the surface.

It is commonly imagined, that the *Fusion* and metalline form of ores is wholly the effect of fire; and we have theories of fusibility built on this principle: but it is a mistaken one. Fire, no doubt, is the principal agent; but fire alone is not sufficient.

A mineral, or piece of metal not purified, being put alone in a crucible, melts with a world of difficulty, and never becomes a perfect metal: copper ore, for instance, being thus applied, its impure part forms a scoria, and vitrifies; the metalline part residing at bottom, under the appearance of a black regulus. To promote the *Fusion* and separation, they mix coals, or stones, or cinders, or old scoria along with the ore; the inflammable

F U S

flammable principle in which, by help of fire, fuses them perfectly, sets the heterogeneous part at liberty, and raises it to the top.

The general reason of *Fusion* is pretty easily assigned. The firmness, or solidity of a body arises from the force wherewith its particles cohere. And the cohesion of all bodies is as the quantity of contact in the component particles.

Now, the corpuscles of fire entering with rapidity into the pores of the metal, agitate, and, by degrees, loosen, divide, and diminish their contact; till at length there is not enough to hinder their rolling over each other, and giving way upon the least impulse.

The dilatation observable in all *Fusion*, is a proof that the particles of the bodies are separated and set at a distance from each other, and consequently their contacts and cohesions diminished. In effect, rarefaction and dilatation are the necessary consequences of fire and heat.

From the difference of cohesion proceeds that variety we observe in the *Fusion* of bodies: for such as have least contact of parts, soonest give way to the fire; and some will melt away by the warmth of a vapour only; when others, which have a stronger contact, are not to be separated without much difficulty. Upon this account, vegetables very easily disunite; minerals slower; and metals slowest of all: and of the last, those wherein the contact of parts is least, as in lead and tin, most readily melt; but those which are more compact, as gold, and silver, are not to be managed, but by a violent heat.

If now the force of cohesion were proportional to the quantity of matter, or to the weight of bodies, we might from statics account for all the variety that occurs in *Fusion*: for by knowing the specific gravity of a body, we should then know, what force is required to melt it: but because the same quantity of matter may be so variously disposed, that in one body there shall be a much greater contact, than in another, though the gravity be equal, or even greater in the latter; therefore the force of cohesion cannot be estimated by gravity: for lead, though more ponderous than all other metals, except gold; yet in the fire is more easily melted, than almost any other: so that it necessarily follows, that in this metal there must be a less cohesion, or contact of parts, how much soever it may exceed others in the quantity of its matter.

Bodies after *Fusion* return again into a solid mass, upon removing them from the fire; because their particles hereupon approach nearer to one another by their attractive force, and are so compelled to unite.

Such as consist of homogeneous and unalterable parts, as wax, gums, and the purer metals, recover their ancient form: for when the same texture of parts remains in the whole body, it must of course reassume the same appearance, when the separating power ceaseth to act; but other bodies, whose parts, with respect to density and surface, are extremely different from one another, while some are carried off by the force of heat, and others are changed as to figure and position, must be forced to appear in another form: for they cannot recover their original phases, unless every particle could reinstate itself in that very situation it had before, which may be hindered infinite ways; as may be experienced easily in heterogeneous bodies.

The difference therefore, observed even in homogeneous bodies after liquefaction, is no ways to be accounted for but from the changeableness of surface in their parts: for those bodies whose parts constantly retain the same surfaces, never lose

F U Z

their form; but others, by having the surfaces of their parts altered, have a different texture, and put on another appearance. **FUST***, in architecture, the shaft of a column; or that part comprehended between the base, and the capital; called also *the naked*.

* The word is French, and literally signifies a *Coff*.

The *Fust* is that cylindrical part, which makes, as it were, the body, or trunk of the column, exclusive of the head and foot.

FUSTIAN*, in commerce, a kind of cotton stuff, which seems, as it were, quilted, or whaled on one side.

* *Ménage* derives the word from *Fusillum*, which in the corrupt Latin writers is used in the same sense, and is supposed to be formed from *Fusilli*, on account of the tree whereon the cotton grows. Bochart derives it from *Fuslat*, which in Arabic signifies the ancient city of Memphis, where cotton is produced in great abundance.

Right *Fustians* should be made altogether of cotton thread, both wool, and warp.

There are *Fustians* of divers kinds, wide, narrow, coarse, fine; with shag, or nap, and without it. There are also a great many made whereof the warp is flax or even hemp.

FUSTIAN, in criticism, a word used to express bombast.

FUSTICK, or **FUSTOCK**, a yellow wood, used by the dyers.

The colour it yields is a fine golden yellow; but there should be some other ingredients mixed with it, to make it lasting.

The tree that yields it, grows in all the Caribbee islands, particularly in Barbadoes, and Tobago, where it rises to a great height.

The dyers use it chiefly for black. See **BLACK**. But some of the ablest, and honestest among them, who would dye none but the best, and most lasting colours, are of opinion it should be absolutely excluded out of all dying.

Beside this, there is another kind of *Fustick* or *Fustel*, growing in Italy, Provence, &c. this is used to dye a coffee colour.

F-U-T-F-A, in music. See **F**. and **CLEF**.

FUTURE, something to come hereafter.

We say, a *future* state, a *future* contingency; there is none but God to whom *future* things are present.

FUTURE, or **FUTURE Tense**, in grammar, denotes an inflexion of verbs, whereby they denote, that a thing will be, in some time yet to come. As, the last day will come: I shall see an end.

The *future* time admits of two cases: either we may intend to express a thing that shall come to pass in a short time; or a that shall happen in any indefinite time.

Thus the Greeks have their *paulo post futurum*, *μετ' ολιγον μελλω*, which marks a thing just going to be done; as *ποινησωμαι*; beside the common, indefinite *future*, *ποινησω*, I will do it; *amabo*, I will love.

In Latin, Italian, French, and even in English, the *future* of the indicative expresses only the design, or intention of doing a thing, or simply that the thing will be; as, I will praise, I will be approved: and the *future* of the subjunctive shews that the thing will be done under certain circumstances: when I shall have seen Versailles, I will tell you. Sometimes the *future* is expressed in English by the present; if I meet your friend, I will send him to you; *si offendero, si incidero*, &c.

FUZE or **FUZE**, see the article **FUSEE**.

FUZILEERS, see the article **FUSILEERS**.

G The seventh letter of our alphabet, and the fifth consonant: though in the alphabets of all the oriental languages, the Hebrew, Phœnician, Chaldeæ, Syriac, Samaritan, Arabic, and even Greek, *G* is the third letter.

The Hebrews call it *Ghimel*, or *Gimel*, *g. d.* camel; by reason it resembles in its form the neck of that animal: and the same appellation it bears in the Samaritan, Phœnician, and Chaldeæ: in the Syriac it is called *Gamel*, in Arabic *Gim*, and in Greek, *Gamma*.

The letter *G* is of the mute kind and cannot be any way founded without the help of a vowel. It is formed by the reflexion of the air against the palate, made by the tongue as the air passes out of the throat: which Martinius Capella expresses thus, *G spiritus cum palato*; so that the *G* is a palatal letter.

The Latins took the liberty to drop the letter *G* at the beginnings of words, before an *n*; as in *gnatus*, *gnosco*, *gnobilis*, *gnaratus*, &c. which they ordinarily wrote *natus*, *nosco*, *nobilis*, &c. They also frequently changed it into *C*, as *Gamelus*, into *Camelus*; *Grogulus*, *Graculus*; *Quingentum*, *quincuntum*, &c. Sometimes it was put instead of *N*, before a *C*, and for another *C*, as *Agchises*, *Aggora*, *Aggullia*, &c. for *Anchises*, *Anchora*, *Anguilla*, &c. And instead of *P*; as *Magalia*, for *Malpalia*, &c. *G* is also used instead of *Q*, and *Q* instead of *G*, as in *Anguina*, *Anguina*, &c. Instead of *R*, as in *Aquagium*, for *Aquarium*; *Agger*, for *Arger*, &c. And instead of *S*, as in *Spargi*, *sparsi*, *sparsum*; or, rather, it is retrenched from those last words, to avoid the cacophony of *spargi*, or *sparsu*. *G* is also put for *C*; as in *Cneus*, for *Gneus*; *Caius*, for *Gaius*; *Caeta*, for *Caieta*: And for *V*, as in *figere*, for *fuere*. See *N*, *P*, &c.

The northern people frequently change the *G* into *V*, or *W*; as in *Gallus*, *Wallus*; *Gallia*, *Wallia*, *Wallia*, &c. For in this instance it must not be said that the French have changed the *W* into *G*; by reason they wrote *Gallus* long before *Wallus*, or *Wallia* were known; as appears from all the ancient Roman and Greek writers.

And yet it is equally true, that the French change the *W* of the northern nations, and the *V* consonant into *G*; as *Willelmus*, *William*, into *Guillaume*; *Wulphilas*, into *Gulphilas*; *Vasco*, into *Gaston*, &c.

Diomed. l. ii. c. de *Litera*, calls *G*, a new letter; his reason is, that the Romans had not introduced it before the first Punic war; as appears from the rostral column, erected by C. Dullius, on which we every where find a *C* in lieu of *G*. It was Sp. Carvilius, who first distinguished between those two letters; and invented the figure of the *G*: as we are assured by Terentius Scaurus. The *C* served very well for *G*; it being the third letter of the Latin alphabet, as the *g* or *γ* was of the Greek.

The *G* is found instead of *C* on several medals: *Vaillant Nem. Imperat. t. i. p. 39*. M. Beger produces a medal of the *Familia Ogulina*, where *GAR* is read instead of *CAK*, which is on those of M. Patin. But the *C* is more frequently seen on medals, in lieu of *G*; as *AUGUSTALIS*, *CALIAECTA*, *CARTACINENCES*, &c. for *AUGUSTALIS*, &c. Not that the pronunciation of those words was altered; but only that the *G* was unartfully or negligently cut by the workmen. As is the case in divers inscriptions of the eastern empire; where *AUC*, *AUCC*, *AUCCC*, are frequently found for *AUG*, &c.

The form of our *G* is taken from that of the Latins, who borrowed it from the Greeks; the Latin *G* being certainly a corruption of the Greek gamma, *Γ*, as might easily be shewn, had our Printers all the characters and forms of this letter, which we meet withal in the Greek and Latin MSS. through which the letter passed from *Γ* to *G*.

As to the gamma of the Greeks, it is manifestly the *g* *ghimel* of the Hebrews or Samaritans. All the difference between the gamma and *ghimel* consists in this, that the one is turned to the right, and the other to the left, according to the different manners of writing and reading, which obtained among those different nations: so that all the pains Salmastus has taken on Solinus, to prove that the *G* was derived from the Greek kappa, is lost.

G has also been used as a numeral letter, signifying 400, according to the verse,

G Quadrigentis demonstrativa tenet.

When a dash was added a-top, *G̃*, it signified forty thousand.

G is also used in music, to signify one of the clefs; viz. that of the highest part, called the *Treble*, or *Alt*. See *CLEF*, and *TREBLE*.

GABBARA, a name which the Egyptians gave the dead bodies, which they kept by them, instead of burying them.

That people, out of a custom which they had received from their ancestors, and which arose in some measure from the dis-

position of their country, which is exposed to the inundations of the Nile; used to wrap up the bodies of persons of eminence, particularly those of saints, and martyrs, in a great number of linen cloths, with balms, and spices; and instead of interring them, they preserved them in their houses: thinking that thereby they did them much more honour.

And these, St. Augustin tells us, were what they called *Gabbaras*. Sermon cxx. de diversis, c. 12.

Pliny makes mention of the same thing, lib. vii. c. 16. where he relates, that in the time of Claudius, a *Gabbara* was brought from Arabia, almost ten foot long*.

* Fa. Hardouin imagines, that Pliny here took the word for a proper name; and accordingly searches in Tacitus, for one Abbarus, a king of Arabia: but Hardouin himself is not of that opinion; taking the word to be rather the גַבְבָר, *Gibbor*, of the Hebrews; or גַבְבָר, *Gabbbar*, of the Arabians: and to signify a *Giant*.—But the Jesuit Rosweyde gives a better account in his learned notes on the life of St. Anthony, c. 7. and in his *Onomasticon*, under the word *Gabbara*; where he shews that we meet with both *Gabbara*, *Gabbare*, *Gabarus*, and *Gabbarus*; and that they all signify a body embalmed; which he proves from the testimonies of Cicero, *Tuscul. Quest.* of Pompon. Mela, lib. i. c. 9; of Sextus Empiricus, lib. iii. *Pyrrhon Hypothes.* c. 24; of Lucian, *de Luctu*; of Corippus, lib. iii. *de funere Justiniani*; of St. Augustin, *Cassian*, *Damaſcenus*, &c. — The word in reality is Arabic, Syriac, and Hebrew, formed of גַבְר *Gaber*, a man.

GABEL, in building, see the article *GAVEL*.

GABEL, or *GABELLE**, in the French customs, a duty or imposition on salt.

* Etymologists are divided as to the origin of the word. Some derive it from the Hebrew *Gab*, a present; others from גַבַל to deliver; others from קַבְלָה *Kabbalah*, receipt; others from *Gbael*, or *Gabe*, unjust law; and others from the corrupt Latin *Gabella*, or *Gablum*, tribute.

The *Gabel* is let out to farm; and makes the second article in the king's revenue.

There are three farms of *Gabels*; the first comprehends the greatest part of the kingdom: the second is that of the Lyons and Languedoc; and the third that of Dauphine and Provence. There are several provinces exempt from the *Gabel*; having purchased that privilege of Henry II.

This duty is said to have had its rise in France, in 1286. under Philip the fair. Philip the long took a double per livre on salt, by an edict in 1331; which he promised to remit when he was delivered from his enemies; and which he did accordingly in 1345. King John resumed it in 1355; and it was granted the dauphin in 1358, to ransom king John: Charles V. made it perpetual. Charles VII. raised it to six deniers; Louis XI. to twelve; and Francis I. to twenty-four livres per muid. And it has been considerably augmented since that time. Philip de Valois first established granaries and officers of the *Gabelles*, and prohibited any other persons from selling salt: from which time the whole commerce of salt, for the inland consumption, has lain wholly in the king's hands, who sells and distributes every grain thereof by his farmers, and officers created for the purpose.

The produce of this impost is so considerable, that it is computed to make one fourth of the whole revenue of the kingdom; and yields the crown as much as all the mines of Peru, Chili, Potosi, and the rest of America does the king of Spain.

GABEL, or *GABLE*, is also used in some of our ancient writers, for any sort of tax, or imposition: as *Gabel* of wines, of silks, &c.

GABINIA Toga, see the article *TOGA*.

GABIONS, in fortification, &c. large baskets, made of other twigs, woven of a cylindrical form, six foot high, and four wide; which being filled with earth, serve as a defence, or shelter from the enemy's fire.—See *Tab. Fortif. fig. 19*.

They are commonly used in batteries, to screen the engineers, &c. In order to which one is placed on either side each gun, only leaving room for the muzzle to appear through. See *BATTERY*.

There are also a smaller sort of *Gabions*, used on parapets, in trenches, &c. to cover the musqueteers; being placed so close as that a musket can but just peep through.

They also serve as a parapet on lines, lodgments, &c. where the ground proves too hard to dig into.

To render the *Gabions* useless, they endeavour to set them on fire, by throwing pitched faggots among them.

GABLE, or *GABLE-End* of a house, is the upright triangular end; from the cornice, or eaves, to the top of its roof.

Land-Gable, see the article *LAND-Gable*.

GABRES, or **GAVRES**, a religious sect in Persia; called also *Gabres*, *Gevres*, &c.

The Turks call the Christians, *Gabres*; *q. d.* infidels, or people of a false religion; or rather, as Leunclavius observes, Heathens, or Gentiles: the word *Gabre* among the Turks having the same signification, as *Pagan*, or *Infidel*, among the Christians; and denoting any thing not Mahometan.

In Persia, the word has a more peculiar signification; wherein it is applied to a sect dispersed through the country, and said to be the remains of the ancient Persians, worshippers of fire: though, upon the whole, they rather appear to have been Persians converted to christianity; who being afterwards left to themselves, mingled their ancient superstitions with the truths and practices of Christianity; and so formed themselves a religion a-part.

The *Gabres* pretend they derive their religion from one *Azer*, a Frank by nation, and by profession a sculptor: this man coming to Babylon, where they then dwelt, they say, married a maid of the country, named *Dogdon*; who, after a visit which he received from an angel, was filled with a divine light; and soon afterwards found herself with child. The astrologers, at the same time, perceiving that the child would be a great prophet, and the founder of a new religion; *Neubrou*, the prince then reigning, was advertised hereof; who gave immediate orders for all the women with child to be put to death, throughout the empire.

The order was executed accordingly; but the mother of the future prophet, shewing no token of pregnancy, escaped; and was at length happily delivered of a son, called *Ebrahim Zer-Ateuchi*.

After his birth, new dangers arose: and the king, being informed thereof, had him brought before him; and drawing his sabre, would have slain him with his own hand; but, they say, his arm grew motionless upon the spot: upon this, a huge fire was lighted, and the child cast into the same; but he rested therein, as on a bed of roses. He was afterwards delivered from other kinds of death, by a sort of flies, which infested the kingdom; one whereof, entering the king's ear, rendered him frantic, and at length killed him.

Cha-Gloches, his successor, made the like attempts on the child; but was so struck with the miracles which he saw him work, that he began to adore him, as all the rest of the people already did.

At length, after a great number of miracles, the prophet disappeared.—Some held he was translated into heaven, body and soul; others, that he found an iron coffin near *Bagda*, where shutting himself up, he was carried away by the angels.

After he was in possession of paradise, God sent them, they say through his means, seven books; which contained all the matters of religion; and afterwards, seven more, of the explanation of dreams; and lastly, seven of medicine. *Alexander* the great burnt the first seven, by reason no body understood the language, and kept the other fourteen for his own use.

After his death, some of the priests and doctors among the *Gabres* retrieved as much as their memory would allow them, of the lost books; and composed a large volume, still extant among the modern *Gabres*; though they understand nothing, either of the words, or the character.

Throughout the whole of this romantic story, we may discern the marks, and traces of christianity; though grievously defaced: the annunciation; the magi; the massacre of the infants; our Saviour's miracles; his persecutions, ascension, &c.

GAGE, in our ancient customs, signifies a pledge, or pawn, given by way of security.

The word is only properly used in speaking of moveables: for immoveables, the term *Hypotheca* is used.

If the *Gage* perish, the person who received it is not to answer for it, but only for extreme negligence, &c.

GAGE is also used for a challenge, to combat. See *CARTEL*.

In which sense, it was a pledge, which the accuser, or challenger cast on the ground, and the other took up, as accepting the challenge: this was usually a glove, gantlet, chaperoon, or the like.

The *Grand customary* mentions *Gages Pleiges de Duel*. These were gentlemen, of the relations or friends of the combatants: if he who had given the *Gages Pleiges*, was overcome, he was to pay a mulct agreed on.

GAGE is only now retained as a substantive: as a verb, the *G* is changed into *W*, and of *Gage* is formed *Wage*; as, to wage law, to wage deliverance, *q. d.* to give security a thing shall be delivered.

If a person who has distrained be sued for not having delivered what he had took by distress, he should wage or gage, or gager deliverance; that is, put in surety that he will deliver them.

Mort-GAGE, is that which is left in the hands of the proprietor, so that he reaps the fruits thereof.

In opposition to *Vif-gage*, where the fruits or revenues are respect by the creditor, and reckoned on the foot of the debt, which diminishes in proportion thereto. The second, acquits, or discharges itself; the first does not.

Pomey also uses *Mort-gage* for the possession of any effects, on condition of surrendering them up at the good pleasure of the person who gave them. See *MORTGAGE*.

GAGE, in the sea language. When one ship is to windward of another, she is said to have the *weather-gage* of her.

The seamen also call trying how much water a ship draws, *gaging*, or rather *gauging* of her; and it is done thus:

They drive a nail into a pike, near the end, and then put down this pike by the rudder, till the nail catch hold under it; for then as many feet as the pike is under water, is the ship's *Gage*, or depth of water she draws.

GAGE, in joinery, is an instrument made to strike a line truly parallel to the straight side of any board or piece of stuff.

Its chief use is for *gaging* of tenons true, to fit into mortises; and for *gaging* stuff of an equal thickness.

It is made of an oval piece of wood, fitted upon a square stick, to slide up and down stiffly thereon, and with a tooth at the end of a staff, to score, to strike a line upon the stuff at any distance, according to the distance of the oval from it.

Water-GAGE, see the article *WATER-GAGE*.

GAGER del Ley; see *WAGE*, and *WAGER of Law*.

GAGER, and } in geometry, } see } *GAUGER*.

GAGING } } see } *GAUGING*.

GAIANITES, *GAIANITÆ*, a sect of ancient hereticks, sprung from the Eutycheans.

This sect was of an older standing than *Gaian*, a bishop of Alexandria, in the sixth century, from whom however they took their name. They adhered to the opinions of *Julian Halicarnassæus*, the chief of the Insuperables and Phantastici; and came at length to be denominated *Gaianites*, upon *Gaian's* putting himself at their head. They denied that *Jesus Christ*, after the hypostatical union, was subject to any of the infirmities of human nature.

GAIN, the profit, or lucre a person reaps from his trade, employment, or industry.

* Some derive the word from the German *Gewin*; whereof the Italians have made *Guadagno*; the French, and English, *Gain*.

There are legal and reputable *Gains*, as well as fordid and infamous ones. What is *gained* by gaming, is all liable to be restored again, if the loser will take the benefit of the law.

GAIN, in architecture, is the workmen term for the bevelling shoulder of a joist, or other timber.

It is used also for the lapping of the end of the joist, &c. upon a trimmer, or girder; and then the thickness of the shoulder is cut into the trimmer also bevelling upwards, that it may just receive the *Gain*; and so the joist and trimmer lie even and level with their surface.—This way of working is used in floors and hearths.

GAINAGE, *GAINAGIUM*, in our ancient writers, signifies the draught-oxen, horses, wain, plough, and furniture for carrying on the work of tillage by the baler sort of sokemen and villans.

Gainage is the same with what is otherwise called *Wainage*. *Bracton*, lib. i. cap. 9. speaking of lords and servants, says, *Ut si eis distringant, quod saluum non possit eis esse Wainagium suum*. And again, lib. iii. tract. 2. cap. 1. *Villanus non amercietur, nisi salvo Wainagio suo*. For antiently, as it appears both by *Mag. Chart.* and other books, the villan, when amerced, had his *Gainage*, or *Wainage* free; to the end his plough might not stand still: and the law, for the same reason, does still allow a like privilege to the husbandman, that is, his draught-horses are not, in many cases, distrainable.

GAINAGE is also used for the land itself, or the profit raised by cultivating it.

GALACTITIS, *Γαλακτιτις*, in natural history, a stone, thus called by reason when broke or ground with water, it yields a white liquor, like milk, which the Greeks call *γαλα*.

The stone is of an ash colour, and pretty soft, and sweet to the taste. It is said to be still found in Tuscany, Saxony, and other parts.

Authors recommend it as good in distensions of the eyes, and for ulcers: it is supposed to make the milk more copious in nurses; and when hung on the necks of children, they say, it promotes dentition. See *Supplement*, article *GALACTITES*.

GALACTOPHAGI*, and *Γαλακτοφάγοι*, in antiquity, persons who lived wholly on milk, without corn, or the use of any other food.

* The words are compounded of *γαλα*, *γαλακτω*, milk; *φαγω*, to eat; and *αντι*, of *αντις*, I drink.

Certain nations in Scythia Asiatica, as the *Getæ*, *Normades*, &c. are famous in ancient history, in quality of *Galactophagi*, milk-eaters. Homer makes their elege, *Iliad*, lib. iii.

Ptolemy, in his geography, places the *Galactophagi* between the Rhipæan mountains, on one side, and the Hircanian sea on the other.

GALACTOPHOROUS *Dutts*, are such vessels as serve to convey milk.

GALACTOPOTÆ, see the article *GALACTOPHAGI*.

GALACTOSIS, the production of milk; or the action whereby the food, or chyle, is converted into milk.

GALANGAL,

GALANGAL, **GALANGA**, a medicinal root, brought from the East-Indies; the produce of a plant of the same name. There are two kinds of *Galangal*; the *small*, and the *great*: the *small* is a rough, knotty root, of a ruddy colour both within, and without, and of a very pungent aromatic taste, and smell. It is brought from China, and is used with good success in all disorders of the stomach, bowels, and womb, arising from the weakness of the nerves.

The *greater Galangal*, growing chiefly in Java and Malabar, inclines more to the ash colour. Its qualities are of the same kind with those of the other; only less efficacious, but it used to be more common. The vinegar-makers use both.

GALANT, see the article **GALLANT**.

GALAXY*, in astronomy, that long, white, luminous track, which seems to encompass the heavens like a swath, scarf, or girdle; and which is easily perceivable in a clear night, especially when the moon does not appear.

* The Greeks call it Γαλαξίας, *Galaxia*, of γάλα, γαλακτός; Milk; on account of its colour, and appearance: the Latins, for the same reason, call it *via lactea*; and we, the *milky way*.

It passes between Sagittary and Gemini, and divides the sphere into two parts: it is unequally broad; and in some parts is single, in others double.

The ancient poets, and even philosophers, speak of the *Galaxy*, as the road, or way, by which the heroes went to heaven.

Aristotle makes it a kind of meteor, formed of a croud of vapours, drawn into that part by certain large stars disposed in the region of the heavens answering hereto.

Others, finding that the *Galaxy* was seen all over the globe; that it always corresponded to the same fixed stars; and that it transcended the height of the highest planets; set aside Aristotle's opinion, and placed the *Galaxy* in the firmament, or region of the fixed stars, and concluded it to be nothing but an assemblage of an infinite number of minute stars.

Since the invention of the telescope this opinion has been abundantly confirmed. By directing a good telescope to any part of the milky way; where, before, we only saw a confused whiteness, we now descry an innumerable multitude of little stars. These stars are so remote, that a naked eye confounds them: the like we observe in those other spots, called *Nebulose Stars*, which when examined with the telescope, are distinctly perceived to be clusters of little stars, too faint to affect the eye singly. See **STAR**.

GALBANETUM, a composition, or preparation of galbanum formerly prescribed; but now much out of use.

GALBANUM*, in pharmacy, a gum issuing from an incision in the root of a ferulaceous plant, called in Latin, *Ferula Galbanifera*; growing in Arabia, Syria, &c.

* The word is derived, according to Martinus, from the Hebrew *Gelbanah*, fat.

There are two kinds of *Galbanum*; the one in grains, or tears; the other in a coarſe mass: the first is to be choſe of a golden yellow without ſide, but much paler within; of a bitter taſte, and ſtrong, diſagreeable ſmell. For the ſecond, take that which is fullſt of tears, very dry, clear, and not ſinking. This laſt is eaſily ſophiſticated with broken beans, roſin, and gum armoniac.

Galbanum is of an emollient, and reſolutive nature; good in all hyſteric caſes, and in aſthma's and inveterate coughs: it provokes the menſes, and brings on delivery: but it is chiefly uſed externally, in plaſters for the belly, which it alſo looſens, what way ſoever applied.

GALE, a ſea phraſe, for the blowing of the wind.

When the ſea is not blown too hard, but that a ſhip can carry her top-ſails a-trip, that is, hoisted up to the higheſt, they ſay it is a *Lean Gale*.

When it blows very ſtrong, they ſay it is a *Stiff Gale*, or at leaſt a *Freſh Gale*; but when it blows too hard, and violently, that a ſhip cannot bear any fail, they ſay, it blows a *Storm*.

When two ſhips are near one another at ſea, and there being but little wind blowing, one feels more of it than the other; they ſay, the ſhip *gales* away from the other.

GALEARI, in antiquity, *helmet-lavers*; a name the Romans gave to the black guards, or ſervants of the ſoldiers.—See *Vegetius* in *b.* and *Salmaſius* on the third chapter of the *Life* of *Adrian* by *Spartian*.

GALEASSE, a large, low built, heavy veſſel, uſing both ſails and oars; being the biggeſt of all the veſſels that go with the latter.

It may carry twenty guns; with a ſtern, capable of lodging a great number of mulqueters: it has three maſts; the main, mizen, and bowsprit, which are never to be taken down, or lowered, as they may be in galleys. It has thirty-two benches of rowers, and to each bench five or ſix ſlaves. Will. of Tyre makes mention of *Galeaſſes*, with one hundred benches of oars.

It has three tire of guns, in the head, one over the other; they are of two guns each, bearing balls of thirty-fix, twenty-four,

and ten pounds. It has but two tire in the ſtern; each containing three guns, carrying balls of eighteen pounds.

The Venetians are the only people who now uſe *Galeaſſes*: antiently, the French likewiſe made uſe of them.

GALEATE Flower, ſee the article **FLOWERS**.

GALENIC, or **GALENICAL Medicine**, is that manner of conſidering and treating diſeaſes, founded on the principles of *Galen*; or introduced by *Galen*.

Claud. Galen, was of *Pergamus* in *Aſia*, the ſon of *Nicon*, a famous geometrician, architect, and was a pupil of *Satyrion* and *Pelops*, two able phyſicians. He firſt diſtinguiſhed himſelf at *Athens*; then at *Alexandria*; and laſtly at *Rome*; where he wrote a great deal; and where he alſo died, in the year of *Chriſt* 140.

He is ſaid to have compoſed two hundred treatiſes, whereof there are one hundred and ſeventy ſtill extant. There have been twenty-three ſeveral editions of this author: the firſt is that of *Venice*, in folio, in the year 1525: but the beſt is that of *Paris*, in thirteen volumes in folio, Greek and Latin, published in 1639.

This author, collecting and digeſting what the phyſicians before him had done; and explaining every thing according to the ſtricteſt doctrines of the *Peripatetics*, ſet phyſic on a new footing; he introduced the doctrine of the four elements; the cardinal qualities, and their degrees; and the four humours, or temperaments.

GALENIC is now more frequently uſed; as contradiſtinguiſhed from *chemical*.

In this ſenſe, *Galenical Medicine*, and *Galenical Pharmacy*, are thoſe which go upon the eaſier preparations of herbs, roots, &c. by infuſion, decoction, &c. and attain their ends, and make their remedies effectual, by the combining and multiplying of ingredients: in oppoſition to the chemical medicine, or pharmacy, which torture the materia medica by fire, and draw their more intimate and remote virtues by elaborate preparations; as calcination, diſtillation, fermentation, &c.

Medicine was wholly *Galenical*, till the time of *Paracellus*. *Geber* indeed, and after him *Raymund Lully*, *Arnoldus de Villa Nova*, and *Baſil Valentine*, made ſome attempts to apply chemistry to medicine; eſpecially the laſt of them: but no great advance was made. *Paracellus*, and after him *Van Helmont*, altered the whole body of medicine; exploded *Galenism*; and the *Peripatetic* doctrine; and rendered medicine almoſt wholly chemical.

The late improvements in philoſophy have reformed, and retrieved the *Galenical* medicine, which however has now little of *Galen*'s in it. It is become all mechanical, and corporeal: inſtead of qualities and degrees, every thing is now reduced to mechanical affections; to the figures, bulks, gravities, &c. of the component particles, and to the great principle of attraction.

GALENICAL Physicians, ſee the article **PHYSICIANS**.

GALENISTS, a denomination given to ſuch phyſicians, as praſtice, preſcribe, or write on the *Galenical* principles.

The *Galenists* ſtand oppoſed to the *chemists*: the materia medica of the firſt, is chiefly of the vegetable kind; the virtues of which they procure by the more ſimple and eaſy means; and ſeldom go beyond decoction. The latter take in minerals, ſalts, ſtones, and even metals, and ſemi-metals: Theſe, they hold, afford more efficacious remedies; and their virtues, are procured by long, artful, labour'd proceſſes, with the help of fire, are had more pure, and in a leſſer compaſs.

At preſent, the *Galenists* and *chemists* are pretty well accommodated; and moſt of our phyſicians uſe the preparations and remedies of both.

GALENISTS, or **GALENITES**, are alſo a branch of *Menonites*, or *Anabaptiſts*, who take in ſeveral of the opinions of the *Socinians*, or rather *Arians*, touching the divinity of our Saviour.

They are thus called from their leader, *Abr. Galenus*, a learned, and eloquent phyſician of *Amſterdam*, who is accuſed of being a thorough *Socinian*. *Jouv.* t. i. p. 413, &c.

GALERICULATE Flowers, ſee **FLOWERS**.

GALILEANS, **GALILÆI**, a ſect among the antient Jews, denominated from *Judas of Galilee*, their chief; who, eſteeming it unworthy, that the Jews ſhould pay tribute to ſtrangers, raiſed up his countrymen againſt the edict of the emperor *Auguſtus*, which had ordered a cenſus or enumeration to be made of all his ſubjects.

Their pretence was, that God alone ſhould be owned as maſter, and called by the name of the *Lord*. In other reſpects they had much the ſame doctrine as the *Phariſees*; but as they judged it unlawful to pray for invidious princes, they ſeparated themſelves from the reſt of the Jews, and perſonated their ſacrifices apart.

As our Saviour, and his apoſtles were of *Galilee*, they were ſuſpected to be of the ſect of *Galileans*; and it was on this principle, as *St. Jerom* obſerves, that the *Phariſees* laid a ſnare for him, aſking, Whether it was lawful to give tribute

to Cæsar; that in case he denied it, they might have an occasion of accusing him. Vid. Joseph. *Ant. Jud.* lib. xviii.

GALILEO's Telescope, see the article **TELESCOPE**.

GALL, a yellow, bitter juice, or humor, called also *Bile*, secreted from the blood, in the glands of the liver, and deposited in a peculiar reservoir, called the *Gall-bladder*.

The bile contained in the *Gall-bladder*, properly called *Gall*, is somewhat different from the bile deposited in the porous biliary; being of a brighter yellow, a greater consistence, and more bitter and acrimonious. For the rest; the manner of secretion, with the qualities, use, &c. of the two juices, are the same; which see under the article **BILE**.

The *Gall* of divers animals, is found of divers uses: that of a hog is said to make the hair grow, and deterses and heals ulcers of the ears: that of a lamb is recommended for the epilepsy: that of the pike, for intermitting fevers: that of the carp, clears and strengthens the sight; that of a kid, mixed with the white of an egg, bread, and oil of bays, and applied in form of poultice on the navel, is an approved remedy for a quotidian ague: that of a cock, and a bullock, are reputed good in distiles of the eyes, and to take away freckles and other disfigurements of the skin; that of a roe-buck, or hare, deterses and carries off clouds, specks, and cataracts of the eyes: that of the boar, externally applied, is resolute, and good in scrophulous tumors: those of the sheep and partridge, serve to deterse and cleanse ulcers of the eyes. Fa. Roger adds, that the Mahometans of Palestine use no other remedy against poisons, but seven, or eight drops of the *Gall* of a bear.

GALL-BLADDER, *vesicula*, or *folliculus felleus*, is a membranous receptacle, in figure somewhat like a pear; situate at the lower margin of the liver, on the concave side; being about the bigness of a pullet's egg.—See *Tab. Anat.* (Splanchn.) fig. 1. lit. c. fig. 5, lit. c. (Angiol.) fig. 1. n. 34.

The *Gall-bladder* adheres to the liver, both by its vessels, which it receives from it; and likewise by its membranes, whereof the external is common with that of the liver. The lower part, which hangs out of the liver, rests on the pylorus of the stomach, which it dyes yellow with the *Gall* transuding through its membranes.

Its membranes are reckoned five: an outer, or common one, from the peritonæum; an inner one, from the capsula of the porta, and porous biliary; and three proper ones: the first, *vascular*, consisting of white fibres, interwove with vessels; the second, *muscular*, consisting of a double row of fleshy fibres, the one longitudinal, the other angular; the third, or inner coat, *glandulous*, consisting of a great number of glands, like the crista villosa of the stomach, which separate a mucus that lines the inside of the *Gall-bladder*, and defends it from the acrimony of the bile.

This bladder is usually divided into two parts, the *fundus*, or bottom; and the *collum*, or neck: at the orifice of which latter is placed a ring, or circle of muscular fibres, which serve as a sphincter to confine the orifice of the *Gall-bladder*, and hinder the too liberal discharge of the bile.

There are some animals without *Gall bladders*, as deer, horses, asses, mules, camels; and among fishes, the sea-calf, and dolphin. The *Gall* of these animals is inclosed in ducts, which terminate in the intestines.

Wind GALL, see the article **WIND-GALL**.

GALL Æ, see the article **GALLI**.

GALLANT, or **GALANT**, a French term, signifying civil, polite, well-bred; or a person of wit, and address; who does every thing with a good grace: in fine, a civil person, somewhat brighter, gayer, and more agreeable than ordinary.

It is difficult to define all the qualities annexed to the idea of a *gallant* man: it frequently implies an air of the world; a disposition to please, and particularly the ladies; and a great devotion to the sex. The French authors are very nice on the point: they distinguish *galant homme*, and *homme galant*.

Mercur GALANT, is the title of a book, which appeared monthly at Paris for several years.

It contain'd abundance of pretty, curious things; though several of the wits have made it their business to decry it. M. de Vize was the first projector, and author, or rather collector of it; and after his death, it was continued by other persons successively.

GALLED-Saddle, see the article **SADDLE-galled**.

GALLEON, see the article **GALLION**.

GALLERY *, in architecture, a covered place in a house, much longer than broad, and which is usually placed in the wings of the buildings; and serves to walk in.

* Savot, in his architecture, derives the word *Gallery* from *Gaul*, as supposing the ancient *Gauls* to have been the first who used them: Nicod fetches it from the French *aller*, to go, *q. d. Allerie*. Others bring it from *Galere*, galley, by reason it bears some resemblance thereto in respect of length. In the corrupt Latin we meet with *Galilea*, for the *Gallery* of a monastery.

The *Galleries* of the Louvre are magnificent: a *Gallery* of painting; a complete apartment is to consist of a hall, antichamber, chamber, cabinet, and *Gallery*.

GALLERY, also denotes a little ille, or walk; serving as a common passage to several rooms placed in a line, or row.

The *Gallery* of a church is a kind of continued tribune, with a balustrade; built along the sides or lower end of a church, to make it hold the more people: and, in the Greek churches, to separate the women from the men.

GALLERY, in fortification, a covered walk, or passage made across the ditch of a town besieged, with timbers fastened on the ground, and planked over.—See *Tab. Fortif.* fig. 22.

The sides of the *Gallery* are to be musket proof, and to consist of a double row of planks, lined with plates of iron; and the top is sometimes covered with earth, or turf, to hinder the effect of the stones, artificial fires, &c. of the enemy.

Galleries are chiefly used to secure and facilitate the miners approach to the face of the bastion, over the moat, which is already supposed filled up with faggots and bawns, and the artillery of the opposite flank dismounted. Sometimes this is called a *Traverse*.

GALLERY of a Mine, denotes the *branch*; or that narrow passage under ground, leading to a mine carrying on under any work designed to be blown up.

The besiegers, and besieged do each of them carry *Galleries*, or branches under ground, in search of each other's mines, and these sometimes meet and destroy each other.

GALLERY in a Ship, is a kind of balcony, made upon the stern, without board, into which there is a passage out of the great cabin.—See *Tab. Ship.* fig. 1. lit. M. fig. 2. n. 98. and 101.

These *Galleries* are for the shew, and the captain's pleasure, rather than any other benefit; for in ships of war, all open *Galleries* of this kind are to be avoided; in regard of the facility of an enemy's entrance, and boarding of the ship that way.

GALLEY *, a low built vessel, going both with oars and sails; chiefly used by the states bordering on the Mediterranean.

* The *Galley* is called by the Greek authors under the eastern empire, *Γαλιαις*, and *Γαλιαις*; and by the Latin authors of the same time, *Galea*; whence the modern denomination. Some say, it was called *Galea*, on account of the figure of a calf, or helmet, which it bore on its head, or prow, as Ovid attests, *De Tristib.* The French call it *Galere*, by reason, they say, that the top of the masts is usually cut in manner of a hat, which the Italians call *Galero*. Others derive both *Galea* and *Galere* from a fish, by the Greeks called *Γαλιαις*, or *Γαλιαις*; and by us, the *Sword-fish*, whose shape this vessel resembles. Lastly, others derive *Galley*, *Galea*, *Galere*, *Galeaffe*, &c. from the Syriac and Chaldee *Gaul*, and *Gallin*, a man exposed on the water, or in a vessel of wood.

Galleys have usually from twenty-five to thirty benches of oars, on each side; and four or five *Galley-flaves*, to each bench.

The *Galley* carries a large gun, called the *Courfer*; two bastard pieces; and two small pieces, with two masts and two latin or square sails. It is usually from twenty to twenty-two fathoms long; three broad; and one deep; and has two masts, viz. a main-mast, and a fore-mast, which may be struck or lowered at pleasure.

All the *Galleys*, both ancient and modern, are of a finer, and slenderer make than ships. Formerly they made divers kinds; at present the *Galleys* are all alike: all the difference between them is as to size, and nothing as to figure. They usually keep towards the coasts; though sometimes they cross the sea.

The king of France keeps up forty *Galleys* for the use of the Mediterranean, the arsenal thereof being at Marseilles: the general of the *Galleys* bears a double anchor, placed in pale, behind the escutcheon of his arms, as a mark of his office.

Galleys, in Latin, are called *Biremes*, *Triremes*, and *Quadriremes*, not on account of their having two, three, or four ranges of oars before one another, as many learned men have imagined, and particularly Scaliger and Snellius, though this last has wrote excellently on the subject of navigation; for this were impracticable: nor yet on account of their having but two, three, or four oars; for then they would want strength: but by reason there were two, three, or four rowers fastened to each oar, as in the *Galleys* used among us; as is very well shewn by the Jesuit Dechales, in his *art of sailing*.

The error was occasioned by some ancient *Galleys*, represented on medals, or basso-relievos, wherein are several ranges of rowers placed over each other: but all the mathematicians, pilots, and ship-builders look on this as a mere vision; inasmuch as Pliny makes mention of *Galleys* of fifteen, twenty, thirty, forty, fifty rows of rowers; so that if they were ranged over each other, though we were only to allow four feet for each deck, there would be a distance of one hundred and sixty feet between the lowest rowers, and the highest: and yet we are assured, that the highest vessel ever built, was only twenty-two feet high.

Scaliger affirms, that the first *Triremis*, or *Galley* of three stories, was built at Corinth; and is of opinion, that what

Pliny

Pliny calls *Long Ships*, were what we call *Galeasses*; the fifth whereof was that of the Argonauts. Vegetius mentions a *Galley* of five decks; and Memnon, another with eight, and only one man to each oar. See *Supplement, article TRIREMIS*.
Captain-GALLEY is the principal *Galley* of a fleet, commanded by the captain-general of the *Galleys*: in France, the *Royal Galley* is the first.

Patron-GALLEY denotes the second *Galley*, both of France, Tuscany, and Malta.

The second general of the *Gallies* is always on board the royal *Galley*; and the lieutenant on board the patron.

The terms peculiar to *Galleys* are very numerous, and make a new system of sea-language, different from that, used in ships. Monf. de Baras, an ancient officer on board the king of France's *Galleys*, engaged himself in writing a new dictionary of the dialect of the *Galleys*.

Condemnation to the GALLEYS, is a penalty imposed on criminals and delinquents, particularly in France; whereby they are adjudged to serve the king, or state, as slaves on board the *Galleys*, either for ever, or for a limited time.

Condemnation to the *Galleys* for ever, imports confiscation of lands, goods, &c. For in France, that which confiscates the person, confiscates the goods.

A man condemned to the *Galleys* for perpetuity, is dead in a civil sense. He cannot dispose of any of his effects; cannot inherit; and if he be married, his marriage is null; nor can his widow have any of her dower out of his goods.

The ecclesiastical courts cannot sentence to the *Galleys*: it is out of their jurisdiction.

By an ordinance of Charles IX. in 1564, the judges are enjoined not to condemn a criminal to the *Galleys* for less than ten years: and Hen. III. by another of 1579, enjoins the captains, not to detain their *Galley* slaves, after their time is expired. But neither of these laws are now observed.

GALLEY, in printing, a wooden frame, or instrument, into which the compositor empties the letters out of his composing-stick, as often as it is filled.

The *Galley*, when filled, contains the matter of one page; and when they have composed as many pages as are required for a whole sheet, half sheet, or the like, they impose them, *i. e.* they take the several pages out of the *Galleys*; put them into a chase; lock them up with the furniture; and so make forms, ready for the press.

GALLI, or GALLÆ, in antiquity, a name given in Phrygia to the eunuch priests of the goddess Cybele.

The principal of them was called *Archi-Gallus*. The *Galli* were also called *Daſtyli, Idiæ, Corybantes, &c.* Authors are not agreed as to the reason of this denomination. St. Jerom, on the fourth chapter of Hosea, says, it was, because they took Gauls for the priests of this goddess, and, by way of punishment and derision for burning of Rome, castrated them. Forcatulus maintains the same opinion, l. v. de *Gallor. Imp. & Philof.* But Valla, *Eleg. v. c. 6.* and Vossius, de *Idolol.* l. i. c. 29. reject it, with reason; as the Phrygians were no ways interested in the burning and sacking of Rome.

Others derive the name from the river Gallus; by reason these priests drank of its waters, which inspired them with I know not what religious fury and enthusiasm, and deprived them of their senses to such degree, that they mutilated themselves. Others hold, that the first priest of Cybele having been named *Gallus*, the name became appropriated to all his successors. Vossius, who proposes these two opinions, seems to incline most to the latter; though Ovid, in the fourth of his *Fasti*, and Herodian, l. i. favour the former.

These priests threw themselves into a kind of phrenzy, when they performed the ceremonies of the goddess; apparently, in imitation of the young Atys, her favourite; whom they likewise imitated, by mutilating themselves.

For authors relate, that Cybele being desperately in love with that young Phrygian, she gave him the superintendence of her sacrifices, on condition he would keep his virginity; but that soon after, forgetting his promise, he had an affair with the nymph Sangaritis: that Cybele, provoked hereat, struck him mad: that in a vehement access of his phrenzy he was going to kill himself; and that the goddess relenting, restored him to his understanding: that out of his own remorse, he castrated himself; and that after his example all the priests of Cybele from that time did the like.

Their phrenzy at the time of the sacrifices, consisted in throwing round the head with great rapidity, and making violent contortions of the whole body: they had also drums and flutes, wherewith they played, and danced to them; as already observed under the articles *CORYBANTES*, and *CURETES*.

Caput GALLI, } See the articles { **CAPUT.**
Crista GALLI, } **CRISTA.**

GALLIAMBIC, in the antient poetry. — **GALLIAMBIC** poem is a composition in *Galliambic* verses.

GALLIAMBIC verse, a sort of Iambic, consisting of six feet: 1^o, An Anapaest, or a Spondee; 2^o, An Iambus, or an Anapaest;

or Tribach; 3^o, An Iambus; 4^o, A Daſtyl; 5^o, A Daſtyl; and 6^o, An Anapaest.

Though one might measure the *Galliambic* verse in another manner; and make a different arrangement and combination of syllables; which would give different feet. — It is certain the antients regarded little more in the *Galliambic* verse, beside the number of measures, or intervals, without troubling themselves about the number of syllables, or the kinds of feet, whereof it was composed.

GALLIAMBUS*, in poetry, a pleasant kind of verse, used to be sung by the Galli, priest of Cybele, in honour of that goddess.

* The word is a compound of *Gallus*, a priest of Cybele, and *Iambus*, a foot in the Greek and Latin verse.

Galliambus also denotes a piece, or composition in *Galliambic* verses.

GALLIARD*, or *GAGLIARDA*, in music and dancing, a sort of dance, antiently in great request; consisting of very different motions, and actions, sometimes proceeding *terra à terra*, or smoothly along; sometimes capering; sometimes along the room, and sometimes a-crois.

* The word is French, *Gaillards*, or rather Italian, and literally signifies gay, merry, sprightly. This dance was also called *Romanesque*, because brought from Rome.

Thoinot Arbeau, in his *Orchesography*, describes it as consisting of five steps, and five positions of the feet, which the dancers performed before each other, and whereof he gives us the score, or tablature, which is of six minims, and two triple times.

GALLICAN Church denotes the church of France; or the assembly or convocation of the prelates of France.

M. du Puy has an express treatise of the liberties of the *Gallican* church.

GALLICAN Breviary, denotes the breviary used by the church of Agrigentum, in Sicily; which the modern writers call *Breviariū Agrigentanū*.

The reason, no doubt, is its having been introduced by St. Gerlan, who was made bishop of Agrigentum, after earl Roger had been driven out of Sicily by the Saracens; and by the other French bishops, which the Norman princes brought thither.

GALLICAN liturgy, is the manner of performing divine service, antiently observed in the Gauls.

Fa. Mabillon shews wherein it differed from the Roman liturgy.

1. *Liturg. Gall.* c. 5, &c.

GALLICAN Mass, see the article *MESSÉ*.

GALLICISM, a phrase, or construction, peculiar to the French language; or which has something contrary to the ordinary rules of grammar of other languages.

Thus, *Cet homme est sur sa bouche*, is a *Gallicism*, having no regular construction: and the same may be said of *Paire de la terre le fesse*; which no grammar could ever find out.

GALLIMATHIAS*, a dark, perplexed discourse, where words and things are huddled together so as to make an inconceivable jargon.

* The word is French, formed, as some will have it, from *poly-mathia*, which signifies diversity of sciences; by reason such as have their memory burdened with several kinds of sciences, are usually confused, and express themselves ill. M. Huet rather takes the word *Gallimathias* to have had the same origin with *aliborum*; and to have first arose at the time when all the pleadings at the bar were in Latin. There was a cause, it seems, upon the carpet; about a cock, belonging to the plaintiff *Matthias*. The counsel in the heat of his harangue, by often repeating the words *Gallus* and *Matthias*, happened to blunder; and instead of saying *Gallus Matthias*, said *Galli Matthias*; which at length became a general name for all confused, imbroiled language and discourse.

GALLIMAWFRY*, a ragout, hache, or hotch-pot, made of the remains of several kinds of meats.

* The word is French, *Gallimafree*, which signifies the same.

Hence the word is also used in a figurative sense for a piece, or composition, of several different parts, ill digested, and embarrassed.

GALLINAGINIS Caput, see **CAPUT**.

GALLING, see **BARK-galling**, **SADDLE, &c.**

GALLION, or **GALLEON**, formerly denoted a large vessel, or ship of war, of three or four decks.

GALLION is now only used in speaking of the Spanish fleet; the *Gallions* being a part of the ships employed in the commerce of the West Indies.

The Spaniards send every year two fleets; the one for Mexico, which they call the *Flota*; and the other for Peru, which they call the *Gallions*. The first, we have already given an account of, under the article *FLOTA*.

The *Gallions* are eight in number, the principal whereof are the Capitana, the Amirante, il Governo, the Patache, and Marguaria, of fifty pieces of brass cannon; beside which there is a Patache of advice. These are all ships of war, and go on

the king's account; but they are so laden and embarrassed with merchandizes, that in case of an attack, they find it difficult to defend themselves.

Beside the king's *Gallions*, there are usually twelve, or sixteen merchant ships, called *Register Ships*, belonging to private persons, who obtain leave for the same, or rather buy it; there being no West India Company in Spain. See REGISTER.

The *Gallions* are loaded at Cadix, from whence they may put out at any time: they are about two years in the whole voyage. Their departure is usually some months before that of the *Flota*; which cannot put out before August, by reason of the wind. When they put out together, they separate about the Antilles islands; the *Gallions* for Carthage and Porto Bello; and the *Flota* for Vera Cruz. At their return, they rejoin at the Havanna in the isle of Cuba.

The loading of the *Gallions* is always the richest: an estimate of the yearly returns or cargo's, both of the *Flota* and *Gallions*, is as follows:

Of gold, the *Gallions* bring yearly about two or three millions of crowns; and the *Flota* about one. Of silver, the *Gallions* bring eighteen or twenty thousand crowns; and the *Flota* ten or twelve. Of precious stones, the *Gallions* bring as follow; two hundred thousand crowns worth of pearls; two or three hundred thousand crowns of emeralds; and twenty or thirty thousand crowns worth of bezards, amethysts, and other stones of less value: the *Flota* brings none at all. Of wools, the *Gallions* bring forty or fifty thousand crowns: the *Flota*, none. Of quinquina, the *Gallions* bring the value of twenty thousand crowns: the *Flota*, none. Of skins and leathers, the *Gallions* bring seventy thousand crowns worth: the *Flota*, as much. Of campeche wood, the *Gallions* bring sixty thousand crowns worth: the *Flota*, none. Of skins and leathers from Buenos Ayres, the register ships may bring to about two hundred thousand crowns: of cochineal, about a million of crowns: and of indigo, about six hundred thousand crowns.

GALLIOT, a small galley; or a sort of brigantine, built very slightly, and designed only for chase.

She hath but one mast, and can both sail and row. She usually carries two or three pedrero's, and hath sixteen or twenty oars.

Some also call the bomb-ketches, *Galliot*.

GALLOGLASSES, a kind of militia, or soldiery, in Ireland.

Canden, in his annals of Ireland, p. 792, relates that the Irish militia consists of cavalry, or horsemen, called *Gallglusis*, or *Gauls*, who use a very sharp sort of hatchet: and infantry, called *Kernes*.

GALLON, an English measure, for things both liquid and dry, containing two pottles, or four quarts.

The *Gallon* always contains eight pints, or four quarts; but those pints and quarts, and consequently the *Gallon* itself, are different, according to the quality of the things measured: the wine *Gallon*, for instance, contains 231 cubic inches, and holds eight pound, averdupois, of pure water: the beer, and ale *Gallon*, contain 282 solid inches: and the *Gallon* for grains, meals, &c. 272 inches, and holds nine pound, thirteen ounces, of pure water.

GALLOON, in commerce, a thick, narrow kind of ferret, ribband, or lace, used to edge or border clothes.

The term is ordinarily understood of that made of wool; sometimes, that of a thread, or even gold, or silver.

GALLOP*, in the manage, is the swiftest natural pace of a horse, performed by reaches, or leaps; the two fore-feet being raised almost at the same time; and when these are in the air, and just ready to touch the ground again, the two hind-feet are also lifted almost at once.

* The word is borrowed from the barbarous Latin *calupare*, or *calpare*, to run. Some derive it from *caballare*: others from the Greek *καλπαζειν*, or *καλπειν*, to spur a horse.

In *Gallopping*, the horse may lead with which fore-leg he pleases; the most usual way is that with the right: but which soever it be, the hind-leg of the same side must follow it next; otherwise the legs are said to be *disunited*, and the *Gallop* to be *false*. To remedy which disorder, the rider must stay the horse a little on the hand, and help him with the spur on the contrary side to that on which he is disunited.

In a circle the horse is confined always to lead with his fore-leg, within the turn; otherwise he is said to *gallop false*. But here, too, the hind-leg of the same side must follow.

We say, a *Hand-Gallop*, a *Canterbury-Gallop*, a *School-Gallop*, &c. A smooth *Gallop*, close to the ground, the French call, the *English Gallop*, *Galop à l'Angloise*.

GALLOWES, an instrument of punishment whereon persons convicted capitally of felony, &c. are executed by hanging. Among our ancestors it was called *Furca*, fork; a name by which it is still denominated abroad, particularly in France and Italy. In this latter country, the reason of the name still subsists; the *Gallows* being a real fork drove into the ground, across the legs whereof is laid a beam, to which the rope is tied.

GALLS, or **GALL-NUTS**, in natural history, &c. a kind of morbid tumors, or excrescences found on divers trees and plants, as the oak, willow, &c. in form of balls, cones, or little apples, sometimes solid, sometimes perforated. The manner of the production of *Galls* is well described by Malpighi, in an express treatise, *de Gallis*. The process, as observed in the cone *Galls*, or apples on the gems of oaks, is also given us by Mr. Derham.

These cones, says that author, are in outward appearance perfectly like the gems, or nuts themselves, only vastly bigger; and, in effect, they are no other than the gems swelled out in bulk, which naturally ought to be pushed out at length. The cause of which obstruction of vegetation is this: into the very heart of the young, tender bud, which begins to be twined in June, and shoots out in a month more, an insect of the ichneumon fly kind, thrusts one, or more eggs; and, in all probability, some venomous ichor therewith. This egg soon becomes a maggot; which eats itself a little cell in the very heart or pith of the gem, which should be the rudiment of the branch, leaves, and fruit.

The branch thus destroyed, or, at least, its vegetation obstructed; the sap that was to nourish it, is diverted into the remaining parts of the bud, which are only the scaly teguments; and which by this means grow large and flourishing, and become a covering to the infected case, as before they were to the tender branch. The case lying within this cone, is, at first, but small; but by degrees, as the included maggot increases, so does the case; till it comes to the size of a large white pea, shaped like an acorn.

It may be added, that even nettles, ground-ivy, &c. have a kind of balls or cases produced on their leaves, by the injection of the eggs of a fly of the same kind. These cases always grow in, or adjoining to some rib of the leaf; and their production Malpighi and Mr. Derham describe thus:

The parent-insect, with its stiff setaceous tail, bores into the rib of the leaf, when tender, and makes way for its eggs into the very pith, or heart thereof; emitting along with them a proper juice to pervert the regular vegetations.

From this wound rises a small excrescence, which, when the maggot is hatched, increases and swells on each side the leaf, between the two membranes; extending itself into the parenchymous parts thereof, till it be grown as big as two grains of wheat. In this case lies a small, white, rough maggot; which turns to an aurelia, and afterwards to an ichneumon fly. See Supplement, article GALLS.

GALLS, or **Allep GALLS**, are a particular kind of vegetable tumors, or excrescences, wherein insects are hatched; and which are much used in dying, making ink, &c.

These *Galls* are produced on the hardest species of oak, called *Quercus Gallum ferens*. Those on other oaks are less fit for the purpose. They are hard as shells; and yet are no other than the cases of the insects, which are bred in them after the manner above described; and which, when come to maturity, gnaw their way out; which is the cause that those little holes observable in them. Of these insects bred in them, we have a particular account in *Philop. Insectar.* N^o 245.

There are three sorts of these *Galls*: the first, blackish; the second, bordering on green; the third, whitish. The dyers use them all, according to their respective qualities; the green and black serve to dye in black; and the white for linsens. 'Tis the black and green that are used in making of ink.

The English and Dutch import yearly from Aleppo, ten thousand quintals of *Galls*. The Turks have likewise a kind of ruddy *Gall*, of the size of a small nut, which they mix with cochineal and tartar, to dye scarlet with.

GAMBEZON, **GAMBEYSON**, **GAMBESO**, in the ancient military language, was a kind of coat, or doublet, wore under the cuirass, to make it sit easy, and prevent its hurting the body.

It was made of wool, or cotton, quilted between two stuffs; and was likewise called *Counter-point*.

Others define the *Gambeson* a kind of soft, quilted waistcoat, wore under the coat of mail, and hanging down over the thighs.

Pellora tot coriis, tot gambesonibus ornant.

GAME, *ludus*, a regular diversion; or a sport preferred, and limited by rules.

Genus may be distinguished into those of exercise, and a *hobby*, and those of chance, or hazard.

To the first, belong tennis, billiards, chess, bowls, cudgels, wrestling, quits, shooting with bows, &c.

To these also belong the ancient *jests* and *tour nan outs*.

Under the second come cards, and dice, &c.

Under cards, again, come several subordinate *Games*; the principal whereof are, *ombre*, *piquet*, *buffet*, *whist*, &c. See OMBRE, and PIQUET.

GAMES, *ludi*, in the plural, were shews, or public representations used among the antients, on religious, funerary, and other solemn occasions.

Such among the Greeks, were the *olympic*, *pythian*, *isthmian*, and *isolympic Games*.

Among the Romans, there were three sorts of *Games*; *sacred*, *honorary*, and *ludicrous*: and Ausonius observes a difference, somewhat of the same kind, among those of the Greeks; two of their celebrated *Games* being dedicated to Gods, and two to Heroes.

Sacred GAMES were those instituted immediately in honour of some deity; of which kind were the *ludi cereales*, *florales*, *martiales*, *apollinares*, *megaleses*, *romani consulares*, or *circenses*, *capitolini*, *seculares*, *plebei*, *compitalitii*, *augustales*, *palatini*, and *votivi*. See each described in its place.

To this class may also be referred those celebrated in memory of some illustrious person, or action; as the *ludi neroniani*, and *adriaci*, &c.

Authors mention a decree of the Roman senate by which it was enacted, that the public *Games* should be consecrated, and united with the worship of the gods as a part thereof; and accordingly, feasts, sacrifices, and *Games* appear to have made up the greatest part, or rather the whole, of the external worship, or service, offered to the deities of the Romans.

Honorary GAMES, *Ludi Honorarii*, were those exhibited by private persons, out of their own purse; in order to gratify the people, or ingratiate themselves with them, to make way for their own preferment.—Such were the combats of gladiators, scenic *Games*, tragedies, comedies, and other theatrical and amphibious sports.

Ludicrous GAMES were of the same kind with the *games* of exercise, and hazard among us.—Such were the *ludus trojanus*, or *pyrrhus*; the *tesse*, or *tali*, or dice; and the *lutrunculi*, or chess; the *discus*, or quoit; the *pila*, ball; *strobilus*, top; *nucis*, or *par impar*, odd and even with nuts; *harpastum*, foot-ball; *capita vel navem*, cross and pile, &c.

Others distinguish the ancient *Games* into three classes, *viz.* *racis*, *combats*, and *spectacles*. The first were called *equestrian*, or *curule Games*, *ludi equestres*, or *curules*; being races of horses, and chariots, performed in the circus, in honour of the Sun and Neptune.

The second were called *agones*, or *gymnici*; being combats of men, or beasts, in the amphitheatre, dedicated to Mars and Minerva.

The last, called *senici*, *poetici*, and *musici*, were tragedies, comedies, balls, &c. represented on the theatres, sacred to Venus, Bacchus, Apollo and Minerva.

Homer gives us a fine description of the *Games* which Achilles instituted at the funeral of his friend Patroclus, in his *Iliad*; and others of the different *Games* held among the Phœaci, Ithacans, and at the court of Alcinoüs, in his *Odyssey*. And Virgil's description of the *Games* celebrated by Æneas, at the funeral of old Anchises, is nothing inferior to any of them.

GAME is also used for all kinds of wild beasts and birds, fit for eating, and which are fought after on that account.

Game includes wild beasts of venery and chase; and also beasts and fowls of warren.

Some authors divide *Game* into *large*; which include red, and fallow deer: and *small*, to which belong hares, rabbits, pheasants and partridges.

A forest is a place set apart for preserving, feeding, breeding, &c. of all sorts of *Game*; and consists of divers things, *viz.* soil, covert, laws, courts, judges, officers, *Game*, and bounds. A chase differs from a forest, in this, among other things, that it has no such variety of *Game*.

Ways of catching *Game*, are by Hunting, Hawking, Fowling, &c.

There are abundance of laws made for the security and preservation of the *Game*.—The *Forest Laws* of King Canutus, and the *Charta de Foresta* of King Henry III. we have elsewhere mentioned.

By a statute in 33 Hen. VIII. it is enacted, That no person shoot with, or keep in his house any cross-bow, or stone-bow, hand-gun, or hagbut, under the length of one yard; unless he have lands of the yearly value of 100 l. on pain of a forfeiture of 10 l. for every offence: Nor shall any person travel with a cross-bow bent, or gun charged; or shoot within a quarter of a mile of a city or town, except at a dead mark, or in defence of his house, under the like forfeiture, to be divided between the king and the prosecutor.—None, under the degree of a baron, shall shoot with any hand-gun, within a city, or town; or shoot at any fowl whatever with hail-shot; on the same forfeiture. *Id. Stat.*

Any person shooting in the night-time, or disguised, shall be deemed a felon, if he deny; if he confess, he is fineable at the next general sessions. 1 Hen. VII.

None shall kill or take pheasants or partridges, with any net, or engine, in the night-time; on forfeiture of 20 s. for every pheasant; and 10 s. for every partridge. 33 Eliz.

None shall hawk or hunt with spaniels in standing corn, or before it be shocked, unless on his own ground; on the penalty

of 40 s. half to the king, and the other half to the proprietor of the ground.

He that is convicted of killing or taking a pheasant, partridge, duck, heron, hare, or other *Game*; or of taking and destroying the eggs of swans, pheasants, or partridges, shall pay 20 s. for every such fowl, hare, &c. to the use of the poor, 1 Jac. I.

Every person convicted to have kept a greyhound dog, or net, to kill, or take deer, hare, pheasant, or partridge, unless he have inheritance of 10 l. per annum, a lease for life of 31 l. per annum; or be worth 200 l. in goods; or be the son of a knight, or heir-apparent of an esquire, shall pay 40 s. for the use aforesaid.—Nor shall any sell, or buy to sell again, any deer, hare, pheasant, or partridge, on pain of 40 s. *Id. Stat.*

The lord of a manor, or one having inheritance of 40 l. per annum, freehold of 10 l. or goods worth 400 l. or their servants licensed by them, may take pheasants, or partridges within their own lands or precincts, in the day-time between Michaelmas and Christmas. 7 Jac. I.

No lay-man, who hath not lands of 40 s. per annum; nor clerk, who hath not 10 l. revenue, shall keep any greyhound, hound, ferret, net, or engine, to destroy deer, hares, conies, or other gentleman's *Game*; on pain of a year's imprisonment. 13 Jac. I.

They that kill and take away red, or fallow deer, without consent of the owner, shall forfeit 20 l. to be taken by distress; one half to the owner, and the other to the informer; or for want of such distress, shall suffer a year's imprisonment. 13 Car. II.

Lords of manors, or other royalties, not under the degree of esquire, may commission one or more *Game-keepers*, who may seize all guns, dogs, bows, &c. of persons not having estates of 100 l. per annum freehold, or 150 l. per annum leasehold, or are not sons and heirs of esquires; and destroy, or convert such guns, &c. to the use of the lord. 22 Car. II.

If any enter a coney-warren though not inclosed, and chase or kill conies, he shall forfeit treble damages, and be imprisoned three months: and they that kill conies in the night-time upon the borders of warrens, or grounds used for keeping conies, shall be amerced at the discretion of the justice of peace, in any sum not exceeding 10 s. *Id. Stat.*

He who unlawfully hunts, takes in toils, kills, or takes away any deer, in any forest, chase, park, purview, or other inclosed ground; or shall be aiding and assisting therein, shall forfeit 30 l. for every deer killed, taken, or even wounded; and 20 l. though none shall be wounded or taken: to be levied by distress. 3 Will. and Mar.—And if the keeper of a forest, &c. be an offender herein, or be aiding thereto, he shall forfeit 50 l. 5 Georg. I. to be levied as above.

In case any hare, partridge, pheasant, fish, fowl, or other *Game* shall be found in any offender's house, he shall forfeit a sum not less than 5 s. nor more than 20, to be levied by distress; or in want thereof, he shall be committed to the house of correction for a space of time not greater than a month; nor less than ten days. And if any person, not qualified by law, shall keep or use any bows, grey hounds, setting-dogs, ferrets, tumblers, snares, &c. he shall be subject to the same penalties.

If any higher, chapman, carrier, inn-keeper, or victualler, shall have in his keeping any hare, pheasant, partridge, hound, *Game*, or growse, not put in his hands by a person qualified by law, he shall forfeit 5 l. for every such hare, &c. half to the informer, and half to the poor, to be levied by distress; or for want thereof, he shall be sent to the house of correction for three months. 5 Anne.

Persons not qualified, keeping greyhounds, lurchers, setting-dogs, or engines to destroy *Game*; and *game-keepers*, who under colour of office, kill and sell *Game*, without their masters knowledge, are liable to the like penalty. *Id. Stat.*

No lord of a manor to appoint more than one *game-keeper*, and his name to be entered with the clerk of the peace, who is to give a certificate thereof; otherwise he is liable to the penalties against higlers. 5 Anne.

If any hare, pheasant, &c. be found in the possession of a person not qualified; unless he be entitled to it by some person that is qualified; the same shall be adjudged an exposing it to sale. Persons destroying a hare in the night, shall incur the forfeiture of 5 l. 5 Ann.

No lord of a manor shall appoint a *game-keeper*, with power to kill or destroy *game*, unless he be truly a servant of such lord; or be immediately employed to kill *game* for the sole use of such lord: nor shall any lord authorize a person not qualified to keep or use gun, greyhounds, &c. and such persons as shall be found offending in either of these points, shall for every offence forfeit 5 l. 3 Geo. I.

Lastly, if any person enter a park, paddock, or other inclosed ground, where deer are usually kept, and wilfully wound or kill any red, or fallow deer, he shall be transported to the plantations for seven years. 5 Georg. I.

G A M

A and B are engaged at single quoits, and after playing some time,

wants 4 of a and b together, and B, 6; but B is so much the better gamester, that his chance against A upon a single throw, would be as 3 to 2: what is the ratio of their *chance*?—Since A wants 4, and B, 6, the game will be ended in 9 throws at the most; therefore $a^4 + b^4$ to the ninth power, and it will be $a^4 + 9a^3b + 36a^2b^2 + 84ab^3 + 126a^4b^4 + 126a^5b^3 + 84a^6b^2 + 36a^7b + 9a^8b^2 + b^9$; and take all the terms wherein a has 4 or more dimensions, for A; and all those wherein it has 6 or more, for B; and the ratio of the chances will be as $a^4 + a^3b + 36a^2b^2 + 84ab^3 + 126a^4b^4 + 126a^5b^3 + 84a^6b^2 + 36a^7b + 9a^8b^2 + b^9$. Call a , 3; and b , 2; and you will have the ratio of the chances in numbers 1759077 to 104048.

A and B are to play with single quoits; and A is the best gamester; so that he can give B, 2 out of 3: what is the ratio of their chances, then, in a single throw?—Suppose the chances as x to 1; and raise $x+1$ to its cube; it will be x^3+3x^2+3x+1 . Now since A could give B 2 out of 3; A might undertake to win three throws running; and consequently the chances in this case will be as x^3 to $3x^2+3x+1$. Consequently, $x^3=3x^2+3x+1$. Or, $2x^3=3x^3+3x^2+3x+1$.

And therefore $x \sqrt[3]{2} = x + 1$; and consequently $x = \sqrt[3]{2} - 1$.

The chances therefore are $\sqrt[3]{2}-1$ and 1 respectively.

To find at how many trials it is probable any event will happen; so that A and B may lay a wager upon even terms.—Let the number of cases, wherein the thing may happen at the first trial, be a , those wherein it may not, b ; and x the number of trials, wherein it is an even chance, whether the thing happen or not. By what is above shewn $a + b \times x - bx = bx$.

Or, $a + b \mid x = 2 \cdot b^x$. Therefore, $x = \frac{\text{Log. } 2.}{\text{Log. } a + b - \text{Log. } b}$. Again, resume the equation $a + b \mid x = 2 \cdot b^x$, and let $a : b :: 1 : a$.

and the equation will change into this, $x + \frac{1}{q} x^q = 2$, Raise $x + \frac{1}{q}$ to the power of x , by Sir I. Newton's theorem, and

it will be $1 + \frac{x}{q} + \frac{x^2}{2q^2} + \frac{x^3}{3q^3} + \dots$, &c. = 2.

In this equation, therefore, if $q=1$, then $x=1$: if q be infinite, x will also be infinite. Supposing x to be infinite,

the equation above will be $1 + \frac{x}{1} + \frac{x^2}{1} + \frac{x^3}{1} + \dots$, &c. = 2.

Again, let $z = \frac{1}{\sqrt{2}}$, and we shall have $1 + \frac{1}{2}z + \frac{1}{2}z^2 + \frac{1}{8}z^3 + \dots$
 $\mathcal{E}r. = 2$. But $1 + z + \frac{1}{2}zz + \frac{1}{8}z^3$, $\mathcal{E}r.$ is a number
 whose hyperbolical logarithm is z ; consequently $z = \log. 2$.

But the hyperbolic logarithm of 2 is .7 very nearly; and therefore $z=.7$ nearly.
Hence where q is 1, there $x=1$ q ; and where q is infinite,

$x = .7 q$ nearly. Thus are the limits of the ratio of x to q fixed; for that ratio begins with equality, and when raised to infinity, ends at length in the ratio of 7 to 10 nearly.

to find in how many throws A may undertake to throw two aces with two dice?—Since A has but one case wherein he may throw two aces with two dice; and 35 wherein he may not, $q=35$; therefore multiply q by n : the product $q \times n = 35$ shows that A

To find the number of cases, wherein any given number of points may be thrown with a given number of dice?—Let $n+1$ be the given

number of points; n the number of dice; and f the number of sides or faces of each die: let $p-f=q$, $q-f=r$, $r-f=s$, $s-f=t$, &c. The number of cases required will be,

$$+ \frac{p}{1} \times \frac{p-1}{2} \times \frac{p-2}{3}, \text{ etc.}$$
$$\frac{q}{1} \times \frac{q-1}{2} \times \frac{q-2}{3} \times \dots \times \frac{n}{1}, \text{ \&c.}$$
$$-\frac{1}{\Gamma} \times \frac{\Gamma-1}{2} \times \frac{\Gamma-2}{3} \cdots \xi^{\circ} c, \quad \times \frac{n}{1} \times \frac{n-1}{2} \times \frac{n-2}{3} \cdots$$

Which series is to be continued, till some of the factor

either become equal to nothing, or negative. And note
 so many factors of the several products $\frac{q}{x} \times \frac{p-1}{x} \times \frac{p-2}{x} \times \dots$

$$\xi^2 c. - \frac{r}{1} \times \frac{r-1}{2} \times \frac{r-2}{3} \xi^2 c. - \frac{s}{1} \times \frac{s-1}{2} \xi^2 c. \text{ are to be taken as}$$

there are units in $n-1$. *Suppos*

Suppose the number of cafes required, wherein 16 points may be thrown with four dice?

$$\begin{aligned} + \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} &= 455 \\ - \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} &= 336 \\ - \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} &= + 6 \end{aligned}$$

Now, $455 - 336 + 6 = 125$; so that 125 is the number required.

To find at how many casts A may undertake to throw 15 points with six dice?—Since A has 1666 cafes, wherein he may turn up 15 points, and 44990 against him; divide 44990 by 1666; and the quotient 27 will be $= q$. Therefore, multiply 27 by 7; the product 189 shews the number of throws required to be nearly 19.

To find the number of trials wherein it is probable any event may happen twice; so that A and B may lay a wager thereon with an equal chance?—Suppose the number of cafes wherein the event may happen the first trial, to be a ; and those wherein it may not, b ; and call the number of trials required, x : it appears from what is above shewn, that $a + b = x$

$$= 2b^x + 2axb^{x-1} - 1. \text{ Or, making } a : b :: 1 : q, 1 + \frac{2x}{q} = 2 + \frac{2}{q}.$$

Let $q = 1$, and then $x = 3$. Let q be infinite, and x will also be infinite: suppose x infinite, and

$$1 + \frac{2x}{q} = 2 + \frac{2}{q}, \text{ and then } 1 + \frac{2}{q} = 2 + \frac{2}{q}, \text{ and } \frac{2}{q} = 1, \text{ and } q = 2.$$

Let $q = 2$, and then $x = 3$. Let q be infinite, and x will also be infinite: suppose x infinite, and

$$1 + \frac{2x}{q} = 2 + \frac{2}{q}, \text{ and then } 1 + \frac{2}{q} = 2 + \frac{2}{q}, \text{ and } \frac{2}{q} = 1, \text{ and } q = 2.$$

and therefore $z = \log. 2 + \log. 1 + z$: if then $\log. 2$ be called y ; the equation will be transformed into the follow-

$$\text{ing fluxional one } \frac{dz}{1+z} = y. \text{ And investigating the value}$$

of z by the powers of y , we shall find $z = 1.678$, nearly; and therefore x will always be between the limits 37 and 1.678 q ; but x will soon converge to 1.678 q ; and therefore if q have not a very small ratio to 1, we may take $x = 1.678 q$. Or if there be any suspicion of x being too small,

$$\text{substitute its value in the equation } 1 + \frac{2x}{q} = 2 + \frac{2}{q}, \text{ and}$$

note the error, if it be worth regarding: thus will x be a little increased: substitute the thus increased value for x in the foregoing equation, and note the new error: thus, from the two errors, may the value of x be corrected with sufficient accuracy. Here we shall add a table of limits, that will carry the intent of this problem much further.

If the wager be upon happening once, the number of trials will be between

If upon twice, between	1 q and 0.693 q
If upon thrice, between	3 q and 1.678 q
If upon four times, between	5 q and 2.675 q
If upon five times, between	7 q and 3.671 q
If upon six times, between	9 q and 4.673 q
If upon fix times, between	11 q and 5.668 q

To find at how many throws A may undertake to throw three aces, twice, with three dice?—Since A has but one cafe, wherein he may throw three aces; and 215, wherein he may not; $q = 215$. Therefore multiply 215 by 1.678. The product 360.7 will shew the number of throws required to be between 360 and 361.

A and B deposit each 12 pieces of money, and play with three dice, on this footing, that every time 11 points are thrown, A shall give B one piece; and every time 14 points are thrown, B shall give A a piece; and that he shall win the whole, that first gets all the money in his hands: we demand the ratio of the chance of A to that of B.—Let p be the number of pieces each severally takes; and a and b the number of cafes wherein A and B may respectively gain each a piece; the ratio of their chances will be as a^p to b^p : In this case, $a = 12$, $b = 15$; or if when 27: 15 :: 9: 5, you make $p = 9$, $b = 5$; and therefore the ratio of the expectancies will be as 9^{12} to 5^{15} , or as 244140625 to 282429536481.

N. B. Great care must be taken to avoid the confounding of different problems together, from some appearance of affinity between them. The following one seems very like the former.

C having 24 pieces or counters, throws three dice; and every time 27 points turn up, gives one counter to A; and every time 14 turns up, gives one to B, and A and B engage on this footing, that he who first gets 12 counters, shall win the stake: we require the ratio of their expectancies.—This problem differs from the preceding one, in that the game must necessarily end in 23 throws; whereas, in the former, it might hold out to eternity, by reason of the reciprocations of loss and gain, which destroy one another.—Raise $a + b$ to the 23^d power, and the 12 former terms will be to the 12 latter as the expectancy of A to that of B.

Three gamblers, A, B, and C, have each twelve balls, 4 of them white, and 8 black; and being hoodwinked, play on this condition, that the first who chuses a white ball shall win the stake;

and that A shall have the first choice, then B, then C; and so round again: what, then, is the ratio of the chances of A, B, C?—Let n be the number of balls, a the number of white ones, b of black ones, and n the stake. Here

1^o A has the cafes a , wherein he may chuse a white ball; and the cafes b for a black one: consequently, his expectancy,

from the first choice, is $\frac{a}{n}$, or $\frac{a}{a+b}$. Wherefore, subtracting $\frac{a}{n}$ from 1; the value of the remaining expectancies will

$$\text{be } 1 - \frac{a}{n} = \frac{n-a}{n} = \frac{b}{n}.$$

2^o B, has the cafes a for a white, and the cafes $b-1$ for a black one; but the first election is in A; and it is uncertain, whether or no he may have won the stake; and therefore the

stake, in respect of B, is not 1, but only $\frac{b}{n}$; so that his expectancy

$$\text{from the second choice is } \frac{a}{n} \times \frac{b}{n-1} = \frac{ab}{n(n-1)}.$$

Subtract $\frac{ab}{n(n-1)}$ from $\frac{b}{n}$ and the value of remaining expectancies will be

$$\frac{nb - b - ab}{n(n-1)} = \frac{b(n-b-1)}{n(n-1)}.$$

3^o C, has the cafes a for a white; and the cafes $b-2$ for a black one; and therefore his expectancy from the third choice

$$\text{is } \frac{a \times b \times b - 1}{n \times n - 1 \times n - 2}.$$

4^o After the like manner, A has the cafes a for a white, and $b-3$ for a black; so that at the fourth choice, the expectancy will be

$$\frac{a \times b \times b - 1 \times b - 2}{n \times n - 1 \times n - 2 \times n - 3}.$$

And so of the rest.

Write down, therefore, the series $\frac{a}{n} + \frac{b}{n-1} + \frac{b-1}{n-2} + \dots$

2 $\frac{a}{n-3} + \frac{b-2}{n-4} + \dots$, where $P, Q, R, S, \&c.$ denote the preceding terms, with their characters; and take as many terms of this series, as there are units in $b+1$ (for there cannot be more choices than there are units in $b+1$) and the sum of all the third terms, skipping the two intermediate,

beginning from $\frac{a}{n}$, will be the whole expectancy of A; the

sum likewise of all the third terms, commencing from $\frac{b}{n-1}$

P , will be the whole expectancy of B; and the sum of the

thirds, commencing from $\frac{b-1}{n-2}$, the whole expectancy of C.

Lastly, making $a=4$, $b=8$, $n=12$; and the general series will change into the following one $\frac{4}{12} + \frac{8}{11} + \frac{7}{10} + \frac{6}{9} + \frac{5}{8} + \frac{4}{7} + \frac{3}{6} + \frac{2}{5} + \frac{1}{4}$.

Or into this other (by multiplying all the terms by some common number judged most expedient for the throwing out of fractions, viz. in the present case, by 495)

$$165 + 120 + 84 + 56 + 35 + 20 + 10 + 4 + 1$$

And therefore A will have 165 + 56 + 10 = 231: B will have 120 + 35 + 4 = 159; and C will have 84 + 20 + 1 = 105. So that their several expectancies will be as 231, 159, 105; or as 77, 53, 35.

A and B having 12 counters, four of them white, and eight black; A wagers with B, that taking out seven counters, blindfold, three of them shall be white: what is the ratio of their expectancies?

—1^o Seek how many cafes there is for seven counters, to be taken out of 12; they will be found from the doctrine of combinations, to be 792.

$$1 \times \frac{4}{12} \times \frac{3}{11} \times \frac{2}{10} \times \frac{1}{9} \times \frac{1}{8} \times \frac{1}{7} = 792.$$

2^o Set aside three white ones, and find all the cafes wherein 4 of the 8 black ones may be combined therewith; they will be found to be 70.

$$\frac{4}{12} \times \frac{3}{11} \times \frac{2}{10} \times \frac{1}{9} = 70.$$

And since there are 4 cafes, in which 3 white may be taken out of four; multiply 70 by 4: Thus, the cafes, wherein 3 whites may come out with 4 blacks, are found to be 280.

3^o By the common laws of gaming, he is reputed conqueror, who produces an effect oftener than he undertook to do, unless the contrary be expressly agreed on; and therefore, if A take out 4 whites with 3 blacks, he wins. Set aside 4 whites, and then find all the cafes wherein 3 of the 8 blacks may be combined with 4 whites: these cafes will appear to be 56.

$$\frac{4}{12} \times \frac{3}{11} \times \frac{2}{10} = 56.$$

4^o A,

40 A, therefore, has $280 + 56 = 336$ cases, wherein he may win; which subtracted from the whole number of cases 792, leaves 456, the number of cases wherein he may lose. The ratio of the chance of A, therefore, to that of B, is as 336 to 456; or as 14 to 19.

To avoid too much prolixity in this article, we must desist from further investigations, which in the following problems grow very long, and more perplexed. In the rest, therefore, we shall content ourselves to give the answer, or result, without the process of arriving at it; which may be of use, as it furnishes so many data, from whence, as standards, we may be enabled occasionally to judge of the probability of events of the like kinds: tho' without letting the mind into the precise manner, and reason thereof.

A and B play with two dice on this condition, that A shall win, if he throw six; and B, if he throw seven: A to have the first throw, in lieu of which B to have two throws; and both to continue with two throws each turn, till one of them wins: What is the ratio of the chance of A to that of B?—*Ans.* as 10355 to 12276.

If any number of gamesters, A, B, C, D, E, &c. equal in point of dexterity, deposit each one piece of money, and engage on these conditions, that two of them, A, and B, beginning the game, which ever of them shall be overcome shall give place to the third, C, who is to play with the conqueror; and the conqueror here, to be taken up by the fourth man, D, and thus on; till some one, having conquered them all round, draws the stake: what is the ratio of their expectancies?—This problem, M. Bernoulli solves analytically. Here, calling the number of gamesters $n+1$, he finds that the probabilities of any two immediately following each other in the course of playing, are in the ratio $1+2^n$ to 2^n ; and therefore the expectancies of the several gamesters A, B, C, D, E, &c. are in a geometrical progression $1+2^n : 2^n :: a : c :: c : d :: d : e$, &c.

Hence it is easy to determine the state of the probabilities of any two gamesters, either before the game, or in the course thereof. If, *e. gr.* there be three gamesters, A, B, C, then $n=2$ and $1+2^n : 2^n :: 5 : 4 :: a : c$: that is, their several probabilities of winning, before A have overcome B, or B, C; are as the numbers 5, 5, 4; and therefore their expectancies are $\frac{5}{12}, \frac{5}{12}, \frac{4}{12}$; for all of them taken together, must make 1, or absolute certainty. After A has overcome B, the probabilities from A, B, and C will be $\frac{5}{4}, \frac{5}{4}, \frac{4}{4}$, as in the answer above. If there be four gamesters, A, B, C, D, their probabilities from the beginning will be as 81, 81, 72, 64. After A has beat B, the several probabilities of B, D, C, A, will be as 25, 32, 36, 56, respectively. After A has beat B and C, the probabilities of C, B, D, A, will be as 16, 18, 28, 87.

Three gamesters, A, B and C, whose dexterities are equal, deposit each one piece, and engage upon these terms: That two of them shall begin to play, and that the vanquished party shall give place to the third, who is to take up the conqueror: and the same condition to go round; each person when vanquished, forfeiting a certain sum to the main stake; which shall be all swept by the person who first beats the other two successively. How much, now, is the chance of A and B better or worse than that of C?—1° If the forfeiture be to the sum each person first deposited, as 7 to 6, the gamesters are upon an equal footing. 2° If the forfeiture be in a less ratio to the deposit, A and B are on a better footing than C: if in a greater ratio, the advantage is on the side of C. 3° After A has overcome B once, the probabilities are as $\frac{12}{7}, \frac{6}{7}, \frac{3}{7}$; or as 4, 2, 1; viz. that of A the greatest, and of B the least.

M. Bernoulli gives an analytical solution of the same problem, only made more general; as not being confined to three gamesters, but extending to any number at pleasure.

A and B, two gamesters of equal dexterity, play with a given number of balls; and after some time A wants 1 of being up, and B, 3: what is the ratio of their chances?—A's expectancy is worth $\frac{2}{3}$ of the stake, and B's only $\frac{1}{3}$; so that their chances are as 7 to 1.

Two gamesters, A and B, of equal dexterity, are engaged in play, on this condition, that as often as A exceeds B, he shall give him one piece of money; and that B shall do the like, as oft as A exceeds him; and that they shall not leave off, till one has won all the other's money: each now having four pieces; two by-standers, R and S, lay a wager on the number of turns, in which the game shall be finished; viz. R, that it shall be over in 10 turns: what is the value of the expectancy of S?— $\frac{16}{25}$ or $\frac{2}{3}$ of the wager; or it is to that of R as 560 to 464.

If each player had 5 pieces, and the wager were, that the game shall end in ten turns, and the dexterity of A were double that of B; the expectancy of S would be $\frac{18}{25}$.

If each gamester have 4 pieces; and the ratio of the dexterities be required to make it an even wager that the game shall end in 4 turns; it will be found that the one must be to the other as 5.274 to 1.

If each gamester have 4 pieces, and the ratio of their dexterities be required to make it an even lay that the game shall be ended in 6 turns; the answer will be found to be, as 2.576 to 1.

Two gamesters, A and B, of equal dexterity, having agreed not

to leave off playing till ten games are over; a spectator, R, lays a wager with another, S, that by that time, or before, A shall have beat B by three games: what is the value of the expectancy of R?— $\frac{3}{11}$ of the wager; or it is to that of S, as 352 to 672.

GAMMUT, GAMUT, or GAM-ut, in music, a scale, whereon we may learn to sound the musical notes, *ut, re, mi, fa, sol, la*, in their several orders, and dispositions. The invention of this scale is owing to Guido Aretin, a monk of Arezzo, in Tuscany; though it is not so properly an invention, as an improvement on the diagramma or scale of the antients.

The gammut is also called the *harmonical hand*; by reason Guido first made use of the figure of the hand, to arrange his notes on.

Finding the Greek diagramma of too small extent, Guido added five more chords, or notes to it: one, below the prollambanomenos, or gravest note of the antients; and four, above the nete, or acuteft.

The first, he called *hypo-prollambanomenos*; and denoted it by the letter G, or rather the Greek Γ, gamma: which note being at the head of the scale, occasioned the whole scale to be called by the barbarous name *gamma*, or *gammut*.

Some say, Guido's intention in calling his first note Γ, *gamma*, was to shew, that the Greeks were the inventors of music: others that he meant hereby to record himself; this being the first letter of his own name.

Guido's scale is divided into three series, or columns; the first called *molle*, or flat; the second *natural*; and the third *durum*, or sharp, as represented in the scheme, *Tab. Mischel. fig. 17*. But since his time, some alterations have been made therein.

The use of this scale, is to make the passages, and transpositions from B *molle*, to B *durum*, by means of the tones and semi-tones. The series of B natural standing betwixt the other two, communicates with both; so that to name the chords of the scale by these syllables, if we would have the semitones in their natural places, viz. *b c* and *e f*, then we apply *ut* to *g*; and after *la* we go into the series of *b* natural at *fa*; and after *la* of this, we return to the former at *mi*, and so on: or we may begin at *ut* in *c*, and pass into the first series at *mi*, and then back to the other at *fa*: by which means the one transition is a semitone, viz. *la, fa*: and the other a tone, *la, mi*. To follow the order of *b* *molle*, we may begin with *ut* in *c*, or *f*, and make transitions after the same manner.

Hence came the barbarous names of *gammut*, *are*, *bmi*, &c. But what a perplexed work is this, with so many different syllables applied to every chord; and all to mark the places of the semitones, which the simple letters *a, b, c*, &c. do as well, and with more ease?

Several alterations have since been made in the *gammut*. M. le Maire, particularly, has added a seventh note, viz. *fi*; and the English usually throw out both *ut* and *fa*, and make the other five serve for all: as will be shewn under the article SOL-FADING.

GAMMUT, or GAMM, is also the first, or gravest note in the modern scale of music, the reason whereof is shewn under the preceding article.

GANG, in the sea language, signifies a crew.

To man a boat, is called to put a gang of men (which is a company) into her: they are commonly called the *cockswain's gang*, who has the charge of her.

GANG-WAY, is applied to all the several entrances, ways, or passages, from one part of the ship to the other.

Whatsoever is put in one of these passages, is said to be laid, or put in the gang-way. See *Tab. Ship. fig. 2. n. 22, 84, 94*.

Water-GANG, see the article WATER-gang.

GANGLIO*, GANGLION, in medicine, a small, hard knotty tumor, formed on the nervous and tendinous parts, without any discolouring of the skin, or any sense of pain.

* The word is Greek, γᾱγγλιον, which signifies the fame. The tumor, when on the nerves, tendons, articulations, or any of the membranous parts, retains its name, *ganglio*; every where else, it is called *nodus*.

The cause of the ganglio is a too great distention of the pores of the part; or the too great compression; or a laceration thereof: any of these occasion the nutritious juice to be there stopped and retained; and even to exude, condense, and harden into a tumor. The same effect is sometimes also produced by a bruise, hard labour, or the like. Most authors hold the cause of the ganglio to be a heavy, viscid pituita.

The ganglio is sometimes removed, and resolved by mere dry friction, long continued; and sometimes by friction with saliva: some chuse to apply a plate of lead, anointed with mercury: others use gum ammoniac; or the emplaster of vigo, with mercury. If these do not succeed, recourse is had to section.

G A N

GANGRENE*, **GANGRÆNA**, in medicine, is a mortification in its first, or beginning state; while yet the part retains some sense of pain, and a share of the natural heat.—By which this disease is distinguished from a *sphacelus*, or thorough mortification; where there is no sense or warmth left.

* The word is Greek, *Γαγγραινα*, derived by some authors from the Paphlagonian *ganra*, a goat; it being the character of a goat to brooze the grass all around, without shifting its place. It is juster, perhaps, to derive it from the Greek verb *γανω, γανωω, manduco, absumo*; I eat, I consume.

The *gangrene* is a disease in the flesh of the part, which it corrupts, consumes, and turns black; spreading and seizing itself of the adjoining parts: and it is rarely cured without amputation.

It arises from a stoppage, or interception of the circulatory motion of the blood; which by this means fails to furnish the part with the nutritious and spirituous juices, necessary to preserve its warmth, and life.

This interception of circulation, which is the proximate cause of the *gangrene*, is itself occasioned divers ways: as by large tumors, erysipela's, great inflammations, violent cold, tight bandages or compressions, sudden fluxions of some malignant humor, bites of venomous beasts, fractures, wounds, and ulcers ill managed, &c.

It is distinguished by the colour of the flesh, which first turns pale, then dusky, or sublivid; and by its growing loose, and flabby from vehemently sense which it was before. In the progress of the disease, the part distils a fetid, discoloured water; and emits a cadaverous smell.

Upon the first seizure, the skin turns pale; afterwards it becomes livid; vesications arise, and the colour at length changes to black; the flesh becomes fetid, fanious, and moist; then withers, and soon becomes insensible: the heat and pulsation of the part being likewise diminished. Shaw.

If in a large wound, the tumor of the lips do not suppurate, nor any flux of matter, or inflammation arise; if the lips do not swell, or after swelling grow lank and flaccid again on a sudden: it is reckoned a sure sign of an approaching *gangrene*.

When a *gangrene* proceeds from extreme cold, the part affected is first benumbed, or seized with a pricking pain, this is followed by a redness, which gradually changes to black.

When a tight bandage is the cause, a flaccidity of the part is joined to the insensibility thereof; when the scurvy, it often begins in the great toe, and appears in form of a blackish spot, which turns to a dry crust, succeeded by a stupor of the part, &c.—When the bite of any venomous creature is the cause, a continual fever attends, &c. and pain is felt in the part; which usually brings on a syncope, or delirium: and pustles arise about the bite.

By the microscope a *gangrene* has been discovered to contain an infinite number of little worms, ingenerated in the morbid flesh; and which continually producing new broods, swarm and overrun the adjacent parts.

To stop the progress of the *gangrene*, physicians prescribe, internally, sudorifics, and alexipharmics; externally, decoctions of quick-lime, either simple, or with the addition of sulphur, mercurius dulcis, and spirit of wine camphorated.

In a severe stage of the distemper, they scarify deep, to the very quick; and afterwards apply hot liquors, cataplasms, &c. Some recommend horse-dung boiled in wine, or urine. The unguent ægyptiacum also comes into use in this case.

Belloste prescribes the following, as the most efficacious remedy, known for *gangrenes*; viz. quicksilver dissolved in double the quantity of spirit of nitre, or aqua fortis; a linen cloth being dipt therein, and applied to the *gangrenous* part. This alone, he assures us, is sufficient. If the *gangrene* be occasioned by an intense frost; snow water, or a linen cloth dipt in cold water, and applied to the part affected, Boerhaave directs as the best cure.

If the *gangrene* proceed to an utter sphacelation, and be seated in any of the limbs, or extreme parts, recourse must be had to the operation of amputation.

GANTLET*, or **GAUNTLET**, a large, strong glove, made to cover the arm, or hand of a cavalier, when armed at all points.

* The word is derived of the French *gantlet*; and that from *gant*, or *gant*, glove.

The *Gauntlet* was of iron; and the fingers, plated.—The *gant*, and *Gauntlets* were always bore in the ancient marches in ceremony.—*Gauntlets* were not introduced, till about the thirteenth century.

The *gantlet* was frequently thrown, like the glove, by way of challenge.

GANTLET, in chirurgery, is a kind of bandage for the hand; being a swathe, four or five yards long; wherewith they wrap up the hand, and all the fingers, one after another.

GANYMEDE, *Γαγυμένης*, a term lately come in use to express a catamite, or bardacio. See **SODOMY**.

G A R

The expression takes its rise from a young beautiful Trojan shepherd, thus called; whom Jupiter ravished, or carried off by his eagle, or rather by himself under the figure of an eagle, as he was hunting on mount Ida; and made him his cup-bearer, in the place of Hebe; who, having made a false step, and spilt her liquor, was turned out of that office.

Some say, that the Jupiter, who ravished *Ganymede*, was Tantalus, king of Phrygia; the eagle expressed the swiftness, wherewith he was carried off. See Vossius de *Idolol.* l. i. c. 14. &c. and Barthius, on the *Thebaid*, l. i. ver. 548.

GAOL*, a prison, or place of legal confinement.

* The word is formed of the French *geole*; and that of the barbarous Latin *geola, gaola, gayola, a cage*: whence the Picards still call a bird-cage, *gayolle*.—The gaoler, geolier, was called *gaularius*, and *cajularius*. Scaliger derives the word *goaler* from *janicularius*. And some Latin authors call him *comentariensis*, by reason he keeps a register, or list of all those under his custody.

GOAL-Delivery, see the article **JUSTICE**.

GARBE, in heraldry, a representation of a sheaf of corn, or other grain; sometimes born in coat armour, to signify summer, or the month of August; as the bunch of grapes does autumn.

He bears azure a *garbe* or; the arms of the Grosvenors of Eaton in Cheshire.

GARBLER of Spices, an officer of great antiquity, in the city of London, who is empowered to enter any shop, warehouse, &c. to view, and search drugs, &c. and to *garble* and cleanse them.

GARBLES, the dust; soil, or filth, severed from good spices, drugs, &c.

GARBLING*, of spice, drugs, &c. is the cleansing it from the dross and dust mixed therewith; and severing the good from the bad.

* The word comes from the Italian *garbellare*, to shake.

GARBLING of bow staves, is the sorting, or culling out the good from the bad.

GARCON*, or **GARSOON**, a French term, literally signifying a boy, or male child, any time before his marriage.

* Pontanus remarks, that the word was antiently wrote *warçon*. Etymologists cannot agree as to its origin.—To say nothing of all the rest, Martinus alone proposes seven derivations; without pitching upon any, viz. the Latin *garrire*, to prattle; the Chaldee *גַּרְרָא*, student, learner; the French *garder*, to guard; the German *warren*, to tarry, or wait; the Greek *ναγος*, young-man; the Arabic *قارون*, young-man; and the Hebrew *גַּרְרָא*, the young of any brute.

GARTON, is also applied to divers inferior officers, among us called *grooms, garciones*.—Thus, all the servants in the French king's chamber, wardrobe, &c. who do the lesser offices thereof under the proper officers, are called *garçons de la chambre, de la garderobe*, &c.

GARD, see the article **GUARD**.

Ravishment of GARD, see the article **RAVISHMENT**.

GARDE—Corps de GARDE, see the article **CORPS**.

GARDANT, in heraldry, see the article **GUARDANT**.

GARDEN, an inclosure, or plot of ground, curiously cultivated, and furnished with variety of plants, flowers, fruits, &c.

Gardens are distinguished into *flower-gardens, fruit-gardens*, and *kitchen-gardens*: the first are for pleasure, and ornament; and therefore are placed in the most conspicuous parts: the two latter are for service; and therefore made in by-places.

In a *garden*, the principal things to be considered, are the *form, soil, situation, and aspect or exposure*.

For the *form*: a square, or rather oblong, is most eligible; leading from the middle of the house, with a gravel walk in the midst; narrow grass-borders on each side; and on either side of these, rows of variety of winter greens. If the ground be irregular, it may be made uniform, so as to afford a prospect nothing inferior to the most regular; straight lines will reduce any figure to order. A triangle has its beauty, as well as a square; and the most irregular spots may be brought by borders, and walks, to those two figures.

Indeed, an irregularity is easily hid in a large *garden*, by long walks, and tall hedges, interrupting a distant view: and the little corners, and triangular spaces, may be agreeably filled up with borders of flowers, dwarf trees, flowering shrubs, or evergreens. Nor is it prudent, to be solicitous to throw the whole *garden* into a single view; as irregularities, and unevennesses, afford many uncommon, and pretty devices, &c.

For the second point, or the *soil*: a deep, rich, black mould is best for useful plants; sandy land is warm and forward, and good for flowers; chalky land is cold and backward. But both are easily corrected by composts, or materials of opposite kinds.

For the *situation*: if the *garden* be too high, it will be exposed to the winds, which are highly prejudicial to trees; if too low, the dampness will be injurious, beside the breeding of vermin; a flat, therefore, or the side of a hill, are the happiest situations; especially the latter, as it is usually well

watered, and sheltered from the extremities of weather, beside that the water descending from on high, will supply it with fountains, cascades, and other ornaments of a garden. For the *aspect*, or *exposure*, we have already considered what relates thereto, under the article *exposure*.

Of all things, the ground, or soil of the garden is the most important: unless this be rich, and fertile, all the other advantages will be vain. To judge of the quality of the soil, some direct us to look, whether there be any heath, thistles, or other such weeds growing spontaneously therein, this being a certain sign of a poor ground: the growth of the trees, too, thereabout, is to be considered: if they grow crooked, ill-shaped, and grubby, of a faded green, and full of moss; the place is to be immediately rejected. If the contrary be found; you must proceed to examine the depth of the soil, by digging holes into the ground. The soil should be three foot deep; but less than two, is not sufficient.

The chief furniture of pleasure gardens are, parterres, villa's, glades, groves, compartments, quincunces, verdant halls, arbour work, mazes, labyrinths, fountains, cabinets, cascades, canals, terraces, &c. See each under its proper article.

In the planting a fruit or kitchen garden, if the soil be a hungry gravel, or sand, Mr. Switzer directs the holes where the trees are to be planted, to be dug two feet deep, and three or four over, and filled with rotten horses or cows dung, mixed with rich mould: if it be marl or stiff clay, a compost of rubbish, lime, pieces of brick, ashes, sand, &c. will be best to mix with the dung and mould; though he is of opinion, that untried earth, dung from a waste or common where cattle have been fed, would prove the best soil of any for young trees.

The trees being now taken out of the nursery, the biggest roots are to be shortened to about six inches; all the small fibres taken off; and the head to be pruned, so as not to leave above two branches; and those not above six inches long.

The wall trees, to be placed as far from the wall, as may be; that there may be the more room for the roots to spread. Then, filling up the hole with mould, there remains nothing but to secure the roots from the winter's frost, by covering the spot with straw, fern, dung, &c. And in summer, from the sun; by sand and pebble stones.

For trees planted in borders, the common practice is to make a trench by the wall-side, two foot broad, and as many deep. This trench they fill with old dung, mixed with earth, lightly laid, near as high as the borders are intended to be; and then trodden down to half the height in the places where the trees are intended to be. It is prudent, to plant the trees shallow, and to raise the earth about them; especially in a wet, clayey soil.

It is an observation of some importance, that wall trees, and fruit thrive best, when the walks that run parallel to them, are gravel; more of the rays of the sun being thereby reflected to them, than if they were grass. Add, that no sort of tall trees are to be suffered to grow in any of the opposite borders, or intermediate spaces, so, that their shade might reach to the south-east, or south-west walls. The places near the walls are most advantageously filled with dwarfs.

GARDENING, *Horticulture*, the art of cultivating a garden.

Gardening has in all ages been esteemed an employment worthy the greatest hero's, and philosophers: the emperor Dioclesian, at Salona; and Epicurus, and Metrodorus, at Athens, have ennobled the art beyond all encomium.

Goetzius, superintendent of Lubeck, printed a dissertation in 1706. entitled *Κηποφιλία, seu de eruditis hortorum cultoribus*, of the learned men who have loved, and cultivated gardens; among which number he ranks Adam, Gregory Nazianzen, St. Augustin, Pliny, and Cicero: nor should he have forgot the elder Cato, Democritus, and Plato, and his academy.

The Sieur le Nostre first carried gardening to any thing of perfection: M. la Quintinie has gone yet further; nor have our own countrymen of late been wanting to its improvement; as London, Wile, Bradley, Laurence, Fairchild, Miller, &c.

M. Fatio has lately applied mathematical reasoning to gardening, and shewn how to make the best use of the sun's rays in gardens.

The principal operations in gardening, are planting, transplanting, engraving, inoculating, pruning, sowing, &c. All which see under their proper articles.

Other particulars, relating to the art of gardening, see under PINCHING, VARIEGATING, NURSERY, SEED, GREENHOUSE, HOT-BED, &c. See also FRUIT-TREE, DWARF, &c. See also SALLET, &c.

GARDENING, in falconry—To garden a hawk, is to put her on a turf of grass to cheer her.

Some also use the same phrase for the giving her an airing, at letting her fly at large.

GARDEROBE, see the article **WARD-ROBE**.

GADEVISURE, in heraldry; see **VIZOR**.

GARDEYN, see the article **GUARDIAN**.

GARDIAN, see the article **GUARDIAN**.

GARDS, see the article **GUARDS**.

GARGARISM*, **GARGLE**, in medicine, a liquid form of remedy, for disorders of the mouth, gums, throat, &c.

* The word is Greek, *Γαργαρησμός*, formed of *Γαργαρησ*, *collure*, to wash.—Or of the Hebrew *Garghera*, the throat.

Gargarisms are composed of honey, salt, syrups, spirits, vinegar, waters, and decoctions; and produce their effect by cleansing, lubricating, &c. the parts.

We say, an astringent *gargarism*, detergent *gargarism*, refrigerent *gargarism*, emollient *gargarism*, apopleptic *gargarism*, &c.

GARLAND*, an ornament for the head, made in manner of a crown, or chaplet.

* The word is formed of the French *guirlande*, and that of the barbarous Latin *garlanda*, or Italian *ghirlanda*: Menage traces its origin from *g yrus*, through *gyrulus*, to *gyrulare*, *gyrlandum*, *ghirlandum*, and at length *ghirlanda* and *guirlande*; to that *guirlande* and *garland* are descended in the sixth or seventh degree from *g yrus*. Hicks rejects this derivation, and brings the word from *garde* *banda*, which in the northern languages signify, a *mesage* artfully wrought with the hand.

Garlands are a sort of chaplets, made of flowers, feathers, or even of precious stones; but especially of flowers: To which the word in our language is more immediately appropriated. Janus passes in antiquity, for the inventor of *garlands*. *Athen. Dipnol.* l. xv.

Garlands also denote ornaments of flowers, fruits, and leaves intermixed, antiently much used at the gates of temples, where feasts, or solemn rejoicings were held; or at any other places, where marks of public joy and gaiety were desired; as at triumphal arches, tournaments, &c. *Garlands* or *Festoons*, were also put on the heads of victims in the antient heathen sacrifices. St. Paulinus, in his poem on St. Felix, does not forget the *garlands* and crowns of flowers, placed at the door of the church, and on the tomb of that saint.

The Italians have a sort of artificers, called *festaroli*, whose office is, to make *garlands* or *festoons*, and other decorations for realts.

GARLAND, in a ship, denotes a collar of ropes, wound about the head of the main-mast, to keep the shrouds from galing.

GARNET, see the article **GRANATE**.

GARNISH, in some antient writings and statues—To *garnish* the heir, signifies to warn the heir.

GARNISHEE, in law, the party, in whose hands money is attached within the liberties of the city of London; so called in the sheriffs court, because he has had *garnishment*, or warning, not to pay the money, but to appear and answer to the plaintiff-creditor's suit. See **ATTACHMENT**.

GARNISHING*, is popularly used for the furniture, affemblage, or sortment necessary for the using, or adorning any thing.

* The word is French, formed of the verb *garnir*, to furnish, or fit out.

The *Garnishing* of a dish, consists of certain things which accompany it; either as a part, and ingredient thereof; in which sense pickles, mushrooms, oysters, &c. are *garnishing*: or as a circumstance or ornament; as when leaves, flowers, roots, &c. are laid about a service, to amuse the eye.

The same word is used for the finer herbs, fruits, &c. laid about a fallet: *garnishings* are of lemon, pistachio's, pomgranate, yolks of hard eggs, artichok bottoms, capers, truffles, sweetbread, &c.

GARNISHMENT, in law, denotes a warning given any one to appear; for the better furnishing the cause, and court. Thus if one be sued for the debt of certain charters, and says, they were delivered to him, not only by the plaintiff, but by J. S. also; and therefore prays, that J. S. may be warned to plead with the plaintiff, whether the conditions are performed, or no—in this petition he is said to pray *garnishment*; which may be interpreted, a warning to J. S. to provide himself of a defence; or else a furnishing the court with all parties to the action, whereby it may thoroughly determine the cause.

GARRISON*, a body of forces, disposed in a fortress, to defend it against the enemy; or to keep the inhabitants in subjection; or even to be subsisted during the winter season.

* Du Cange derives the word from the corrupt Latin *garniso*, which the latter writers use to signify all manner of munition, arms, victuals, &c. necessary for the defence of a place, and the sustaining of a siege.

Garnish, and *winter quarters*, are sometimes used indifferently for the same thing; and sometimes they denote different things.

In the latter case, a *garrison* is a place wherein forces are maintained, to secure it; and where they keep regular guard: as, a frontier town, a citadel, castle, tower, &c. — The *garrison* should always be stronger than the towns-men.

Winter-quarters, signify a place where a number of forces are laid up in the winter-season, without keeping the regular guard. The soldiers therefore like better to be in winter-quarters, than in *garrison*.

GARTER, *Περικαλῆς*, a ligature to keep up the stockings; it is also particularly used for the badge, or cognizance of a noble order of knights, hence denominated the

Order of the GARTER, a military order, instituted by king Edward III. in 1350; under the title of the *Sovereign*, and *knights-companions of the most noble order of the Garter*.

This order consists of twenty-six knights, or companions; generally, all peers, or princes; whereof the king of England is the sovereign, or chief.

They wear a *garter*, set with pearls and precious stones, on the left leg, with this motto, *honi soit qui mal y pense*, q. d. shame to him, that thinks evil thereof.

They are a college, or corporation; having a great, and little seal: their officers are, a prelate, chancellor, register, king at arms, and usher.

Beside which, they have a dean, and twelve canons, with petty canons, vergers, and twenty-six pensioners, or poor knights.

The order is under the patronage, or protection of St. George of Cappadocia, the tutelary saint of this kingdom.

Their college is held in the castle of Windsor, within the chapel of St. George, and the chapter-house, erected by the founder for that purpose. Their robes, &c. are the *garter*, decked with gold and gems, and a buckle of gold, to be worn daily; and, at feasts and solemnities, a fur-coat, mantle, high velvet cap, collar of SS's, composed of roses enamelled, &c.

When they wear not their robes, they are to have a silver star on the left side; and they commonly bear the picture of St. George, enamelled on gold, and beset with diamonds, at the end of a blue ribbon, crossing the body from the left shoulder. They are not to appear abroad without the *garter*, on penalty of 6 s. 8 d. paid to the register.

The order of the *garter* appears the most antient and noble lay order in the world. It is prior to the French order of St. Michael, by 50 years; to that of the golden fleece, by 80 years; to that of St. Andrew, by 190 years; and to that of the Elephant, 209 years.

Since its institution, there have been eight emperors; and twenty-seven or twenty-eight foreign kings; beside numerous sovereign princes enrolled as companions thereof.

Its origin is somewhat differently related: the common account is, that it was erected in honour of a *garter* of the countess of Salisbury, which she dropped in dancing, and which king Edward picked up: but our best antiquaries set this aside as fabulous.

Camden, Fern, &c. take it to have been instituted on occasion of the victory obtained over the French, at the battle of Crecy: that prince, say some historians, ordered his *garter* to be displayed, as a signal of battle; in commemoration whereof he made a *garter* the principal ornament of the order, erected in memory of this signal victory; and a symbol of the indissoluble union of the knights.

Fa. Papebroche, in his *Analeſta* on St. George, in the third tome of the *Acta Sanctorum* published by the Bollandists, has a dissertation on the *order of the garter*. This order, he observes, is not less known under the name of *St. George*, than under that of *garter*; and that, though it was only instituted by king Edward III. yet it had been projected before him, by king Richard I. in his expedition to the Holy-Land; if we may credit an author, who wrote under Henry VIII. Papebroche adds, however, that he does not see what that author grounds his opinion on; and that though the generality of writers fix the epocha of this institution to the year 1350, he rather chuses, with Froissard, to refer it to the year 1344; which agrees better with the history of that prince; where we read, that he called an extraordinary assembly of knights that year.

In 1551, Edward VI. made some alterations in the ritual of this order; that prince composed it in Latin, the original whereof is still extant in his own hand writing. He there ordained, that the order should no longer be called the order of *St. George* but that of the *garter*; and instead of the George, hung at the collar, he substituted a cavalier, bearing a book on the point of his sword, with the word *protectio* graven on the sword; and *verbum D* on the book; with a buckle in the left hand, and the word *fides* thereon. Larrey.

For a further account of the order of the *garter*, see Camden, Ashmole, Dawson, Elagad, Polydore Virgil, Heylin, Legar, Glover, and Faun.

Erhard, Cellius, and the prince of Orange, adds Papebroche, have given descriptions of the ceremonies used at the installment of knights. A Cistercian monk, named Mendocius Belvaletus, has a treatise, intitled *la Garretiere*, or *Spectulum Anglicanum*, since printed under the title of the *Catal. m of*

VOL. I.

the *order of the garter*: wherein he explains all the allegories, real, or pretended, of those ceremonies, with the moral significations thereof.

GARTER, *principal king at arms*; see **KING at arms**.

Garter, and *principal king at arms*, are two distinct offices, united in one person: *garter's* employment is to attend the service of the order of the *garter*; for which he is allowed a mantle and badge, a house in Windsor castle, and pensions both from the sovereign and knights, and lastly, fees. He also carries the rod and sceptre at every feast of St. George, when the sovereign is present: and notifies the election of such as are new chosen: attends the solemnity of their installations, and takes care of placing their arms over their seats: and carries the *garter* to foreign kings and princes; for which service, it has been usual to join him in commission with some peer, or other person of distinction.

Garter's oath relates only to services to be performed within the order; and is taken in chapter before the sovereign and knights. His oath, as king at arms, is taken before the earl marshal.

GARTER is also a term in heraldry, signifying the moiety, or half, of a bend.

GARTH, see the article **FISHGARTH**.

GAS, in chemistry, a term used by Van Helmont, to express a spirit not coagulable; such as that arising from wine when fermenting; or from aqua regia when preying on gold.

In reality, he applies the word so obscurely, and precariously, that 'tis hard reducing it to any one sense.

Thus, he calls the vital principle in man, *gas vitale*; and the same denomination *gas* he gives to the sulphurous steams which occasion damps: add, that he calls the air, *gas ventosum*; and water, the *gas of salt*.

Some would fix his meaning to the spirit, or subtle and most volatile part of a body: and thus, *gas cerevisiae*, is the spirituous steam, which flies off from ale, while in working; but this does not take in his whole idea of *gas*.

GA SCOIGN, or **GASCOING**, the hinder thigh of a horse; commencing from the stifle, and reaching to the ply, or bending of the ham.

GASCONADE, a boast or vaunt of something very improbable.—He pretended he had fought singly against three men; a downright *gasconade*!

The term has its rise from the Gascons, or people of Gascony, in France, who, it seems, have been distinguished for bragging, and rhodomontado.

GASKOIN, see the article **GASCOIN**.

GAS TALDUS*, or **CASTALDUS**, an officer, antiently entertained in the courts of divers princes.

* The word is also wrote *gastaldus*, *gastaldio*, *gastaldatus*, *gastaldus*, &c. Macri derives it from the Arabic *chafendar*, purveyor of a house; others, from the German *gast*, and *balten*, to retain travellers.

The *gastaldus* was what in Italy and Spain is now called *major-domo*, viz. the master, or steward of a household. The *gastaldus* was a comes, or count, which shews his office to have been very considerable.

In the laws of Italy we sometimes also meet with *gastaldus*, in the sense of a courier; and sometimes as an ecclesiastical officer; so that it is somewhere expressed to be simony, to buy the function of *gastaldus*.

GASTREPILOICA, in anatomy, a vein, which opens into the trunk of the vena porta; formed of several branches, derived from the stomach, and epiploon*.

* Whence its name from *γαστρῆς*, stomach, and *επιπλοος*, epiploon.

GASTRIC, **GASTRICUS**, in anatomy, is applied to divers veins, on account of their proceeding from the stomach, or ventricle, which the Greeks call *γαστρῆς*.

The *gastrius major*, or greater *gastrius* vein, is inserted into the splenic vein; and the *minor*, or lesser *gastrius*, into the trunk of the vena porta.

GASTRILOQUUS*, or **GASTRILOQUOS**, a person who speaks inwardly, or within his stomach; and whose voice seems to come from a-far off; more usually called *ventriloquus*. See **VENTRILOQUUS**.

* The word is formed of the Greek, *γαστρῆς*, belly, stomach, and the Latin *loqui*, to speak.

GASTROCNEMIUS, in anatomy, a name common to two muscles, constituting the *fura*, or calf of the leg; the one called *externus*, the other *internus*. See *Tab. Anat. (Myol.)* fig. 6, 11, 41, 41.

GASTROCNEMIUS externus, called also *surculus externus*, and *gemellus*, has two distinct, fleshy originations, from the superior, and hindermost part of each tubercle of the lower appendage of the thigh-bone; which in their descent are each dilated into two small fleshy bellies, the innermost of which is thickest and largest; having each a different series of fleshy fibres, which at length uniting, make a broad, strong tendon; which narrowing itself, joins the great tendon of the soleus, four fingers breadth above its insertion into the os calcis. See *Tab. Anat. (Myol.)* fig. 1. n. 66. fig. 2. n. 48.

When this muscle acts, the foot is said to be extended or pulled backwards; which motion is very necessary in walking, running,

ning, leaping, or standing on tip-toe, &c. whence it is, that those who walk much, or carry heavy burdens, and who wear low-heeled shoes, have these muscles larger than others.

GASTROCHEMIUS, or *furculus internus*, called also *solaus*, from its figure resembling a sole fish, is placed under the external. Its outer fleshy part is covered with a transparent tendinous expansion, which makes it appear of a livid colour.—See *Tab. Anat. (Mysol.)* fig. 1. n. 63. fig. 2. n. 47.

It begins partly tendinous, chiefly from the hindermost part of the upper appendix of the fibula, and back-part of the tibia, that is, below the insertion of the subpopliteus; and increases to a large fleshy belly, composed of various orders of fleshy fibres, some of them underneath aptly expressing the figure of the top of a feather, whose stamina, being here tendinous, join with the great tendon, which is about a finger's breadth long; and inserted into the superior and hindermost part of the os calcis.

The foot, together with the toes, being, as it were, a lever to the whole body, ought therefore to be attended with muscles of great strength to extend it; which is the reason that these muscles so much exceed their antagonists.

GASTROLATER, a glutton, or belly-god: *cujus deus ventris est*.

GASTROMANCY*, or **GASTROMANTIA**, a kind of divination, practised among the ancients, by means of words coming, or seeming to come out of the belly.

* The word is Greek, γαστρομαντία, composed of γάστρον, belly, and μαντία, divination.

There is another kind of divination, called by the same name *gastromancy*, which is performed by means of glasses, or other round, transparent vessels; within which certain figures appear, by magic art. It is thus called, by reason the figures appear as in the belly of the vessels.

GASTROTOMY, the operation of cutting open the belly; otherwise called the *Cæsarian section*. See **CÆSARIAN SECTION**.

GATE, a large door, leading, or giving entrance, into a city, town, castle, palace, or other considerable building. Thebes, in Egypt, was antiently known by the appellation, *with an hundred gates*. Fez, in Africa, has thirty-one gates. In antient Rome there was a triumphal gate, *porta triumphalis*. In modern Rome there is the *jubilee gate*, which is only opened in the year of a grand jubilee. See **JUBILEE**.

The gates of London are many of them converted into gaols, or prisons; as *Ludgate*, *Newgate*, &c.—The lesser, or by-gates, are called *posterns*.

Gates through which coaches, &c. are to pass, should not be less than seven foot broad; nor more than twelve; the height to be $\frac{1}{2}$ the breadth.

Opening of GATES, in astrology, see **OPENING**.

GAVEL, or **GABEL**, in law, signifies tribute, toll, custom, yearly rent, payment, or revenue; of which there were antiently several kinds, *gavel-corn*, *gavel-malt*, *out-gavel*, *gavel-fodder*, &c.

GAVEL, is sometimes also used for what we more usually call the *gable*. See **GABLE**.

GAULET, **GAULETUM**, in law, a special, and antient kind of cessavit, used in Kent, where the custom of gavel-kind continues; whereby the tenant shall forfeit his lands and tenements to the lord, if he withdraw from him his due rents, and services*.

* The process of the *gavulet* is thus: the lord is first to seek by the steward of his court, from three weeks to three weeks, to find some distress upon the tenement; till the fourth court; and if at that time he find none, at this fourth court, it is awarded, that he take the tenement in his hand in name of a distress, and keep it a year and a day without manuring; within which time, if the tenant pay his arrears, and make reasonable amends for the withholding, he shall have and enjoy his tenement as before: if he come not before the year and day he pay, the lord is to go to the next county court, with witnesses of what had passed at his own court, and pronounce there his process, to have further witnesses; and then by the award of his own court, he shall enter and manure the tenement as his own: so that if the tenant desire afterwards to have and hold it as before, he must agree with the lord, according to this old saying: "His he not since any thing 'gavels, or any thing paid, then let him pay five pound for 'his wery, ere he become headler again." Other copies have the latter part with some variation; "Let him nine times 'pay, and nine times repay."

GAVELKIND, a tenure, or custom, whereby the lands of the father are equally divided, at his death, among all his sons; or the land of the brother among all the brethren, if he have no issue of his own.

*Tenementis patris partem facit in agros
Angelem patris omnis, ne foret ulla potens.*

This custom, which antiently obtained throughout England, is still of force in the greatest part of Kent, Urchenfeld in Herefordshire, and elsewhere; though with some difference: But by the Stat. 34 and 55 Hen. VIII. all *Gavelkind* lands in Wales are made defendable to the heir, according to the course of common law.

In an antient book of records in Christ-church, Canterbury, of the time of Henry VIII. our Saxon ancestors are said to have held all their lands either by writing or without: the first were called *bookland*; whose owners were men, whom we now call *freeholders*: the second was called *folkland*; the owners whereof were of servile condition, and possessed *ad voluntatem domini*. Now, the inheritance, or freehold, did not, in those days, descend to the eldest son, but to all alike; which in Saxon was called *landscyftan*, and in Kent, *to shifft land*; whence came the custom *gavelkind*. And the reason why it was retained in Kent more than other places, was that "The people of Kent, upon the Norman invasion, could not be reduced to surrender to the conqueror, but on these conditions, that they should retain their antient country-customs without any infringement or diminution; and especially that called *gavelkind*."

"The lands held under this denomination, descend equally, and are divided, share and share alike, among all the male children; and in default of these, among the females." He adds, "That they are of age, or qualified to take the lands upon them, at fifteen; and may then give, vend, or alienate the same to any person, without the consent of any lord: and children here inherit their father's land though convicted of felony, murder, &c. The tenants in *gavelkind* are to do fealty; and to be in the tuition of the next a-kin, who is not next heir after them, till fifteen years of age; to pay 'acknowledgment to the lord for the lands," &c.

GAVELMAN*, a tenant who is liable to tribute.

* *Villani de Terring, qui vocantur Gavelmanni.* Somner, *Gavelkind*.

GAUGE-Line, a line on the common gauging-rod, whose description and use see under the article **GAUGING**.

GAUGE-Point, of a solid measure, is the diameter of a circle, whose area is equal to the solid content of the same measure. Thus, the solidity of a wine gallon being 231 cubic inches; if you conceive a circle to contain so many inches, the diameter of it will be 17.15; and that will be the *gauge-point* of wine measure.

And an ale gallon containing 288 cubic inches; by the same rule, the *gauge-point* for ale-measure will be found to be 19.15; and in the same manner may the *gauge-point* of any other measure be determined.

Hence we deduce, that when the diameter of a cylinder in inches is equal to the *gauge-point* in any measure, (given likewise in inches) every inch in length thereof will contain an integer of the same measure. In a cylinder whose diameter is 17.15 inches, every inch in height contains one intire gallon in wine-measure; and in another, whose diameter is 19.15, every inch in length contains one ale gallon.

GAUGER, an officer, appointed by the king, to gauge, i. e. to examine, or measure all casks, tuns, pipes, barrels, hogheads of beer, wine, oil, &c. and to give them a mark of allowance (which is a circle burnt with an iron) before they be sold in any place within the extent of this office.

GAUGING, the art, or act of measuring the capacities, or contents of all kinds of vessels; and determining the quantity of fluids, or other matters contained therein.

Gauging is the art of reducing the unknown capacity of vessels of divers forms, cubical, parallelepipedal, cylindrical, spheroidal, conical, &c. to some known cubic measure; and of computing, for instance, how many gallons, quarts, pints, or the like, of any liquor, *a. gr.* ale, beer, wine, brandy, &c. are contained therein.

Gauging is a branch of stereometry.

The principal vessels that come under its operation, are pipes, barrels, rundlets, and other casks; also backs, coolers, fats, &c. The solid content of cubical, parallelepipedal and prismatical vessels, is easily found in cubic inches, or the like, by multiplying the area of the base by the perpendicular altitude.

And for cylindrical vessels, the same is found by multiplying the area of the circular base, by the perpendicular altitude, as before.

Casks of the usual form of hogheads, kilderkins, &c. may be considered as segments of a spheroid cut off by two planes, perpendicular to the axis; which brings them to Oughtred's theorem, for measuring ale and wine casks; which is thus: Add twice the area of the circle at the bung, to the area of the circle of the head. Multiply the sum by one third of the length of the cask; the product is the content of the vessel in cubic inches.

But, for accuracy, Dr. Wallis, Mr. Caswell, &c. think, that most of our casks had better be considered as frustums of parabolic spindles; which are less than the frustums of spheroids of the same base, and height; and give the capacity of vessels nearer the truth, than either Oughtred's method, which

which supposes them spheroids; or than that of multiplying the circles at the bung and head, into half the length of the cask, which supposes them parabolic conoids; or than that of Clavius, &c. who takes them for two truncated cones; which is furthest off of all.

The common rule for all wine or ale casks, is to take the diameters at the bung, and at the head; by which you may find the areas of the circle there; then taking two thirds of the area of the circle at the bung, and one third of the area of the circle at the head; and adding them together into one sum; this sum multiplied by the internal length of the cask, gives the content in solid inches: which are converted into gallons, by dividing by 282 for ale, and by 231 for wine gallons.

But *gauging*, as now practised, is chiefly done by means of instruments, called *gauging-rods*, or *rules*, which do the business at once, and answer the question without so much calculation; which is no inconsiderable addition, both to the ease and dispatch of the work. This instrumental way of *gauging*, therefore, we shall here chiefly insist upon.

Construction of a GAUGING-rod, whereby the content of any cylindrical, or other common vessel is easily had.—Take the diameter AB of a cylindrical vessel, ABDE, *Tab. Surveying*, fig. 26. that holds one of the measures wherein the fluid is estimated, *e. gr.* gallons; and join it at right angles to the indefinite line A 7. From B to 7, set off a right line equal to AB; then will B 1 be the diameter of a vessel, that holds two measures, or gallons, of the same height as the former.

Again, let $A 2 = B 2$; then will B 3 be the diameter of a vessel that holds three measures, but of the same height as that which only holds one. And after the same manner, find the diameters of other larger vessels, B 4, B 5, B 6, B 7, &c. Lastly, let off the several divisions thus found, A 1, A 2, A 3, &c. upon the side of a rod, or rule; and on the other, the height, or depth of a cylinder, that holds one measure or gallon, repeated as oft as it will go. This is the *gauging-rod* complete.

For cylinders, that have the same altitude, are to each other as the squares of their diameters; consequently the square of the diameter that holds 2, 3, or 4 gallons, must be double, triple, or quadruple of that which only holds one. And since in the first, $AB = A 1$, the square of B 1 is double, that of B 2 triple, that of B 3 quadruple, &c. it is evident, that the right lines A 2, A 3, A 4, &c. are the diameters of the vessels required.

These divisions, therefore, being applied to the side of a cylindrical vessel, it will immediately appear how many measures, *e. gr.* gallons, a cylindrical vessel of that bafe and of the height of that which holds one gallon, will contain.

Wherefore, finding by the divisions on the other side of the rod, how often the height of one gallon is contained in the height of the given vessel; and multiplying the diameter before found by this number: the product will be the number of gallons the vessel contains.

Thus, *e. gr.* if the diameter of the cylindrical vessel be 8, and its height 12, its content will 96 gallons.

Note, 1st. The less you take the height of the cylinder, containing one gallon, the greater will the diameter of the bafe be: whence both that, and the diameters of the cylinders, containing several gallons, will be the more easily dividible into lesser parts. Bayer directs such height to be only one digit, or tenth of an inch.

2^d. The diameters of vessels holding one or more decimal parts of a gallon, will be had by dividing one or more decimal parts of the vessel holding a whole gallon, by its height; which gives us the area of the circular bafe; from whence the diameter is easily found by the rules delivered under DIAMETER, CIRCLE, &c. And after the same manner the diameters are found for the divisions of vessels that hold two or more gallons.

Use of the GAUGING-Rod.—To find the content of a cask; that is, to determine the number of measures, *e. gr.* gallons, it will hold: apply the *gauging-rod* to the vessel, as directed in the preceding article; and find both the length of the cask, A C, fig. 27. and both diameters GH, and AB. Now, as we find by experiment, how far soever it may be from geometrical exactness, that a common cask of this form may safely enough be reputed as a cylinder, whose bafe is a medium between the head and the belly; find such medium, which call the *equated diameter*.

Then multiplying the number thus found by the length of the cask, A C; the product will be the number of measures the vessel contains.

Suppose, *e. gr.* $AB = 8$, and $GH = 12$, and $AC = 15$; the equated diameter will be 10; which multiplied by 15, gives the capacity of the cask, 150 measures.

If it happen that the diameters of the two ends be not equal; measure them both, and take half their sum for the diameter to work by.

There is another method whereby the content of a vessel is had without any calculation at all, which obtains in divers parts of many and the Low Countries; but as this supposes all vessels to be similar to each other; and their length double of

the equated diameter, that is, of half the sum of the diameters AB, and GH; it is not safe to use it in all places. Kepler, however, prefers it so much before all others, as including all the precautions possible; that he recommends it to the public, to enact it by law, that all casks be made in this proportion. The methods of *gauging*, which chiefly obtain among us, are by the four-foot *gauging-rod*, and Everard's *sliding-rule*.

Description and use of the four-foot GAUGING-rod.—The four-foot *gauging-rod*, represented in *Tab. Surveying*, fig. 18. n. 2. is usually made of box, and consists of four rules, each a foot long, and about three eighths of an inch square, joined together by three brass joints; by which means the rod is rendered four foot long, when the four rules are quite opened; and but one foot when they are all folded together.

On the first face of this rod, marked 4, are placed two diagonal lines; one for beer, and the other for wine: by means of which the content of any common vessel in beer or wine gallons may be readily found, by putting the rod in at the bung-hole of the vessel, till it meets the intersection of the head of the vessel with the staves opposite to the bung-hole. For distinction of this line, there is writ thereon, *beer and wine gallons*.

On the second face, 5, are a line of inches, and the gauge-line; which is a line expressing the areas of circles, whose diameters are the correspondent inches in ale gallons. At the beginning is writ, *ale area*.

On the third face, 6, are three scales of lines; the first, at the end of which is writ *hoghead*, is for finding how many gallons there is in a hoghead, when it is not full, lying with its axis parallel to the horizon. The second line, at the end of which is writ B. L. signifying a *butt lying*, is for the same use as that for the hoghead. The third line is to find how much liquor is wanting to fill up a butt when it is standing; at the end of it is wrote B. S. signifying a *butt standing*. Half way the fourth face of the *gauging-rod*, 7, there are three scales of lines, to find the wants in a harkin, kilderkin, and barrel, lying with their axes parallel to the horizon. They are distinguished by letters F. K. B. signifying a *firkin, kilderkin, and barrel*.

Use of the diagonal lines on the GAUGING-rod.—To find the content of a vessel in beer or wine gallons, put the brafed end of the *gauging-rod* into the bung-hole of the cask, with the diagonal lines upwards; and thrust this brafed end to the meeting of the head and staves: then, with chalk, make a mark at the middle of the bung-hole of the vessel; and also on the diagonal lines of the rod, right against, or over one another, when the brafed end is thrust home to the head and staves. Then turn the *gauging-rod* to the other end of the vessel, and thrust the brafed end home to the end as before.

Lastly, see if the mark made on the *gauging-rod* come even with the mark made on the bung-hole, when the rod was thrust to the other end; which if it be, the mark made on the diagonal lines, will, on the same lines, shew the whole content of the cask in beer or wine gallons.

If the mark made on the bung-hole, be not right against that made on the rod, when you put it the other way; then, right against the mark made on the bung-hole, make another on the diagonal lines: and the division on the diagonal line, between the two chalks, will shew the vessel's whole content in beer or wine gallons.

Thus, *e. gr.* if the diagonal line of a vessel be 28 inches four tenths, its content in beer gallons will be near 51, and in wine gallons 62.

If a vessel be open, as a half-barrel, tun, or copper, and the measure from the middle on one side, to the head and staves, be 38 inches; the diagonal line gives 122 beer gallons; half of which, *viz.* 61, is the content of the open half tub.

If you have a large vessel, as a tun or copper, and the diagonal line taken by a long rule, prove 70 inches; the content of that vessel may be found thus:

Every inch at the beginning-end of the diagonal line, call ten inches. Thus, ten inches become 100 inches; and every tenth of a gallon call 100 gallons; and every whole gallon call 1000 gallons.

Exam. at 44.8 inches, on the diagonal beer-line, is 200 gallons; so that 4 inches 48 parts, now called 44 inches 8 tenths, is just two tenths of a gallon, now called 200 gallons; so also if the diagonal line be 76 inches and 7 tenths, a close cask, of such diagonal, will hold 1000 beer gallons; but an open cask but half so much, *viz.* 500 beer gallons.

Use of the GAUGE-line.—To find the content of any cylindrical vessel in ale gallons: seek the diameter of the vessel in inches, and just against it, on the *gauge-line*, is the quantity of ale gallons contained in one inch deep: this multiplied by the length of the cylinder, will give its content in ale gallons.

For example, suppose the length of the vessel 32.06, and the diameter of its bafe 25 inches; to find what is the content in ale gallons?

Right against 25 inches, on the *gauge-line*, is one gallon, and .745 of a gallon; which multiplied by 32.06, the length, gives 55.9447 gallons for the content of the vessel.

GEH

The bung diameter of a hoghead being 25 inches, the head diameter 22 inches, and the length 32.06 inches; to find the quantity of ale gallons contained in it?

Seek 25, the bung diameter, on the line of inches; and right against it on the *gauge-line*, you will find 1.745: take one third of it, which is .580, and set it down twice: seek 22 inches the head diameter, and against it you will find on the *gauge-line* 1.356; one third of which added to twice .580, gives 1.6096; which multiplied by the length 32.06, the product will be 51.603776, the content in ale gallons.

Note, this operation supposes, that the aforesaid hoghead is in the figure of the middle frustum of a spheroid.

The use of the lines on the two other faces of the rod, is very easy; you need only put it down right into the bung-hole (if the vessel you desire to know the quantity of ale gallons contained therein be lying) to the opposite staves; and then, where the surface of the liquor cuts any one of the lines appropriated to that vessel, will be the number of gallons contained in that vessel.

The description and use of Everard's sliding rule for *gauging*, see under the article *SLIDING-Rule*.

GAUGING-Rod; see the article **GAUGING**.

GAULISH Language; see **ROMAN** and **FRENCH**.

GAUNT, an old word for lean, or lank.—Thus we say, a *gaunt*-bellied or light-bellied horse, when his belly shrinks up towards his flanks.

GAUNTLET, see the article **GANTLET**.

GAURES, or rather **GAVRES**, or **GABRES**; see the article **GABRES**.

GAUZE, in commerce, a very thin, slight, transparent kind of stuff, wove sometimes of silk, and sometimes only of thread.

To warp the silk for making of *gauze*, they use a peculiar kind of mill, upon which the silk is wound: this mill is a wooden machine, about six foot high; having an axis perpendicularly placed in the middle thereof, with six large wings, on which the silk is wound from off the bobbins, by the axis turning round.

When all the silk is on the mill, they use another instrument, to wind it off again on to two beams: this done, the silk is passed through as many little beads as there are threads of silk; and thus rolled on another beam, to supply the loom. The *gauze* loom is much like that of the common weavers, though it has several appendages peculiar thereto. See **LOOM**.

There are figured *gauzes*; some with flowers of gold and silver, on a silk ground: these last are chiefly brought from China.

GAYAC, see the article **GUAIACUM**.

GAZE-Hound, see the article **HOUND**.

GAZETTE*, a news-paper, or printed account of the transactions of divers countries, in a loose sheet, or half sheet.

* The word is formed of *Gazetta*, a kind of coin, formerly current at Venice; which was the ordinary price of the first newspapers printed there: though others derive it, by corruption, from the Hebrew *izgad*, which signifies *nuntius*, a messenger; but this etymology is too much forced.

We say, the *London Gazette*, *Paris Gazette*, *Gazette de la main*, &c.—*Gazettes*, which most people look on as tritles, are by some held the most difficult kind of compositions that have appeared. They require a very extensive acquaintance with the languages, and all the terms thereof; and a great facility, and command of writing, and of relating, things cleanly, and in a few words.

To write a *Gazette*, a man should be able to speak of war both by land, and sea; be thoroughly acquainted with every thing relating to geography, the history of the time, and that of the noble families: with the several interests of princes, the secrets of courts, and the manners and customs of all nations.

Vigneul de Marville recommends a set of *Gazettes* well wrote, as the fittest books, for the instruction of young persons, coming into the world.

The first *Gazette* published in these parts, is said to have been that of Paris, begun in the year 1631, by Theophrast Renaudor, a physician of Montpellier, in his office of intelligence.

GAZONS, in fortification, turfs, or pieces of fresh earth covered with grass, cut in form of a wedge, about a foot long, and half a foot thick: to line or face the ramparts of works made of earth, in order to keep up the same, and prevent their mouldering.

GEERS, a general term for trappings, harness, and all other things, that belong to draught-horses, or oxen.

GEHENNA, *Parva*, a scripture term, which has given some pain to the critics. It occurs in St. Matthew v. 22. 29. 30. x. 28. xviii. 9. xlii. 15. 33. Mark ix. 43. 45. 47. Luke xii. 5. James iii. 6.

The authors of the Louvain, and Geneva versions, retain the word *Gehenna*, as it stands in the Greek; the like does M. Simon: the English translators render it by *hell*, and *hell-*

GEL

fire; and the like do the translators of Mons, and father Bouhours.

The word is formed from the Hebrew *gehinom*, i. e. valley of Hinnom. In that valley, which was near Jerusalem, there was a place named *Tophet*, where some Jews sacrificed their children to Moloch, by making them pass through the fire. King Josiah, to render this place for ever abominable, made a cloaca, or common-shore thereof, where all the filth and carcases in the city were cast.

The Jews observe further, that there was a continual fire kept up there, to burn and consume those carcases; for which reason, as they had no proper term in their language, to signify *hell*, they made use of that of *gehinna*, or *gehinom*, to denote a fire unextinguishable.

GELALEAN Calendar, see the article **CALENDAR**.

GELATINOUS, among physicians, is applied to any thing approaching the glutinous consistence of a jelly.

GELD, or **GILD**, in our ancient customs, a mulct, or compensation for a crime, or delinquency. See **GILD**.

Hence, *wergild* was anciently used for the value or price of a man slain; and *orfgild*, of a beast, * &c.

* *Et sint quieti de Geldis, & Denegeldis, Horngeldis, & Fortgeldis, & de Blodwita & Flhwita, & Lavrentia, & Hingwita, & Feminsfæda, & Werdpeni, & Awerpeni, & Hundscpeni, & Tellingeni.* Charta Ric. II. Priorat. de Hatland in Devon.

Foot-GELD, } see the articles { **Foot-Geld**.
Horn-GELD, } { **Horn-Geld**.
Wood-GELD, } { **Wood-Geld**.

GELDABLE, see the article **GILDABLE**.

GELDING, the operation of castrating, and particularly horses.

The same term is also applied to a horse thus castrated; or whose testicles are cut out, to disable him from being a stallion.

In gelding of horses, regard is to be had to their age, the season of the year, and, as the farriers say, to the state of the moon.—For the first, if it be a colt, the operation may be performed at nine, or at fifteen days old, if the testicles be come down; in regard the sooner he is *gelded*, the better it will be for his growth, shape, and courage; though a horse may be gelded at any age, if care be taken in the cure.—As for the second, the best time is about April, or May; or else about the latter end of September. And for the third, the wane of the moon is preferred as the fittest time.

The manner of gelding is thus: the beast being cast on some soft place, the operator takes the testicles between his fore and great finger; splits the cod, and presses out the stones; then taking a pair of nippers made very smooth, either of steel, box, or brass, he claps the strings of the stones between them, very near to where the stones are set on; and presses them so hard, that there may be no flux of the blood; and then sears away the stone with a thin drawing cauterizing iron, made red-hot.

This done, he takes a hard plaster, made of wax, rosin, and washed turpentine melted together, and melts it on the head of the strings with the hot iron; and afterwards sears the strings, and melts more of the salve, till there is a good thickness of the salve laid on the strings.

This being done to one stone, the nippers are loosened, and the like is done to the other; and the two flits of the cod are then filled with white salt; and the out-side of the cod anointed with hogs grease: and thus they let him rise, and keep him in a warm stable, without tying him up.

If he swells much in his cod, or sheath, they chafe him up and down, and make him trot an hour in a day; and he soon recovers.

GELSCOPY, **GELSCOFIA**, a kind of divination, drawn from laughter: or, a knowledge of any person's character, and qualities, acquired from the consideration of his laughter.

GEM, or **GEMM**; **GEMMA**, a common name for all precious stones, or jewels.

Among *gems*, the principal are the diamond, ruby, sapphire, emerald, turquoise, opal, agat, &c. See each under its proper article, **DIAMOND**, **RUBY**, **SAPPHIRE**, **EMERALD**, &c. Pearls are also ranked among *gems*; though not stones.

Several authors, both ancient and modern, relate wonders of the virtues, and medicinal properties of *gems*: but their reputation, in this respect, is now not a little fallen; and many even deny them any virtue at all. Yet are the fragments of such stones still preserved by some physicians, in some of the most celebrated compositions; and there are several chemical preparations made of them.

In effect, as several persons of the greatest candour and experience, have related some considerable effects of certain *gems*, on their own particular observations; and, as it is no ways improbable that some of the softer stones may have considerable operations on the human body; it might be imprudent indiscriminately to exclude them all from any medicinal virtue at all.

When much the greatest part of their traditinary qualities are set aside as fabulous; there will still remain some, on as real, and well warranted a footing, as many of our other medicines.

On such considerations, Mr. Boyle was induced to give us a treatise of the origin and virtues of gems; the purport whereof is to make appear, that such stones were originally in a fluid state, or made up of such substances as were formerly fluid; and that many of their general virtues are probably derived from the mixture of metalline, and other mineral substances usually incorporated with them; while the great variety, and the particular efficacy of their virtues arise from some happy concurrent circumstances of that commixture; *e. gr.* the peculiar nature of the impregnating liquor, the proportion wherein it is mixed with the perfect juice, and the like.

To support this hypothesis of the virtues of gems, he shews that several of them are not simple concretions of any perfect liquors, but that they consist also of other mineral adventitious parts; which he argues from the separableness of such substances in some stones, the specific gravity in others, and the different waters or tinctures to be met with in gems of the same species, as rubies, sapphires, granates, and even diamonds; of which last some are yellow, some of other colours, and some green, almost like emeralds.

There may therefore be in some gems, numberless adventitious corpuscles: but there is great reason to think that some of these corpuscles may be induced with several properties and medicinal virtues: there is a great difference among these impregnating particles, and probably a greater variety than known by us; and lastly, many gems are very richly impregnated with these particles: why, then, may not they exert some power? This is the substance of what is directly alleged, in behalf of gems.

The stress of what is objected against them, is, that the mineral substances they contain, are so closely locked up, that they can communicate nothing to the body, and so can have no medicinal operation, being unconquerable by so small a heat, as that of the stomach, and other parts of the body.

Which objection might be plausible enough to prevent one's ascribing any medicinal virtues to them a priori; but can conclude nothing against what is warranted by so many facts, and observations; especially, when there are several particulars, that obviate this objection.

For, a vigorous loadstone, though frequently harder than many gems, is known to emit copious effluvia: and there are many which have been found to have a manifest and inconvenient operation on the human body, by being wore in the pocket, or long held in the hand. Mr. Boyle has found divers transparent pebbles, which, when cut, would resemble diamonds, that might be immediately brought to emit copious, and strong scented steams. And if electrical attractions be owing to the effluvia of bodies excited by rubbing; very slight alterations may suffice to procure exspirations from transparent gems, many of which are electrical, and even the hardest of all, *viz.* diamonds; one of which Mr. Boyle kept by him, which upon a little friction would attract very vigorously.

To that part of the objection, which pretends gems not to be digestible by the heat of the stomach, it may be replied, that we do not know how far the digestion of things in the stomach is owing to heat: nor is it proved, that such materials can have no operation on the body, without being digested, *i. e.* in passing through it, without undergoing any sensible change of bulk, figure, &c. as gems, when swallowed, are supposed to do.

For some chemists make a kind of bullets of regulus of antimony, which they call *pillula perpetua*, because when they have performed their operation in the body, and are cast forth with the excrements, they may be us'd again and again for the same purpose. Nor do we know, what analogy there may be between some juices in the body, and those mineral parts which impregnate gems: for though the oculus mundi be reckoned among the rare gems, yet if one of the best sort be, for a while, kept in common water, it will undergo an alteration, obvious to the eye.

Add that Mr. Boyle has, without heat, obtained a manifest tincture from several hard bodies, and even from a transparent sort of gems, by means of a faint liquor, distilled from a vegetable substance, as harmless, and as plentifully eaten as bread. And whether some juices of the body, assisted by the natural heat thereof, may not serve for menstrua to some gems, we will not say; but even the natural heat of a human stomach, may perhaps of the external parts of the body, may be able, though not to digest precious stones, yet to fetch out some of their virtues: for it is certain, it makes a sensible alteration in the hardest sort of them: witness a diamond of Mr. Boyle's, whose electrical faculty might be excited without rubbing, only by a languid degree of adventitious heat: and another, which, by means of water made a little more than luke warm, might be brought to shine in the dark. See PHOSPHORUS.

VOL. I.

Lastly, if it be yet objected, that it is not likely gems should part with any effluvia, or portions of themselves, inasmuch as they lose none of their weight: it may be answered, that the antimonial glass and cup imbue wine and other liquors, with a strong emetic quality, without undergoing any sensible diminution of weight. Add, that though common water be not allowed a menstruum fit to draw any thing from mercury; yet, both Helmont, and others inform us, that a large quantity of it being kept a day or two upon a small proportion of that drug, will acquire a virtue of killing worms; though the mercury retains its former weight.

GEM, GEMMA, in botany, an eye. See GEMMA.

GEMARA *, or GHEMARA, the second part of the Babylonian Talmud.

* The word גמרא *Gemara*, is commonly supposed to denote a supplement; but, in strictness, it rather signifies complement, perfection; being formed of the Chaldee גמר *Gemar*, or *Ghemar*, to finish, perfect, or complete any thing.

The Rabbins call the Pentateuch, simply the Law. The first part of the Talmud, which is only an explication of that law, or an application thereof to particular cases, with the decisions of the ancient Rabbins thereon, they call the *Mischna*, *i. e.* second law: and the second part, which is a more extensive and ample explication of the same law, and a collection of decisions of the Rabbins posterior to the *Mischna*, they call *Gemara*, *q. d.* perfection, completion, finishing; by reason they esteem it the finishing of the law, or an explication, beyond which there is nothing further to be desired.

The *Gemara* is usually called simply *Talmud*, the common name of the whole work. In this sense we say, there are two *Gemara's*, or *Talmuds*; that of Jerusalem, and that of Babylon: though in strictness, the *Gemara* is only an explication of the *Mischna*, given by the Jewish doctors in their schools: much as the commentaries of our school divines on St. Thomas, or the master of the sentences, are an explication of the writings of those authors.

A commentary, Monsr. Tillemont observes, was wrote on the *Mischna*, by one Jochanan, whom the Jews place about the end of the second century: but Fa. Morin proves from the work itself, wherein mention is made of the Turks, that it was not wrote till the time of Heraclius, or about the year 620: and this is what is called the *Gemara*, or *Talmud of Jerusalem*, which the Jews do not use or esteem much, by reason of its obscurity.

They set a much greater value on the *Gemara*, or *Talmud of Babylon*, begun by one Asa; discontinued for seventy-three years, on occasion of the wars with the Saracens and Persians; and finished by one Josa, about the close of the seventh century.

Though the name *Talmud*, in its latitude, includes both the *Mischna*, and the two *Gemara's*; yet it is properly that of Asa and Josa alone which is meant under that name.

This the Jews prize above all their other writings; and even set it on a level with scripture itself: in effect, they conceive it as the word of God, derived by tradition from Moses, and preserved without interruption to their time.—Ra. Jehuda, and afterwards R. Jochanan, R. Asa, and R. Josa, fearing the traditions should be lost in the dispersion of the Jews, collected them into the *Mischna* and the *Gemara*.

GEMATRIA *, or GAMETRIA, the first kind of artificial cabbala, used by the Jews.

* The word is formed from the Rabbinical Hebrew גמטריא *Gematria*, formed by corruption of the Greek Γεωμετρία.

Gematria is a geometrical, or arithmetical method of explaining words; whereof there are two kinds: the first bearing a more immediate relation to arithmetic; and the latter, to geometry.

The first consists, in taking the numerical value of each letter in a word, or phrase; and giving it the sense of some other word whose numerical letters, taken after the same manner, make the same sum.—For it is to be observed, that neither the Hebrews, nor Greeks, have any other numeral figures, beside the letters of the alphabet.

Thus, a cabbalist, taking the two first words in Genesis, בראשית *braasheet*, and by addition getting the sum total of all the numbers, signified by those letters; finds that these two words signify the same as those other three, ראש *raas*, 1; השנה *hashana*, 2; 300; 10; 400; 2; 200; 1; 1: which, together make 1116. And as to the latter; בראש *braasheet*, 2; 200; 1; 1; 300; 5; 5; 1; 1: which summed up, yield the same number 1116.

Whence the cabbalist concludes, בראשית *braasheet*, in the beginning he created: signifies the same thing as השנה *hashana*, בראש *braasheet*, it was created at the beginning of the year; and accordingly, the received opinion of the cabbalists, is, that the world was created at the beginning of the month Thifri, which was antiently the first month in the year, and answers to our first month in autumn, *viz.* September.

G E M

again, in the prophecy of Jacob, *Gen. xlix. 10.* the words *וְיָשׁוּבָה* are understood of the Messiah; by reason they make the same number with *וְיָשׁוּבָה* which signifies the Messiah. The second kind of *Gematria* is much more obscure, and difficult; and accordingly is less used: it is employed in seeking for abstruse, and hidden interpretations in the dimensions and parts of the buildings mentioned in scripture, by dividing, multiplying, &c. those measures by each other.—Of this we shall give an example from some christian cabbalists.

The scripture says, that Noah's ark was 300 cubits long, 50 wide, and 30 high: now, the cabbalist takes the length for the basis of his operations; 300, in the Hebrew, is expressed by the letter *ש*; which length, divided by the height 30, gives the quotient 10: the Hebrew character whereof is *'*, this is to be placed on the right side of *ש*. He then divides the same length by the width, 50; the quotient whereof, 6, is expressed by a *ו*; which being placed on the left side of *ש*, makes, together with the other two letters, the name *JESUS*, *וְשׁוּבָה*.—Thus, by the rules of the Cabbala, it appears, that there is no salvation, but in Jesus Christ; as, at the deluge, no person was saved but those in the ark.

After the like manner, is the same name *וְשׁוּבָה* found in the dimensions of Solomon's temple.—But it is rather an injury than an advantage to the christian religion, to support it by such frivolous evidences.

GEMELLES, in heraldry, a bearing of bars by pairs, or in couples, in a coat of arms.—He beareth gules on a chevron argent, three bars gemelles fable, by the name of Throgmorton. See **BAR**.

GEMELLUS, in anatomy, a muscle of the arm, called also *biceps externus*, as having two heads.—See *Tab. Anat. (Myol.)* fig. 1. n. 26. fig. 6. n. 14. fig. 7. n. 13. 13. 13. 13. See also the article **BICEPS**.

One of the heads of this muscle rises tendinous from the upper part of the inferior costa of the scapula; whence passing between the muscles to the back part of the humerus, it joins the other head; and both run together to their insertion at the ancon or tip of the elbow.

The *gemellus* is the first extensor of the cubit; and is by many reckoned two distinct muscles; the first called *longus*, the latter *brevis*.

GEMINATED Column, see the article **COLUMN**.

GEMINI, in astronomy, the *twins*; a constellation, or sign of the Zodiac; the third in order; representing Castor and Pollux. See **SIGN**, and **CONSTELLATION**.

The stars in the sign *Gemini*, in Ptolemy's catalogue are 24; in Tycho's 29; in the Britannic catalogue 89. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow:

Names and situations of the stars.		Longitude.	Latitude.	Magn.

GEMINI, in anatomy, two muscles of the thigh, which arise from the protuberance of the ischium, and are inserted with the pyriformis into the dent at the root of the great trochanter.			
GEMMA , see the article GEM .			
<i>Sal GEMMÆ</i> , is peculiarly used for rock salt, or salt dug out of mines.			
The name <i>Gemma</i> is applied hereto, on occasion of its lustre, and brilliancy; which is not unlike that of crystal.			
The principal mines of this salt are those of Wilkesa in Poland; those of Eperie, in Upper Hungary; and those of Cardonna, in Catalonia.			
The chief use of this salt is for the powdering, or pickling of meats, in places destitute of salt-springs, &c. See SALT .			
GEMMA , or GEM , among old botanists, the torpid bud of a vine*, or other tree, when it is beginning to bear; called also <i>oculus</i> , eye.			
* <i>Gemma est a qua oriens uva se ostendit.</i> Cic. de Senect. c. 15.			
GEMONIÆ <i>Scale</i> *, or <i>gradus GEMONII</i> , among the Romans, were much the same as gallows, or gibbets in England.			
* Some say, they were thus denominated from the person who raised them: others, from the first criminals, that suffered on them: and others, from the verb <i>gemo</i> , I sigh, or groan.			
The <i>gradus gemonii</i> , according to Publius Victor, or Sextus Rufus, was a place raised on several steps, from whence they precipitated their criminals. Others represent it as a place whereon			

whereon offenders were executed, and afterwards exposed to public view.—The *genomia scale*—were in the tenth region of the city, near the temple of Juno. Camillus first appropriated the place to this use, in the year of Rome 358.

GEMOTE, or **GEMOT**, *conventus*, a Saxon word, denoting a meeting, or assembly *.

* *Omnis homo pacem habet eundo ad Gemotum & rediens de Gemoto, nisi probatus fur fuerit.* LL. Ed. Conf. See WIT-TANA.

GENÆ *Quadratus*, see the article **QUADRATUS**.

GENDARMES, or **GENS D'ARMES**, *g. d.* men of arms; a term used among the French, for a select body of horse-guards; by reason that they succeeded the ancient men of arms, who were armed at all points, and thence were called *gendarmes*. At present, the troops of the king's guard de corps, the musqueteers, and light horse, are reputed to belong to the *gendarmerie*.

The *grand gendarmes*, sometimes called simply the *gendarmes*, are a troop of gentlemen, to the number of about 250, who guard the king's person. The king himself is their captain; and one of the prime peers, the captain-lieutenant. When the king marches with all his household troops, the *gens d'armes* close the march.

Their device is, a thunder-bolt, falling from heaven, with the motto, *Quo jubet iratus Jupiter*. There are also, beside these, *gens d'armes* of the queen, the dauphin, &c.

GENDARMERY, or **GENS D'ARMERIE**, the French cavalry, and particularly that of the king's household.

The *Gendarmery* at present is a body of horse, consisting of sixteen companies, viz. the Scotch gendarmes, the English gendarmes, the Burgundian gendarmes, and the Flemish gendarmes; which four companies compose the king's *gens d'armes*, or life-guard.

The other companies take their names from the princes who command them, as captains, viz. the queen's gendarmes; the queen's light horse: the dauphin's gendarmes; the dauphin's light horse: the duke of Burgundy's gendarmes; the duke of Burgundy's light horse: the duke of Orleans' gendarmes, &c. each troop, at a medium, consists of seventy-six gendarmes, or light horse.

GENDER, **GENUS**, in metaphysics; see **GENUS**, and **KIND**.

GENDER, in grammar, denotes a division, or distinction of nouns, or names, according to the different sexes of the things they denote.

It has been thought proper, in order to render discourse more express and distinct, as also to embellish it by a variety of terminations, to contrive certain diversities in adjectives, accommodated to the substantives they are applied to: whence, from a regard to that notable difference there is between the two sexes, all nouns substantives have been distinguished into masculine and feminine; and the nouns adjectives also varied to correspond therewith.

But as there was an infinity of words, which had no proper relation, either to the one sex, or the other; they had genders assigned them, rather out of caprice, than reason: and hence it is that the *gender* of a noun is frequently dubious and fluctuating.

It should here however be observed, that this institution of *genders* was not made with design and deliberation, by the masters of language; but was introduced by custom and usage. At first, there was only a difference between the names of animals, when spoke of males and females; and by degrees, the same regulation was extended to other things: the grammarians have only noted and allowed, what usage had established.

The oriental languages frequently neglect the use of *genders*; and the Persian language has absolutely none at all, which is no disadvantage; the distinction of genders being in great measure useless.

The Latins, Greeks, &c. generally content themselves to express the different *genders* by different terminations, as *bonus equus*, a good horse; *bona equa*, a good mare, &c. But in English we frequently go further, and express the difference of sex by different words: as boar, sow; boy, girl; buck, doe; bull, cow; cock, hen; dog, bitch; &c.

We have only about twenty-four feminines, distinguished from the males, by the variation of the termination of the male into *es*; of which number are abbot, abbess; count, countess; actor, actress; heir, heiress; prince, princess; &c. which is all that our language knows of any thing like *genders*.

The eastern languages, as well as the vulgar languages of the west, have only two *Genders*; the masculine and feminine. The Greek and Latin have likewise the neuter, common, and the doubtful *Gender*; and beside these, they have the epicene, or promiscuous, which under one single *Gender* and termination includes both the kinds.

GENDER, in geometry.—Geometrical lines are distinguished into *Genders*, classes, or orders, according to the number of the dimensions of the equation that expresses the relation between their ordinates, and the abscissas. See **GEOMETRICAL-LINE**.

GENDER, in botany, }
GENDER, in music, &c. } see **GENUS**.

GENEALOGICA Arbor, see **ARBOR**.

GENEALOGY *, a series or succession or ancestors, or progenitors: or, a summary account of the relations and kindred of a person, or family, both in the direct, and collateral lines.

* The word is Greek, *γενεαλογια*, which is formed of *γενος*, *genus*, *progenia*, race, lineage; and *λογος*, *sermo*, discourse.

In divers chapters, and military orders, it is required that the candidates produce their *Genealogy*, to shew that they are noble by so many descents.

Genealogical table, *genealogical tree*, *genealogical trunk*, or *column*, &c. see **ARBOR**.—The *genealogical* degrees are usually represented in circles, ranged over under, and aside of each other. The ancients had the like; which they called *stemmata*, from a Greek word, signifying *crown*, *garland*, or the like.

GENERAL, something that comprehends all, or extends to a whole genus, or kind.

We say, a *general* rule, *g. d.* an universal rule; a *general* loss, &c. It is disputed by many, whether Noah's flood was *general*, or no.

All the sciences have some *general* principles, or axioms. See **AXIOM**. A *general* court: *general* councils are particularly called *oecumenical*. See **OECUMENICAL**.

GENERAL <i>affairs</i> ,	} See	ASSISE.
GENERAL <i>avertment</i> ,		AVERTMENT.

GENERAL <i>fee tail</i> ,		FEE-TAIL.
GENERAL <i>geography</i> ,		GEOGRAPHY.
GENERAL <i>gravity</i> ,		GRAVITY.
GENERAL <i>issue</i> ,		ISSUE.
GENERAL <i>nature</i> ,		NATURE.

GENERAL officers, in an army, are those who do not only command over a single company, or regiment; but whose office, and authority extends over a body of several regiments of horse and foot.

Such are lieutenant-generals; major-generals, generals of the horse, of the foot; paymaster-general, commissary-general, chirurgion-general, muster-master-general, &c.

The term is also now used in a more extensive sense; and comprehends such as may command, by virtue of their rank, over several bodies of forces, though all of the same kind.—In which sense brigadiers are *general officers*, notwithstanding that they are attached to one kind of forces, either infantry, or cavalry.

The pay of a lieutenant-general, when in service, is *4 l.* per day: of a major-general, *2 l.* of a brigadier-general, *1 l.* 10 s. of a captain-general, *10 l.* See **LIEUTENANT-general**, **MAJOR-general**, &c.

We have also officers in the law, in the revenues, &c. distinguished by the appellation of *general*: as, attorney-general, solicitor-general, &c. see **ATTORNEY**, and **SOLICITOR**.—Receiver-general, controller-general, &c. See **RECEIVER**, and **CONTROLLER**.

GENERAL terms, or *words*, are such as express, or denote *general* ideas.

Ideas become *general*, by separating from them, the circumstances of time, place, or any other ideas that may determine them to this or that particular existence.

By this way of abstraction they become capable of representing more individuals than one; each of which having a conformity to that abstract idea, is of that fort.

All things, Mr. Locke observes, that exist, being particulars, it might be expected that words should be too too in their signification; but we find it quite contrary; for most of the words that make all languages, are *general* terms.

This is the effect of reason and necessity: for, 1^o, it is impossible that every particular thing should have a distinct, peculiar name: because it is impossible to have distinct ideas of every particular thing, to retain its name with its peculiar appropriation to that idea. 2^o, It would be useless, unless all could be supposed to have the same ideas in their minds: for names applied to particular things, whereof one alone has the ideas in his mind, could not be significant, or intelligible to another, who is not acquainted with all those particular things which had fallen under his notice. 3^o, It would be of no great use for the improvement of knowledge; which, though founded in particular things, enlarges itself by *general* views, to which things reduced into sorts under general names, are properly subvenient.

In things, where we have occasion to consider and discourse of individuals, and particulars, we use proper names: as in persons,

fons, countries, cities, rivers, mountains, &c. Thus we see that jockeys have particular names for their horses, because they have often occasion to mention this, or that horse particularly, when he is out of fight.

The first ideas children get, are only particular; as those of the nurse, or mother; and the names they give them, are confined to these individuals: afterwards, observing that there are a great many other things in the world that resemble them in shape, and other qualities, they frame an idea, which they find those many particulars do partake in: to that they give, with others, the name, *man*, for example. In this they make nothing new, but only leave out of the complex idea they had of Peter, James, Mary, &c. that which is peculiar to each, and retain only what is common to all. And thus they come to have a *general* name, and a *general* idea.

By the same method they advance to more *general* names and notions: for, observing several things that differ from their idea of man, and which cannot, therefore, be comprehended under that name, to agree with man in some certain qualities; by retaining only those qualities, and uniting them into one idea, they have another, more *general* idea; to which, giving a name, they make a term of a more comprehensive extension.

Thus, by leaving out the shape, and some other properties signified by the name, man; and retaining only body, with life, sense, and spontaneous motion; we form the idea signified by the name *animal*. After the same manner, the mind proceeds to body, substance, and at last to being, thing, and such universal terms, which stand for any ideas whatsoever.

Hence we see the whole mystery of genus and species, is nothing but abstract ideas, more or less comprehensive, with names annexed to them: this shews us the reason, why in defining words, we make use of the genus; namely to save the labour of enumerating the several simple ideas, which the next general term stands for.

From what has been said, it is plain, that *general* and universal belong not to the real existence of things: but are the inventions of the understanding, made by it for its own use, and concern only signs, either words, or ideas.

General words do not barely signify one particular thing; for then they would not be *general* terms, but proper names: neither do they signify a plurality; for then man and men would signify the same thing: but what they signify, is a sort of things: and this they do, by being made signs of abstract ideas in the mind; to which ideas, as things existing are found to agree, so they come to be ranked under that name, or to be of that sort.

The essences then of the sorts, or species of things, are nothing but these abstract ideas.

It is not denied here, that nature makes things alike; and so lays the foundation of this sorting and classing: but the sorts or species themselves are the workmanship of human understanding; so that every distinct abstract idea, is a distinct essence; and the names that stand for such distinct ideas, are the names of things essentially different. Thus oval, circle, rain, and snow are essentially different. See this further illustrated under ESSENCE, and SUBSTANCE.

GENERAL <i>verdict</i> ,	} See	{	VERDICT.
Vicar-GENERAL,			VICAR.
GENERAL <i>wind</i> ,			WIND.

GENERAL is also used in a monastic sense, for the chief of an order; or of all the houses, or congregations established under the same rule.

Thus we say, the *general* of the Cistercians, the Franciscans, &c.

Fa. Thomassin derives the origin of *generals* of orders, from the privileges granted by the ancient patriarchs to the monasteries situate in their capital cities. By such means they were exempted from the jurisdiction of the bishop, and immediately subjected to that of the patriarch alone.

GENERAL is also used in the military art for a particular march, or beat of drum; being the first which gives notice, commonly in the morning early, for the infantry to be in a readiness to march.

GENERALISSIMO, called also *Captain-GENERAL*, and simply the *GENERAL*; is an officer, who commands all the military powers of a nation; who gives orders to all the other general officers; and receives no orders himself but from the king.

Monf. Balzac observes, that the cardinal de Richieu first coined this word, of his own absolute authority, upon his going to command the French army in Italy.

GENERATED, or GENITED, is used by some mathematical writers for whatever is produced, either in arithmetic, by the multiplication, division, or extraction of roots; or in geometry, by the invention of the contents, areas, and sides; or of extreme and mean proportionals, without arithmetical addition, and subtraction. Harris.

GENERATING *line*, or *figure*, in geometry, is that which by its motion or revolution produces any other figure, plane, or solid. See GENESIS.

GENERATION, in physics, denotes the act of procreating, or producing a thing which before was not: or, the total change, or conversion of a body, into a new one, which retains no sensible part, or mark of its former state.

Thus, fire is said to be *generated*, when we perceive it to be where before was only wood, or other fuel; or, when the wood is so changed, as to retain no sensible character of wood: thus also, a chick is said to be *generated*, when we perceive the chick, where before was only an egg; or when the egg is changed into the form of a chick.

In *generation*, there is not properly any production of new parts, but only a new modification or manner of existence of the old ones; by this *generation* is distinguished from *creation*.

It is distinguished from *alteration*, in that the subject, in this latter, remains apparently the same; and only the accidents, or affections are changed: as when the same body is to day well, and to morrow sick; or that brass, which before was round, is now square.

Lastly, *generation* stands opposite to *corruption*, which is the utter extinction of a former thing: as, when that which before was wood, or an egg, is no longer the one or the other; whence it appears, that the *generation* of one thing is the corruption of another.

The peripatetics explain *generation* by a change, or passage from a privation, or want of a substantial form, to the having of such a form.

The moderns allow of no other change in *generation*, than what is local: according to them, it is only a transposition, or new arrangement of parts; and thus, the same matter shall successively undergo an infinity of *generations*.

A grain of wheat, *&c. gr.* is committed to the ground; this imbibing the humidity of the soil, becomes turgid, and dilates to such degree, that it becomes a plant, and, by a continual accession of matter, ripens by degrees into an ear; and at length into new feed. This feed, ground in the mill, appears in form of flower; which, mixed up with water, makes a paste; whereof, with the addition of yeast, fire, &c. bread is *generated*: and this bread, broke with the teeth, digested in the stomach, and conveyed through the canals of the body, becomes flesh.

Now, in all this series of *generations*, the only thing effected, is a local motion of the parts of the matter, and their settling again in a different order; so that, in reality, wherever there is a new arrangement, or composition of elements, there is a new *generation*; and therefore *generation* is finally reducible to motion.

GENERATION is more immediately understood of the production of animal and vegetable bodies, from seed, or the coition of others of different sexes, but of the same genus, or kind.

Some modern naturalists maintain, after Monf. Perrault, that there is not properly any new *generation*: that God created all things at first: and that what we call *generations*, are only augmentations and expansions of the minute parts of the bodies of seeds; so that the whole species to be afterwards produced, were really all formed in the first, and inclosed therein; to be brought forth and disclosed to view in a certain time, and according to a certain order and oeconomy.

Thus, Dr. Garden: "It is most probable, that the stamina of all the plants and animals that have been, or ever shall be in the world, have been formed ab origine mundi, by the Almighty Creator, within the first of each respective kind. And he who considers the nature of vision, that it does not give us the true magnitude, but only the proportion of things; and that what seems to our naked eye but a point, may truly be made up of as many parts as appear to be in the whole universe, will not think this an absurd or impossible thing." *Mod. Theor. of Generat.*

The manner, wherein the seed of the male animal acts on that of the female, in order to impregnate, and render it prolific, has long been inquired after; and yet remains still a mystery. Some, with Aristotle, hold the male semen to do the office of a coagulum; and the female that of milk: which some later authors have improved on, by supposing the male feed an acid; and the female an alcali.—Others consider the thicker seed of the male, as the flower; and the thinner seed of the female, as water, out of which two an animal paste is wrought, and baked by the heat of the womb.—But the moderns are generally agreed, that what effect soever the male feed produces on the female, it is by motion and mechanics, that it produces it.

GENERATION of animals, or animal GENERATION, is a process in the oeconomy of nature, very difficult to be traced. The parts concurring hereto, are numerous; and their functions are mostly discharged in the dark.

The antients distinguished two kinds of *generation*: *regular*, called *unevocal*; and *anomalous*, called also *equivocal*, or *spontaneous*.

The first is that effected by parent-animals of the same kind; as that of men, birds, beasts, &c.—The second was supposed

supposed effected by corruption, the fun, &c. as that of insects, frogs, &c. But this latter kind is now generally and deservedly exploded.

There are two principal theories, or methods of accounting for the Generation of animals: the one supposes the embryo, or fetus, to be originally in the feed of the male; the other, in the ovum, or egg of the female.

The first supposes the animalcules found in the male seed, to be the first rudiments of the fetus; and that the female only furnishes a proper nidus, and nutriment to bring them forwards.

The second supposes the first rudiments of the animal to be in the ova; and that the male seed only serves to warm, cherish, and ripen the ova, till they fall off out of the ovary into the womb.

The first system is well illustrated by Dr. Geo. Garden.—That author, upon comparing the observations and discoveries of Harvey, Malpighi, De Graaf, and Leewenhoek together, concludes it most probable, “That all animals are ex animalculo: that these animalcules are originally in feminine marium, and not in that of the female; but that they can never come forward, nor be formed into animals, without the ova in the female.”

The 1st of these points he argues from the three following observations.—

1^o, That something has often been observed by Malpighi, in the cicatrícula of an egg before incubation, like the rudiments of an animal, in form a tadpole.

2^o, From the sudden appearance and displaying of all the parts, after incubation, it seems probable, that they are not then actually formed out of a fluid; but that the stamina of them have been formerly there existent, and are now expanded.—The first part of the chick, which is discovered with the naked eye, is the punctum saliens, and that not till three days and nights of incubation are past; on the fifth day the rudiments of the head and body appear. This made Dr. Hervey conclude, that the blood had a being before any other part of the body, and that from it all the organs of the fetus were both formed and nourished: but by Malpighi's observations it appears that the parts are then only so far extended, as to be made visible to the naked eye; and that they were actually existent before, and discernible by glasses. After a further incubation of thirty hours, we see the head, the eyes, and the carina, with the vertebrae, distinct, and also the heart. After forty hours its pulse is visible, and all the other parts more distinct, which cannot be discerned by the naked eye, before the beginning of the fifth day: from whence it seems very probable, that even the so early discovery of those parts of the fetus by the microscope, is not the discerning of parts newly formed; but only parts more dilated and extended by receiving of nutriment from the colligamentum; so that they seem all to have been actually existent before the incubation of the hen. And what Swammerdam has discovered in the transmutation of insects, gives no small light to this; since he makes it appear, that in those large crucea's which feed upon cabbage, if they be taken about the time they retire to be transformed into aurelia's, and plunged often in warm water to make a rupture of the outer skin; you will discern, through the transparency of their second membrane, all the parts of the butterfly, the trunk, wing, feelers, &c. folded up: but, that after the crucea is changed into an aurelia, none of these parts can be discerned; being so much drenched with moisture; though they be there actually formed.

3^o From the analogy between plants and animals. All vegetables, we see, do proceed ex plantula; the seeds of vegetables being no other but little plants of the same kind, folded up in coats and membranes: whence we may infer, that so curiously an organized creature, as an animal, is not the sudden product of a fluid, or colligamentum, but does much rather proceed from an animalcule of the same kind, and has all its little members folded up according to their several joints and plicatures, which are afterwards enlarged and diffused, as we see in plants.

The 2^d point, which our late discoveries have made probable, is, that these animalcules are originally in the feed of the male, and not in the female.—For, 1^o, There are observed innumerable animalcula in feminine masculino, of all animals. Leewenhoek has made this so evident, that there seems little room to doubt of it.

2^o, We observe the rudiments of a fetus in eggs, which have been fecundated by the male; though no such thing is visible in those not yet fecundated. Malpighi, in his observations, makes it very probable, that these rudiments proceed originally from the male; and not from the female.

3^o, The resemblance between the rudiments of the fetus in ova, both before and after incubation, with the animalcule, makes it very probable that they are one and the same. The same shape and figure, which Mr. Leewenhoek gives us of the animalcule, Malpighi gives of the rudiments of the fetus, both before and after incubation; yea, and even the fetus's of viviparous animals appear so at first to the naked eye; whence Dr. Harvey acknowledged, that all animals, even the most perfect, are formed of a worm.

VOL. I.

4^o, This gives a rational account of many fetus's at one birth especially that of the countess of Holland: and how, at least, a whole cluster of eggs in a hen are fecundated by one coition of the male.

5^o, This gives a new light, as it were, to the first prophecy concerning the Messiah, that “the seed of the woman shall bruise the head of the serpent,” all the rest of mankind being thus most properly and truly the seed of the man.

6^o, The analogy already mentioned, which we may rationally suppose between the manner of the propagation of plants and animals, does likewise make this probable. Every herb and tree bears its seed after its proper kind; which seed is nothing else but a little plant of that kind; which being thrown into the earth, as into its uterus, spreads forth its roots, and receives thence its nourishment; but has its form within itself: and we may rationally conjecture some such analogy in the propagation of animals.

The 3^d thing, which our discoveries make probable, is, that animals cannot be formed of these animalcula, without the ova in feminis, which are necessary for supplying them with proper nutriment; and this is evinced from the following considerations.

1^o, It appears, that an animalcule cannot come forward, if it do not fall into a proper nidus: this we see in the cicatrícula in eggs; and though a million of them should fall into one egg, none of them would come forward, but what were in the center of the cicatrícula; and perhaps the nidus, necessary for their formation, is so proportioned to their bulk, that it can hardly contain more than one animalcule; which may be the reason why there are so few monsters. This, we see, is absolutely necessary in the oviparous kinds; and the only difference which lies between them and the viviparous, seems to be this, that in the latter the ova are properly nothing but the cicatrícula, with its colligamentum, so that the fetus must spread forth its roots into the uterus, to receive its nourishment; but the egg in oviparous animals may be properly termed an uterus, in relation to the fetus; as it contains not only the cicatrícula, with its amnion and colligamentum, which is the immediate nourishment of the fetus, but also the materials which are to be converted into that colligamentum; so that the fetus spreads forth its roots no farther than into the white and yolk of the egg, from whence it derives all its nourishment. Now, that an animalcule cannot come forward without some such proper nidus, will not be denied; for if there were nothing needful but their being thrown into the uterus, we do not see why many hundreds of them should not come forward at once, at least while scattered in so large a field.

2^o, That this cicatrícula is not originally in utero, seems evident from the frequent conceptions which have been found extra uterum: such as the child which continued twenty-six years in the woman of Thoulouse's belly; and the little fetus found in the abdomen of Mad. de St. Mere, together with the testicle torn, and full of clotted blood: such also seem to be the fetus in the abdomen of the woman of Copenhagen, mentioned in the *Nouv. de la Rep. des Lett.* for Sept. 1685. all the members of which were easily to be felt through the skin of the belly, and which she had carried in her belly for four years: the seven years gravidation related by Dr. Cole; and many other the like instances. Now, granting once the necessity of a proper nidus for the formation of an animalcule into an animal, these observations make it probable, that the testes are the ovaria appropriated for this use: for though the animalcule's coming thither in such cases, may seem to be extraordinary, and that usually the impregnation is in utero; yet it may be collected from hence, that the cicatrícula or ova to be impregnated, are in testibus feminis; for if they were not so, the accidental coming of animalcules thither, could not make them come forward more than in any other part of the body; since they cannot be formed and nourished without a proper nidus.

3^o, It is acknowledged, that the fetus in utero, for some considerable time after conception, has no connection with the womb; that it sits wholly loose in it, and is no other than a little round egg, with the fetus in the midst; which sends forth its umbilical vessels by degrees, and at last lays hold of the uterus. Now, from hence it seems evident, that the cicatrícula, which is the fountain of the animalcule's nourishment, does not spout from the uterus, but has its origin elsewhere; and falls in thither as into a fit soil, from whence it may draw nutriment for the growth of the fetus: else it cannot be easily imagined how it should not have an immediate connection with the uterus, from the time of conception.

It is indeed difficult to conceive, how these eggs should be impregnated per semen maris, both because there is no connection between the fallopian tubes, and the ovary for its transmission; and for that Dr. Harvey could never discover any thing of it in utero: but as to the last, M. Leewenhoek has cleared that difficulty by the discovery of innumerable animalcula in the tube, or cornua uteri, and those living a considerable time after coition. And as to the former, we may

either suppose that there is such an inflation of the tubæ, at the time of coition, as make them embrace the ovaries; and such an approach of the uterus and its cornua, as that it may easily transmit the feed into the ovary: or else, that the ova are impregnated by the animalcules after they descend into the uterus, and not in the ovary. The former seems probable for this reason, that at least a whole cluster of eggs in a hen will be fecundated by one tread of the cock: now this fecundation seems to be in the vitellary, and not in the uterus, as the eggs pass along from day to day: for it can hardly be supposed, that the animalcules should subsist so long, being scattered loosely in the uterus, as to wait there, for many days, for the fecundation of the eggs as they pass along. The latter conjecture has this to strengthen it; that the animalcules are found to live a considerable time in the uterus, and that if they should impregnate the ova in the ovary itself, the foetus would increase so fast, that the ova could not pass through the tubæ uteri; but would either burst the ovary, or fall down into the abdomen, from the orifices of the tubæ: and from hence probably proceed those extraordinary conceptions in the abdomen, out of the uterus. Thus much is urged for the system *ab animalculis*.

The retainers to the system of *Generation ab ovo*, contend, that the rudiments of the foetus are laid in the ovary, and that the female furnishes the whole matter of the body; which they chiefly support from the conformation in rabbits, sheep, cows, &c. where the vagina of the womb is so long, and sinuous, that it is scarce possible the male feed should ever arrive within the body of the uterus; especially in cows, whose vagina is filled with a thick, viscid ichor, and the inner orifice of the womb is exactly closed: beside, that the thickness of the membranes of the ova should seem impenetrable to so crass a matter as the male feed. Add, that if animalcula be found in the male feed, which, however, will admit of some dispute (that intestine motion and agitation of the grosser particles thereof, which gave rise to the opinion, being accountable for, from the common laws of warm fluids) yet are the same observed in vinegar, pepper, water, &c. Add, that it is highly improbable, that those animalcules should contain the rudiments of a future body; since their large numbers would produce too plentiful an offspring; inasmuch that it would be necessary for 9999 parts of them to be in vain, and perish: which is contrary to the economy of nature in other things.

Analogy is likewise urged in favour of this system: thus all plants are maintained to arise from eggs; seeds being no other than eggs under another denomination. All oviparous animals do unexceptionably arise from eggs; which the female cast forth; and it is highly probable, that the viviparous only differ from oviparous, in that the females lay and hatch their eggs within themselves.

Against this hypothesis it is urged, that what are usually called ova, or eggs, in women, are no other than little cells, or bladders, full of a certain liquor: and how can a drop of liquor pass for an egg? Add, that these imaginary eggs have no proper membrane belonging to them, nor any covering but that of the cell; which seems so inseparable therefrom, that when they are discharged, it is hard to conceive how they should take it with them. And beside, how should they make themselves a passage through the common membrane wherewith the ovary is invested, which is of so close a texture, that it must seem absolutely impenetrable by a round body of so soft a consistence, as one of these vesicles. Lastly, vesiculæ, in all respects perfectly like ova, have been found in other parts of the body, where it is apparent they could not serve for any purposes of *Generation*. *Mém. de l'Acad. Royal des Scien. an. 1708, 1709.*

To this it is answered, that ova or vesiculæ have been actually found in dissections, detached and separated from the ovary, and the ruptures in the membrane of the ovary, through which they had passed, remaining still visible. M. Littré even observed some of these separated ova spread with blood vessels, like those in the yolks of birds' eggs. Nay more, the same author is positive, that he saw an embryo in one of the ova not yet separated; and could discern its head, mouth, nose, trunk, and funicular umbilicalis, whereby it adhered to the membranes of the ovary. But this will come to be farther considered under *GENERATION of man*.

Sir John Floyer starts a difficulty, which seems to press equally against each system, taken singly: it is fetched from monsters. In a male, for instance, which is the production of a venereal copula between an ass and a mare, the bulk of the body partakes of the form of the dam; and the feet, tail, and ears, of that of the sire. Hence it is argued, that the rudiments of the greater part of the foetus are laid in the ovum; and that the impregnation either conveys, or changes the extremities. If the male supplied the animalcula, the texture should always be of the same species as the male: if the female supply it, it should be of her kind; whereas monsters are of both.

GENERATION of man. — As it is in human subjects that the

gradual process of *Generation* has been principally inquired into, and the structure and office of the organs subservient thereto, chiefly examined: what the latest naturalists, and anatomists have settled with regard thereto, is reserved for this head.

The parts of *Generation*, then, are different in the different sexes. — Those, proper to the male, are the penis, the testicles, the vesiculæ seminales, the vasa deferentia, the parastata, and the vasa preapantia; which see described each under its proper article, *PENIS, TESTICLE, &c.*

The parts of *Generation* proper to the female, are the pudendum, the clitoris, nymphæ, hymen, uterus, fallopian tubes, and ovaries or testes. See *GÉNITAL, CLITORIS, NYMPHÆ, HYMEN, MATRIX, FALLOPIAN tubes, and OVARIES*.

The process of *Generation*, so far as the male contributes to it, is as follows. — The penis being erected by an affusion of blood; as shewn under *ERECTION*; the glans at the same time tumified; and the nervous papillæ in the glans much rubbed, and highly excited in coitu; an ejaculatory contraction follows, by which the seed is pressed out of the seminal vesicles, and expelled with some considerable force.

The process of *Generation* on the part of the female, is thus: the clitoris being erected, after the like manner as the penis in man; and the neighbouring parts all distended with blood, they more adequately embrace the penis in coitu: and by their intumescence press out a liquor from the glands about the neck of the womb, to facilitate the passage of the penis.

At the same time, the fibres of the womb contracting, open its mouth (which at other times is extremely close) for the reception of the finer part of the feed.

Thus, the feed, pregnant with animalcules, is conveyed, with some impetus, into the uterus; where being retained by the convulsive constriction of the inner membrane thereof, and further heated and agitated therein, it is prepared to impregnate the ovum.

During the act of coition, the fallopian tubes growing stiff, embrace the ovaries with their strong muscular edges, like fingers; and compress them; till, their mouths being dilated and expanded by this embrace, force the egg, now ripened, into their cavities, and gradually drive it forwards, by their vermicular motion, till at last they protrude it into the cavity of the womb, to meet the feed, some of the animalcules whereof entering the dilated pores of the glandulous membrane of the egg, are there retained, nourished, grow to its navel, and suffocate the rest of the less lively animalcula. And thus is conception performed.

Others rather suppose the feed conveyed from the uterus, through the fallopian tubes, to the ova; and thus take the impregnation to be first performed in the ovaries; or even in the tubæ themselves, the ova and feed meeting by the way.

Others, considering the closeness of the mouth of the womb, and the thickness of the membranes of the ovaries, judge it impossible for the feed to pass that way, and therefore suppose it taken up by the veins, which open into the cavity of the vagina, or even womb; where circulating, it ferments with the mass of blood; and hence all the symptoms which appear in conception. At length it enters and impregnates the egg by the small twigs of arteries, which are upon its membranes. This fermentation swelling the membranes of the tubæ, they open their cavity and make room for the ova to pass into the womb.

The egg impregnated, and close shut up in the womb, swims in the humours thereof; which growing more and more subtil, enter the patent pores found on one side the ovum, and soon distend, fill, and augment it; and there being still further attenuated, nourish the embryo; thicken and expand the membranes of the ovum, especially in that part by which it grew to the ovary, and thus form the rudiments of a placenta.

The same causes still continuing, and the pores both of the placenta, and the membranes being enlarged; the egg begins to fill the capacity of the womb; and at length its stem or calyx grows to the concave surface thereof: and thus is the navel-string, or funiculus, formed. See *funiculus UMBILICALIS, &c.* See also *FOETUS*.

This system is founded on the supposition of animalcula in the male seed. — They who set them aside as unconcerned in *Generation*, account for it thus: the feed, containing volatile, oily, and saline parts, as appears from its fetid smell, oleaginous substance, &c. being lodged in the womb, and there further digested and exalted; grows yet more volatile, fetid, pungent, and stimulating; and thus, adding to the heat occasioned by coition, velleitates the nervous fibres of that part, and occasions a fermentation, and gentle inflammation; and by that means an extraordinary flux of humours to that, and the adjacent parts.

By this means the tubæ become rigid, and fit to grasp the ovaries, which are also heated by the effluvia of the semen,

and the warmth of the parts surrounding. Upon this, there is a greater flux into the ovaries; till at length, the ova, some of them at least, by such greater supply of nourishment, increase in bulk; and as those grasped by the edges of the tubes, will be kept warmest, and the greatest flux be made thereto, they will soonest be ripened, fall off, and be received by the tubes, and conveyed to the womb; where growing, after the manner of the seeds of plants, the placenta at length takes hold of, and adheres to the uterus; from which time the embryo begins to be nourished after a different manner. See GESTATION; see also NUTRITION, and CIRCULATION.

GENERATION of insects, see the article INSECT.

GENERATION of plants bears an admirable analogy to that of animals.—See the process delivered at large under the article generation of PLANTS.

The parts of generation of plants, are the flowers; and particularly the stamina, apices, farina fecundans, and pistils thereof. See FLOWER; see also STAMINA, FARINA, and PISTIL.

GENERATION of minerals, or fossils, see MINERAL, and FOSSIL.

GENERATION of mushrooms, see the article MUSHROOM.

GENERATION of shells, see the article SHELL.

GENERATION of stones, see STONE, SPAR, TROCHITES, and CRYSTAL.

GENERATION, in theology. The Father is said to have produced his Word, or Son, from all eternity, by way of generation; on which occasion the word generation raises a peculiar idea: that procreation, which is really effected in the way of understanding, is called generation, by reason the Word, in virtue thereof, becomes like to him from whom he takes his original; or, as St. Paul expresses it, is the figure, or image of his substance, i. e. of his being and nature. See TRINITY, and PERSON.

And hence it is, that the second person in the Trinity is called the Son.

GENERATION is also used, though somewhat improperly, for genealogy; or the series of children, issued from the same stock.—Thus, the gospel of St. Matthew commences with the book of the generation of Jesus Christ, &c.

The latter, and more accurate translators, instead of generation, use the word genealogy.

GENERATION is also used to signify a people, race, or nation; especially in the literal translations of the scripture: where the word generally occurs, wherever the Latin has generatio; and the Greek, γενεα, or γενος.

Thus, "A wicked and perverse generation seeketh a sign, &c." "one generation passeth away, and another cometh," &c.

GENERATION is also used in the sense of an age, or the ordinary period of man's life.

Thus, we say, to the third, and fourth generation.—In this sense, historians usually reckon a generation the space of thirty-three years, or thereabouts. See SECLUM.

Herodotus makes three generations in an hundred years; in which computation appears from the later authors of political arithmetic, to be pretty just. See ANNUITY, and POLITICAL arithmetic.

GENERIS secundæ, see the article SECUNDI.

GENEROsa, a gentlewoman, see GENTLEMAN.

Generosus is a good addition; and if a gentleman be named spinster, in any original writ, appeal, or indictment, may abate and quash the same. 2 Inst. fol. 668. See ADDITION.

GENESIS, the first book of the Old Testament; containing the history of the creation, and the lives of the first patriarchs. The book of Genesis stands at the head of the Pentateuch. Its author is held to be Moses; it contains the relation of 2367 years; viz. from the beginning of the world, to the death of Joseph.—The Jews are forbid to read the beginning of Genesis, and the beginning of Ezekiel, before thirty years of age.

The Hebrews call this book Bereſhibith, in regard it begins with that word, which in their language signifies in principio, or, in the beginning. It was the Greeks who gave it the name Genesis, Γενεσις, q. d. production, generation; by reason it begins with the history of the production, or generation of all beings.

Cedrenus makes mention of an apocryphal book, entitled the little Genesis, Genesis parva, containing several incidents, not in the other; some of which he has preserved: particularly that Cain was buried under the ruins of a house. that an angel taught Abraham the Hebrew tongue: that Matriphat, prince of the devils, advised God to order Abraham to sacrifice his son, for a trial of his obedience: that the children of the Israelites were only cast into the Nile for ten months, &c.

GENESIS, in geometry, denotes the formation of a line, plane or solid, by the motion, or flux of a point, line, or surface. See LINE, and SURFACE; see also POINT, FLUXION and CURVE.

The Genesis, or formation, e. gr. of a globe, or sphere conceived by supposing a semi-circle to revolve upon a line, drawn from one extreme thereof to the other; and call-

its axis, or axis of circumvolution: the motion or revolution of that semi-circle, is the genesis of the sphere, &c. See AXIS, SPHERE, and GLOBE.

In the genesis of figures, &c. the line, or surface that moves, is called the describent; and the line around which, or according to which the revolution, or motion is made, the dirigent.

GENET, or genet, in the manage, &c. a small sized, well proportioned Spanish horse.

Some also give the term genet to well-made Italian hofes.

To ride a la GENETTA, is to ride in the Spanish fashion, i. e. with the stirrups so short, that the spurs bear upon the flanks of the horse.—This is deemed a piece of gallantry in Spain, but not among us.

GENETHLIACI*, in astrology, persons who erect horoscopes; or pretend to foretell what shall befall a man, by means of the stars which presided at his nativity.

* The word is formed of the Greek γενεα, origin, generation, nativity.

The antients called them chaldaei, and by the general name, mathematici; accordingly, the several civil, and canon laws which we find made against the mathematicians, only respect the genethliaci, or astrologers.

They were expelled Rome, by a formal decree of the senate; and yet found so much protection from the credulity of the people, that they remained therein unmolested.—Hence an antient author speaks of them as hominum genus quod in civitate nostra semper & vetabitur & retinebitur.

Antipater, and Achinapolis have shewn that genethliology should rather be founded on the time of the conception, than on that of the birth. Vitruvius.

GENETHLIACUM, GENETHLIAC poem, is a composition in verse, on the birth of some prince, or other illustrious person: wherein the poet promises him great honours, advantages, successes, victories, &c. by a kind of prophecy or prediction.

Such is the eclogue of Virgil to Pollio, beginning, Sicelides Musæ, paulo majora canamus.

There are also genethliac speeches, or orations; made to celebrate a person's birth day.

GENEVA, a popular name for a compound watet; which is or ought to be procured from the berries of the Juniper-tree, distilled with brandy, or malt-spirits.

* The word is formed from genevre, the French name of the juniber-berry.

GENEVIEVE, St. GENEVIEVE, or St. GENEVIEFVE,—Fathers or religious of St. Genevieve, the name of a congregation of regular canons of the order of St. Augustin; established in France.

The congregation of St. Genevieve is a reform of the Augustin canons. It was begun by St. Charles Faure, in the abbey of St. Vincent de Senlis, whereof he was a member, in the year 1618. The reform soon spread into other houses; particularly that of Notre Dame d'Eu, and the abbey of St. Genevieve at Paris, chiefly by the intereff of the cardinal de la Rochefoucault, who was chose abbot thereof in 1619; and in 1621. propoſed the reform to the religious of his abbey.

In the year 1634. the abbey was made eleective; and a general chapter, composed of the superiors of fifteen houses who had now received the reform, chose F. Faure co-adjutor of the abbey of St. Genevieve, and general of the whole congregation. Such were its beginnings.

It has since increased very much, and it now consists of above an hundred monasteries; in some whereof the religious are employed in the administration of the parishes, and hospitals; and in others, in the celebration of divine service, and the instruction of ecclesiastics in seminaries for the purpose.

The congregation takes its name from the abbey of St. Genevieve, which is the chief of the order; and whose abbot is the general thereof.—The abbey itself took its name from St. Genevieve, the patroness of the city of Paris: who died in the year 512. Five years after her death, Clovis erected the Church of St. Genevieve under the name and invocation of St. Peter; where her relics are still preserved, her shrine visited, and her image carried with great processions and ceremonies, upon extraordinary occasions, as when some great favour is to be intreated of heaven.

GENIAL*, GENIALIS, an epithet, applied by the antients to certain deities, whom they supposed to preside over the affair of generation.

* They were thus called a gerendo, from bearing; or, according to the correction of Scaliger and Vossius, a genendo; to yean, produce. Yet Festus says, that they were also called geruli, which seems to require the former reading. M. Dacier, in a note, shews that gerere has the sense of $\alpha\gamma\alpha\rho\alpha\iota\sigma\iota$.

Among the genial gods, dii geniales, says Festus, were water, earth, fire, and air, which the Greeks called elements.—The twelve signs were sometimes also ranked in the number: as also the sun, and moon.

GENICULI, in botany, the joints or knots, which appear in the shoots of plants. Whence botanists call those marked therewith geniculate plants.

GENIOGLOSSI*, in anatomy, the name of a pair of muscles, proceeding inwardly from the fore part of the lower jaw, under another called *geniohyoidæ*; and which, enlarging themselves, are fattened into the basis of the tongue.—They serve to pull the tongue forward; and to thrust it out of the mouth.

* The word is formed from *γεννη*, *mentum*, the chin, and *γλωσσα*, *lingua*, the tongue.

GENIOHYOIDÆUS*, in anatomy, a muscle of the os hyoides, which, with its partner, is short, thick, and fleshy, arising from the internal parts of the lower jaw-bone, called the chin; and dilating themselves, are soon lessened again, and inserted into the superior part of the fore-bone of the os hyoides, and assist the genio-glossi in thrusting the tongue out of the mouth.

* The word is formed from *γεννη*, *mentum*, the chin, and *ὑοειδης*, *hyoides*.

GENITAL, GENITALIS, in medicine, something that relates to generation.

Genital parts, denote the parts in both sexes employed in the affair of generation, otherwise called *Adosa*, *puenda* or *puendum*. See *Tab. Anat. (Splanchn.)* fig. 8, 9, 10, 11, 13, 15, &c. See also **PENIS, TESTICLE, CLITORIS, HYMEN, &c.**

GENITAL gods, dii genitales, are sometimes used in the ancient Roman poets for those we otherwise call *indigetes*. See **INDIGETES**. Ausonius, in the argument of the fourth book of the *Æneid*, takes the word in a different manner: the *dii genitales*, he observes, were not such as were born of human parents, were not thus called *quasi geniti ex hominibus*, but rather because they themselves had begot human children.

GENITALIA, or **GENITORIES**, in anatomy, a name sometimes given the testes, or testicles of man; on account of their office in generation. See **TESTICLE**.

GENITES, *γεννηται*, or **GENETÆ**, among the Hebrews, those descended from Abraham, without any mixture of foreign blood.

The Greeks distinguished by the name of *genites* such of the Jews, as were issued from parents who, during the Babylonish captivity, had not allied with any Gentile family.

GENITED, in geometry, see **GENERATED**.

GENITIVE, in grammar, the second case of the declensions of nouns.

The relation of one thing considered as belonging in some manner to another, has occasioned a peculiar termination of nouns, called the *genitive case*.

In English, the *genitive case* is made by prefixing the particle *of*; in French, *de*, or *du*, &c. though in strictness, there are no cases at all in either of those languages, inasmuch as they do not express the different relation of things by different terminations, but only by additional prepositions.

In the Latin, this relation is expressed in divers manners: Thus we say, *caput hominis*, the head of a man; *color rosæ*, the colour of a rose; *opus Dei*, the work of God, &c.

As the *genitive case* serves to express very different, and even opposite relations, there sometimes arises an ambiguity therefrom: thus in the phrase *vulnus Achillis*, the wound of Achilles, the *genitive*, *Achillis* may either signify the relation of subject, in which sense it is taken passively for the wound Achilles has received; or the relation of a cause, in which sense it is taken actively for the wound Achilles has given: thus in that passage of St. Paul, *certus sum quod nec me nec mari, neque vita, &c. nos poterit separare a charitate Dei in Christo, &c.* The *genitive*, *Dei*, has been taken by interpreters in two different senses; some giving it the relation of object, and understanding the passage of the love which the elect bear to God in Jesus Christ, whereas others give it the relation of subject, and explain it of the love which God bears the elect in Jesus Christ.

In the Hebrew tongue, the *genitive case* is marked after a manner very different from that of the Greek and Latin; for whereas in those languages the noun governed is varied; in the Hebrew the noun governing undergoes the alteration.

GENITURA, GENITURE, a name, which some authors give to the seed; both that of the male, and female. See **SEED**.

GENIUS, a good, or evil spirit, or daemon, whom the antients supposed set over each person, to direct his birth, accompany him in life, and to be his guard.

Among the Romans, Festus observes, the name *genius* was given to the god who had the power of doing all things, *damusque omnino obtinet rerum omnium gerendum*; which Varro, de *Ling. Lat.* rather chuses to read *generandum*, who has the power of producing all things; by reason Censorinus frequently uses *gerere* for *gignere*. Accordingly, St. Augustine, de *Civitate Dei*, relates, from Varro, that the *genius* was a god who had the power of generating all things, and presided over them when they were produced.

Festus adds, that Ausonius spake of the *genius* as the Son of God, and the Father of men, who gave them life; others, however, represented the *genius* as the peculiar or tutelary god of each place: And it is certain, this last is the most usual meaning of the word.

The antients had their *genii* of nations, of cities, of provin-

ces, &c. Nothing is more common than the following inscription on medals, **GENIUS POPULI ROM.** the *genius* of the Roman people: or, **GENIO POP. ROM.** to the *genius* of the Roman people.

In this sense, *genius* and *lar* were the same thing; as, in effect, Censorinus and Apuleius affirm they were.

The Platonists, and other eastern philosophers, supposed the *genii* to inhabit the vast region, or extent of air between earth and heaven. They were a sort of intermediate powers, who did the office of mediators between gods and men. They were the interpreters, and agents of the gods; communicated the wills of the deities to men; and the prayers, and vows of men, to the gods. As it was unbecoming the majesty of the gods to enter into such trifling concerns; this became the lot of the *genii*, whose nature was of a middle kind between the two; who derived immortality from the one, and passions from the other; and who had a body framed of an aerial matter. Most of the philosophers, however, held that the *genii* of particular men were born with them, and died; thus Plutarch attributes the ceasing of oracles partly to the death of the *genii*.

The heathens, who considered the *genii* as the guardian spirits of particular persons, believed that they rejoiced and were assisted at all the good, and ill fortune that befel their wards. They never or very rarely appeared to them; and then only in favour of some person of extraordinary virtue or dignity. They likewise held a great difference between the *genii* of different men; and that some were much more powerful than others; on which principle it was, that a wizard in Appian bids Anthony keep at a distance from Octavius, by reason Anthony's *genius* was inferior to, and stood in awe of that of Octavius.

There were also evil *genii*, who took a pleasure in persecuting men, and bringing them evil tidings: such was that in Paterculus, &c. which appeared to Brutus the night before the battle of Philippi. These were also called *larvæ*, and *lemures*.

GENIUS is more frequently used for the force or faculty of the soul considered as it thinks or judges.

Thus we say, a happy *genius*, a superior *genius*, an elevated *genius*, a narrow confined *genius*, &c.—In the like sense we also say, a work of *genius*, a want of *genius*, &c.

GENIUS is also used in a more restrained sense for a natural talent, or disposition to one thing more than another.

In which sense we say, a *genius* for verse; for the sciences, &c.

GENSD'ARMERIE, see **GENDARMERY**.

GENSD'ARMES, see the article **GENDARMES**.

GENTIAN, a medicinal root, the product of a plant of the same name: which the antients, to render it the more considerable, denominated from Gentius, king of Illyria, who is supposed to have been the first that discovered the admirable virtues thereof.

The root *gentian* is of a yellowish colour, and intolerably bitter; it is sometimes as thick as the arm, but more commonly divided into branches no bigger than the thumb: its stem grows several feet high, being very smooth and glossy, though divided by knots from space to space, out of which arise the leaves, which somewhat resemble those of plantain. Its flowers, which likewise accompany the knots, are yellow: and its seed is flat, round, smooth, and light.

This root is held excellent against poisons, and even against the plague. It stands at the head of stomachics, warming and strengthening the stomach, and helping digestion. It is also sudorific, and used with fucels in intermitting fevers, whence some call it the *European quinquina*; and it is also an ingredient in Venice treacle. Externally it is used for wounds.

The plant affects moist places, and is found commonly enough in Burgundy, the Alps, and Pyreneans. It is called by botanists, *gentiana vulgaris major, ellebori albi folio*: The little *Gentiana* growing in England are called *Gentianæ*.

The root is to be chosen dry, new, of a moderate thickness, free from earth, and furnished with little branches or nodes; and, if possible, that which is dried by the air, which is distinguishable by the colour, it being blackish within side, when dried in the oven; and of a golden yellow, when in the air.

GENTIAN water, see the article **WATER**.

GLNTILE, GENTILIS, a pagan, or person who adores false gods.

The Hebrews applied the name גֵּוֹיִם *gentes*, nations, to all the people of the earth, who were not disciples of the Messiah. Some will have it, that the *Gentiles* were thus called in consequence of distinction to the Jews, by reason these latter have a positive law to observe in matters of religion, whereas the *Gentiles* have only the natural law; hence they are called *Gentiles*, *gentes*, *gentes*, *gentes*, because they remain in a state of nature.

The Jews apply the denomination *Gentiles* much as the Christians do that of *infidels*.—St. Paul calls the *gentes* *infidels* of the *Gentiles*, which appellation he first gave him, Rom. xi. 13. “As I am the *pe* of the *Gentiles*, I magnify mine office.”

The calling of the *Gentiles* to Christianity, had been predicted in the Old Testament, as it was accomplished in the N. W.

See Psal. ii. 8. If. ii. 2. Joel ii. 29. Matth. viii. xi. xii. 18. Acts xi. 18. xiii. 47. 48. xviii. 28. Rom. i. 5. iii. 29. xi. 12. 13. 25. Eph. ii. 11. Revel. xi. 2. xlii. 2.

GENTILE, GENTILIS, in the Roman law and history, a name which sometimes expresses those whom the Romans otherwise called *Barbarians*: whether they were allies of Rome, or not. In which sense the word occurs in Ammianus, Ausonius, and the *Notitia Imperii*.

GENTILIS was also used in a more peculiar sense, for all strangers, or foreigners, not subject to the Roman empire; as we see in the *Theodosian code*, in the title de *nuptiis gentiliū*, where the word *Gentilis* stands opposed to *Provinciales*, or the inhabitants of the provinces of the empire.

The word is likewise used in this sense in the Greek; but it was not introduced either into that, or the Latin tongue, till after christianity was established; it being taken from scripture.

GENTLEMAN*, a person of noble birth, or descended of a family which has long bore arms.

* The word is formed of the French *gentilhomme*, or rather of *gentil*, fine, fashionable, or becoming; and the Saxon *man*, q. d. *homo*, or *beneficium loco natus*.—The same signification has the Italian *gentiluomo*, and the Spanish *hidalgo*, or *hijo dalg*, that is, the son of somebody, or of a person of note.—If we go farther back, we shall find *gentleman* originally derived from the Latin *gentilis homo*, which was used among the Romans for a race of noble persons of the same name, born of free or ingenuous parents, and whose ancestors had never been slaves or put to death by law.—Thus Cicero, in his *Topics*, *Gentiles sunt, qui inter se eodem sunt nomine ab ingenuis oriundi, quorum majorem nemo fore itatem servavit, qui capite non sunt diminuti*, &c. Some hold that it was formed from *gentile*, i. e. pagan, and that the ancient Franks, who conquered Gaul, which was then converted to christianity, were called *gentiles* by the natives, as being yet heathens.—Others relate, that towards the declension of the Roman empire, as recorded by Ammianus Marcellinus, there were two companies of brave soldiers, the one called *gentilium*, and the other *gentiariorum*; and that it was hence we derived the names *gentleman* and *esquire*. See **ESQUIRE**.—This sentiment is confirmed by Paquier, who supposes the appellation *gentiles* and *esquires* to have been transmitted to us from the Roman soldiery; it being to the *gentiles* and *scutarii*, who were the bravest of the soldiery, that the principal benefices and portions of lands were assigned. See **BENEFICE**.—The Gauls observing, that during the empire of the Romans, the *scutarii* and *gentiles* had the best tenements, or appointments, of all the soldiers on the frontiers of the provinces, became insensibly accustomed to apply the same names, *gentilhommes*, and *esquires*, to such as they found their kings gave the best provisions or appointments to. *Paq. Rech. l. 2. c. 15.*

In strictness, *Chamberlayne* observes, a *gentleman* is one whose ancestors have been freemen, and have owed obedience to none but their prince: on which footing, no man can be a *gentleman* who is not born so.

Among us, the term *gentleman* is applicable to all above yeomen; so that noblemen may be properly called *gentlemen*.

In our statutes, *gentilis homo* was adjudged a good addition for a *gentleman*, 27 Edw. III. The addition of knight is very ancient, but that of *esquire* or *gentleman*, was rare, before 1 Hen. V.

GENTLEMAN usher of the black rod, see **BLACK**.

GENTLEMAN of the bed-chamber, see **BED-CHAMBER**.

GENTLEMAN of the chapel, are officers, whose duty and attendance is in the royal chapel; being in number thirty-two: twelve whereof are priests, and the other twenty called *clerks of the chapel*, who assist in the performance of divine service.

One of the first twelve is chosen for confessor of the household; whose office it is to read prayers every morning to the household servants; to visit the sick; examine, and prepare communicants, and administer the sacraments.

Another, well versed in musick, is chosen first organist; who is master of the children to instruct them in musick, and what is necessary for the service of the chapel: a second is likewise an organist: a third a lutanist; and a fourth a violist.

There are likewise three *vergers*, so called from the silver rods they usually carry in their hands, being a squire, yeoman, and groom of the vestry: the first attends the dean, and lub-dean, finds surplices, and other necessaries for the chapel: the second has the whole care of the chapel, keeps the pews, and seats the nobility and gentry: the groom has his attendance within the chapel door, and looks after it.

GENTLEMEN of honour, See **HONOUR**.

GENTLEMEN pensioners, See **PENSIONER**.

GENUFLEXION, the act of bowing, or bending the knee; or rather, of kneeling down.

The jesuit *Rosweyd*, in his *Onomasticon*, shews that *genuflexion*, or kneeling, has been a very ancient custom in the church; and even under the Old Testament dispensation: and that this practice was observed throughout all the year, excepting on Sundays, and during the time from Easter to Whitsuntide, when kneeling was forbid by the council of Nice.

Others have shewn, that the custom of not kneeling on Sundays had obtained from the time of the apostles; as appears from St. Irenaeus, and Tertullian: And the *Aethiopic* church, VOL. I.

scrupulously attached to the ancient ceremonies, still retains that of not kneeling at divine service. The Russians esteem it an indecent posture, to worship God on the knees. Add, that the Jews usually prayed standing.—*Rosweyd* gives the reasons of the prohibition of *genuflexion* on Sundays, &c. from St. Basil, Anastasius, St. Justin, &c.

Baronius is of opinion that *genuflexion* was not established in the year of Christ 58; from that passage in *Acts* xx. 36, where St. Paul is expressly mentioned to kneel down at prayer; but *Saturn* shews that nothing can be thence concluded.

The same author remarks also, that the primitive christians carried the practice of *genuflexion* so far, that some of them had worn cavities in the floor where they prayed: and St. Jerome relates of St. James, that he had contracted a hardness on his knees, equal to that of camels.

GENUS, Kind, in logicks and metaphysics, is that which has several species under it; or, it is the origin, and radix of divers species, joined together by some affinity or common relation between them.

Genus is a nature, or idea, so common and universal, that it extends to other general ideas, and includes them under it.

Thus, animal is said to be a *genus*, in respect of man, and brute, in regard man and brute agree in the common nature and character of animal: so a right-lined figure of four sides, is a *genus*, in respect of a parallelogram, and a trapezium; and so likewise is substance, in respect of substance extended, which is body; and thinking substance, which is mind.

A good definition, say the schoolmen, consists of *genus*, and difference.

In the general, *genus* may be said to be a class of a greater extent than species; and which is not convertible therewith. For though we may say, that all body is substance; yet it cannot be said all substance is body.

Add, that whatever may be said of the *genus*, may likewise be said of the species under it; e. g. whatever is said of *ens*, beings, will equally hold of the body.

The schoolmen define the *genus logicum* to be an universal which is predicable of several things of different species; and divide it into two kinds: the one, the *summum*, which is the highest or most general, and has nothing above it to respect as a *genus*: the other the *subaltern*, which they likewise call *medium*.

GENUS summum is that which holds the uppermost place in its class, or predicament; or that which may be divided into several species, each whereof is a *genus* in respect of other species placed below it.

Thus in the predicament of things subsisting of themselves, *substance* has the place and effect of *genus summum*, and is predicated of all the things contained in that class; for both Plato and man, and animal, and even spirit, are properly called substance.

Accordingly there are as many *summa genera*, as there are classes of predicaments or categories.

Subaltern GENUS is that which being a medium between the highest *genus*, and the lowest species, is sometimes considered as a *genus*, and sometimes as a species.

Thus bird, when compared with animal, is a species; when to a crow, and eagle, or the like, it is a *genus*.

Genus, again, is divided into *remotum*, remote, where between it and its species, there is another *genus*; and *proximum*, or next, where the species is immediately under it; as man, under animal.

GENUS is also used for a character, or manner, applicable to every thing of a certain nature, or condition.—In which sense it serves to make capital divisions in divers sciences; as music, rhetoric, botany, anatomy, &c. *a. gr.*

GENUS, GENDER, in botany, denotes a system, or assemblage of several plants, agreeing in some one or more common characters in respect of the structure of certain parts; whereby they are distinguished from all other plants.

The distribution of plants into *genera*, and species, is absolutely necessary to ease the memory, and prevent its being oppressed, and overburdened with an infinity of different names. The knowledge of a *genus* comprehends, in a kind of miniature, that of all the plants belonging thereto; each being denominated from some circumstance, common to the whole kind, to save the embarrass of so many particular names.

Something like this, even the common people do, especially in the instance of *ranunculus*, &c. but in many other plants the difficulty is infinitely greater, as it is hard to find any thing in common among them, whereon to found their *genus*.

Hence botanists differ as to the manner of regulating these *genera*, and the characters whereon they are to be established; Mr. Ray's distribution, see under the article **PLANT**.

One of the later writers, *Monf. Tournefort*, after a long and accurate discussion, has chose, in imitation of *Gesner*, and *Columna*, to regulate them by the flowers, and fruit considered together; so that all plants, which bear a resemblance in those two respects, are of the same *genus*: after 4 K & which

which the respective differences as to root, stem, or leaves make the different species, or sub-divisions.

Mr. Ray made some objections to this distribution; which grew into a considerable controversy between the two authors. The question was, whether the flowers and fruits were sufficient to establish genera, and to determine whether a plant was of this genus, or that?

The same M. Tournefort introduces another higher kind of genus, or class, which is only regulated by the flowers: he observes, that he has never hitherto met with above fourteen different figures of flowers; which, therefore, are all that are to be retained in the memory; so that a person who has a plant in flower, whose name he does not know, will immediately see what class it belongs to in his *Elements of botany*; and the fruit appearing some days afterwards, determines its genus in the same book; and the other parts give its species.

It is a wonderful ease to the memory, to have only fourteen figures of flowers to retain, and by means hereof to be enabled to defend to fix hundred and seventy three genera, which comprehend eight thousand eight hundred and forty-six species of plants; which was the number of those then known by land and sea.

GENUS, in music, by the antients called *genus melodia*, denotes a certain manner of subdividing the principles of melody, i. e. the consonant intervals, into their concinnous parts.

The moderns, considering the octave, as the most perfect interval, and that whereon all the other concords depend in the present theory of music; the division of that interval is considered as containing the true division of the whole scale.

But the antients went to work somewhat differently: the diatessaron, or fourth, was the least interval which they admitted as concord; and therefore they fought first how that might be most concinnously divided; from which they constituted the diateme, or fifth; and diapason, or octave.

The diatessaron being thus, as it were, the root or foundation of the scale; what they call the genera, kinds, arose from its various divisions; and hence they defined the *genus modulandi*, the manner of dividing the tetrachord, and disposing its four sounds as to succession.

The genera of music were three, viz. the *enharmonic*, *chromatic*, and *diatonic*: the two last whereof were variously subdivided; and even the first, though it is commonly reckoned to be without any species, yet different authors have proposed different divisions under that name, though without giving particular names to the species, as was done to the other two.

For the character, &c. of the several genera, see ENHARMONIC, CHROMATIC, and DIATONIC.

The parts, or divisions of a diatessaron they called the *diatess* and *ditonum*; in the chromatic, the *hemitonium*, and *tritemonium*; and in the diatonic, the *hemitonium*, or *limma*, and the *tonus*.

But under these general names, which distinguished the genera, there are several other different intervals, or ratios which constitute the *colores generum*, or species of enharmonic, chromatic, and diatonic. Add, that what is a diateme in one genus, is a system in another.

GENUS, in rhetoric.—Authors distinguish the art of rhetoric, as also orations, or discourses produced thereby, into three genera, or kinds: *demonstrative*, *deliberative*, and *judiciary*.

To the *demonstrative* kind belong panegyrics, genethliacs, epithalamiums, funeral harangues, &c. See each under its head, PANEGYRIC, EPITHALAMIUM, &c.—To the *deliberative* kind belong persuasions, dissuasions, commendations, &c.—To the *judiciary* kind belong defences, and accusations. See RHETORIC, ORATION, &c.

GENUS, in algebra.—The antient algebraists distributed that art into two genera, or kinds; the *logistic*, and *specious*. See LOGISTIC, and SPECIOUS.

GENUS, in anatomy.—The *genus nervosum*, or nervous kind, or, as others say, the *nervous system*, is an expression, pretty frequent among authors; signifying the nerves, considered as an assemblage or system of similar parts, distributed throughout the body.

Tobacco contains a deal of sharp, caustic salt, proper to cause irritations in the nervous kind: vinegar, taken in too great quantity, incommodes the nervous kind.

GEOCENTRIC, in astronomy, is applied to a planet, or its orbit, to denote it concentric with the earth; or, as having the earth for its centre, or the same centre with the earth.

All the planets are not *geocentric*: the moon alone is properly *geocentric*.

GEOCENTRIC latitude of a planet, is its latitude seen from the earth; or the inclination of a line connecting the planet and the earth, to the plane of the earth's (or true) ecliptic.

Or, it is the angle, which the aforesaid line (connecting the planet, and the earth) makes with a line drawn perpendicular

to the plane of the ecliptic. See LATITUDE.

Thus, in *Tab. Astronom.* fig. 40. the angle QTe is the measure of that planet's *geocentric* latitude, when the earth is in T , and the angle eTQ , the measure of it when the earth is in t .

GEOCENTRIC place of a planet, is the place wherein it appears to us, from the earth; supposing the eye there fixed: or, it is a point in the ecliptic, to which a planet seen from the earth is referred.

GEODÆSIA*, that part of practical geometry, which teaches how to divide, or lay out lands, or fields, between several owners.

* The word is Greek, $\gamma\epsilon\omicron\delta\alpha\iota\sigma\iota\alpha$, formed of $\gamma\eta$, terra, earth, and $\delta\alpha\iota\sigma\iota\alpha$, divide, I divide.

GEODÆSIA is also applied by some to all the operations of geometry, which are performed in the field.

This is more usually called *surveying*, when employed in measuring of lands, grounds, roads, countries, provinces, &c. See SURVEYING.

Vitalis defines *geodæsia* the art of measuring surfaces, and solids, not by imaginary right lines, as is done in geometry, but by sensible and visible things, as by the sun's rays, &c.

GEOGRAPHICAL mile, is the minute, or sixtieth part of a degree of a great circle. See MILE, and DEGREE.

GEOGRAPHICAL table, see the article MAP.

GEOGRAPHY*, the doctrine or knowledge of the earth, both as in itself, and as to its affections; or a description of the terrestrial globe, and particularly of the known inhabitable part thereof, with all its parts.

* The word is Greek, $\gamma\epsilon\omicron\gamma\gamma\alpha\phi\iota\alpha$, formed of $\gamma\eta$, terra, earth, and $\gamma\gamma\alpha\phi\iota\sigma$, scribo, I write, I describe.

Geography makes a branch of mathematics, of the mixed kind; in that it considers the earth, and its affections, as depending on quantity, and consequently as measurable, viz. its figure, place, magnitude, motion, celestial appearances, &c. with the several circles imagined on its surface.

Geography is distinguished from cosmography, as a part from the whole: this latter considering the whole visible world, both heaven and earth.

From topography, and chorography, it is distinguished as the whole from a part. See TOPOGRAPHY, and CHOROGRAPHY.

Golinth considers *geography* as either *exterior*, or *interior*: but Varenus more justly divides it into *general*, and *special*; or, *universal*, and *particular*.

General, or *universal* GEOGRAPHY, is that which considers the earth in general, without any regard to particular countries; or the affections, common to the whole globe, as its figure, magnitude, motion, land, sea, &c.

Special, or *particular* GEOGRAPHY, is that which considers the constitution of the several particular regions, or countries; their bounds, figure, &c. with the mountains, forests, mines, waters, plants, animals, &c. therein: as also their climates, seasons, heat, weather, distance from the equator, &c. And their inhabitants, arts, foods, commodities, customs, language, religion, policy, cities, &c.

Geography is very antient; at least the special part thereof: for the antient writers scarce went beyond the description of countries.

It was a constant custom among the Romans, after they had conquered and subdued any province, to have a map, or painted representation thereof carried in triumph, and exposed to the view of the spectators.

Historians relate that the Roman senate, about a hundred years before Christ, sent geographers into divers parts, to make an accurate survey and mensuration of the whole globe; but they scarce ever saw the twentieth part thereof.

Before them, Neco, king of Egypt, ordered the Phœnicians to make a survey of the whole coast of Africa, which they accomplished in three years: Darius procured the Ethiopians sea, and the mouth of the Indus to be surveyed: and Pliny relates, that Alexander, in his expedition into Asia, took two geographers, Diogenes, and Bæton, to measure and describe the roads; and that from their itineraries the writers of the following ages took many particulars. Indeed, this may be observed, that whereas most other arts are suffered by war, *geography* and fortification alone have been improved thereby.

The art, however, must needs have been exceedingly defective; as a great part of the globe was then unknown; particularly all America, the Northern parts of Europe, and Asia, with the Terra Australis, and Magellanica; and as they were ignorant of the earth's being capable of being failed round, and of the Torrid Zone's being habitable, &c.

The principal writings on this art, among the antients, are Ptolemy's eight books; among the moderns are, Johannes de sacro Bosco *de Sphæra*, with Clavius's *Comment*: Ricciolus's *Geographia*, and *Hydrographia Reformata*: Weigelius's *Speculum Terræ*; De Chales's *Geographia*, in his *Mundus Mathematicus*; and above all Varenus's *Geographia generalis*, with Jurin's additions: to which may be added Liebknecht's *Elementa*

Elementa Geographiae generalis: Sturmii's *Compendium Geographicum*, and Wolfius's *Geographia*, in his *Elementa Mathematica*.

GEOMANCY *, **GEOMANTIA**, a kind of divination, performed by means of a number of little points, or dots, made on paper at random; and considering the various lines and figures, which those points present; and thence forming a pretended judgment of futurity, and deciding any question proposed.

* The word is formed of the Greek $\gamma\eta$, *terra*, earth; and $\muαντια$, divination; it being the ancient custom to cast little pebbles on the ground, and thence to form their conjectures; instead of the points now made use of.

Polydore Vergil defines *Geomancy* a kind of divination performed by means of clefts or chinks made in the ground; and takes the Persian magi to have been the inventors thereof. *De Invent. Rer. lib. i. c. 23*.

GEOMETRICAL, something that has a relation to *Geometry*.

Thus we say, a *geometrical method*, a *geometrical genius*, *geometrical strictness*, a *geometrical construction*, *geometrical demonstration*, &c.

Geometry itself seems to lead us into errors: after once reducing a thing to *geometrical* consideration, and finding that it answers pretty exactly, we pursue the view, are pleased with the certainty and agreeableness of the demonstrations, and apply the *Geometry* further and further, till we often out-run nature. Hence it is, that all machines do not succeed: that all compositions of music, wherein the concords are the most rigidly observed, are not agreeable: that the most exact astronomical computations do not always foretell the precise time and quantity of an eclipse, &c.

The reason is, that nature is not a mere abstract; mechanical levers and wheels are not *geometrical* lines and circles; as they are often supposed to be: the taste for tunes is not the same in all men; nor at all times in the same man: and as to astronomy, as there is no perfect regularity in the motions of the planets; their orbits hardly seem reducible to any fixed, known figure.

The errors, therefore, we fall into in astronomy, music, mechanics, and the other sciences to which *geometry* is applied, do not properly arise from *geometry*, which is an infallible science; but from the false use, or the misapplication of it. Malebr. *Recher. de la Ver.*

GEOMETRICAL construction of an equation, is the contriving and drawing of lines and figures, whereby to demonstrate the equation, theorem, or canon to be geometrically true. See **CONSTRUCTION** of equations.

GEOMETRICAL line, or *curve*, called also *algebraic line*, or *curve*, is that wherein the relation of the abscissas to the semi-ordinates may be expressed by an algebraic equation.

Thus, suppose in a circle, *Tab. Geometry, fig. 52*. $AB=a$, $AP=x$, $PM=y$; then will $PB=a-x$, and consequently, since $PM^2=AP \cdot PB$, $y^2=ax-x^2$.—Again, supposing $PC=x$, $AC=a$, $PM=y$; then will $MC=a-x$, $PC^2=PM^2$, that is, $a^2-x^2=y^2$. *Tab. Anal. fig. 8*. See **EQUATION**.

Geometrical lines are distinguished into classes, orders, or genera, according to the number of the dimensions of the equation that expresses the relation between the ordinates and the abscissas: or, which amounts to the same, according to the number of points in which they may be cut by a right line. Thus, a line of the first order will be only a right line: those of the second, or quadratic order, will be the circle, and the conic sections; and those of the third, or cubic order, will be the cubical and Neilian parabolas, the cissoid of the antients, &c.

But a curve of the first gender (because a right line cannot be reckoned among the curves) is the same with a line of the second order; and a curve of the second gender, the same with a line of the third order; and a line of an infinitesimal order is that, which a right line may cut in infinite points; as the spiral, cycloid, the quadratrix, and every line generated by the infinite revolutions of a radius.

However, it is not the equation, but the description, that makes the curve a *geometrical* one: the circle is a *geometrical* line, not because it may be expressed by an equation, but because its description is a postulate: and it is not the simplicity of the equation, but the easiness of the description, which is to determine the choice of the lines for the construction of a problem. The equation that expresses a parabola, is more simple than that which expresses a circle; and yet the circle, by reason of its more simple construction, is admitted before it.

The circle and the conic sections, if you regard the dimensions of the equations, are of the same order, and yet the circle is not numbered with them in the construction of problems, but by reason of its simple description is depressed to a lower order, viz. that of a right line; so that it is not improper to express that by a circle, which may be expressed by a right

line: but it is a fault to construct that by the conic sections; which may be constructed by a circle.

Either, therefore, the law must be taken from the dimensions of equations, as observed in a circle, and so the distinction be taken away between plane and solid problems: or the law must be allowed not to be strictly observed in lines of superior kinds; but that some, by reason of their more simple description, may be preferred to others of the same order, and be numbered with lines of inferior orders.

In constructions that are equally *geometrical*, the most simple are always to be preferred: this law is so universal as to be without exception. But algebraic expressions add nothing to the simplicity of the construction; the bare descriptions of the lines here are only to be considered; and these alone were considered by those geometers, who joined a circle with a right line. And as these are easy or hard, the construction becomes easy, or hard: and therefore it is foreign to the nature of the thing, from any thing else to establish laws about constructions.

Either, therefore, with the antients, we must exclude all lines besides the circle, and perhaps the conic sections, out of *geometry*; or admit all according to the simplicity of the description: if the trochoid were admitted into *geometry*, we might, by its means, divide an angle in any given ratio: would you therefore blame those, who would make use of this line to divide an angle in the ratio of one number to another, and contend that this line was not defined by an equation, but that you must make use of such lines as are defined by equations?

If, when an angle were to be divided, for instance, into 1001 parts, we should be obliged to bring a curve defined by an equation of above an hundred dimensions to do the business; which no body could describe, much less understand; and should prefer this to the trochoid, which is a line well known, and described easily by the motion of a wheel, or circle, who would not see the absurdity?

Either, therefore, the trochoid is not to be admitted at all in *geometry*, or else in the construction of problems, it is to be preferred to all lines of a more difficult description: and the reason is the same for other curves.

Hence, the trisections of an angle by a conchoid, which Archimedes in his *Lemma's*, and Pappus, in his *Collections*, have preferred to the invention of all others in this case, must be allowed to be good, since we must either exclude all lines, beside the circle, and right line, out of *geometry*, or admit them according to the simplicity of their descriptions; in which case, the conchoid yields to none, except the circle. Equations are expressions of arithmetical computation, and properly have no place in *geometry*, except so far as quantities truly *geometrical* (that is, lines, surfaces, solids, and proportions) may be said to be some equal to others: multiplications, divisions, and such sort of computations are newly received into *geometry*, and that apparently contrary to the first design of this science; for whoever considers the construction of problems by a right line and a circle, found by the first geometers, will easily perceive, that *geometry* was introduced, that we might expeditiously avoid, by drawing lines, the tediousness of computation.

It should seem, therefore, that the two sciences ought not to be confounded together: the antients so industriously distinguished them, that they never introduced arithmetical terms into *geometry*; and the moderns, by confounding both, have lost a great deal of that simplicity, in which the elegance of *geometry* principally consists. Upon the whole, that is arithmetically more simple which is determined by more simple equations; but that is geometrically more simple which is determined by the more simple drawing of lines; and in *geometry*, that ought to be reckoned best, which is geometrically most simple.

GEOMETRICAL locus, or *place*, called also simply, *locus*. See **LOCUS**.

GEOMETRICAL medium, see the article **MEDIUM**.

GEOMETRICAL osculum, see **EVOLUTA** and **OSCULUM**.

GEOMETRICAL pace, is a measure consisting of five feet. See **PACE**, and **FOOT**.

GEOMETRICAL plan, in architecture, see **PLAN**.

GEOMETRICAL plane, see the article **PLANE**.

GEOMETRICAL progression, is a series of quantities, in continued *geometrical* proportion, i. e. increasing or decreasing in the same ratio.

Thus, e. gr. 1, 2, 4, 8, 16, 32, 64, and 128: 729, 243, 81, 27, 9, 3, 1, are *geometrical* progressions. See **GEOMETRICAL PROGRESSION**.

GEOMETRICAL proportion, called also absolutely and simply, *proportion*; is a similitude or identity of ratios. See **RATIO**.

Thus, if A be to B, as C to D, they are in *geometrical* proportion: so 8, 4, 30 and 15, are *geometrical* proportionals. See **PROPORTION**.

GEOMETRICAL scale, see **DIAGONAL scale**.

GEOMETRICAL solution of a problem, is when the problem is directly solved according to the strict principles and rules of *geometry*, and by lines that are truly *geometrical*.

In this sense we say, *geometrical solution*, in contradistinction to a mechanical, or instrumental solution, where the problem is only solved by ruler, and compasses.

The same term is likewise used in opposition to all indirect, and inadequate kinds of solutions, as by infinite series's, &c.

We have no *geometrical way* of finding the quadrature of the circle, the duplicature of the cube, or two mean proportionals: mechanical ways, and others, by infinite series's, we have.

The antients, Pappus informs us, in vain endeavoured at the trisection of an angle, and the finding out of two mean proportionals by a right line, and a circle. Afterwards they began to consider the properties of several other lines, as the conchoid, the cissoid, and the conic sections, and by some of these endeavoured to solve those problems. At length, having more thoroughly examined the matter, and the conic sections being received into geometry, they distinguished *geometrical problems* into three kinds, *viz.*

1^o *Plane ones*, which deriving their original from lines on a plane, may be regularly solved by a right line, and a circle.

2^o *Solid ones*, which are solved by lines deriving their original from the consideration of a solid, that is, of a cone.

3^o *Linear ones*, to the solution of which are required lines more compounded.

According to this distinction, we are not to solve solid problems by other lines than the conic sections; especially if no other lines but right ones, a circle, and the conic sections must be received into geometry.

But the moderns advancing much farther, have received into geometry all lines that can be expressed by equations; and have distinguished, according to the dimensions of the equations, those lines into kinds; and have made it a law, not to construct a problem by a line of superior kind, that may be constructed by one of an inferior kind.

GEOMETRICAL square, see the article **SQUARE**.

GEOMETRICAL table, see the article **PLAIN table**.

GEOMETRICALLY proportionals, are quantities in continual proportion; or which proceed in the same constant ratio; as 6, 12, 24, 48, 96, 192, &c.

They are thus called, in contradistinction to *equidifferent quantities*; which are called, though somewhat improperly, *arithmetically proportionals*. See **ARITHMETICALLY PROPORTIONAL**.

GEOMETRY*, the science, or doctrine of extension, or extended things; that is, of lines, surfaces, and solids.

* The word is Greek, *γῆμετρία*, formed of *γῆ*, *terra*, earth, and *μετρον*, *metron*, to measure; it being the necessity of measuring the earth, and the parts and places thereof that gave the first occasion to the invention of the principles and rules of this art; which has since been extended and applied to numerous other things; inasmuch that *geometry*, with arithmetic, are now the general foundation of all mathematics.

Geometry is commonly divided into four parts, or branches; planimetry, altimetry, longimetry, and stereometry. See each under its proper article, **PLANIMETRY**, **ALTIMETRY**, **LONGIMETRY**, and **STEREOMETRY**.

Geometry, again, is distinguished into *theoretical* or *speculative*, and *practical*.

The first contemplates the properties of continuity; and demonstrates the truth of general propositions, called *theorems*.

The second applies those speculations and theorems to particular uses in the solution of problems. See **PROBLEM**.

Speculative Geometry, again, may be distinguished into *elementary*, and *sublime*.

Elementary, or *common GEOMETRY*, is that employed in the consideration of right lines, and plain surfaces, and solids generated therefrom.

Higher, or *sublime GEOMETRY*, is that employed in the consideration of curve lines, conic sections, and bodies formed thereof.

Herodotus, lib. ii. and Strabo, lib. xvii. assert the Egyptians to have been the first inventors of *geometry*; and the annual inundations of the Nile to have been the occasion of it; for that river bearing away all the bounds and land-marks of mens estates, and covering the whole face of the country, the people, say they, were obliged to distinguish their lands by the consideration of their figure, and quantity; and thus by experience and habit, formed themselves a method, or art, which was the origin of *geometry*.—A farther contemplation of the draughts or figures of fields thus laid down and plotted in proportion, might naturally enough lead them to the discovery of some of their excellent and wonderful properties; which speculation continually improving, the art became gradually improved, as it continues to do to this day. Josephus, however, seems to attribute the invention to the Hebrews; and others among the antients make Mercury the inventor. Polyd. Vergil, *de Inventa Rer.* l. i. c. 18.

The province of *geometry* is almost infinite: few of our ideas,

but may be represented to the imagination by lines; upon which they straight become of *geometrical* consideration; it being *geometry* alone that makes comparisons, and finds the relations of lines.

Astronomy, music, mechanics, and, in a word, all the sciences which consider things susceptible of more, and less; *i. e.* all the precise and accurate sciences, may be referred to *geometry*: for all speculative truths consisting only in the relations of things, and in the relations between those relations, they may be all referred to lines. Consequences may be drawn from them; and these consequences, again, being rendered sensible by lines, they become permanent objects, which may be constantly exposed to a rigorous attention, and examination: and thus we have infinite opportunities both of inquiring into their certainty, and pursuing them farther.

The reason for instance, why we know so distinctly, and mark so precisely, the concords called *octave*, *fifth*, *fourth*, &c. is, that we have learnt to express sounds by lines, *i. e.* by chords accurately divided; and that we know that the chord, which sounds octave, is double of that which it makes octave withal; that the fifth is in the sesquialterate ratio, or as three to two; and so of the rest.

The ear itself cannot judge of sounds with such a nice precision; its judgments are too faint, vague, and variable to form a science. The finest, best tuned ear, cannot distinguish many of the differences of sounds; whence many musicians deny any such differences; as making their sense their judge. Some, for instance, admit no difference between an octave and three ditones: and others, none between the greater and lesser tone; the comma, which is the real difference, is insensible to them; and much more the scisma, which is only half the comma.

It is only by reason, then, that we learn, that the length of the chord which makes the difference between certain sounds, being divisible into several parts, there may be a great number of different sounds contained therein, useful in music, which yet the ear cannot distinguish. Whence it follows, that had it not been for arithmetic and *geometry*, we had had no such thing as regular, fixed music; and that we could only have succeeded in that art by good luck, or force of imagination, *i. e.* music would not have been any science founded on incontestable demonstrations: though we allow that the tunes composed by force of genius and imagination, are usually more agreeable to the ear, than those composed by rule.

So, in mechanics, the heaviness of a weight, and the distance of the centre of that weight from the fulcrum, or point it is sustained by, being susceptible of plus and minus, they may both be expressed by lines: whence *geometry* becomes applicable hereto; in virtue whereof, infinite discoveries have been made, of the utmost use in life.

Geometrical lines and figures, are not only proper to represent to the imagination the relations between magnitudes, or between things susceptible of more and less; as spaces, times, weights, motions, &c. but they may even represent things which the mind can no otherwise conceive, *e. gr.* the relations of incommensurable magnitudes.

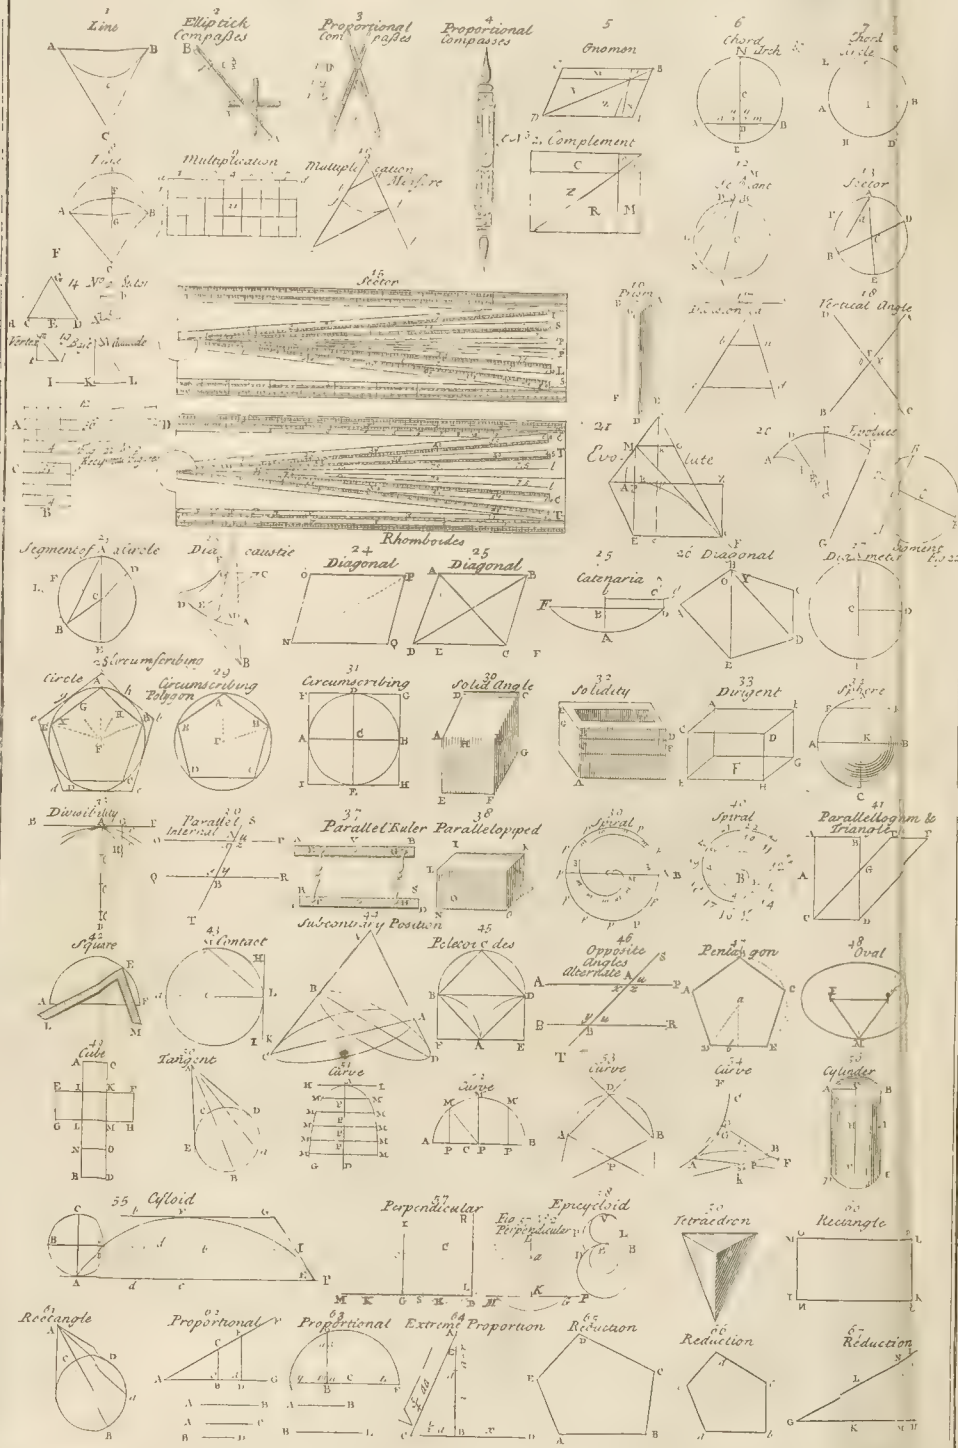

We do not, however, pretend, that all subjects men may have occasion to enquire into, can be expressed by lines. There are many not reducible to any such rule: thus, the knowledge of an infinitely powerful, infinitely just God, on whom all things depend, and who would have all his creatures execute his orders, to become capable of being happy, is the principle of all morality, from which a thousand undeniable consequences may be drawn, and yet neither the principle, nor the consequences can be expressed by lines, or figures. Malebr. *Recher. de la Ver.* T. ii.

Indeed, the antient Egyptians, we read, used to express all their philosophical, and theological notions by *geometrical* lines. In their researches into the reason of things, they observed, that God, and nature affect perpendiculars, parallels, circles, triangles, squares, and harmonical proportions; which engaged the priests and philosophers to represent the divine and natural operations by such figures: in which they were followed by Pythagoras, Plato, &c. Whence that saying of Boethius, *nullum divinarum scientiam arithmetice attingere posse*.

But it must be observed, that this use of *geometry* among the antients was not strictly scientific, as among us; but rather symbolical: they did not argue, or reduce things and properties unknown from lines; but, represented or delineated by them things that were known. In effect, they were not used as means or instruments of discovering, but as images or characters, to preserve, or communicate the discoveries that were already made.

“The Egyptians (Gale observes) used *geometrical* figures, not only to express the generations, mutations, and deductions of bodies; but the manner, attributes, &c. of the “Spirit of the universe, who diffusing himself from the centre of his unity, through infinite concentric circles, pervades all bodies, and fills all space. But of all other figures “they

TAB. GEOMETRY.

Back of
Foldout
Not Imaged

they most affected the circle, and triangle; the first, as being the most perfect, simple, capacious, &c. of all figures: whence Hermes borrowed it to represent the divine nature; defining God to be an intellectual circle or sphere, whose centre is every where, and circumference no where." See Kirch. *Odip. Egyptiac.* and Gale *Phil. General.* lib. i. c. 2.

The ancient *Geometry* was confined to very narrow bounds, in comparison of the modern. It only extended to right lines and curves of the first order, or conic sections; whereas into the modern *Geometry* new lines of infinitely more and higher orders are introduced.

The writers who have cultivated and improved *Geometry*, may be distinguished into elementary, practical, and those of the sublimer *Geometry*.

The principal writers of elements, see enumerated under the article **ELEMENTS**.

Those of the higher *Geometry* are Archimedes, in his books de *Sphæra*, *Cylindro*, and *Circuli Dimensio*; as also de *Spiralibus*, *Conoidibus*, *Sphaeroidibus*, de *Quadratura Parabolæ*, and *Arenarius*; Kepler, in his *Stereometria Nova*; Cavalieri, in his *Geometria Indivisibilium*; and Torricellius, de *Solidis Sphaeroidibus*; Pappus Alexandrinus, in *Collectionibus Mathematicis*; Paulus Guldinus, in his *Mechanics and Statics*; Barrow, in his *Lectures Geometricæ*; Huygens, de *Circuli Magnitudinis*; Bullialdus, de *Lineis Spiralibus*; Schooten, in his *Exercitationes Mathematicæ*; de Billy, de *Proportionibus Harmonicæ*; Lalovera, de *Cycloide*; Fer. Ernest. Com. ab Herbenstein, in *Diatome Circulorum*; Viviani, in *Exercit. Mathematicæ de Formatione, et Mensura Formarum*; Bap. Palma, in *Geomet. Exercitation.* and Apoll. Pergæus, de *Sectionibus Rationis*.

For practical *Geometry*, the fullest and completest treatises are those of Mallet, written in French, but without the demonstrations; and those of Schwenter, and Cantzelius, both in High-dutch.—In this class are likewise to be ranked Clavius's *Tacquet's*, and Ozanam's *Practical Geometry*; De la Hire's *Ecole des Arpenteurs*; Reinholdus's *Geodesia*; Hartman Beyers's *Stereometria*; Voigtel's *Geometria Subterranea*, all in High-dutch; Hüllius, Galileus, Goldmannus, Scheffelt, and Ozanam, on the sector, &c.

Characters in **GEOMETRY**, } See { **CHARACTER.**
Spherical **GEOMETRY**, } See { **SPHERICAL.**

GEOPONIC, something describing or relating to agriculture. See **AGRICULTURE**. Cato, Varro, Columella, Palladius, and Pliny, are sometimes called *geoponic* writers.

St. GEORGE, a name whereby several orders, both military and religious, are denominated. It took its rise from a saint, famous throughout all the east; called by the Greeks, *Μεγαλειώτης*, q. d. great martyr.

On some medals of the emperors John, and Manuel Comneni, we have the figure of St. George armed, holding a sword, or javelin in one hand, and in the other a buckler, with this

inscription, an O, and therein a little A, and ΓΕ—ΓΙΟC, making

ing O ΑΤΙΟC ΓΕΟΡΓΙΟC, O Holy George. He is generally represented on horseback, as being supposed to have frequently engaged in combats in that manner.

He is highly venerated throughout Armenia, Muscovy, and all the countries which adhere to the Greek rite: from the Greek, his worship has long ago been received into the Latin church; and England and Portugal have both chose him for their patron saint.

St. GEORGE is particularly used for an English order of knights, more commonly now called the *order of the garter*. See **GARTER**.

Our king Edward VI. out of a spirit of reformation, made some alterations in the ceremonial, laws, and habit of the order, that the Romish saint might have less share therein. It was the first commanded that the order should no longer be called the *order of St. George*, but that of the *garter*.

Rights of St. GEORGE.—There have been various orders under this denomination, most of which are now extinct; particularly one founded by the emperor Frederic III. in the year 1451, to guard the frontiers of Bohemia and Hungary against the Turks.—Another, called *St. George of Armenia*, founded by the king of Arragon.—Another in Austria and Carinthia.—And another in the republic of Genoa, still subsisting.

St. George's order of St. GEORGE. Of these there are several, and congregations; particularly canons regular of St. George in Alsace, at Venice, established by two noble Venetians, in the year 1451.—Another congregation of the same institute in Sicily, &c.

St. George's Cross, the emblem of the Cross.

GEORGIC, something that relates to the culture, or tilling of the ground.

The word is taken from the Latin *agricus*, and that of the Greek *γεωργία*, q. d. terra, earth, and *γεωργός*, q. d. opus, labour; of *georgica*, &c.

The *Georgics* of Virgil, a poem book composed by that poet on the subject of agriculture.

See **GE.**

GEOSCOPY*, a kind of knowledge of the nature, and qualities of the ground, or soil; gained by viewing, and considering it.

* The word is formed of the Greek *γῆ*, earth, and *σκοπέω*, I see, view.

Geoscopy is only conjectural; but its conjectures are very well grounded.

GERESOL, in music, one of the clefs. See **CLEF**.

GERFALCON, or **GYRFALCON**, a bird of prey, of a size between a vultur and a hawk; and of the greatest strength next the eagle. See **FALCON**, and **HAWK**.

GERM, see the article **GERMEN**.

GERMAN, in matters of genealogy, signifies whole, entire, or own.

Germani quasi eadem stirpe geniti. Felt. Hence, *Brother GERMAN* denotes a brother both by the father's and mother's side, in contradistinction to uterine brothers, &c. who are only so, by the mother's side.

Cousins GERMAN are those in the first or nearest degree; being the children of brothers or sisters.

Among the Romans we have no instance of marriage between cousins *german* before the time of the emperor Claudius; when they were very frequent.

Theodosius prohibited them under very severe penalties, even fine and proscription. See **CONSANGUINITY**.

GERMAN acacia,	} See	ACACIA.
GERMAN bezoar,		BEZOAR.
GERMAN black,		BLACK.
GERMAN coin,		COIN.
GERMAN compasses,		COMPASSES.
GERMAN empire,		EMPIRE.
GERMAN flute,		FLUTE.
GERMAN language,		TEUTONIC, and LANGUAGE.
GERMAN measure,		MEASURE.
GERMAN monies,		MONEY.

GERMEN, or **GERM**, that part of a seed which germinates, i. e. sprouts or shoots out the first, for the production of a new plant. See **SEED**.

Botanists call it the *plume*, see **PLUME**; see also **PLANT**, **SEED**, and **GERMINATION**.

GERMINATION, the act of germinating; that is, of a plant's sprouting, or shooting in the ground.

Some use the word in a more extensive sense; so as likewise to include the first shooting out of leaves, blossoms, branches, flowers, fruits, and seeds.

The modern philosophers have been very attentive to the *Germination* of plants, as well as the formation of the chick in the egg.

The progress of *Germination* has been very accurately observed by the curious Malpighi, in the seed of a gourd. The day after it was committed to the ground, he found the outer coat or integument a little tumid, and in its tip there appeared a small cleft or aperture, through which the plume or germ was seen.

The second day, the outward coat, or secundine, appeared much softer, the inner torn and corrupted, the plume, or plantule, somewhat longer and more tumid, and the beginning of the roots shewed themselves.

The third day the outward secundine was become dusky, and the leaves of the plantule inflated; and the root or radicle had made itself a passage through the secundines near the former aperture: the plume, or stem, as also the seed leaves being now grown much bigger.

On the sixth day, more of the seed leaves had broke through the secundines, and they were found thicker and harder; the root having now emitted a great number of fibres, and the stem grown a finger's length.

The following days the root still shot further, other roots arising from them, and others from these; and the stem, in its progress grew hollow, or fistulous, and the seed leaves broader and greener.

About the twenty-first day, the plant seemed complete; from which time the seed leaves began to droop, and at length died away. See **SEMINAL LATER**.

GERONTES*, in antiquity, a kind of judges, or magistrates, in ancient Sparta, answering to what the Arcopagites were at Athens. See **ARCEPAGITE**.

* The word is formed of the Greek *γῆρας*, which signifies old man. Whence also the words *gerontic*, something belonging to an old man; and *geronticon*, a famous book among the modern Greeks, containing the lives of the ancient monks. The senate of *gerontes* was called *gerusia*, that is, assembly or council of old men.

The *Gerontes* were originally instituted by Lycurgus: their number, according to some, was twenty-eight; and according to others thirty-two. They governed in conjunction with the king, whose authority they were intended to balance, and to watch over the interests of the people.

None were to be admitted into this office under sixty years of age, and they held it for life.—They were succeeded by the Ephori.

GERUND *, in grammar, a sort of tense, or time of the infinitive mood; very like to the participle, but indeclinable.

* The word is formed of the Latin *gerundicus*, and that from the verb *gerere*, to bear.

The *Gerund* expresses not only the time, but also the manner of an action; as, he fell in running foot.

It differs from the participle, in that it expresses the time, which the participle does not.

And from the tense properly so called, in that it expresses the manner, which the tense does not.

Grammarians are much embarrassed to settle the nature and character of the *Gerunds*: it is certain, they are no verbs, nor distinct moods of verbs, in regard they do not mark any judgment or affirmation of the mind, which is the essence of a verb. — And besides, they have their several cases, which verbs have not.

Some therefore will have them to be adjectives passive, whose substantive is the infinitive of the verb: on this footing they denominate them *verbal nouns*, or names formed of verbs, and retaining the ordinary regimen thereof. See **NOUN**.

Thus, say they, *tempus est legendi libros*, or *librorum*, is as much as to say, *tempus est se legere libros, vel librorum*. But others stand up against this decision.

CESSERIT—*quamdiu*, see **QUAMDIU** *se bene gessit*.

GESSES, in the furniture belonging to an hawk. See **JESSES**.

GESTATION, the time of a woman's going with child; or the interval between conception and delivery. See **DELIVERY**; see also **FETUS**, and **CONCEPTION**.

GESTATION is also a term in the ancient medicine, used for a sort of exercise, by us called carriage.

It consisted in making the patient ride on horse-back, or in a chariot, or a boat; or even in rocking him in his bed, if he could not endure a more violent agitation.

Alepiads first brought frictions and *Gestation* into practice.

—The design of *Gestation* was to recover strength after a fever, &c. was none.

GESTICULATION, the making of affected, indecent, or unsuitable gestures, or even of proper ones in too great number. *Gesticulation* is a grievous fault in an orator.

GESTURE, a motion of the body, intended to signify some idea, or passion of the mind.

Quintilian defines *Gesture*, *totius corporis motus & conformatio*.

Gestures are a kind of natural language, which supplies the use of speech in those naturally dumb. The Mimes and Pantomimus were very great proficient in the style of *Gesture*.

Gesture consists principally in the action of the hands, and face.

GHEMARA, see the article **GEMARA**.

GIAGH, or **JEHAGH**, a cycle of twelve years, in use among the Turks and Cathayans.

Each year of the *Giagh* bears the name of some animal: the first, that of a mouse; the second, that of a bullock; the third, of a lynx, or leopard; the fourth, of a hare; the fifth of a crocodile; the sixth, of a serpent; the seventh, of a horse; the eighth, of a sheep; the ninth, of a monkey; the tenth, of a hen; the eleventh, of a dog; and the twelfth of a hog.

They also divide the day into twelve parts, which they call *Giaghs*; and distinguish them by the names of the same animals.—Each *Giagh* contains two of our hours, and is divided into eight *keh*, as many as there are quarters of hours in our day.

GIANT, *Fryas*, a man of extraordinary, enormous stature and bulk.

The reality of *Giants*, and of nations of *Giants*, is much controverted among the learned. Travellers, historians, and relations, both sacred and profane, furnish various instances thereof; a great part of which, naturalists and antiquaries set aside.

Those among the ancients who speak of *Giants*, as historians, and affirm there were such things, are Cæsar, *de Bello Gallico*, l. i. Tacitus, *de Morib. Germanor.* and *Anal.* l. ii. Florus, l. 3. c. iii. St. Augustine, *de Civit. Dei*, l. xv. c. 9. and Saxo Grammaticus, at the end of his preface: among the moderns, Hieron. Magius, *Miscellan. de Gigantibus*, Chassignonius *de Gigantibus*, Kercher *Mund. Subterr.* l. viii. sect. ii. c. 4. and so many others, that Stephanus, in his notes on Saxo Grammaticus, affirms nothing can be more extravagant than to deny, or allegorize the authorities we have thereof.

Mr. Denham observes, that though we read of *Giants* before the flood, Gen. vi. 4. and more plainly after it, Numb. xiii. 33. yet it is highly probable, the size of man has always been the same from the creation; for as to the Nephilim, Gen. vi. the ancients vary about them; some taking them for monsters of impiety, atheism, rapine, tyranny: and as to thoe, Numb. xiii. which were evidently spoke of as men of a gigantic size, it is probable the fears of the spies might add thereto.

Be this as it will, it is manifest that in both these places *Giants* are spoken of as rarities and wonders of the age, not of the common stature: and such instances we have had in all ages. There are many fabulous relations; such as we take to be that of Theutobochus, who is said to have been dug up anno 1613.

and to have been higher than the trophies, and twenty-six feet long: and no better we suppose the *Giants* to have been, which Ol. Magnus gives an account of, in his fifth book, such as Harthen and Starchater among the men; and among the women, *reperita est* (saith he) *puella—in capite vulnerata, mortua, induta chlamyde purpurea, longitudinis cubitorum 50, latitudinis inter humeros quatuor*. Ol. Mag. *Hist.* l. v. c. 2.

But, as for the more credible relations of Goliath (whose height was six cubits, and a span, 1 Sam. xvii. 4. which, according to bishop Cumberland, is somewhat above eleven feet English) of Maximinus the emperor (who was nine foot high) and others in Augustus' and other reigns, of about the same height; to which might be added the dimensions of a skeleton, dug up lately in the palace of a Roman camp, near St. Albans, by an urn inscribed Marcus Antoninus; of which an account is given by Mr. Cheshelden, who judged, by the dimensions of the bones, that the person was eight foot high. *Philos. Transact.* N° 333. For these antique examples and relations, we say, they may be matched, nay out-done, with modern ones; of which we have divers in J. Ludolph. *Comment. in Hist. Ethiop.* l. ii. c. 2. sect. 22. Magius, Conringius, D. Hakewel, and others; which last speaks from Nannez, of porters and archers belonging to the emperor of China, fifteen foot high; and others from Purchas, of ten and twelve foot high, and more. See that learned author's *Apol.* p. 208.

GIBBOUS, in medicine, is used to denote a person bunch'd or hump-backed.

That part of the liver, out of which the vena cava arises, is also called the *gibbus* part.

GIBBOUS is also used in reference to the enlightened parts of the moon, while the is moving from full to the first quarter, and from the last quarter to full again; for all that time the dark part appears horned, or falcat, and the light one bunched out, convex, or *gibbus*.

GIBELINS, **GIBELINS**, or **GIBELLING**, a famous faction in Italy, opposite to another called the *Guelphs*.

The *Guelphs* and *Gibelins* ravaged, and laid waste Italy for a long series of years; so that the history of that country, for the space of two centuries, is only a detail of their mutual violence, and mortal wars.

We have but a very obscure account of their origin, and the reason of their names: the generality of authors affirm, that they arose about the year 1240, upon the emperor Frederic the 11th being excommunicated by pope Gregory the 10th.

That prince, say they, making a tour among the cities of Italy, gave the name *Gibelins* to such as he found well affected to him; and that of *Guelphs* to those who adhered to the pope. But as to the reason, and signification of those words, there is a deep silence; *Gibelin* might possibly be formed of *gebiet*, *imperator*; whence *gebietersich*, *imperies*. Of *gebiet*, the Italians might make, by corruption *Gibelin*; so that *Gibelins*, in this light, should be the same with *Imperialists*, or such as followed the emperor's party.

By the way, some writers maintain, that the two factions arose ten years before; though still under the same pope and emperor.

Other historians relate, that Conrad III^d marching into Italy, in the year 1139, against the Neapolitans, Roger, count of Naples and Sicily, in order to defend his states, called to his assistance *Guelph*, duke of Bavaria; and that one day, when the two armies were ready to join battle, the Bavarians cried out in High Dutch, *bie, Guelph!* or, as others say, in Flemish, *hier, Guelph!* that is, *here, Guelph!* and that the Imperialists answered, on their side, with the words *bie*, or *hier Gibelin!* *here, Gibelin!* calling the emperor by the name of the place where he had been bred.

Hornius refers the names to the war in 1140, between Henry the proud, duke of Bavaria and Saxony, and Conrad the 11th, duke of Suabia; the two princes preparing to engage near the town of Winlberg, the Bavarians began to cry out, *Guelph!* which was the name of duke Henry's brother; and the partisans of the emperor, *Weibelingen*, which was the name of the place where that prince was born and bred, in the duchy of Wirtemberg, whose surname he bore: from which *Weibelingen*, the Italians at length formed *Gibelin*.

This account is confirmed by Martin Crusius: *initium Gibelinae (Weibeline a patria Conradi regis) & Welficae concertationis*. Conrad being of *Weibelingen*, that word, says Crusius, gave rise to *gibelline*, and that to *gibelling*, *Gibelins*, *Gibelini*.

Platina, on the other hand, assures us, that the name *Gibelins* arose from that of a German at Pistoia; whose brother, named *Guelph*, gave likewise his name to the opposite faction; the two brethren, it seems, bearing an irreconcilable hatred.

Others maintain, that the emperor gave the appellation *Gibelins* to those of his party, from the German word *giffel*, signifying ridge, or top; by reason the empire rested on them, as the rafters of a house lean on the ridge, which joins them a-top.

Karus, a learned canon of Strasbourg, in the lives of the emperors of the house of Brunswick, is of the second opinion above related: in a battle, says he, between *Welf*, or *Guelph*, and Frederic, the army of the first crying out, *bie, Welf*,
bie,

bie, Welf! the second commanded his, to cry out, *bie, Gibeling!* *bie, Gibeling!* the name of his birth place; and the French and Lombards asking the signification of those words, they were answered, that by *Welf* was meant the pope's party; and by *Gibeling*, the emperor's.

Yet others contend, that the word *Gibelin* is only a softening of the word *gibertin*, or *gubertin*; and that it arose from Gubert, an anti-pope, set up by the emperor Henry III., in the year 1080, *Acta Sancti. Propyl. Maii.* p. 108.

Maimbourg, in his *Hist. de la Decad. de l'Emp.* advances another opinion: the two factions, and their names, says he, arose from a quarrel between two very ancient and illustrious houses, on the confines of Germany, that of the Henry's of *Gibeling* and that of the Guelphs of Adorf: which account appears the most probable of them all.

GIBET*, a machine in manner of a gallows, whereon notorious criminals, after execution, are hung in irons, or chains: as spectacles, in terror.

* The word in French, *gibet*, properly denotes what we call *galloves*: it is supposed to come originally from the Arabic *gibel*, mount, elevation of ground: by reason *gibets* are usually placed on hills, or eminences.

GIBLETS*, the offals, or entrails of a goose; including the heart and liver, with the feet, gizzard, &c.

* The word is supposed to be formed of *goblets*, from the French *gobeau*, mouth-full.

Giblets make a considerable article in cookery: they boil *giblets*, stew *giblets*, make ragouts of *giblets*, *giblet-pies*, &c.

GIGANTIC, see the article **GIANT**.

F. Bouhours relates, that one of the artifices of the Indian Bramins consists in persuading the simple people, that the gods eat like us; and, that they may bring them store of victuals, they represent these gods as of a *gigantic* size, and above all, give them a huge tun belly.

GIGANTOMACHIA*, the battle of the giants against the fabulous gods of the antient heathens.

* The word is Greek *γίγαντομαχία*, formed of *γίγας*, *γίγας*, giant, and *μαχία*, combat, of *μαχίαν*, pugna, I fight.

Several of the poets have composed *gigantomachia*'s: that of Scarron is the finest of all his pieces.

GIGG*, *GIGA*, or *JIG*, in music and dancing, a gay, brisk, sprightly, composition, and yet in full measure, as well as the allemand, which is more serious.

* Menage takes the word to arise from the Italian *giga*, a musical instrument mentioned by Dante.

GILBERTINES, an order of religious, thus called from St. Gilbert, of Sempringham, in the county of Lincoln, who founded the same, about the year 1148.

Antiently, none were received into it but married people: the monks observed the rule of St. Augustin; and were accounted canons; and the nuns that of St. Benedict.

The founder of this order erected a double monastery, or rather two different ones, contiguous to each other, the one for men, the other for women, but parted by a very high wall.

The order, afterwards, consisted of ten such monasteries: all which were suppressed at the general dissolution of monastic orders under king Henry VIII.

GILD*, or **GUILD**, originally signifies a fraternity, or company.

* The word is formed from the Saxon *gildan*, to pay, because every man was *gildare*, i. e. to pay something towards the charge and support of the company. Hence also our Guild-hall, *q. d.* the hall of the society or fraternity, where they meet and make orders and laws among themselves.

The original of *gilds*, or *guilds*, is thus related: it being a law amongst the Saxons, that every freeman of fourteen years old should find sureties to keep the peace, or be committed; certain neighbours entered into an association, and became bound for each other, either to produce him who committed an offence, or to make satisfaction to the injured party: this, that they might the better do, they raised a sum of money among themselves, which they put into a common stock; and when one of their pledges had committed an offence, and was fled, then the other nine made satisfaction out of this stock, by payment of money, according to the offence.

Because this association consisted of ten families, it was called a *decemary*: and from hence came our later kinds of fraternities. But, as to the direct time when these *gilds* had their origin in England, there is nothing of certainty to be found; since they were in use long before any formal licence was granted to them for such meetings.

Edward the third, in the fourteenth year of his reign, granted licence to the men of Coventry, to erect a merchant's *gild* and fraternity, of brethren and sisters, with a master, or warden; and that they might found chantries, bestow alms, do other works of piety, and constitute ordinances touching the same, &c. So Henry the fourth, in his reign, granted a licence to found a *gild* of the holy cross, at Stratford upon Avon.

GILD in the royal boroughs of Scotland, is still used for a company of merchants, who are freemen of the borough.

Every royal borough has a dean of *gild*, who is the next ma-

gistrate below the bailiff. He judges of controversies among men concerning trade; disputes between inhabitants touching buildings, lights, water-courses, and other nuisances; calls courts, at which his brethren of the *gild* are bound to attend; manages the common stock of the *gild*, and amercies and collects fines.

GILD, or **GELD**, according to Camden, also signifies a tribute, or tax. See **GELD**.

GILD, according to Crompton; also signifies an amercement. As in foot-geld, which he interprets a prestation within the forest. Hence to be quit of all manner of *gild*, is to be discharged of all manner of prestations to be made for gathering sheafs of corn, lamb, and wool, to the use of foresters.

GILE, or **GELD**, is also used among our antient writers for a compensation, or mulct for a fault committed. See **UNGELD**. Hence, *weregeld*, is the price of a man; *orsgeld*, is the price of cattle; *angeld*, the single value of a thing; *twigeld* the double value, &c.

There are divers other words, which end with *geld*, and shew the several kinds of payments; as *dangeld*, *wadegeld*, *senegeld*, *hornegeld*, *fosegeld*, *penigeld*, &c. which see.

GILD, or **GUILD** *rents*, are rents payable to the crown by any *gild*, or fraternity; or such rents as formerly belonged to religious *gilds*, and came to the crown at the general dissolution: being ordered for sale by the stat. 22 Car. II.

GILDABLE, or **GELDABLE**, denotes a person tributary, that is, liable to pay tax, or tribute.

Camden, dividing Suffolk into three parts, calls the first *gildable*, because liable to tax; from which the other two parts were exempt, because ecclesiastical donates.

GILDABLE is also explained in an antient MS. to be that land or lordship which is *sub districtione curie vicecom.*

GILDHALDA *Teutonicorum*, was used for the fraternity of Easterling merchants in London; called also the *stithard*. See **STILLYARD**.

GILD-HALL, *q. d.* *Gilda aula*, the chief hall in the city of London. See **GUILD-hall**.

GILD-MERCHANT, *Gilda mercatoria*, was a certain privilege, or liberty, granted to merchants, whereby they were enabled among other things to hold certain pleas of land within their own precincts.

King John granted *gildam mercatorum* to the burgesses of Nottingham.

GILDING, or **GUILDING**, the art, or act of spreading or covering a thing over with gold, either in leaf, or in amalgam with quicksilver.

The art of *gilding* was not unknown among the antients, tho' it never arrived among them at the perfection to which the moderns have carried it.

Pliny assures us, that the first *gilding* seen at Rome, was after the destruction of Carthage, under the censorship of Lucius Mummius, when they began to *gild* the ceilings of their temples, and palaces; the capitol being the first place on which this enrichment was bestowed. But he adds, that luxury advanced on them so hastily, that in a little time you might see all, even private and poor persons, *gild* the very walls, vaults, &c. of their houses.

We need not doubt but they had the same method with us, of beating gold, and reducing it into leaves; though, it should seem, they did not carry it to the same height; if it be true, which Pliny relates, that they only made seven hundred and fifty leaves four fingers square of a whole ounce. Indeed he adds that they could make more; that the thickest were called *bractea praefinita* by reason of a statue of the goddess Fortune at Praeneste gilt with such leaves; and that the thinner sort were called *bractea questoria*.

The modern gilders do also make use of gold leaves of divers thickneses: but there are some so fine, that a thousand don't weigh above four or five drachms. The thickest leaves are used for *gilding* on iron, and other metals: and the thinnest on wood. But we have another advantage over the antients, in the manner of using, or applying the gold: the secret of painting in oil, discovered of late ages, furnishes us with means of *gilding* works that shall endure all the injuries of time and weather, which to the antients was impracticable. They had no way to lay the gold on bodies that would not endure the fire but with whites of eggs, or size; neither of which will endure the water: So that they could only *gild* such places as were sheltered from the moisture of the weather.

The Greeks called the composition on which they applied their *gilding* on wood, *lucaphenum* or *lucaphorum*; which is described as a sort of platinous, compound earth, serving, in all probability, to make the gold stick, and bear polishing. But the particulars of this earth, its colour, ingredients, &c. the antiquaries and naturalists are not agreed upon.

There are several methods of *gilding* in use among us; viz. *gilding on an oil size*; *gilding on a water size*; *gilding by the fire*, which is peculiar to metals; *gilding of books*, &c.

Method of **GILDING** in oil, or on oil size.—The basis, or matter, whereon the gold is applied, in this method, according to M. Felibien, is the remains of colours found settled

to the bottom of the pots wherein the painters wash their pencils. This matter, which is very viscid, they first grind; then pass it through a linen cloth; and thus lay it with a pencil on the matter to be gilt, after having first washed it once or twice over with size; and if it be wood, with some white paint.

But however this method may obtain in France, the English gilders, in lieu hereof, generally make use of a gold size, made of yellow oker ground fine with water, and laid to dry, on a chalk-stone; and then ground up with a due proportion of fat drying oil, to give it the body or degree of stiffness required.

With this size they wash over the thing to be gilt, by means of a brush or a large pencil.—And, when almost dry, but while yet unctuous enough to catch and retain the gold, they spread their gold leaves thereon, either whole, or cut in pieces. To take up and apply the leaves, they make use of a piece of fine, soft, well carded cotton; or of a pallet for the purpose; or barely the knife, wherewith the leaves were cut, according to the parts of the work they are to gilt, or the breadth of the gold to be applied.

In proportion as the gold is laid, they press it down smooth with a bunch of cotton, or a hare's foot, to make it stick, and, as it were, incorporate with the ground: and with the same hare's foot, or a camel's hair pencil, they mend any cracks that may happen therein, after the same manner as will be hereafter shewn in *water-gilding*.

This sort of gilding is chiefly used for domes, and the roofs of churches, courts, banquetting-houses, &c. and for figures of plaster, lead, &c. that are to stand exposed to the weather.

Method of GILDING on a water size.—Water gilding is not performed without more apparatus; nor is it used so frequently, nor on such large works, as the former: wooden works, and those of stucco, are almost the only ones gilt in this way: which, beside, must be sheltered from the weather. The size made use of for gilding, is to be made of threads, &c. of parchment, or gloves, boiled in water, to the consistence of a jelly. If it be wood that is to be gilt, they first give it a wash of this size, boiling hot; and when this is dry, another of whitening, mixed up with the same size. For this whitening, some use plaister of Paris, well beaten and sifted; others Spanish white, or ceruse, &c. It is laid on with a stiff brush, and oftener, or seldom repeated, according to the nature of the work: for pieces of sculpture, seven or eight lays suffice; for flat, or smooth works, they use ten, or twelve. In the latter case they are applied by drawing the brush or pencil over the work; in the former, by dabbing it smartly on, that the size may enter all the dents of the carving.

When the whole is dry, they moisten it with fair water, and rub it over with several pieces of coarse linen, if it be a flat; otherwise, they beat or switch it with several slips of the same linen tied to little sticks, to make it follow and enter all the cavities and depressures thereof.

The white thus finished, they proceed to yellow it; observing that if it be a piece of sculpture in relief, they always first touch up, and repair the several parts which the white ground may have disfigured, with little iron instruments, as gravers, chisels, gouges, &c.

The yellow, which they use, is only common oker well ground and sifted, and thus mixed up with the size used for the white, only weaker by one half. This colour is laid on hot; and in works of sculpture it serves to supply the place of gold, which frequently cannot be carried into all the cavities and dentings of foliage and other ornaments.

Over this yellow is applied a lay, which is to serve for the ground whereon the gold is to be immediately laid: it is usually composed of the Armenian bole, blood stone, black lead, and a little fat, to which some add soap and olive oil; others, burnt bread, bistre, antimony, tin-glass, butter, and sugar-candy. These ingredients being all ground together, with hot size, they apply three lays of the composition upon the yellow, each after the other is dried; taking care not to put any in the small cavities of the work, to hide the yellow. The brush used in this application, is to be soft; and when the matter is well dried, they go over it with a stronger brush, to rub it down, and take off the little prominent grains, and thus facilitate the burnishing of the gold.

In order to proceed to gilt, they must have three sorts of pencils: one to wet; another to touch up, and amend; and a third to flatten: there is also required a cushion, to spread the gold leaves on, when taken out of the book; a knife to cut them; and a hare's foot, or squirrel's tail, fitted with a handle, or else a piece of cotton, to take them up, direct, and apply them.

They begin with the wetting pencils, by which they moisten the layer last laid on with water, that it may the better receive and retain the gold: the leaves are then laid on the cushion; and taken up, if whole, with the squirrel's tail; if in pieces, with the other instrument, or even the knife they are cut withal, and laid, and spread gently on the parts of the work before moistened.

When the leaves happen to crack, or break in laying on, they

make up the breaches with little pieces of leaf taken up on the repairing pencil; and with the same pencil, or another somewhat bigger, they smooth the whole; pressing the gold into the dents, where it could not so well be carried with the squirrel's tail.

The work being thus far gilt, when dry, remains either to be burnished, or matted.

To burnish it, is to smooth, and polish it with a burnisher, which is usually a dog's, or wolf's tooth, or a blood-stone, an agate, or a pebble, or something else very smooth, fitted in a handle for the purpose.

To mat, is to give it a light lick in the places not burnished, with a pencil dipped in size, wherein a little vermilion sometimes has been mixed. This helps to preserve and prevent its flaking, when handled.

The last thing is to apply a vermeil, or lacker, in all the little lines, and cavities; and to stop and amend any little faults with shell gold.

The composition here called *vermeil*, is made of gum gutta, vermilion, and a little of some ruddy, brown colour, ground together, with Venice varnish, and oil of turpentine. Some gilders, in lieu hereof, content themselves with fine lacca, or dragons blood, with gum water.

Sometimes, instead of burnishing the gold, they burnish the ground or composition laid on last before it; and content themselves afterwards to wash the part over with size. This method is chiefly practised for the hands, face, and other nudities in relief; which, by this means, do not appear so very brilliant as the parts burnished; though much more so than the parts perfectly flat, or matted.

To gilt a work, and yet preserve white grounds; they use to apply a layer of Spanish white mixed with a weak fish glue, on all the parts of the ground whereon the yellow, or the layer next under the gold, might run.

Method of GILDING metals, or of gilding by the fire.—There are two ways of gilding by fire, viz. that with liquid gold, and that with leaf gold.

The first is performed with gold amalgamated with mercury, in the proportion of about an ounce of mercury to a drachm of gold.

In order to this operation, they heat a crucible red hot, then put the gold and mercury in it, and stir them gently about, till the gold be found melted and incorporated into a mass with the mercury. This done, they cast them into water, to wash and purify; and thence into other waters, repeating the lotion, in order to take away the blackness. From the mass they separate the mercury not united therewith, by squeezing it between the fingers through a piece of flannel skin, or a linen cloth.

To prepare the metal to receive this amalgam, they scrub it with a wire brush, and wet it with water or beer; continuing to rub, and wet it till all the foulness which might hinder the close union of the metals be removed: which done, to quicken the work further, they rub a mixture of quicksilver and aqua fortis over it.

They proceed now to apply the gold, in order to which they use a little knife, or a brush made of brass wire for the purpose; with which they spread or overlay the whole work, as evenly as may be, being careful to miss no part. Then giving the work a gentle heat before the fire, with a hair brush they dab and spread the amalgam further and evener thereon.

Thus far advanced, the metal is set over the fire, upon a grate, or in a sort of cage, under which is a pan of coals, by which means the mercury is raised in fumes, and leaves the gold alone adhering to the work: in proportion as the mercury evaporating and flying off discovers places where gold is wanting, they take care to supply them, by adding new pieces of amalgam with the knife or brush.

The work is then rubbed over, with the wire brush dipped in beer, or vinegar, this leaves it in a condition to be heated, or helled, i. e. to have its colour and lustre heightened, which is the last part of the process, and which the gilders keep to themselves as a mighty secret; though we apprehend it cannot differ much from what we have elsewhere shewn of the manner of giving gold species their colour, under the article COINING.

The method given by Parker, is to dip the work in a decoction of argal, sulphur, salt, and as much water as will cover it, holding it therein till it have acquired the colour that pleases: then dipping it in cold water.

To have the gilding more rich and lasting, they sometimes quicken the work over again with quicksilver and aqua fortis, and then gilt it a second time, after the same manner; proceeding, if occasion be, even to a third or fourth time, till the gold lies the thickness of a nail on the metal.

GILDING by the fire with gold leaves.—To prepare the metal for this gilding, it must be first well scratched, or raked; then polished with a polisher; and thus set to the fire to blue, i. e. to heat, till it appear of a blue colour. This done, the first lay of gold is clapped thereon, and lightly rubbed down with a polisher; and thus exposed to a gentle fire.

They usually only give it three such lays, or four at most; each lay consisting of a single leaf for the common works, and

and of two for the extraordinary ones: after each lay they fet it a-fresh to the fire. After the last day, the gold is in a condition to be burnished.

GILDING of books, see the article *Book-BINDING*.

GILEAD—*Balm of GILEAD*, see the article *BALSAM*.

GILGUL, *hamethin*, a Hebrew phrase, literally signifying the *rolling of the dead*.—To conceive the use of this expression, it is to be observed that the Jews have a tradition, that at the coming of the Messiah, no Israelite shall rise any where but in the holy land. What then shall become of all the faithful interred in other parts? shall they perish, and remain in the state of death?

No, say the Jewish doctors: but God will dig them subterraneous canals, or cavities, through which they shall roll from their tombs to the holy land; and when they are arrived there, God will blow on them, and raise them again.

This imaginary passage of the carcasses or ashes of the Jews, from their tombs, to the holy land, by rolling under ground, is what they call *gilgul hamethin*, the rolling of the dead.

GILL, *ground-ivy*, a medicinal plant, which gives the denomination to a sort of medicated ale, or drink, commonly called *Gill*, or *Gill-ale*, made by infusing the dried leaves of the plant therein.

Gill is absterfve and vulnerary, and prescribed in disorders of the lungs, and breast; and also esteemed in obstructions of the viscera; whence it passes for hepatic, diuretic, splenic, and nephretic. It is said to do wonders in tubercles and tartarous indurations of the lungs. Willis commends its powder in obstinate coughs; and Ettmuller gives the history of a scorbutic consumption cured by a strong decoction of this herb, after a vomit.

GILLA, in chemistry and pharmacy, is an Arabic term for salt; peculiarly used among us for the emetic salt of vitriol.

This salt is prepared from that mineral, by three, or four, repeated operations, *viz.* dissolution, in May dew; filtration; and crystallization. In defect of May dew, rain water may serve.

Gilla is used in tertians, and all fevers arising from a corruption of humours in the first passages. It destroys worms, and prevents putrefaction. The dose is from twenty grains to half a drachm, taken in broth, or in cordial waters.

GILLS, *Branchia*, in natural history, those membranous, cartilaginous parts in fishes, whereby they respire.

What we call *Gills* in fishes, serve the purposes of lungs: respiration of air is as necessary to fishes, as to terrestrial animals; there is always a deal of air inclosed among water; and it is this air that fishes respire. The whole mechanism of their *Gills* is contrived with this view, *viz.* to separate and imbibe this air from the water, and present it to the blood, after the same manner as it is presented to the lungs of other animals.

M. du Verney has unravelled this infinitely complicated piece of mechanism, in the *Gills* of a carp: the first thing that offers, is a fabric, consisting of a great number of bony laminae, each subdivided into an infinity of bony fibres, whose office is to sustain the innumerable ramifications of an artery dispatched thither from the heart. The use of these ramifications is to prevent the blood extremely subdivided, and, as it were, each globe of blood by itself, to the water. Between these laminae, and throughout the whole texture of the *Gills*, are an infinite number of very narrow passages, destined to receive and subdivide the water which the fish takes in by the mouth, into little parcels. In this state the air, its prison doors being now in some measure opened, makes its escape, and joins itself to the blood of all the little arteries.

The *Gills* have necessarily an alternate motion of dilatation and compression, which is effected by another very curious piece of mechanism: when they dilate, the water is taken in, and when they contract, it is expelled again. Hence it is probable, that it is in the very instant of contraction, that the air expressed from the water is forced to enter the pores of the little blood vessels; by reason the force is then greater than at any other time; and this action requires a considerable force. The same reason holds with respect to the lungs of men; accordingly M. du Verney maintains, that though the air enter the lungs in the time of inspiration, it is only received into the blood in that of expiration, when the superfluous air is carried off by the trachea; so that the real inspiration, *i. e.* the entrance of the air into the blood, should be the expiration.

The water is taken in by the mouth, and carried off again, stripped of its air, by the *Gills*; and the air gained from it, is distributed first to the arterioles of the *Gills*, and thence by the law of circulation to all the little veins inoculated therewith.

See *Supplement*, article *BRANCHIA*.

GILT *varnish*, see the article *VARNISH*.

GINGER, *GINGIBER*, or *Zingiber*, an aromatic root, of considerable use both as a spice, and a medicine.

VOL. I.

It is chiefly brought from Calicut, in the East Indies; though of late it has been cultivated with good success in the Caribbee islands.

The plant which affords it, somewhat resembles our reed, both in respect of stem and leaves. The root goes to no great depth under ground, but spreads itself near the surface, in form not unlike a man's hand, but very knotty.

When arrived at maturity, they dig it up, and dry it on hurdles, either in the sun, or an oven: the best is that which is new, dry, well filled, hard to break, of a brownish colour without, refinous within, and of a hot, pungent taste.

They use to candy the root, when green, with sugar, and honey; having first steeped it some time in water, to take away part of its acrimony, and to dispose it to let go the outer skin. They also make a marmelade of it, and dry cakes.

The northern people make great use of this confection, as holding it sovereign against the scurvy. The Indians eat the root, when green, by way of salad, first chopping it small, mixing it with other herbs, and seasoning it with oil and vinegar.

As to its medicinal use, it is hot and penetrating; it is also held good to strengthen the stomach, and promotes appetite. It promotes also digestion, prevents putrefaction, &c.

GINGERBREAD, a richer kind of bread, the flavour and taste whereof are heightened and improved with spices, and particularly *Ginger*, whence the name.

There are various forms and preparations of *Gingerbread*: we shall content ourselves with the following receipt, which is well recommended.

Into a pound of almonds, grate a penny white loaf, sift, and beat them together: to the mixture add an ounce of *Ginger*, scraped fine, and liquorice and aniseed in powder, of each a quarter of an ounce: pour in two or three spoonfuls of rose-water, and make the whole into a paste, with half a pound of sugar: mould and roll it, print it, and dry it in a stove.

Others make it of treacle, citron, lemon, and orange peel, with candied *Ginger*, coriander, and caraway seeds, mixed up with as much flour as will make it into a paste.

GINGIVA, in anatomy, the *Gum*; a hard sort of flesh, investing the alveoli, or sockets of the teeth.

The *Gingivæ* are formed by the union of two membranes; one of which is a production of the periosteum, and the other of the internal membrane of the mouth.

GINGLYMUS, *Γινγλυμος*, in anatomy, one of the species of articulation.

The *Ginglymus* is that jointure of the bones, where each bone mutually receives the other; so that each both receives, and is received.

There are three species of *Ginglymus*: the first, when the same bone, at the same extremity, receives and is reciprocally received by another bone; after the manner of a hinge: such is that of the cubitus and humerus.

The second, when a bone receives another at one of its extremes, and is received into another, at the other: as the vertebrae do.

The third, is that where a bone is received into another, after the manner of a wheel, or axis of a wheel in a box: such is that of the second vertebra of the neck in the first.

GING-SENG, or *GIN-SEM*, or *GIN-ZENG*, in natural history, a very extraordinary and wonderful plant, principally found in Tartary.

The *Ging-seng* is one of the principal medicines of the Chinese and Tartars: and their most eminent physicians have wrote many a volume of its virtues.

It is known among them by divers other names, expressing the only spirit, or the pure spirit of the earth; the plant that gives immortality, &c. It makes, in effect, the whole materia medica, for the people of condition; but is too precious for the populace.

All the writers of the Chinese affairs make mention of the *Ging-seng*: as Martinus, in his *Atlas*; F. Kercher, in his *China Illustrata*; F. Tachard, in his *Voyages*; and F. le Comte, in his *Memoirs*.

And yet we know but very little of this plant, before F. Jartoux, a Jesuit, and missionary in China, who being employed by order of the emperor, in making a map of Tartary, in the year 1709, had an opportunity of seeing it growing in a village about four leagues from the kingdom of Corea, inhabited by Tartars, called *Calca-Tarce*.

That father took this opportunity to make a draught of the plant, and give an accurate description thereof, with its virtues, and the manner of preparing it; which, being a great curiosity, we shall here gratify the reader with.

The *Ging-seng*, represented *Tav. Nat. Hist. Sin. 10*, has a white root, somewhat knotty, about three or four inches of the stem, and which goes tapering to the end: the thickness of the stem, it frequently parts into two branches, which gives it some resemblance of a man, whose thighs the trans-

ches represent: and it is hence it takes the denomination, *Ging-feng*, which signifies a figure of a man.

From the root rises a perfectly smooth, and tolerably round stem: its colour is usually a pretty deep red, except toward the foot, where, by the neighbourhood of the earth, it is turned somewhat whiter. At the top of the stem is a sort of joint or knot, formed by the shooting out of four branches, which spread as from a centre: the under side of each branch is green, mixed with white; and the upper part, much like the stalk, of a deep red: the two colours gradually decrease, and at length unite on the sides.

Each branch has five leaves, well enough represented in the figure; and it is observable that the branches divide equally from each other, both in respect of themselves and of the horizon; and with the leaves make a circular figure, nearly parallel to the surface of the ground.

The fibres of the leaves are very distinguishable, and on the upper side are beset with small whitish hairs: the membrane, or pellicle between the fibres, rises a little in the middle, above the level of the fibres.

The colour of the leaf is a dark green, above; and a shining, whitish green underneath; and all the leaves are finely jagged or indented on the edges.

From the centre of the branches arises a second stalk, DE, very straight, smooth, and whitish, from bottom to top, bearing a bunch of round fruit, of a beautiful red colour. This bunch, in the plant viewed by our missionary, was composed of twenty-four berries, two of which are here represented, 9, 9.

The red skin, that covers the berry, is very thin, and smooth, and contains within it a white pulp: as these berries were double, each had two rough stones, of the size and figure of our lentils. The pedicles, whereon the berries were supported, all arose from the same centre; and spreading exactly like the radii of a sphere, made the bunch of berries of a circular form. The fruit is not good to eat; and the stone includes a kernel: it has also a small beard at the top, diametrically opposite to the pedicle.

The plant dies away every year; the number of its years may be known by the number of stalks it has shot forth; of which there always remains some mark, as is shewn in the figure, by the letters *bbb*, &c. From whence it appears, that the root A was seven years old.

As to the flower, F. Jartoux owns he had never seen it; and therefore could not describe it: some have assured him, that it is white, and very small, others, that there is no flower at all, and that no body had ever seen it. He rather inclines to think it so small as to have escaped notice; and, what confirms him in the opinion, is, that those who seek the *Ging-feng*, having nothing in view but its root, overlook and despise the rest of the plant, as useless.

As they have sowed the seed in vain, without any plant ever arising therefrom; it is probable this might give occasion to the fable which is current among the Tartars:—They say, that a bird eats it, as soon as in the earth; and not being able to digest it, it purifies it in its stomach, and afterwards springs up in the place where it was cast by the bird with its dung.—The missionary rather believes that the stone remains a long time in the ground, before it takes root; which opinion appears the more probable, as there are some roots no longer or bigger than one's little finger, which yet have shot forth at least ten stalks.

Though the plant here described had but four branches; yet there are some which have but two; others three; and others five, six, or seven: but each branch has always five leaves.

The height of the plant is proportionable to its bigness, and the number of branches the root has: the larger and more uniform it is, and the fewer small strings or fibres it has, the better it is accounted.

It is hard to say, why the Chinese should call it *Ging-feng*, a word which signifies figure, or representation of a man: neither that father, nor any he enquired of, could ever find that it bore more resemblance to the figure of a man, than is ordinarily seen among other roots. The Tartars, with more reason, call it *Orbata*, that is, the stiff of plants.

Those who gather the *Ging-feng*, preserve only the root; and all they can get of it in ten or fifteen days time, they bury together in some place under ground. Then they take care to wash it well, and scour it with a brush: then dip it in scalding water, and prepare it in the fumes of a sort of yellow miller, which gives it part of its colour.

The miller is put in a vessel, with a little water, and boiled over a gentle fire; the roots are laid over the vessel upon small, transverse pieces of wood, being first covered with a linen cloth, or some other vessel placed over them.

They may also be dried in the sun, or by the fire; but then, though they retain their virtue well enough; they have not that yellow colour, which the Chinese so much admire. When the roots are dried, they must be kept close in some very dry place; otherwise they are in danger of corrupting, or being eaten by worms.

As to the place where this root grows, it is between the thirty-ninth and forty-seventh degree of north latitude, and between the tenth and twentieth degree of east longitude, reckoning from the meridian of Peking. Here is found a long tract of mountains, which the thick forests that cover and encompass them, render almost impassable. It is upon the declivities of these mountains, and in these thick forests, upon the banks of torrents, or about the roots of trees, and amidst a thousand other different sorts of plants, that the *Ging-feng* is found. It is not to be met with in plains, valleys, meadows, the bottoms of rivulets, or in places too much exposed and open.

If the forest takes fire, and be consumed, this plant does not appear till two or three years after: it also lies hid from the sun as much as possible; which shews that heat is an enemy to it.

The places where the *Ging-feng* grows, are on every side separated from the province of Quang-tong, by a barrier of wooden stakes which encompass this whole province, and about which guards continually patrol, to hinder the Chinese from going out, and looking after this root.

Yet, how vigilant soever they are, greediness after gain incites the Chinese to lurk about privately in these deserts, sometimes to the number of two or three thousand; at the hazard of losing their liberty, and all the fruit of their labour, if they are taken, either as they go out of, or come into the province.

The emperor having a mind that the Tartars should reap all the advantage that is to be made of this plant, rather than the Chinese, gave orders, in 1709, to ten thousand Tartars, to go and gather all that they could of the *Ging-feng*, upon condition that each person should give him two ounces of the best; and that the rest should be paid for, weight for weight, in pure silver. It was computed, that by this means the emperor would get this year about twenty thousand Chinese pounds of it, which would not cost him above one fourth part of its value.

We met, by chance, says F. Jartoux, with some of those Tartars, in the midst of those frightful deserts; and these mandarins, who were not far out of the way, came one after another, and offered us oxen for our subsistence, according to the commands they had received from the emperor.

This army of herbarists observed the following order: after they had divided a certain tract of land among their several companies, each company, to the number of an hundred persons, spread itself out in a right line, to a certain fixed place; every ten of them keeping at a distance from the rest.

Then they searched carefully for the plant, going on leisurely in the same order; and in this manner, in a certain number of days, they run over the whole space of ground appointed them.

When the time was expired, the mandarins, who were encamped with their tents in such places as were proper for the subsistence of their horses, sent to view each troop, to give them fresh orders, and to inform themselves if their number was complete.

If any one of them was wanting, as it often happened, either by wandering out of the way, or being attacked by wild beasts, they always looked for him a day or two, and then returned again to their labour, as before.

The *Ging-feng*, we have observed, is an ingredient in most of the medicines which the Chinese physicians prescribe to the better sort of patients: they affirm that it is a sovereign remedy for all weaknesses occasioned by excessive fatigues, either of body or mind; that it attenuates and carries off pituitous humours; cures weakness of the lungs, and the pleurisy; stops vomitings; strengthens the stomach; and helps the appetite; disperses fumes or vapours; fortifies the breast; is a remedy for short and weak breathing; strengthens the vital spirits; and is good against dizziness of the head, and dimness of sight; and that it prolongs life to extreme old age. No body can imagine, that the Chinese and Tartars would set so high a value upon this root, if it did not constantly produce a good effect: those that are in health, often make use of it to render themselves more vigorous and strong; and I am persuaded, adds the father just mentioned, it would prove an excellent medicine in the hands of any European who understands pharmacy, if he had but a sufficient quantity of it, to make such trials as are necessary to examine the nature of it chemically, and to apply it in a proper quantity, according to the nature of the disease for which it may be beneficial.

It is certain that it subtilizes, increases the motion of, and warms the blood; that it helps digestion, and invigorates in a very sensible manner.

After I had designed the root (he goes on) I observed the state of my pulse, and then took half of a root, raw as it was, and unprepared; in an hour after, I found my pulse much fuller and quicker: I had an appetite, and perceived myself much more vigorous, and could bear labour better and easier than before. Four days after, finding myself so fatigued and weary, that I could scarce sit on horseback, a mandarin, who was in company with us, perceiving it, gave me one of these roots: I took half of it immediately, and an hour after I was not in the least sensible of any weakness. I have often

made use of it since, and always with the same success. I have observed also, that the green leaves, and especially the fibrous part of them, chewed, would produce nearly the same effect. The Tartars often brings people the leaves of *gin-seng*, instead of tea; and I always find myself so well afterwards, that I should readily prefer them before the best tea. Their decoction is of a grateful colour; and when one has taken it twice, or thrice, its taste and smell become very agreeable.

As for the root, it is necessary to boil it a little more than tea, to allow time for extracting its virtue; as is practised by the Chinese, when they give it to sick persons; on which occasion they seldom use more than the fifth part of an ounce of the dried root.

To prepare the root for exhibition, they cut it into thin slices, and put it into an earthen pot well glazed, with about half a pint of water; the pot is to be well covered, and set to boil over a gentle fire; and when the water is consumed to the quantity of a cup full, a little sugar to be mixed with it, and to be drank: immediately after this as much more water to be put on the remainder, and to be boiled as before, to extract all the juice, and what remains of the spirituous part of the root. These two doses to be taken, the one in the morning, and the other in the evening. See Supplement, article GIN-SENG.

GIRDERS, in architecture, the largest pieces of timber in a floor.—Their ends are usually fastened into the summers, or breast-sommers, and the joists are framed in at one end to the girders.

By the statute for rebuilding London, no girder is to lie less than ten inches into the wall; and their ends are to be always laid in loam, &c.

GIRDING-beams, in building, the same as girders. See GIRDER.

GIRDLE, *Cingulus*, or *Zona*, a belt, or band of leather, or other matter, tied about the reins; to keep that part more firm, and tight.

It was antiently the custom for bankrupts, and other insolvent debtors, to put off, and surrender their *girdle*, in open court.—The reason hereof, was, that our ancestors used to carry all their necessary utensils, as purses, keys, &c. tied to the *girdle*; whence the *girdle* became a symbol of the estate. History relates, that the widow of Philip I. duke of Burgundy, renounced her right of succession, by putting off her *girdle* upon the duke's tomb.

The Romans always wore a *girdle*, to tuck up the tunica when they had occasion to do any thing. This custom was so general, that such as went without *girdles*, and let their gowns hang loose, were reputed idle, dissolute persons.

Maiden, or Virgins GIRDLE.—It was the custom among the Greeks and Romans, for the husband to untie his bride's *girdle*. Homer, lib. xi. of his *Odyssey*, calls this *girdle* *μαρτυριον* *gown*, *maid's girdle*. Festus relates, that it was made of sheeps wool; and that the husband untied it in bed. He adds, that it was tied in the Herculean knot; and that the husband untied it, as a happy presage of his having as many children as Hercules, who at his death left seventy behind him.

The poets attribute to Venus a particular kind of *girdle*, called *cestus*; to which they annex a faculty of inspiring the passion of love.

Quicksilver GIRDLE, in medicine, is a sort of *girdle* smeared over with mercury, or having mercury inclosed within it. It is made of leather, linen, cloth, cotton, stuff, or the like, and the mercury is prepared or killed various ways; as with fasting spittle, fat, or the like.

It is applied as a topical medicine about the waist, sometimes with good effect, but frequently it proves dangerous, principally in weak constitutions, and those subject to convulsions.—Its intention is, the cure of the itch, driving away vermin, killing lice, &c.

Queen's GIRDLE, is an antient duty, or tax, raised at Paris every three years, at the rate of three deniers upon each muid of wine, and six for each queue. It was intended for the maintenance of the queen's household: afterwards they augmented and extended it to other commodities, as coals, &c. Vigenere supposes it to have been originally thus called, by reason the *girdle* antiently served for a purse; but he adds, that a like tax had been raised in Persia, and under the same name, above two thousand years ago; as appears from Plato, in his *Alcibiades*, Cicero, *Athenæus*, &c.

Christians of the GIRDLE. Motavackkel, tenth caliph of the family of the Abassides, enjoined the Christians, and Jews, in the year of the Hegira, 235, of Jesus Christ 856, to wear a large leathern *girdle*, as a badge of their profession; which they bear to this day throughout the east: from which time the Christians of Asia, and particularly those of Syria and Mesopotamia, who are almost all Nestorians, or Jacobites, have been called *Christians of the girdle*.

Order of the GIRDLE, the order of Cordeliers; see CORD, and CORDELIER.

GIRDLE, in architecture; see CINCTURE.

GIRLE, among hunters, is a roe-buck of two years.

GIRON*, or **GUIRON**, in heraldry, denotes a triangular figure, having a long sharp point, not unlike a wedge, terminating in the centre of the escutcheon.

* The word is French, and literally signifies the *gremium*, or lap; by reason, in sitting, the knees being supposed somewhat asunder, the two thighs, together with a line imagined to pass from one knee to the other, form a figure (somewhat similit hereto).

When a coat has, six, eight, or ten of these *girons*, meeting or centering in the middle of the coat, it is said to be *gironné*, or *gironny*.

GIRONNE, **GIRONNY**, in heraldry, is when a shield or coat is divided into several girons, which are alternately colour and metal. See *Tab. Herald. fig. 63*, which is blazoned *gironné* of six argent and sable.

When there are eight pieces or girons, it is absolutely said to be *gironné*; when there are more, or fewer, the number is to be expressed.—*Gironné* of four, of fourteen, &c.

Some, instead of *gironné*, say, *parti, coupé, tranché, et taillé*, by reason the *giron* is formed by such divisions of the field.—Four *girons* form a falter, and eight, a cross. See *SALTEER*, &c.

GIVEN, *Datum*, a term very frequently used in mathematics, signifying a thing which is supposed to be known.

Thus, if a magnitude be known, or we can find another equal to it, we say, it is a *given* magnitude, or that such a thing is *given* in magnitude.

If the position of any thing be supposed as known, we say, *given* in position.

Thus, if a circle be actually described on a plain, its centre is *given* in position; its circumference *given* in magnitude; and the circle is *given* both in position, and magnitude.

A circle may be *given* in magnitude only, as when only its diameter is *given*, and the circle not actually described.

If the kind, or species of any figure be *given*, they say, *given* in specie.—If the ratio between any two quantities is known, they are said to be *given* in proportion.

GLACIALIS*, *icy*, something relating to ice; and particularly, a place that abounds in ice.

* The word is formed of the Latin *glacies*, ice.

Thus, we say, the *mare glaciale*, or *congelatum*, that is, the icy, or frozen sea; called also the Chironian, or Sarmatian sea.

GLACIS, in building, an easy, infensible slope, or declivity. The descent, or inclination of the *glacis* is less steep than that of the talut.—In gardening, a descent sometimes begins in talut, and ends in *glacis*.

The *glacis* of the cornich is an easy, imperceptible slope in the cymatium of a cornich, to promote the descent and draining off of the rain-water.

GLACIS, in fortification, is particularly used for that of the counterescarp: being a sloping bank which reaches from the parapet of the counterescarp, or covert-way, to the level side of the field.—See *Tab. Fortif. fig. 21*, lit. *a, a* and *c*.

The *glacis*, otherwise called *esplanade*, is about six foot high, and loses itself by an insensible diminution in the space of ten fathoms.

GLADE, in agriculture, gardening, &c. a vista, or open and light passage, made through a thick wood, grove, or the like; by lopping off the branches of trees along the way.

GLADIATORS, in antiquity, persons who were retained to fight, ordinarily in the Arena, for the entertainment of the people. See *COMBAT*.

The *gladiators* were usually slaves, and fought out of necessity; though, sometimes, freemen made profession thereof, like our prize-fighters, for a livelihood.—After a slave had served on the Arena three years, he was dismissed. See *SLAVE*.

The Romans borrowed this cruel diversion from the Asiatics: some suppose that there was policy herein; the frequent combats of *gladiators* tending to accustom the people to despise dangers, and death.

The origin of such combats seems to be as follows: from the earliest times we have any acquaintance withal in profane history, it had been the custom to sacrifice captives, or prisoners of war, to the manes of the great men who had died in the engagement: thus Achilles, in the *Iliad*, lib. xxiii. sacrifices twelve young Trojans, to the manes of Patroclus; and in Virgil, lib. xi. ver. 81. Æneas sends captives to Evander, to be sacrificed at the funeral of his son Pallas.

In course of time they came also to sacrifice slaves at the funerals of all persons of condition: this was even esteemed a necessary part of the ceremony; but as it would have appeared barbarous to have massacred them like beasts, they were appointed to fight with each other, and do their best to save their own lives, by killing their adversary. This seemed somewhat less inhuman, by reason there was a possibility of avoiding death; and it only lay on themselves, if they did not do it. This occasioned the profession of *gladiator* to become an art: hence arose masters of arms; and men learned to fight, and exercise therein.

These masters, whom the Latins called *lanistæ*, bought them slaves to train up to this cruel trade; whom they afterwards sold to such as had occasion to present the people with so horrible a show.

Junius Brutus, who expelled the kings, is said to have been the first who honoured the funeral of his father with these inhuman diversions.—They were at first performed near the sepulchre of the deceased, or about the funeral pile; but were afterwards removed to the circus and amphitheatres, and became ordinary amusements.

The emperor Claudius restrained them to certain occasions; but he soon afterwards annulled what he decreed, and private persons began to exhibit them at pleasure, as usual; and some carried the brutal satisfaction so far as to have them at their ordinary feasts.

And not slaves only, but other persons would hire themselves to this infamous office.

The master of the *gladiators* made them all first swear, that they would fight to death; and if they failed therein, they were put to death, either by fire, or swords, clubs, whips, or the like.

It was a crime for the wretches to complain when they were wounded; or to ask for death; or seek to avoid it, when overcome: but it was usual for the emperor, or the people to grant them life, when they gave no signs of fear, but waited the fatal stroke with courage and intrepidity. Augustus even decreed that it should always be granted them.

From slaves, and freed men, the wanton sport at length spread to people of rank and condition; and Nero is related to have brought upwards of four hundred senators, and six hundred Roman knights upon the arena; though Liplius takes both those numbers to be falsified, and not without reason reduces them to forty senators, and sixty knights; yet Domitian, that other monster of cruelty, refused upon Nero, exhibiting combats of women in the night time.

Constantine the Great is said to have first prohibited the combats of *gladiators*, in the east; at least, he forbid those who were condemned to death for their crimes, to be employed herein: there being an order still extant to the *Præfectus Prætorii*, rather to send them to work in the mines, in lieu thereof: it is dated at Berytus in Phœnicia, the first of October 325.

The emperor Honorius first forbid them at Rome, on occasion of the death of St. Telemachus, who, coming out of the east into Rome, at the time of one of these spectacles, went down into the arena, and used all his endeavours to prevent the *gladiators* from continuing the sport: upon which the spectators of that carnage, fired with anger, stoned him to death. Theodoret. *Hist. Ecclæs.* lib. v. c. 26.

It must be observed, however, that the practice was not entirely abolished in the west before Theodoric, king of the Ostrogoths. Honorius, on the occasion first mentioned, had prohibited them; but the prohibition does not seem to have been executed. Theodoric, in the year 500, abolish'd them finally.

Sometime before the day of battle, the person who presented the people with the shows, gave them notice thereof, by programma's, or bills, containing the names of the *gladiators*, and the marks whereby they were to be distinguished; for each had his several badge, which was most commonly a peacock's feather, as appears from the Scholiast of Juvenal, on the 158th verse of the third satyr; and Turnebus, *Advers.* l. ii. c. 8.

They also gave notice what time the shows would last, and how many couples of *gladiators* there were: And it even appears from the 52d verse of the seventh satyr of the second book of Horace, that they sometimes made representations of these things in painting; as is practised among us, by those who have any thing to shew at fairs.

The day being come, they began the entertainment by bringing two kinds of weapons: the first were staves, or wooden files, called *rudēs*; and the second, were effective weapons, as swords, pikes, &c.

The first were called *arma luseria*, or *exercitoria*; the second *decretoria*, as being given by decree, or sentence of the prætor; or of him at whose expence the spectacle was exhibited.

They began to fence, or skirmish with the first, which was to be the prelude to the battle: And from thence, when well warmed, they advanced to the second, with which they fought naked.

The first part of the engagement was called *ventilare*,

præcludere; and the second, *dimicare ad certum*, or *versis armis pugnare*: And some authors think with much probability, that it is to these two kinds of combat that St. Paul alludes in the passage 1 Cor. ix. 26, 27. 'I fight, not as one that beateh the air; but I keep under my body, and bring it into subjection.'

If the vanquished surrendered his arms, it was not in the victor's power, to grant him life: It was the people, during the time of the republic; and the prince, or people, during the time of the empire, that were alone impowered to grant the boon.

The reward of the conqueror was a branch of palm tree, and a sum of money: Sometimes they gave him his congé, or dismissed him, by putting one of the wooden files, or rudēs in his hand; and sometimes they even gave him his freedom.

The sign, or indication whereby the spectators shew'd that they granted the favour, was, to fall the thumb; or clench it between the other fingers: And when they would have the combat finished, and the vanquished slain, they raised the thumb, and directed it towards the combatants: Which we learn from Juvenal, sat. iii. v. 36.

The *gladiators* challenged, or defied each other, by shewing the little finger; and by extending this or some other during the combat they own'd themselves vanquish'd, and begged mercy from the people: *Vidit ostentam digitum veniam a populo petulantibus*, says the old Scholiast on Festus.—*Vid. Plin. L. xxviii. c. 2.* Prudentius, l. ii. contra Symm. v. 108. Horace, l. iv. v. 66. Politian. *Mijscell.* c. 42. Turneb. *Advers.* l. xi. c. 6. Lipl. *Saturn.* l. ii. c. 22.

There were divers kinds of *gladiators*, distinguish'd by their weapons, manner, and time of fighting, &c. as,

The *andabæte*; of whom we have already given an account under the article *ANDABÆTÆ*.

The *cateruarii*, who always fought in troops, or companies: number against number, or, according to others, who fought promiscuously without any certain order. Lipl. lib. ii. c. 16.

The *consummati*, whom authors mention as a species of *gladiators*, the same with the *rudarii* and *veterani*; founding the opinion on a passage in Pliny, l. viii. c. 7. But Liplius shews, that they have mistaken Pliny; *Saturn.* lib. ii. c. 16. and Turneb. *Advers.* l. xxx. c. 36.

The *culicentarii*; which are a little precarious, being chiefly founded on a passage in Lampridius, in the life of the emperor Commodus: *Inter hæc habitu victimarii, victimas imolavit, in arena rudibus, inter cubicularios gladiatores pugnavit lucentibus aliquando mucronibus.*

Turnebus reads *rudarii*, in lieu of *cubicularios*, and understands it of those who had been dismiss'd, and could no longer be obliged to fight, except with files.

Salmaſius reads *gladiator*, and relates it to the emperor, who fought not only on the arena, and with files, or blunted instruments; but at home, with his servants, and valets de chambre, and with sharps.

Liplius will have nothing altered in the text: The *gladiatores cubicularii*, he observes, were those who fought at private houses, during feasts, &c. Accordingly, Dion says expressly, that Commodus sometimes fought at home, and even killed some persons in such encounters; but that in public he only fought with blunted weapons.

The *dimacheæ*, who fought armed with two poniards, or swords; or with sword and dagger. Lipl. *Saturn.* l. ii. c. 13.

The *assedarii*, who fought in carts; called also, in an inscription lately discovered at Lyons, *assedarii*. *Saturn.* *leam.* l. ii. c. 13.

The *fiscarii*, or *caſariani*, who belonged to the emperor's company, and who being more robust and dexterous than the rest, were frequently called for; and therefore named also *postulatii*. *Saturn.* l. ii. c. 16.

The other kinds were, the *hoplomachi*, *meridiani*, *mirmillones*, *ordinarii provocatores*, *retarii*, *rudarii*, *secutores*, *spectatores*, and *thraçes*: Which see described under their several articles *MERIDIANI*, *RETARII*, *SECUTOR*, &c.

Some authors, and particularly Vigenere on Livy, rank the *obsequentes*, mentioned by Spartian in his life of Marcus Aurelius, among the number of *gladiators*. Liplius laughs at him, *Saturn.* l. ii. c. 16. and with some reason: The obsequentes properly were the troops which that emperor raised among the *gladiators*, or whom of *gladiators* he made soldiers.

GLADIATORS war, bellum GLADIATORUM, or Spannum, called also the *seville war*, was a war which the Romans sustained about the year of their city 680.—Spartacus, Crinus, and Oenomaus, having escaped with other *gladiators*, to the number of 74, out of the place where they had been kept, at Capua, gathered together a body of slaves, put themselves at their head, rendered themselves masters of all Campania, and gained several victories over the Roman prætors.—At length they were defeated, in the year 682, at the extremity of Italy, having in vain attempted to pass over into Sicily.

This war proved very formidable to the Romans. Crassus was not able to finish it: The great Pompey was forced to be sent as general.

GLADIUS*, *sword*. *Ius GLADII*, or, *right of the sword*, is used in our ancient Latin authors, and in the Norman laws, for supreme jurisdiction.

* Camden in *Britannia*, writes *comitatus Flint pertinet ad gladium Cestrie*. And Selden, *Tit. of Honour*, p. 640. *curiam suam liberam omnibus placitis, &c. exceptis ad gladium ejus pertinentibus*.

And it is probably from hence, that at the creation of an earl, he is *gladio succinditur*, to signify that he had a jurisdiction over the county.

GLAND, GLANDULA, in anatomy, a soft, spongy, lax kind of body; serving to separate some particular humour from the mass of blood. See **BLOOD**, and **HUMOUR**.

The ancients took the *glands* to be nothing more than a kind of pillows, or cushions, for the neighbouring parts to rest on.—Some of them, at length, began to fancy them sponges; destin'd to receive and imbibe the superfluous moisture of the other parts.

Later physicians thought proper to assign them nobler, and more important uses.—They considered them as cisterns, which contained proper ferments, whereby the blood, upon its mixing therewith, was put into a fermentation, in the progress whereof it worked, or threw off certain of its parts, and sent them away by excretory ducts.

The moderns who allowed the *glands* to be the organs whereby the vital fluids are separated for the uses of the body, considered them as filters, the pores whereof being all of different figures, would only admit of similarly figured particles, to pass through them.

But the latest authors rather conceive the *glands*, as sieves, whose perforations being of different sizes, though of the same figure, only separate such particles whose diameters are less than their own.

The *glands*, to the eye, appear a sort of whitish, membranous masses, composed of an outer cover, or integument, within which a vascular plexus is contained.—They are denominated from their resemblance in form, to acorns, which the Latins call *glandes*.

By dissection, and the microscope, they are found to be real plexus's or pelotons of vessels, variously wound, and implicated among themselves. But the modern anatomists, Malpighi, Bellini, Wharton, Nuck, Peyer, &c. have gone further, and discovered them to be more than continued convolutions of the capillary arteries.

Their formation appears to be thus.—An artery arriving at a certain part, is divided into an infinite number of exceedingly fine branches, or ramifications: These capillary branches are laid in various bends and circumnutations; and from the returns thereof, arise new branches, or vessels for veins; which, a little further, unite, or terminate in some larger branch.

All these ramifications, both veins and arteries, are rolled up in a bundle; making numerous gyres, and circumnutations: And from the various bends and angles formed by both kinds, arise numerous other minute vessels, which make the principal and most essential part of the *gland*.

The blood brought from the heart-ward, by the artery, into the glandular plexus, pursues all the turns and meanders in the arterial part thereof, till arriving at the venal part, it is by it brought back again to the heart. In the mean time, during its progress through the arterial and venal folds, some part of it is absorbed, or drained off, at the orifices of the tubules arising from the flexures thereof.

What is thus received into these, which we may call the *secretory ducts*, is commonly taken up by other tubules, springing out of them: These, joining together, form a single canal, which is called the *excretory duct*; which, passing out of the body of the *gland*, carries off the secreted matter into some proper receptacle destined to retain, or receive it.

Though, sometimes, the secretory vessels themselves terminate in a basin, or reservoir; and deposit their contents therein.—Such is the general structure, and office of the *glands*; which we shall further illustrate under the article **SECRETION**.

A *gland*, then, is a composition of divers kinds of vessels; viz. an artery, and a vein; secretory, and excretory ducts. To which may be added a nerve, which is found in every *gland*, diffused through the whole substance thereof, to furnish spirits for promoting the secretion; and a membrane which supports the convolutions of the vein and artery, accompanying them through all their minutest divisions; to which add lymphatic vessels, which have been discovered in several *glands*.

The secretory tubes, however, are what we principally consider as the organ of the *gland*. These alone do sometimes form the greatest part of what is called a *gland*, or *glandulous body*.

M. Winslow has discovered a kind of tomentum, or down within their cavity; which he supposes to do the office of a

filter, and to be that whereby such a certain humor is separated from the common mass of blood.—His system will be explained when we come to treat of **SECRETION**.

The down-vessel being the grand organ of secretion, its structure and application is diversified according to the different purposes nature has in view. Sometimes the liquor filtrated through it, trickles out, drop by drop, upon a membrane, to which one extremity of the vessel is fastened; as where the filtration is only intended for moistening and lubricating the part, with that liquor: In which case the down-vessel is both secretory, and excretory; which is the most simple case. Such are those innumerable *glands* spread through the greater part of the viscera.

Sometimes a great number of these down-vessels are spread over the inner surface of a little membranous cell, into which they all pour their liquor, which is discharged hence at a little aperture in the cell:—Such are the solitary *glands* of the intestines, which appear like so many little separate grains.

Sometimes a vessel is bent, and has only down in the first part thereof, which alone is secretory, and the rest excretory, pouring the liquor into some other common cavity.—Such are the *glands* that compose a calf's kidney.

The secretory vessels are sometimes of a very great length, notwithstanding that they take up but little room, being wound over themselves again and again; sometimes in a single peloton, or knot, and sometimes in several, inclosed in a common membrane.—Whence the distinction of *glands* into conglobate, and conglomerate.

The *glands* are of several kinds, in respect of their form, structure, office, and use: Authors usually divide them into *conglobate*, and *conglomerate*.

Conglobate, or *simple GLANDS*, are those consisting of one continuous mass, with an uniform surface.—Such are the subcutaneous *glands*.

A conglobate *gland*, is, more strictly, a little, smooth body, wrapped up in a fine, double skin, by which it is separated from all the other parts; only admitting an artery and nerve to pass in, and a vein and excretory duct to go out.

These *glands* either discharge their secreted humor into the chyle, or venous blood; or else it transpires through the pores of the skin, or the coats of the looser membranes found in most parts of the body.

Of the conglobate kind are the *glands* in the cortical part of the brain, in which the animal spirits are supposed to be secreted. Such also are the labial *glands*, and the testes.

Conglomerate, or *compound GLAND*, is an irregular assemblage of several simple *glands*, tied together, and wrapped up under one common membrane.—Such are the maxillary *glands*, &c.

The humors secreted in these *glands*, are sometimes discharged at a common excretory duct, formed of an union of the excretory ducts of all the particular ones: this is the case in the pancreas and carotides.

Sometimes, the ducts uniting form several tubes, only communicating with each other by cross canals; as in those of the breasts.

Some, again, have several excretory tubes, without any communication together; as the *glandulae lacrymales*, and *prostatæ*.

Others, have their several excretory ducts inserted into a common canal, which opens at last into some of the greater cavities; as the salivary *glands*, intestinal *glands*, &c.

Lastly, in others, each *gland* has its own excretory duct, through which it transmits its liquor to a common basin; such are those of the kidneys.

The *glands* are again divided into *vascular*, and *vascular*.

Vascular GLANDS are only clusters of little vessels, which uniting together, form the canal or excretory duct through which their secreted juice is discharged.

Vascular GLANDS are assemblages of vesiculae communicating with each other, and all terminating in two or three larger vessels; by a prolongation whereof the excretory duct is formed.

The *glands*, again, are divided into the *adventitious*; and the *perpetual* or *natural*.

Adventitious GLANDS, are those kernels arising occasionally under the arm-pits, on the neck, &c.—Such are the strumæ, and the tumors found on the larynx, and middle of the trachea.

Perpetual, or natural GLANDS are of two kinds, conglobate, and conglomerate, as above described.

Buccal GLANDS. See the article **BUCCAL**.

Lachrymal GLANDS. See the article **LACHRYMAL**.

Lumbol GLANDS, *Glandulae lumbares*, are three *glands* thus called by Bartholine, as lying on the loins.

The two largest lie upon one another, betwixt the descending cava and aorta, in the angle made by the emulgent with the cava: The third and smallest stands over the former under the appendices of the diaphragm. They communi-

cate, and are connected together by small lacteal vessels. Bartholine concluded them to serve as a common receptacle of the chyle; but Dr. Wharton's opinion is more probable, viz. that they supply the place of those larger glands found in the mesenteries of brutes.

Miliary Glands, *Glandule miliaryes*. See **MILIARY glands**.
Mucilaginous Glands, are a kind of glands first described by Dr. Havers. See **MUCILAGINOUS glands**.

Mucous Glands, *Glandule mucosæ*. See **MUCOUS glands**.
Myrtiform Glands, are contractions of the hymen, broke by the first act of venery. See **MYRTIFORMES glandulæ**; see also **HYMEN**.

Nuckian Glands. See the article **NUCKIANÆ**.

Odoriferous Glands, *Glandule odoriferae*, are certain small glands discovered by Dr. Tyson, in that part of the penis, where the prepuce is contiguous to the balanus.

He gave them this name from the brisk scent which their separated liquor emits. In such persons as have the prepuce longer than ordinary, these are not only more in number, but larger, and separate a greater quantity of juice; which, lodging there, often grows rancid, and corrupts the glands. These glands are very conspicuous in most quadrupeds, especially in dogs, and boars.

Pineal Gland, *Glandula pinealis*. See **PINEAL gland**, and **CONARIUM**.

Pituitary Gland, *Glandula pituitaria*. See **PITUITARY gland**.

Renal Glands, *Glandule renales*, called also *capsulae atrabiles*, are two glands first discovered by Eustachius, between the aorta, and the kidneys, a little above the emulgent vessels; though their situation and figure is varied: In some they are round; in others square, triangular, &c. The right is usually bigger than the left, and each about the size of a rux vomica: They are enclosed in fat.

Their use is not certainly known: It is supposed to be to separate a liquor from the arterial blood, before it goes to the kidneys.

Sebaceous Glands. See the article **GLANDULA**.

Sublingual Glands. See the article **SUBLINGUAL**.

Thyroid Glands. See the article **THYROIDEÆ**.

GLANDERS, a filthy disease in a horse, consisting in a running, corrupt, slimy matter from the nose, of a different colour, according to the degree of the malignity, or as the infection has been of a shorter or longer continuance; being white, yellow, green, or black.

Authors ascribe it to various causes: some to infection; some, to a disorder of the lungs; others, to the spleen; some, to the liver; and others, to the brain.—After it has been of so long standing, that the matter is become of a blackish colour, which is usually in its last stage, they suppose it to come from the spine; and hence they call it the *mourning of the chine*.

Kernels and knots are usually felt under the caul in this disorder: And as these grow bigger and more inflamed, so the *glanders* increase more.

A late author is of opinion, that the chief seat of this distemper is in a little, soft, spongy flesh, which is easily dilated by the least influx of the blood. And thence it is that some horses have a running at the nose from a very slight cold; but that when this spongy substance happens to be very much relaxed, the running is increased in proportion.

GLANDULA*, in anatomy, the same as *gland*. See **GLAND**.

* The word is a diminutive of the Latin *glans*, acorn; and is here used on account of some external resemblance between the glands of the body, and the fruit of the oak.

GLANDULÆ buccales. See the article **BUCCALÆ**.

GLANDULÆ nuckianæ. See the article **NUCKIANÆ**.

GLANDULÆ sebaceæ, are a number of glands plac'd under the skin of the auricle of the ear, first discovered by Valsalva, and thus denominated, by reason they separate a greasy matter, like sebum, or tallow.

This sebum, he asserts, being carried to the surface of the skin turns into a scaly substance, not unlike bran.

GLANDULÆ thyroideæ. See the article **THYROIDEÆ**.

GLANDULE, in English, signifies a little gland.—Thus, the amygdalæ, or almonds of the ears are by some called *glandules*.

GLANDULA guidoni, among surgeons, is a tumor resembling a gland, soft, single, moveable, without roots, and separate from the adjacent parts.

GLANDULOUS, or **GLANDULAR**, something composed of glands; or that abounds with glands.

The breasts are *glandulous* bodies. See **BREASTS**.—The cortical substance of the brain is commonly reputed to be *glandulous*. Though Ruysch, from the discoveries made by his admirable injections, holds that there is no such thing as a gland therein.

The ancients distinguished a particular kind of flesh, which they

called *carn glandulosa*, or *glandulous flesh*. See **FLESH**.

GLANDULOUS body, *Glandulosum corpus*, more particularly denotes the prostata.

GLANS, *acorn*, in natural history, a fruit contained within a smooth, but hard bark, including a single seed; its hind-part being covered with a kind of cup, and the fore-part bare.

GLANS, in anatomy, the tip, or button of the penis; or that part covered with the prepuce; called also *balanus*.—See **TAB. Anat. (Splanchn.) fig. 10. lit. d. fig. 15. lit. o.**

The *glans* is only a dilatation of the extremity of the spongy substance of the urethra, which is here bunched and turned back on the two conical tips of the corpora cavernosa, which terminate therein.

The extremity of the prepuce is apt to grow so strait in old men, that they cannot bare the *glans*; perhaps through the defect of frequent erections.

GLANS is also used to denote the tip, or extremity of the clitoris; from its resemblance both in form and use, to that of the penis.—See **TAB. Anat. (Splanchn.) fig. 13. lit. c.**

The principal difference consists in this, that it is not perforated: This *glans* is also covered with a preputium, formed of the inner membrane of the labia.

GLASS*, *vitrum*, a transparent, brittle, saccharine body, produced of a salt, and sand or stone, by the action of fire.

* The word is formed of the Latin *gladium*, a plant called by the Greeks *gladii*, by the Romans *vitrum*, by the ancient Britains, *quadum*, and by the English, *wasad*. We find frequent mention of this plant in ancient writers, particularly Cæsar, Virgilius, Pliny, &c. who relate, that the ancient Britons painted, or dyed their bodies with *gladium*, *quadum*, *vicum*, &c. i. e. with the blue colour procured from this plant. And hence, the saccharine matter we are speaking of came to be called *gladi*; as having always somewhat of this bluishness in it. See **WORD**.

The chemists hold that there is no body but may be vitrified, i. e. converted into *glafs*.—By intense heat even gold itself gives way to the sun's rays collected in a burning glass, and becomes *glafs*. See **GOLD**, and **BURNING glass**.

Add, that as *glafs* is the effect, or fruit of fire, so it is the last effect of that element: All the chemist's art, and all the force of fire not being able to carry the change of any natural body beyond its vitrification. Whence Dr. Merret mentions it as a merry saying of a very great artist in the business of *glafs*, that their profession would be the last in the world: For that when God should consume the universe with fire, all things therein should be turned to *glafs*.

Nature and characters of GLASS.—Naturalists are divided, in what class of bodies to rank *glafs*.—Agricola considers it as a concrete juice: Bellovacensis, as a stone: Fallopius ranks it among the media mineralia; and the workmen, when in fusion, call it metal. But Dr. Merret with reason sets aside all these opinions, from this consideration, that all the fore-mentioned bodies are natural concretes; whereas *glafs* is a compound made by art, and is never found in the earth, as the others are.

Fallopius, indeed, contends, that *glafs* is no more artificial than a metal; and that they are both equally extracted, or educed from other bodies: The one from sand; the other from its ore.—He adds, that though salts or ashes be added to sand, for the making of *glafs*, yet it is false that they contribute to the composition of *glafs*; their use, according to him, being only for the better extracting of the *glafs* from the mineral stone.

This Dr. Merret easily confutes: For if *glafs* were extracted from the stones, or sand only, the weight of the metal must be much less than that of the stones alone; whereas, it is in reality much greater; an hundred weight of sand sufficing for one hundred and fifty of *glafs*.

In effect, the ashes contribute a deal of salt to the composition of *glafs*.—Accordingly, in pieces of old *glafs*, one may sometimes pick out grains of salt, easily discoverable to the taste; beside that the finest *glafs* standing long in a subterraneous place, will moulder or resolve into its first ingredients, salt and sand, by the decay of the union thereof. Whence it appears that the salt remains in the *glafs*, in specie: To which may be added that experiment of Van Helmont. "Melt *glafs*-dust with sandever, and "set them in a moist place; and the *glafs* will resolve into water. Pour on aqua regia, enough to saturate the "sandever; and the sand will precipitate to the bottom in "the same quantity, and weight, as was first used." Helm. cap. de Terra.

Here, then, is a true analysis of *glafs*, or a solution into its first principles, or ingredients: The salt being imbibed by the sandever, and aqua regia. Merret. Not. in Ant. Neri de Art. vitrar.

The learned and curious author just mentioned, gives us the following characters, or properties of *glass*; whereby it is distinguished from all other bodies; viz. 1° That it is an artificial concrete of salt, and sand, or stones. 2° Fusible, by a strong fire. 3° When fused, tenacious and coherent. 4° It does not waste, or consume in the fire. 5° When melted, it cleaves to iron. 6° Ductile, when red hot, and fashionable into any form; but not malleable: and capable of being blown into a hollowness; which no mineral is. 7° Frangible, when thin, without annealing. 8° Friable, when cold. 9° Always diaphanous, whether hot, or cold. 10° Flexible and elastic. 11° Diffoluble by cold and moisture. 12° Only capable of being graven, or cut with diamond or other hard stones, and emery. 13° Receives any colour, or dye, both externally, and internally. 14° Not diffoluble by aqua fortis, aqua regia, or mercury. 15° Neither acid juices, nor any other matter extract either colour, taste, nor any other quality from it. 16° It admits of polishing. 17° Neither loses of weight, nor substance by the longest, and most frequent use. 18° Gives fusion to other metals, and softens them. 19° The most pliable thing in the world, and that which best retains the fashion given it. 20° Not capable of being calcined. 21° An open *glass*, filled with water in the summer-time, will gather drops of water on the outside just so far as the water on the inside reaches; and a man's breath blown upon it will manifestly moisten it. 22° Little *glass* balls filled with water, mercury, or other liquor, and thrown into the fire; as also drops of green *glass* broken, fly asunder with a loud noise. 23° Neither wine, beer, nor any other liquor, will make it mussy, nor change its colour, nor rust it. 24° It may be cemented as stones, and metals. 25° A drinking *glass*, partly filled with water, and rubbed on the brim with a wet finger, yields musical notes, higher or lower, as the *glass* is more or less full, and this makes the liquor frisk and leap.—

For the flexibility of GLASS, see further under FLEXIBILITY of Glass.

For the malleability of GLASS, see MALLEABLE, &c.

Origin and history of GLASS.—De Neri will have *glass* as ancient as Job: For that writer, ch. xviii. ver. 17. speaking of wisdom, says, gold and *glass* shall not be equalled to it. This, we are to observe, is the reading of the septuagint, vulgar Latin, St. Jerome, Pineda, &c. For in the English version, instead of *glass*, we read *crystal*; and the same is done in the Chaldee, Atlas, Montanus, and the king of Spain's edition: In other versions, &c. it is read *stone*; in others, *beryl*: In the Italian, Spanish, French, high and low Dutch, &c. *diamond*; in others, *carbuncle*; and in the Targum, *looking-glass*.

In effect, the original word is *zachuchil*, which is derived from the root *zaca*, to purify, cleanse, shine, be white, transparent: And the same word, Exod. xxx. 34. is applied to frankincense, and rendered in the septuagint, pelucid.—Hence the reason of so many different renderings: For the word signifying beautiful and transparent in the general, the translators were at liberty to apply it to whatever was valuable and transparent.

Most authors will have Aristophanes to be the first author who mentions *glass*: That poet, in his comedy called the *Clouds*, scen. 1. act 2. uses the word *hyalus*, *υαλ@*, which is now ordinarily rendered *glass*. He there introduces Strepsiades, teaching Socrates a new way to pay old debts; viz. “by placing a fair transparent stone sold by the druggists, from which the fire is struck, between the sun and the writing; and so melting away the letters thereof.” This stone Socrates calls *υαλ@*; which the choliast on Aristophanes derives from *υα*, to rain, from the likeness it bears to ice, which is rain, or water congealed; though, it must be owned, the word *υαλ@* is ambiguous, and signifies crystal as well as *glass*: And Gortæus observes that the ancients had a kind of yellow amber, transparent as *glass*, called by some, *υαλ@*.

Aristotle has two problems upon *glass*; the first, Why we see through it? The second, why it is not malleable? If these problems be Aristotle's, which the learned doubt very much; this would properly be the earliest piece of antiquity of *glass*: but the first author, who makes unquestionable mention of this matter, is Alexander Aphrodisæus, who uses it in a simile: “As the floridness of a colour is seen through *glass*,” &c. After him the word occurs commonly enough: Lucian mentions large drinking glasses; and Plutarch, in his *Synopsicon*, says that the fire of tamarisk wood is the fittest for the making of *glass*.

Among the Latin writers, Lucretius is the first that takes notice of *glass*. *Nisi recta foramina tranant. Qualia sunt vitri.* Dr. Merret, however, adds, that *glass* could not be unknown to the ancients; but that it must needs be as ancient as pottery itself, or the art of making bricks: For scarcely can a kiln of bricks be burnt, or a batch of pottery ware be made, but some of the bricks, and ware, will be at least superficially turned to *glass*: And therefore, without doubt it was known at the building of Babel.

Hence, Ferrat Imperatus, lib. xxv. c. 7. “*Glass*, like the common kind, is found under ground, in places where great fires have been.—Other *glasses* are found in round clods, like firestone, some brittle, others firm, &c. This fossil *glass* is wrought by the Americans, and used instead of iron.” And no doubt but vitrifications were more common in the ancient bricks than they are in ours: as they tempered their earth two years together, and burnt them better.

Pliny relates the manner of the discovery of *glass*. It was found, according to that author, by accident, in Syria, at the mouth of the river Belus, by certain merchants driven thither by the fortune of the sea. Being obliged to live there, and dress their victuals, by making a fire on the ground; and there being store of the plant kali upon the spot; this herb being burnt to ashes, and the sand or stones of the place, accidentally mixed with it, a vitrification was undesignedly made. From whence the hint was taken, and easily improved.

Indeed, how old soever *glass* may be; the art of making, and working it, appears of no great antiquity. The first place mentioned for the making hereof, is Sydon in Syria, which was famous for *glass* and *glass-houses*, as observed by Pliny, l. xxxvi. c. 26. The first time we hear of *glass* made among the Romans, was in the time of Tiberius; when Pliny relates that an artist had his house demolished for making *glass* malleable, or rather flexible. Though Petronius Arbiter and some others assure us that the emperor ordered the artist to be beheaded for his invention. Venice, for many years, excelled all Europe in the fineness of its *glasses*. The great *glass-works* were at Muran, or Mouran, a village near the city; which furnished all Europe with the finest and largest *glasses*. But within these fifty years the French and English have not only come up to, but even surpassed the Venetians; so that we are now no longer supplied from abroad.

The French made a considerable improvement in the art of *glass*, by the invention of a method to cast very large plates; till then unknown; and scarce practised yet, by any but themselves and the English.

That court applied itself with a laudable industry to cultivate and improve the *glass* manufacture. A company of *glass-men* was established by letters patent; and it was provided by an act, not only that the working in *glass* should not derogate any thing from nobility, but even, that none but nobles should be allowed to work therein.

Ingredients of GLASS. The materials used in the composition of *glass*, we have observed, are salt; and sand; or else some kind of stone.

The salt is of the fixt kind; such as will not evaporate with the most intense heat. The sand, or stone must be such as will melt easily: This is what gives firmness and consistence to the *glass*.

1° This salt is procured chiefly from a kind of ashes, called *polverine*, or *rachetta*, brought from the Levant, and particularly from Alexandria and Tripoli. The ashes are those of a vegetable, frequent in the country, commonly called *kali*; sometimes *kalli*; *kallu*; *cali*; by Geiner, *alkali*; by Lobel, *soda*; by Dodonæus, *salsola*; and by Camer, Gordolus, Eucherius, &c. *anthyllis*. Dr. Merret calls it *English salt-wort*, from its saline taste; and *glass-weed*, from the use made of its ashes in making of *glass*.

Bauhin mentions ten species of this plant; whereof there are four used by the Alexandrians, &c. for the making of *polverine*, and soap; viz. *kali geniculatum*, *kali secunda species*, *kali ægyptiacum*, and *kali spinosum*.

The first and last, our own coasts afford, where they are called by the people *frag-grass*, and *sea-grass*; but they are of no use for making of *glass*: being laid on a hot iron, they fly off almost wholly in fumes, leaving almost no ashes at all; whereas the *kali*'s brought from the Levant, applied on the same iron, are soon converted almost wholly into *polverine*, i. e. very saline ashes, of a dark colour.

To get the salt from this *polverine*, they pulverize, and sift it very fine; then boil it in a bras copper, with fair water and tartar, till a third part of the water is consumed; taking care to stir it from time to time. Then, filling up the copper with fresh water, they boil it a second time, till *kali* be consumed: This done, they have a lee impregnated with salt. To get the salt from the lees, they boil them, till the salt shoots at the top; which they skim off as it rises. An hundred pounds of good ashes, this way, usually yields eighty or ninety of salt.

When the salt is dry, they beat it grossly, and put it into a furnace, to dry it further with a gentle heat. When it is made sufficiently dry, they pound and sift it very fine, and lay it by to make lrit. See FRIT.

Note, Instead of the ashes of the plant *kali*, those of fern will also yield a salt, which makes excellent *glass*; nothing inferior to that of *polverine*. The method of preparation is the same. Add, that the ashes of the code, and stalks of beans; as also those of coleworts, bramble bush, millet

stalks, rushes, cyperus's, and many other plants may be used for the like purpose, and after the same manner.

2^d For stone, the second ingredient in *glafs*.—The best, we have observed, is that which will melt, is white, and transparent. This is found principally in Italy, being a sort of marble, called *tarso*: The next is puocoli, or cuogolo, a sort of pebbles found at the bottoms of rivers.

Indeed, nothing makes finer and clearer *glafs* than common flint, but the charge of preparing it, deters the glafs-men from using it. The preparation necessary for stone, is to calcine, powder, and fierce it.

Ant. Neri observ'd, that all white, transparent stones, which will not burn to lime, are fit to make *glafs*; and that all stones which will strike fire with steel, are capable of being employed in making of *glafs*. But this latter rule, Dr. Merret observes, does not hold universally.

Where proper stone cannot be had, sand is used. The best for the purpose is that which is white and small; for green *glafs* that which is harder, and more gritty: It is to be well washed; which is all the preparation it needs.—Our glafs-houses are furnished with white sand for their crystal *glasses* from Maidstone; and with the coarser, for green *glafs*, from Woolwich.

Some mention a third ingredient in *glafs*, viz. Manganese, or *sydere*, a kind of pseudo loadstone, dug up in Germany, Italy, and even in Mendip hills in Somersetshire. But the proportion hereof to the rest, is very inconsiderable; beside, that it is not used in all *glafs*. Its office is to purge off the natural greenish colour, and give it some other tincture required.

Method of making white and crystal GLASS.—There are three sorts of furnaces used in the glafs-works: One to prepare the frit, called the *calcar*: A second to work the *glafs*; and a third called the *ter*, to anneal it. See them all described under the article FURNACE.

To make crystal *glafs*, take of the whitest *tarso*, pounded small, and fierce as fine as flower, two hundred pounds; of the salt of polyverine, an hundred and thirty pounds. Mix them together, and put them into the furnace called the *calcar*, first heating it. For an hour keep a moderate fire, and keep stirring the materials, that they may incorporate and calcine together. Then increase the fire for five hours: After which take out the matter; which being now sufficiently calcined, is called *frit*.—From the *calcar* put the frit in a dry place, and cover it up from the dust, for three or four months. See FRIT.

Now, to make the *glafs*, or crystal: Take of this crystal frit, called also *bolito*; set it in pots in the furnace, adding to it a due quantity of manganese: When the two are fused, cast the fluid into fair water, to clear it of the salt, called *sandever*; which would otherwise make the crystal obscure and cloudy. This lotion must be repeated again, and again, as often as needful, till the crystal be fully purged. Then set it to boil four, five, or six days; which done, see whether it have manganese enough; and if be yet greenish, add more manganese, at discretion, by little and little at a time; taking care not to overdose it, by reason the manganese inclines it to a blackish hue. Then let the metal clarify, till it becomes of a clear, and shining colour: Which done, it is fit to be blown, or formed into vessels at pleasure.

There are three principal kinds of *glasses*, distinguished by the form, or manner of working them; viz. round *glafs*, as those of our vessels, phials, drinking *glasses*, &c. *table* or *window glafs*, of which there are divers kinds, viz. *crown glafs*, *jealous glafs*, &c. and *plate glafs*, or *looking glafs*.

Working or blowing round GLASSES.—The working furnace, we have observed, is round, and has six boccas, or apertures: At one of these, called the *great bocca*, the furnace is heated, and the pots of frit are at this fit in the furnace: Two other, smaller holes, called *boccellas*, serve to lade or take out the melted metal, at the end of an iron, to work the *glafs*. At the other holes they put in pots of fusible ingredients, to be prepared and at last emptied into the lading pot.

There are six pots in each furnace, all made of tobacco-pipe clay, proper to sustain not only the heat of the fire, but also the effect of the polyverine, which penetrates every thing else. There are only two of these pots that work: The rest serve to prepare the matter for them. The fire of the furnace is made and kept up with dry, hard wood, cast in, without intermission, at the six apertures. This they never omit, not even on the most solemn festivals.

When the matter contained in the two pots is sufficiently vitrified, they proceed to blow, or fashion it: The process whereof we shall here deliver from Agricola, Dr. Merret, the French *Diction. de Commerce*, &c.

The operator, or servitor (the vessel being now sufficiently refined) takes his blowing iron, which is a hollow tube, about two foot and a half long; and dipping it in the melting pot, there turns it about: The metal sticks to the iron, like some glutinous, or clammy juice, much like, but more firmly, than turpentine, or honey.

For each *glafs* he dips four times, and at each dip rolls the end of his instrument, with the *glafs* thereon, on a piece of iron, over which is a vessel of water: the coolness whereof helps to consolidate the *glafs* more readily, and disposes it the better to bind with the next to be taken out of the pot.

After they have dipped a fourth time, and when there is now matter enough on the instrument, the operator begins to blow gently through the iron; by which he raises or lengthens it nearly a foot; much as we do by blowing in a bladder, or globe: And to give it a polish, he rolls it to and fro on a stone, or marble.

This done, he blows a second time, and thus forms the bunch, or belly of the *glafs*. The matter by this second blast assumes the figure of a gourd, or calabash, eighteen or twenty inches in diameter. As often as the operator blows into the iron (which must be very often) he removes it hastily from his mouth to his cheek, lest he should draw the flame into his mouth, when he re-applies it to the iron.

The operator whirls his iron many times round his head, to lengthen and cool the *glafs*; sometimes the *glafs* thus blown round, is returned to the fire, where it flattens a little of itself: When flattened, it is again taken out, and cooled; and, if needful for the design, the workman flats its bottom, by pressing it on the marble; or moulds it in the stamp-irons; and thus delivers it to the master workman, to break off the collet.

The collet, or neck, is the narrow part which clove to the iron: To set the *glafs* at liberty, they lay a drop of cold water on the collet; which by its coldness, cuts or cracks about a quarter of an inch: After which, giving it a slight blow, the fracture is communicated all around the collet. The waste piece to be thrown by to make green *glafs*.

This done, they dip an iron rod, or ponteggio in the melting pots, and with the matter that sticks thereto, they apply and fasten it to the bottom of the vessel, opposite to the collet.—The vessel thus sustained by the iron rod, is carried to the great bocca to be heated, and scalded; and while another person takes care thereof, the former operator rests and prepares himself for the branching.

To branch, or make the bowl, they thrust in an iron instrument, called the *passago*; and the aperture, opened thereby, they further augment, and widen with the *procolo*: In turning this instrument about, to form the bowl, the edge becomes thickened; the *glafs* being, as it were, doubled in that part: Whence the hem observed on the circumference of our *glasses*.

—What is superfluous, they cut off with the shears. The vessel thus opened, is returned to the great bocca; where being sufficiently heated a second time, the workman gives the bowl its finishing, by turning it about with a circular motion; which it increases, in proportion as the bowl opens, and enlarges by means of the heat and agitation.

The *glafs* thus finished, they carry it from the bocca, still turning it round, to a kind of earthen bench, covered with bricks, or coals extinguished: Here they let it cool a little, and come to its consistence, having first detached it from the iron rod, by a stroke or two with the hand.

Thus, with blowing, pressing, scalding, amplifying, and cutting, the *glafs* is framed into the shape preconceived in the workman's mind. If need be, he proceeds to put on a foot and handle; and with the spici puts on rigarines, and marblings.

When the master has finished a number of these, another servitor takes them with an iron fork, and speedily places them in the tower, or leer, to anneal and harden.

What has been here said of white, or crystal *glafs*, holds equally of common, or green *glafs*; the working being the same in all; and the difference only in the salt, or polyverine, made use of.

So many masters as there are, so many pots, at the least, and so many boccas there must be; each man having his proper station: where, says Dr. Merret, they receive those scorching heats falling directly into their faces, mouths, and lungs; whence they are forced always to work in their shirts, like the cyclopes, and nudi-membra pyramones, with a straw broad-brimmed hat on their heads, to defend their eyes from the excessive heat and light.—They sit in large, wide, wooden chairs, with two long elbows, to which their instruments are hung. They work six hours at a time, measured by a single *glafs*; after which they are relieved by others, for the like time: So that the furnaces are never idle.

Working, or blowing WINDOW, or TABLE-GLASS.—The method of making crown window *glafs*, now practised in England, is said to have been borrowed from the French.—An English glafs-maker went over, to work in France, on purpose to get into the secret; which, when he had attained to, he returned, and set up a glafs-work, wherein he far outdid the French, his teachers.

This *glafs* is blown much after the manner of looking-*glafs*. Some writers, from wrong intelligence, have said that

that it was ran, or cast in sand: But the real process is as follows.

The furnace, melting pots, materials, and fire are the same for window, or table *glass*, as they are for round *glass*; and the difference in the operation only commences after the servitor has dipped his blowing-iron the fourth time in the melted metal. The *glass*, then, being in this condition, they blow it; but instead of rounding, or forming it into a bunch, the particular motion the workman gives it in the directing and managing the wind, and the way of rolling it on the iron, make it extend in length two or three foot, and form a cylinder, which at first is but two inches in diameter; but which, by being recommitted to the fire, and blown afresh when taken out, becomes of the extent required for the table of *glass* to be formed. With this circumstance, however, that the side which is fastened to the iron, goes gradually diminishing, and ends in a kind of cone, or pyramid.

To render the two ends nearly of the same diameter, after adding a little *glass* to that opposite to the iron, they draw it out with a pair of iron pincers. Then they incise, or cut off the same end with a little water; and carrying the cylinder back to the bocca, they incise it likewise with water in two other places; one, eight or ten inches from the iron; and the other, the whole length.

The *glass* cylinder thus abridged of both its extremities, is, next, heated on a kind of earthen table; somewhat raised in the middle, in order to promote its opening at the place incised longitudinally. The workman, here, makes use of an iron, wherewith he alternately lowers and raises the twofolds, or halves of the cylinder, which now begin to open, and unfold like a sheet of paper, and at length grow perfectly flat.—The table of *glass* is now in its last perfection, and needs nothing farther but to be heated over again. When taken out, they lay it on a table of copper; whence, after it has cooled and come to its consistence, they carry it on forks to the tower of the furnace, where they leave it to anneal for twenty-four hours.

The number of tables annealed at a time, which sometimes amount to an hundred, or more, with the perpendicular situation they are set in, occasioned, antiently, that those set in first, sustaining in some measure the pressure of all the last, were bent; and thus rendered inconvenient for use: but this inconvenience is now remedied, by separating them into tens, with an iron shiver; which diminishing the weight, by dividing it, keeps the tables as flat, and even as they were put in.

Kinds of table or window GLASS.—There are divers sorts of this *glass* made in divers places, for the use of building: those most known among us, are given us by the author of the *Builder's Dictionary*, as follows:

Crown GLASS, of which, says Neve, there are two kinds; distinguished by the places where they are wrought, *viz.* 1^o, *Ratcliff crown glass*, which is the best and clearest; and was first made at the bear-garden, on the bank-side, Southwark; but since at Ratcliff: of this there are 24 tables to the case, the tables being of a circular form, about three foot six inches in diameter. See **TABLE**, and **CASE**.

2^o, *Lambeth crown glass*, which is of a darker colour than the former, and more inclining to green.

French GLASS, also called *Normandy glass*, and formerly *Lorrain glass*, because made in those provinces: at present it is made wholly in the nine *glass* works; five whereof are in the forest of Lyons, four in the county of Eu; the last, at Beaumont, near Rouen.—It is of a thinner kind than our crown *glass*; and when laid on a piece of white paper, appears of a dirtyish green colour. There are but twenty-five tables of this to the case.

German GLASS, is of two kinds, the *white*, and the *green*: the first is of a whitish colour, but is subject to those small, curved streaks, observed in our *Newcastle glass*; though free from the spots and blemishes thereof. The *green*, beside its colour, is liable to the same streaks as the white: but both of them are straighter, and less warped, than our *Newcastle glass*.

Dutch GLASS, is not much unlike our *Newcastle glass*, either in colour or price. It is frequently much warped, like that, and the tables are but small.

Newcastle GLASS, is that most used in England. It is of an ash colour, and much subject to specks, streaks, and other blemishes and beside is frequently warped. Leybourn says, there are forty-five tables to the case, each containing five superficial feet: some say there are but thirty-five tables, and six foot in each table.

Working of PLATE, or LOOKING GLASS.—The materials whereof *looking glass* is made, are much the same as those of other works of *glass*, *viz.* an alkali salt, and sand.

The salt, however, it is to be observed, should not be that extracted from polverine, or the ashes of the Syrian kali; but that from barilla, or the ashes of a plant of that name, of the genus of kalis, but growing about Alicante in Spain.—It is very rare that we can have the barilla pure; the Spaniards, in burning the herb, make a practice of mixing another herb along with it, which alters its quality; or of adding sand to it.

Vol. I.

increase the weight: which is easily discovered, if the addition be only made after the boiling of the ashes; but next to impossible, if made in the boiling. It is from this adulteration that those threads and other defects in *plate glass* arise.—To prepare the salt, they clean it well of all foreign matters; pound or grind it with a kind of mill, and finally sift it pretty fine.

As to the sand, it is to be sifted and washed, till such time as the water come off very clear; and when it is well dried again, they mix it with the salt, passing the mixture through another sieve. This done, they lay them in the annealing furnace for about two hours; in which time the matter becomes very light, and white: in this state they are called *frit*, or *fritia*, and are to be laid up in a dry clean place, to give them time to incorporate: they lie here for at least a year.

When they would employ this *frit*, they lay it for some hours in the furnace, adding to some, the fragments, or shards of old, and ill-made *glass*; taking care first to calcine the shards, by heating them red hot in the furnace, and thus casting them into cold water. To the mixture must likewise be added manganese, to promote the fusion, and purification.

The matter thus far prepared, is equally fit for *plate glass*, to be formed by blowing; or by casting.

Blowing LOOKING GLASS PLATES.—The work-houses, furnaces, &c. used in the making of this kind of *plate glass*, are the same as those in the following article, to which the reader is referred.

The melting pots, wherein the materials to be blown, are fused, are thirty-eight inches in diameter, and thirty-five inches high. After those materials are vitrified by the heat of the fire; and the *glass* is sufficiently refined; the master workman dips in his blowing-iron, once and again, till he has got matter enough thereon.

This done, he mounts on a kind of block, or stool, five foot high, to be more at liberty to balance it, as it lengthens in the blowing. If the work be too heavy for the workman to sustain on his blowing iron, two or more attendants assist him, by holding pieces of wood under the *glass*, in proportion as it stretches, for fear it should fall off the iron by its own weight.

When, after several repeated heatings, and blowings, the *glass* is at length brought to the compass, proper for its thickness, and the quantity of metal taken out; they cut it off with forces, at the extremity opposite to the iron, in order to point it with the pointil.

The pointil is a long, firm piece of iron, have a piece going across one of its ends, in manner of a T: to point the *glass*, they plunge the head of the T into the melting-pot; and with the liquid *glass* sticking thereto, they fasten it to the extremity of the *glass* before cut off. When this is sufficiently fastened, they separate the other extremity of the *glass* from the blowing-iron; and instead thereof make use of the pointil to carry it to the furnaces appointed for that end: where, by several repeated heatings, they continue to enlarge it, till it be equally thick in every part.

This done, they cut it open with the forceps; not only on the side by which it stuck to the blowing-iron, but likewise the whole length of the cylinder: after which, giving it a sufficient heating, it is in a condition to be entirely opened, extended, and flattened. The manner of doing which is much the same as for table *glass*, and need not be here repeated.

Lastly, the *glass* being sufficiently flattened, is laid to anneal, for ten, or fifteen days, according to the size and thickness.

It may be observed, that *looking glasses* thus blown, should never be above forty five, or at most fifty inches long, and of a breadth proportionable. Those exceeding these dimensions, as we frequently find among the Venice *glasses*, cannot have the thickness sufficient to bear the grinding; and beside are subject to warp, which prevents them from regularly reflecting objects.

Casting, or running large LOOKING GLASS PLATES.—This art is of French invention; and not above fifty years old. It is owing to the Sieur Abraham Thevart, who first proposed it to the court of France, in 1688.

It is performed much like the casting of sheet lead, among the plumbers; and by means hereof we are not only enabled to make *glasses*, of more than double the dimensions of any made the Venetian way of blowing; but also to cast all kinds of borders, mouldings, &c.

The furnaces for melting the materials of this manufacture, are of enormous size; and those for annealing the *glasses*, when formed, are much more so. Round a melting-furnace, there are at least twenty-four annealing furnaces or ovens, each from twenty to twenty-five foot long; they are called *carquasses*: each *carquasse* has two tilfarts, or apertures, to put in wood, and two chimneys. Add, that beside the annealing furnaces, &c. there are others for the making of *frit*, and calcining old pieces of *glass*.

All these furnaces are covered over with a large shed; under which are likewise forges, and work-houses for smiths, car-

penters, &c. continually employed in repairing, and keeping up the machines, furnaces, &c. As also lodges, and apartments for these, and the other workmen employed about the *glafs*; and in keeping up a perpetual fire in the great furnace: So that the *glafs-house*, as that in the castle of St. Gobin, in the forest of Eere, in the Soilfonois, appears more like a little city, than a manufactory.

The inside of the furnaces is formed of a sort of earth, proper to sustain the action of fire; and the same earth serves also for melting-pots, cisterns, &c. The furnaces seldom last above three years; after which they are to be rebuilt, from bottom to top: And to keep them good, even for that time, the inside must be refitted every six months. The melting pots are as big as hogheads, and contain above two thousand weight of metal. The cisterns are much smaller, and serve for the conveyance of liquid *glafs*, which is drawn out of the pots, to the casting tables.

When the furnace is in a condition to receive the pots, and cisterns, they heat it red hot: This done, they fill the pots with materials; which is done at three times, to facilitate the fusion. When the matter is sufficiently vitrified, refined, and settled, which usually happens in twenty four hours; they fill the cisterns, which are in the same furnace, and which are left there about six hours longer, till such time as they appear all white, through the excessive heat.

To get the cisterns with the metal out of the furnace; they make use of a large iron chain, which opens and shuts with hooks and eyes. From the middle hereof, on each side, arise two massive iron pins, whereby, with the assistance of pulleys, the cisterns are rais'd upon a kind of carriage of a proper height; and thus conducted to the table where the *glafs* is to be run. Here, slipping off the bottom of the cistern, there rushes out a torrent of matter, all on fire, wherewith the table prepared for that purpose, is presently cover'd.

The table, whereon the *glafs* is to be run, is of pot meal, about nine foot long, and broad in proportion. It is supported on a wooden frame, with truckles, for the convenience of removing from one carquasse, or annealing furnace to another, in proportion as they are filled.

To form the thickness of a *glafs*, there are two iron rulers or rims, placed around the edge of the table; and on these, rest the two extremes of a kind of roller, which serves to drive the liquid matter before it to the end of the table, or mould. The iron rulers, being moveable, and capable of being set closer, or further a-part at pleasure, determine the width of the *glasses*, and retain the matter, that it does not run off at the edges.

As soon as the matter is arrived at the end of the table, and the *glafs* is come to a consistence, which is in about a minute; they shove it off into the annealing furnace, where it slides with ease enough, by reason of the sand strewed thereon.

What is most surprizing throughout the whole of this operation, is, the quickness and address, wherewith such massy cisterns, filled with so flaming a matter, are taken out of the furnace, convey'd to the table, poured therein, the *glafs* spread, &c. The whole is inconceivable to such as have not been eye-witnesses of that surprizing manufacture.

As fast as the cisterns are emptied, they carry them back to the furnace, and take fresh ones, which they empty as before. This they continue to do, so long as there are any full cisterns; laying as many plates in each carquasse as it will hold, and stopping them up as soon as they are full; to let them anneal, and cool again, which requires at least ten days.

The first running being dispatch'd, they prepare another, by filling the cisterns a-new, from the matter in the pots; and after the second, a third; and even a fourth time, till the melting pots are quite empty.

The cisterns, at each running, should remain at least six hours in the furnace, to whiten; and when the first annealing furnace is full, the casting-table is to be carried to another. It need not here be observed, that the carquasses, or annealing furnaces must first have been heated to the degree proper for them. When the pots are emptied, they take them out, as well as the cisterns, to scrape off what *glafs* remains, which otherwise would grow green by continuance of fire, and spoil the *glasses*.

The manner of heating the large furnaces, is singular enough: the trifor, or person employed for that purpose, quite naked to his shirt, runs round the furnace without making the least stop, with a speed scarce inferior to that of the lightest courier: as he goes along, he takes two billets, or pieces of wood, which are cut for the purpose; these he throws into the first stiftart; and continuing his course, does the same for the second. This he holds on without interruption for six hours, successively; after which he is reliev'd by another, &c. It is surprizing that two such small pieces of wood, and which are consumed in an instant, should keep the furnace to the proper degree of heat; which is such, that a large bar of iron, laid at one of the mouths of the furnace, becomes red hot in less than half a minute.

It is computed that a furnace, before it be fit to run *glafs*, costs above three thousand five hundred pounds: that at least six months are required for the building it a-new; and three months

for the refitting it: and that when a pot of matter bursts in the furnace, the loss of matter and time amounts to above two hundred and fifty pounds.

The *glaff* when taken out of the melting furnace, needs nothing further but to be ground, polished, and foliated.—For the grinding of GLASS, see GRINDING.—For the polishing of GLASS, see POLISHING.—For the foliating of GLASS, see FOLIATING.

Axungia of GLASS, see the article AXUNGIA.

Painting in GLASS.—The primitive manner of painting in *glafs*, was very simple, and of consequence very easy: it consisted in the mere arrangement of pieces of *glafs* of different colours, in some sort of symmetry; and constituted a kind of what we call *Mosaic work*. See PAINTING and MOSAIC.

Afterwards when they came to attempt more regular designs, and even to represent figures rais'd with all their shades, their whole address went no further than to the drawing the contours of the figures in black, with water-colours, and hatching the draperies, after the same manner, on *glasses* of the colour of the object intended to be painted. For the carnations, they chose *glafs* of a bright red; upon which they design'd the principal lineaments of the face, &c. with black.

At last, the taste for this sort of painting being considerably improv'd, and the art being found applicable to the adorning of churches, basilicas, &c. they found means of incorporating the colours with the *glafs* itself, by exposing them to a proper degree of fire, after the colours had been laid on.

A French painter of Marfeilles is said to have given the first notion hereof, upon going to Rome, under the pontificate of Julius II. But Albert Durer, and Lucas of Leyden were the first that carried it to any height.

The colours used in painting on *glafs*, are very different from those used either in painting in oil, or water. See COLOUR.—The black is made of two thirds of flakes, or scales of iron, beaten up, and mix'd with another third of rocaille, or little *glafs* beads.—White, with sand, or little white pebbles, calcined, pounded in a mortar, and afterwards ground on marble; with one fourth part of falc-petre added thereto, and the mixture calcined and pulveris'd over again: to which, when they are ready to use it, is added a little gypsum, or plaister of Paris well ground, &c.—For yellow, they use leaf-silver ground, mixed up in a crucible with sulphur, or falc-petre; then, well beaten and ground on a porphyry stone; and, at length, ground over again with nine times as much red oker.—Red is made of litharge of silver, and scales of iron, gum arabic, ferretta, *glafs*-beads, and blood-stone, nearly in equal quantities. This is one of the most difficult colours; and the preparation only to be learned by experience.—Green, is made of *as utlum*, one ounce; as much black lead, and four ounces of white sand, incorporated by the fire. After calcination, they add a fourth part of falc-petre; after a second calcination, a sixth part more: after which they make a third coction before it is used.—Azure, purple, and violet, are prepared like green, only leaving out the *as utlum*, and in lieu thereof using sulphur, for azure; perigueux, for purple; and both those drugs for violet.—Carnations are made of ferretta and rocaille.—And lastly, colours for the hair, trunks of trees, &c. are made of ferretta, rocaille, &c.

This account of the colours we have from M. Felibien's excellent work *des Principes d'Architecture*, &c. Though it must be own'd, that all the painters on *glafs* do not use them; there being few artists of that kind but have invented their own particular ones, whereof they usually make great secrets. But this is certain, that these above described are sufficient for the best paintings of all sorts; provided the person has but the skill to manage them.

In the windows of divers ancient churches, chapels, colleges, &c. we meet with the most beautiful, and lively colours imaginable; such as far exceed any used among us: but it is not that the secret of making those colours is lost; but that the moderns would not go to the expence of them; nor take all the necessary pains; by reason this sort of painting is not now so much esteem'd as formerly.

Those beautiful works, which were made in the *glafs*-houses, were of two kinds: in some, the colour was diffused through the whole body of *glafs*; in others, which were the more common, the colour was only on one side, scarce penetrating within the substance above one third of a line; though this was more, or less, according to the nature of the colour; the yellow being always found to enter the deepest.

These last, though not so strong and beautiful as the former, were of more advantage to the workmen; by reason, on the same *glafs*, though already colour'd, they could then other kind of colours, where there was occasion to embroider draperies, enrich them with foliages, or represent other ornaments of gold, silver, &c.

In order to this, they made use of emery; grinding, or wearing down the surface of the *glafs*, till such time as they were got through the colour, to the clear *glafs*: this done, they applied the proper colours on the other side of the *glafs*.—By this means the new colours were prevented from running, and mixing among the former, when the *glasses* came to be expos'd to the fire, as will be hereafter shewn.

When the intended ornaments were to appear white, or silver'd, they contented themselves to bare the *glass* of its colour with emery, without applying any new colour at all; and it was in this manner, that they wrought the lights and heightenings of all kinds of colours.

The first thing to be done, in order to paint on glass, in the modern way, is to design, and even colour the whole subject on paper. Then they make choice of pieces of *glass* proper to receive the several parts, and proceed to divide, or distribute the design itself, or the paper it is drawn on, into pieces suitable to those of *glass*: having always a view that the *glasses* may join in the contours of the figures, and the folds of the draperies; that the carnations, and other finer parts may not be damaged by the lead wherewith the pieces are to be joined together.

The distribution being made, they mark all the *glasses*, as well as papers, with letters, or numbers; that they may be known again. Which done, applying each part of the design on the *glass* intended for it, they copy, or transfer the design upon this *glass*, with the black colour, diluted in gum-water; by tracing and following all the lines, and strokes, as they appear through the *glass*, with the point of a pencil.

When these first strokes are well dried, which happens in about two days, the work being only in black and white, they give it a slight wash over, with urine, gum arabic, and a little black; and this several times repeated, according as the shades are stir'd to be heighten'd; with this precaution, never to apply a new wash, till the former is sufficiently dried. This done, the lights and risings are given, by rubbing off the colour in the respective places, with a wooden point, or the handle of the pencil.

As to the other colours above-mentioned, they are used with gum-water, much as in painting in miniature; taking care to apply them lightly, for fear of effacing the out-lines of the design; or even for the greater security, to apply them on the other side, especially yellow, which is very pernicious to the other colours, by blending therewith.

And here, too, as in pieces of black and white, particular regard must always be had, not to lay colour on colour, or lay on a new lay, till such time as the former are well dried. It may be added, that the yellow is the only colour that penetrates through the *glass*, and incorporates therewith by the fire: the rest, and particularly the blue, which is very difficult to use, remaining on the surface, or at least entering very little. When the painting of all the pieces is finished, they are carried to the furnace, or oven, to anneal, or bake the colours. The furnace here used is small, built of brick, from eighteen to thirty inches square: at six inches from the bottom is an aperture, to put in the fuel, and maintain the fire. Over this aperture is a grate, made of three square bars of iron, which traverse the furnace, and divide it into two parts. Two inches above this partition is another little aperture, through which they take out pieces, to examine how the coction goes forward.

On the grate is placed a square earthen pan, six or seven inches deep; and five or six inches less, each way, than the perimeter of the furnace. On one side hereof is a little aperture, through which to make the trials, placed directly opposite to that of the furnaces destined for the same end.

In this pan are the pieces of *glass* to be placed in the following manner: first, the bottom of the pan is covered with three strata, or layers of quick-lime, pulverized; those strata being separated by two others, of old, broken *glass*: the design whereof is to secure the painted *glass* from the too intense heat of the fire. This done, the *glasses* are laid horizontally on the last, or uppermost layer of lime.

The first row of *glasses* they cover over with a layer of the same powder, an inch deep; and over this they lay another range of *glasses*; and thus alternately, till the pan is quite full; taking care that the whole heap always end with a layer of the lime powder.

The pan thus prepared, they cover up the furnace with tiles, on a square table of earthen ware, closely luted all round; only having five little apertures, one at each corner, and another in the middle, to serve as chimneys.

Things thus disposed, there remains nothing but to give the fire to the work.—The fire for the two first hours, must be very moderate; and must be increased, in proportion as the coction advances, for the space of ten, or twelve hours; in which time it is usually completed. At last, the fire, which at first was only of charcoal, is to be of dry wood: so that the flame covers the whole pan, and even issues out at the chimneys.

During the last hours, they make essays from time to time; by taking out pieces laid for the purpose, through the little aperture of the furnace, and pan, to see whether the yellow be perfect, and the other colours in good order. When the annealing is thought sufficient, they proceed with great haste to extinguish the fire, which otherwise would soon burn the colours, and break the *glasses*. See FIRE.

Glasses are distinguished with regard to their form, use, &c. into various kinds; as drinking glasses, optic glasses, looking glasses, burning glasses, &c.

Drinking GLASSES are simple vessels of common *glass* or crystal, usually made in form of an inverted cone.

Each *glass* consists of three parts, viz. the calyx, or bowl; the bottom; and the foot; which are all wrought, or blown separately.

Nothing can be more dexterous, and expeditious, than the manner wherein these parts are all blown; two of them opened, and all three joined together. An idea is only to be had thereof, by seeing them actually at work.

The *glasses* chiefly used in England, are made of the ashes of fern; crystal *glasses* being less frequent in use. The exceeding brittleness of this commodity, notwithstanding the easy rare of each *glass*, renders the consumption hereof very considerable.

Optic GLASSES, are those made use of to strengthen, improve, or preserve the sight. See OPTIC *glass*.

GLASSY humour, see the article HUMOUR.

GLAUCOMA *, Γλαυκωμα, in medicine, the name of a disease of the eye, wherein the crystalline humour is turned of a bluish or greenish colour, and its transparency hereby diminished.

* The word comes from the Greek γλαυκος, *glaukos*, castus, sea-green, sky-coloured, or greyish.

Those in whom this disorder is forming, discover it hence, that all objects appear to them as through a cloud or mist: when entirely formed, the visual rays are all intercepted, and they see nothing at all.

It is reckoned incurable, when inveterate, and in aged persons: and even under other circumstances, is very difficult of cure; externals proving of little service.

The internals best suited to it, are those used in the gutta serena.—Jul. Cæsar Claudinus, *Consult* 74. gives a remedy for the glaucoma.

The glaucoma is usually distinguished from the cataract or suffusion, in this, that in the cataract the whiteness appears in the pupil, very near the cornea, but it shews deeper in the glaucoma.

Some late French authors, however, maintain the cataract and glaucoma to be one and the same disease.—According to them, the cataract is not a film, or pellicle formed before the pupil, as had always been imagined; but an inspissation or induration, or the humour itself, whereby its transparency is prevented; which brings the cataract to the glaucoma. See CATARACT.

GLEAM, is popularly used for a ray, or beam of light. See RAY. Among falconers, a hawk is said to gleam, when she casts or throws up filth from the gorge.

GLEANNING, the act or gathering, or picking up the ears of corn, left behind after the field has been reaped, and the crop carried home.

By the customs of some countries, particularly those of Melun, and Estampes, all farmers, and others, are forbid, either by themselves, or servants, to put any cattle into the fields, or prevent the gleanning in any manner whatever, for the space of twenty four hours, after the carrying off the corn; on penalty of confiscation, &c.

GLEBE, GLEBA, in natural history, chemistry, &c. a clod, or piece of stone or earth, frequently containing some metal, or mineral.

The glebes are carried to the forges to be washed, purified, melted, &c.

GLEBE, or GLEBE-land, is properly used for church-land. *Deus vel terra ad ecclesiam pertinet.*

Glebe-land is most commonly used for land belonging to a parish church, beside the tithes *.

* Thus, Lindwood : *Glebe est terra in qua consistit dos ecclesiarum ; generaliter tamen sumitur pro solo, vel pro terra culta.*

Though in the more general, and extensive use of the word, *glebe* is applicable to any land, or ground belonging to any benefice, fee, manour, inheritance, or the like.

Additio GLEBÆ. In the civil law, slaves were said to be annexed to the *glebe*, i. e. they went with it, were sold with it, &c.—The right of patronage should be annexed to a *glebe*. See PATRONAGE.

GLEET, in medicine, a flux of thin humour from the urethra.

A gleet, or a gonorrhæa simplex, often succeeds the cure of a gonorrhæa virulenta, and sometimes remains obstinate, even after the use of a salivation.

The gleet may happen either from a too great relaxation of the glands of the urethra, or from a corrosion or exulceration of them. It appears most frequently after a gonorrhæa has been of long standing, or ill managed in the cure; as by the use of acid or corroding injections, and the like.

The glands may here also happen to be ulcerated by the matter of the running, which is often sharp and corrosive enough for that purpose.

A gleet is distinguished from a gonorrhæa simplex, not only by the colour, and consistence of the matter evacuated, but also by the manner wherein it comes away : The matter of a gleet comes away as well at one time as at another; but that of a gonorrhæa simplex chiefly in erections, and when the patient goes to stool. The matter of a gleet is commonly brownish, but that of a gonorrhæa simplex is white. Add that the continuance of a true gleet is unattended with weaknels, or other ill consequences, and dangerous symptoms; nor does it unfit men for procreation, as a gonorrhæa simplex will.

An astringent regimen is the most suitable in both; coffee and claret are supposed proper liquors in these cases: So are all those made acid with juice of lemons, vinegar, &c.

GLENE, ΓΛΗΝΗ, properly signifies the cavity, or socket of the eye. See EYE.

GLENE is more frequently used by anatomists for the shallower cavities of bones, into which some other bone is received, and articulated.

By which it stands distinguished from *cotyle* or *acetabulum*, which is a deeper cavity, intended by nature for the like purpose.

GLENOIDES*, an appellation given to the two cavities in the lower part of the first vertebra of the neck.

* The word is Greek, composed of γλην and ειδω, form **GLICYRRHIZA**, or **GLYCYRRHIZA**, liquorice. See LIQUORICE.

GLOBE, in geometry, a round or spherical body; more usually called a *sphere*.

The earth, and water, together, are supposed to form a *globe* hence called the *terrestrial globe*.

The planets, both primary, and secundary, are supposed, as well as our earth, to be solid *globes*.

The earth is, in a peculiar sense, called the *globe*, or *globe of earth*.

Resistance of a GLOBE. See the article RESISTANCE.

GLOBE is more particularly used for an artificial sphere of metal, plaster, paper, or some other matter; on whose convex surface is drawn a map, or representation, either of the earth, or heavens; with the several circles conceived thereon.

Globes are of two kinds, *terrestrial*, and *celestial*; each of very considerable use, the one in astronomy, and the other in geography, to perform many of the operations thereof, in an easy, sensible manner, so as to be conceived without any knowledge of the mathematical grounds of those arts.

The fundamental parts, common to both *globes*, are an axis, representing that of the world; and a spherical shell, or cover, which makes the body of the *globe*, on whose external surface the representation is drawn.

Globes, we have observed, are made of divers materials, viz. silver, brass, paper, plaster, &c. Those commonly used, are of plaster, and paper: The construction whereof is as follows:

Construction of GLOBES.—A wooden axis is provided somewhat less than the intended diameter of the *globe*, and into the extremes hereof two iron wires are driven, for poles: This axis is to be the beam, or basis of the whole structure.

On the axis are applied two spherical, or rather hemispherical caps, formed on a kind of wooden mould, or block.—These caps consist of pasteboard, or paper, laid one lay after another on the mould, to the thickness of a crown-piece; after which, having stood to dry, and imbedded; making an incision along the middle, the two caps thus parted, are slipped off the mould.

They remain now to be applied on the poles of the axis, as before they were on those of the mould: And to fix them in their new place, the two edges are sown together with pack-thread, &c.

The rudiments of the *globe* thus laid, they proceed to strengthen, and make it smooth and regular. In order to this, the two poles are halped in a metalline semicircle, of the size intended; and a kind of plaster, made of whiting, water, and glue heated, melted, and incorporated together, is daubed all over the paper-surface. In proportion as the plaster is applied, the ball is turned round in the semicircle, the edge whereof pares off whatever is superfluous, and beyond the due dimension; leaving the rest adhering in places that are short of it.

After such application of plaster, the ball stands to dry; which done, it is put again in the semicircle, and fresh matter applied: Thus they continue alternately to apply the composition, and dry it, till such time as the ball every where accurately touches the semicircle; in which state it is perfectly smooth, regular, firm, &c.

The ball thus finished, it remains to paste the map, or description thereon: In order to this, the map is projected in several gores, or gussets; all which join accurately on the spherical surface, and together cover the whole ball. To direct the application of these gores, lines are drawn by a semicircle on the surface of the ball, dividing it into a number of equal parts corresponding to those of the gores, and subdividing those again answerably to the lines and divisions of the gores.

The papers thus pasted on, there remains nothing but to colour and illuminate the *globe*; and to varnish it, the better to resist dust, moisture, &c.

The *globe* itself, thus finished, they hang it in a brass meridian, with an hour circle, and quadrant of altitude; and thus fit it into a wooden horizon.

Description of the GLOBES.—The things common to both *globes*, are either delineated on the surface; or added as appendages, without it.

Without the surface, are 1° The two poles, whereon the *globe* is turned, representing those of the world. See POLE.

2° The brazen meridian, which is divided into degrees, and passes through the poles.—3° The wooden horizon, whose upper side represents the horizon; and is divided into several circles: The innermost whereof contains the twelve signs of the zodiac, subdivided into their degrees; the next, the julian; and the third, the gregorian calendar: Without side of all these, are drawn the points of the winds.—4° A brass quadrant of altitude, divided into 90 degrees, to be fastened on the meridian at the distance of 90 degrees from the horizon.

—5° The hour circles, divided into twice twelve hours, and fitted on the meridian, round the poles, which carry an index pointing to the hour.—A mariner's compass is sometimes added on the bottom of the frame; and sometimes, a semicircle of position.

On the surface are delineated, 1° The equinoctial line, divided into 360 degrees; commencing from the vernal intersection.

—2° The ecliptic, divided into twelve signs, and these subdivided into degrees.—3° The zodiac.—4° The two tropics.—And 5° The polar circles, all which see under their proper articles.

What else belongs to *globes*, either as to construction, or description, is different, as the *globe* is either celestial, or terrestrial. See *celestial* and *terrestrial GLOBES*.

Celestial GLOBE, is an artificial sphere, on whose convex surface the fixed stars are laid down, at proportionable distances, together with the principal circles of the sphere.

The use of these *globes*, is to exhibit the phenomena of the motions of the sun, and stars, in an easy, and obvious manner; which, though somewhat inaccurate, is yet exact enough for the common uses of life, and may save the trouble of trigonometrical calculation.

To exhibit the stars, circles, &c. on the surface of a given sphere, or ball, and fit it for the uses of astronomy.—1° Assume any two points diametrically opposite to each other, as P, and Q. (Tab. Astronomy, fig. 58.) and in these, fix up axes, P A, and Q C, for the ball to turn round on. The points P and Q, or A and C, will exhibit the poles of the world.

2° Divide a brazen circle ABCD into four quadrants, A E, E C, C F, and F D; and subdivide each quadrant into 90 degrees, numbered from the points E, and F towards the poles A, and C.

3° Incline the *globe* in this circle, as in a meridian, at the points A, and C, so as it may freely turn therein.

4° Apply a style, or pin, to the surface of the *globe*, in the first degree of the meridian, and turn the ball round; by this means will a circle be described on the surface, representing the equator, to be divided into degrees.

5° From the pole of the world P, towards M, and from the other pole C, towards N, number 23 1/2 degrees; the points M and N will be the poles of the ecliptic.

6° Apply a style to the meridian, in the point M, and turn the globe round; by this rotation will the arctic polar circle be described: And after the same manner is the antarctic polar to be described about the point O.

7° Number $23\frac{1}{2}$ deg. from the equator towards the poles P, and Q; and note the points H, and L. Then, applying a style to the meridian, as before, two circles will be described parallel to the equator; whereof that drawn through H, will be the tropic of cancer, and the other through L, the tropic of capricorn.

8° Hang the globe within the meridian, in the poles of the ecliptic, as before in the poles of the world; and applying a style to E, turn it round: by this means will the ecliptic be delineated; which remains to be divided into 12 signs; and each of these again divided into 30 degrees.

9° While the globe remains thus suspended, bring the degree of longitude of any star under the meridian; and in the meridian, number as many degrees towards the pole as is the degree of latitude of the place: The point of intersection is the place of that star on the surface of the globe. After the like manner may the place of the star be determined from the right ascension and declination given; the globe being supposed suspended from the poles of the world, or the equator.

10° All the stars of a constellation thus laid down; the figure of the constellation is to be designed; after which it may either be coloured, or engraven.

11° Place the globe with the meridian, in a wooden frame, or horizon D B L, supported on four feet; in such manner, as to be divided thereby into two hemispheres; and that the pole A may be raised or depressed at pleasure.

12° On the limb, or edge of the horizon describe a circle, which divide into 360 degrees, and insert the calendars, and winds.

13° Lastly, to the pole A, fit a brazen circle, divided into 24 horary parts, and numbered twice twelve, so that the line or division of XII, may be in the plane of the meridian, on either side the pole. And on the pole itself apply an index, to turn round with the globe.—Thus is the globe completed.

It may be here observed, that as the longitude of the stars is continually growing, a globe does not remain of perpetual use; but the increase in seventy-two years only amounting to a degree, the whole will make no considerable error in an hundred years; the design of a globe being only to represent things something near the truth.

To make a celestial GLOBE.—This method is that the most frequently used; and we only premised the former as being the most easily conceived; and leading more naturally to this.

1° From the given diameter of the globe, find a right line A. B. fig. 59. n. 2. equal to the circumference of a great circle; and divide it into twelve equal parts.

2° Through the several points of division, 1, 2, 3, 4, &c. with the interval of 10 of them, describe arches, mutually intersecting each other in D and E. These figures, or pieces duly pasted or joined together, will make the whole surface of the globe.

3° Divide each part of the right line A B, into 30 equal parts; so that the whole line A B, representing the periphery of the equator, may be divided into 360 degrees.

4° From the poles D, and E, fig. 60. with the interval of $23\frac{1}{2}$ deg. describe arches a b; these will be twelfth parts of the polar circles.

5° After the like manner, from the same poles D, and E, with the interval of $66\frac{1}{2}$ deg. reckoned from the equator, describe arches c d; these will be twelfth parts of the tropics.

6° Through the degrees of the equator & corresponding to the right ascension of any given star, and the poles D and E, draw an arch of a circle; and taking in the compasses the complement of the declination from the pole D, describe an arch, intersecting it in i; this point i will be the place of that star.

7° All the stars of a constellation being thus laid down; the figure of the constellation is to be drawn according to Bayer, Hevelius, or Flamsteed.

8° Lastly, after the same manner are the declinations, and right ascensions of each degree of the ecliptic d g to be determined.

9° The surface of the globe thus projected on a plane, is to be engraven on copper, to save the trouble of doing this over again for each globe.

10° A ball, in the mean time, is to be prepared of paper, plaster, &c. after the manner above directed, and of the intended diameter of the globe. On this, by means of a femicircle, and style, is the equator to be drawn; and through every 30th degree, a meridian. The ball thus divided into twelve parts, corresponding to the segments before projected; they are to be cut from the printed paper, and pasted on the ball.

11° Nothing now remains but to hang the globe as before in a brazen meridian, and wooden horizon. To which may be added a quadrant of altitude H I, fig. 61. made of brass, and divided in the same manner, as the ecliptic and equator.

Vol. I.

If the declinations, and right ascensions of the stars be not given; but their longitudes, and latitudes, in lieu thereof; the surface of the globe is to be projected after the same manner as before, except that in this case D, and E, fig. 59; are the poles of the ecliptic, and f h the ecliptic itself; and that the polar circles, and tropics, with the equator g d, and the parallels thereof, are to be determined from their declinations.

One of the fullest catalogues of the stars is that of Mr. Flamsteed, wherein the right ascensions and declinations, as well as the longitudes, latitudes, &c. are every where expressed.

Use of the celestial GLOBE.—The use of this instrument is very extensive: Scarce any thing in the spherical astronomy; but may be exhibited thereby.

The principal points are contained in the following problems with their solutions; which will let the reader enough into the nature and reason of this noble instrument to apply it, of his own accord, in any other cases.

To find the right ascension, and declination of a star, represented on the surface of the GLOBE.—Bring the star to the graduated side of the brazen meridian: Then, the number of degrees intercepted between the equator, and the point of the meridian cut by the star, gives its declination; and the degree of the equator, which comes under the meridian together with the star, is its right ascension.

To find the longitude and latitude of a star.—Apply the centre of the quadrant of altitude over the pole of the ecliptic in the same hemisphere with the star; and bring its graduated edge to the star: The degree on the quadrant cut by the star is its latitude, reckoned from the ecliptic; and the degree of the ecliptic cut by the quadrant, its longitude.

To find the sun's place in the ecliptic.—Seek the day of the month in the proper calendar on the horizon; and against the day in the circle of signs is the sign and degree the sun is in for that day. This done, find the same sign upon the ecliptic, on the surface of the globe: This is the sun's place for that day.

To find the declination of the sun.—The sun's place for the day given being brought to the meridian; the degrees of the meridian intercepted between the equinoctial and that place, are the sun's declination for that day, at noon.

To find the place of a planet, with its right ascension and declination; its longitude, and latitude, for the time being given.—Apply the centre of the quadrant of altitude on the pole of the ecliptic (the pole, we mean, of the same denomination with the latitude;) and bring it to the given longitude in the ecliptic: this point is the planet's place: And bringing it to the meridian, its right ascension, and declination will be found as already shewn of a star.

To rectify the GLOBE, or adjust it to the place, &c. so as it may represent the present state, or situation of the heavens.—

1° If the place be in north latitude, raise the north pole above the horizon; if in south, raise the south pole; till the arch intercepted between the pole and horizon be equal to the given elevation of the pole. 2° Fix the quadrant of altitude on the zenith, i. e. on the latitude of the place. 3° By means of a compass or meridian line place the globe in such manner as that the brazen meridian may be in the plane of the terrestrial meridian. 4° Bring the degree of the ecliptic the sun is in, to the meridian, and set the horary index to 12. Thus will the globe exhibit the face of the heavens for the noon of that day. 5° Turn the globe till the index come to any other given hour: thus will the globe shew the face of the heavens for that time.

To know all the stars and planets by means of the GLOBE.—

1° Adjust the globe to the state of the heavens, for that time. 2° Look on the globe for some one star; which you know; e. gr. the middlemost star in the tail of the great bear. 3° Observe the positions of the other more conspicuous stars in the same constellation: and by transferring the eye from the globe to the heavens, you will easily note the same there. 4° After the same manner may you proceed from this to the neighbouring constellations; till you have learned them all.

If the planets be represented on the globe, after the manner above described, by comparing them with neighbouring stars, you will likewise know the planets.

To find the sun's oblique ascension, his eastern amplitude, and azimuth, with the time of rising.—Rectify the globe for the hour of 12; and bring the sun's place to the eastern side of the horizon: Then, the number of degrees intercepted between that degree of the equator now come to the horizon, and the beginning of aries, is the sun's oblique ascension.

2° The degrees on the horizon intercepted between the east point thereof, and the point wherein the sun is, is the eastern, or rising amplitude. 3° The hour pointed to by the index, is the time of the sun's rising. 4° Turning the globe, till the index points to the present hour; lay the quadrant to the sun's place; the degree cut by the quadrant, in the horizon, is the sun's azimuth.

To find the sun's oblique descension, western amplitude, and azimuth, with the time of setting.—The solution of this problem

is the same as that of the former; excepting that the sun's place must be here brought to the western side of the horizon; as in the former it was to the eastern.

To find the length of day and night. 1° Find the time of the sun's rising; which being numbered from midnight, the double thereof gives the length of night. 2° Subtract the length of the night from the whole day, or 24 hours; and the remainder is the length of the day.

To find the rising, setting, and culminating of a star, its continuance above the horizon, for any place and day; together with its oblique ascension, and descension; and its eastern and western amplitude and azimuth. 1° Adjust the globe to the state of the heavens, at 12 a-clock, that day. 2° Bring the star to the eastern side of the horizon: Thus will its eastern amplitude, and azimuth, and the time of rising be found; as already taught of the sun. 3° Bring the same star to the western side of the horizon: Thus will the western amplitude and azimuth, and the time of setting be found. 4° The time of rising subtracted from that of setting, leaves the continuance of the star above the horizon. 5° This continuance above the horizon subtracted from 24 hours, leaves the time of its continuance below the horizon. 6° Lastly, the hour to which the index points, when the star is brought to the meridian, gives the time of its culmination.

To find the altitude of the sun, or a star, for any given hour of the day, or night. 1° Adjust the globe to the position of the heavens; and turn it till the index point at the given hour. 2° Fix on the quadrant of altitude, at 90 degrees from the horizon, and bring it to the sun's or star's place. The degrees of the quadrant intercepted between the horizon, and the sun or star is the altitude required.

The altitude of the sun by day, or of a star by night being given, to find the time of that day, or night. 1° Rectify the globe as in the preceding problem. 2° Turn the globe, and quadrant till such time as the star, or degree of the ecliptic of the sun is in, cut the quadrant in the given degree of altitude; then does the index point at the hour sought. See TIME, Hour, &c.

The azimuth of the sun, or a star, given; to find the time of day, or night. Rectify the globe; and bring the quadrant to the given azimuth in the horizon: Turn the globe, till the star come to the same: Then will the index shew the time.

To find the interval of time between the risings of two stars; or their culminations. 1° Raise the pole of the globe to many degrees above the horizon, as is the elevation of the pole of the place. 2° Bring the first star to the horizon; and observe the time the index points to. 3° The same do by the other star. Then subtracting the former time from the latter; the remainder is the interval between the risings.

After the like manner is the interval between two culminations found; by bringing both stars to the meridian.

To find the beginning and ending of the crepusculum or twilight.—1° Rectify the globe; and set the index to the twelfth hour; the sun's place being in the meridian. 2° Note the sun's place, and turn the globe westward, as also the quadrant of altitude, till the point opposite to the sun's place cut the quadrant of altitude in the eighteenth degree above the horizon. The index will then shew the time when the twilight commences in the morning. 3° Taking the point opposite to the sun; bring it to the eastern hemisphere, and turn it, till it meet with the quadrant of altitude in the eighteenth degree: Then will the index shew the time when the twilight ends.

Terrestrial GLOBE, is an artificial sphere, on whose surface are delineated the principal places of the earth, in their proper situations, distances, &c. together with the circles imagined on the surface of the terrestrial sphere.

The use of the terrestrial globe, is to exhibit the several affections, and phenomena of the different places of the earth, depending on magnitude, &c. in an easy, obvious manner, without the trouble of trigonometrical calculation.

To construct a terrestrial GLOBE.—The construction of a terrestrial globe, whether of metal, plaister, paper, &c. is the same as that of a celestial. The same circles are delineated on both: And as for the places, viz. cities, towns, &c. they are laid down from the longitudes, and latitudes given; as the stars are from their right ascensions, and declinations.

Hence, all problems depending on the circles, may be equally wrought on either globe; as the ascensions, descensions, amplitudes, azimuths, arisings, settings, altitudes, &c. of the sun; the lengths of day and night; hours of the day and night; crepuscula, &c.

We shall here, therefore, only give what is peculiar to the terrestrial globe.

Use of the terrestrial GLOBE.—*To find the longitude and latitude of any place delineated on the globe.*—Bring the place to the graduated side of the brass meridian: the degree of the meridian it cuts, is the latitude required; and the degree of the equator at the same time under the meridian, is the longitude required.

The longitude and latitude given, to find the place on the GLOBE.—Seek, in the equator, the given degree of longitude, and bring it to the meridian: then count from the equator on the meridian the degree of latitude given, towards this or that pole, as the latitude is either north, or south: the point under this is the place required.

To find the antixci, perixci, and antipodes of any place. 1° The given place being brought to the meridian; count as many degrees on the meridian from the equator towards the other pole. The point which is thus arrived at, is the place of the antixci. 2° Note the degrees of the meridian over the given place and its antixci; and turn the globe till the opposite degree of the equator, come under the meridian; or, which amounts to the same, till the index, which before stood at twelve, come to the other twelve: then will the place corresponding to the former degree, be the perixci; and the latter, that of antipodes.

To find what place of the earth the sun is vertical to at any time assigned. 1° Bring the sun's place found in the ecliptic to the meridian, and the index to the hour of twelve: noting what point of the meridian corresponds thereto. 2° If the given hour be before noon; subtract it from twelve hours; and turn the globe towards the west, till the index point at the hours remaining. Thus will the place required be under the point of the meridian before noted. 3° If the hour be after noon, turn the globe in the same manner towards the west, till the index point at the given hour: thus again will the place required be found under the point of the meridian before noted.

If, at the same time, you note all the places which are under the same half of the meridian with the place found, you will have all the places to which the sun is then in the meridian: and the opposite half of the meridian will shew all the places, in which it is then midnight.

A place being given in the torrid zone, to find the two days in the year wherein the sun is vertical to the same. 1° Bring the given place to the meridian; and note the degree of the meridian corresponding thereto. 2° Turn the globe about, and note the two points of the ecliptic passing through that degree. 3° Find on what days the sun is in those points of the ecliptic: For on those days he is vertical to the given place.

To find those places in the torrid zone to which the sun is vertical on a given day.—Bring the sun's place in the ecliptic to the meridian: then turning the globe round, note all the places which pass through that point of the meridian. Those are the places required.

After the same manner may be found what people are *ascii*, for any given day. See ASCII.

A place being given in the frigid zone, to find on what days of the year the sun does not rise; and on what days he does not set to the same.—1° Count as many degrees in the meridian from the equator towards the pole, as is the distance of the given place from the pole. 2° Turning the globe round, note all the points of the ecliptic passing through each point noted in the ecliptic: by this means you will have the arches which the sun describes while he neither rises, nor sets; and the points themselves give the places of the sun, when he neither rises nor sets, at the beginning and ending. 3° Find what days of the year the sun is in those places: these are the answer to the question.

To find the latitude of the places wherein any given day is of any given length. 1° Bring the sun's place for the given day to the ecliptic, and set the index to the hour of twelve. 2° Turn the globe, till the index point at the hour of rising or setting. 3° Raise and depress the pole till the sun's place appear in the eastern or western side of the horizon. Then will the pole be duly elevated, and consequently the latitude given.

To find the latitude of those places in the frigid zone, where the sun does not set for a given number of days. 1° Count so many degrees from the next tropic, towards the equinoctial point, as there are units in half the number of the given days; by reason, the sun, in its proper motion, goes nearly a degree every day. 2° Bring the point of the ecliptic, thus found, to the meridian: and its distance from the pole will be equal to the elevation of the pole, or latitude of the places required.

Any hour of the day, or night being given, to shew all those places to which the sun rises, and sets; where it is noon, or midnight; and where day, or night. 1° Find what place the sun is at that time vertical to, as already taught. 2° Let this place be brought to the zenith of the wooden horizon, i. e. elevate the pole as the latitude of that place requires. Then will the places on the eastern side of the horizon, be those the sun is setting to; and on the western side, those he rises to; those under the upper semicircle of the meridian, have it noon; and those under the lower, midnight. Lastly, to those in the upper hemisphere it is day; and to those in the lower, night.

Hence, as, in the middle of an eclipse, the moon is in that degree

G L O

degree of the ecliptic opposite to the sun's place; by the present problem it may be shewn what places of the earth then see the middle of the eclipse; and what, the beginning, or ending.

To find what places of the earth a planet, e. g. the moon, is vertical to, any day of the year.—1° Mark the planet's place on the globe, as above taught. 2° Bring this place to the meridian; and note the degree over it. 3° Turn the globe round; and the places which pass under the point, are those required.

The declination of a star, or any other phenomenon given; to find what parts of the earth the same is vertical to.—Count as many degrees in the meridian, from the æquator towards one pole as are equal to the given declination; and *viz.* towards the north if the declination be northward; and towards the south if the declination be south. Then, turning it round, the places that pass through the extremity of this arch in the meridian, are the places required.

To determine the place of the earth where any star, or other celestial phenomenon, will be vertical at a given hour. 1° Elevate the pole according to the latitude of the place, from whose noon or midnight the hours are numbered. 2° Bring the sun's place for that day to the meridian, and set the index at twelve a-clock. 3° Determine the place of the star on the surface of the globe, and bring it to the meridian: the index will shew the difference of time between the appulse of the sun and star to the meridian of the place: Note the point of the meridian over the place of the star. 4° Find in what places of the earth it is then noon, and set the index to twelve a-clock. 5° Turn the globe towards the west, till the index have passed over the interval of time between the culmination of the sun and star. Then, under the point of the meridian before observed, will the place required be found.

And hence may always be found what place a star, or other phenomenon rises or sets to, at any given time.

To place the GLOBE in such manner, under any given latitude, as that the sun shall illuminate all those regions, which he actually illuminates on earth.—1° Rectify the globe, i. e. elevate the pole according to the latitude of the place: bring the place to the meridian; and set the globe north and south by the compasses: thus, the globe having the same situation with regard to the sun, as the earth has; that part thereof will be illuminated, which is illuminated on earth.—Hence also the globe being situate in the same manner when the moon shines, it will shew what parts are then illuminated by the moon.

And, in the like manner, may we find where the sun and moon rise, and set at any given time.

To find the distance of two places on the GLOBE.—Take the given places in the compasses; and apply them to the æquator. The degrees which they there subtend, being reduced into miles, leagues, or the like, give the distances required.

The same may be done, and that more commodiously, by laying the graduated edge of the quadrant of altitude over the two places; and noting the degrees intercepted.

Dialling GLOBE, see the article DIALLING.

GLOBULAR Chart, a representation of the surface, or some part of the surface, of the terraqueous globe, upon a plane; wherein the parallels of latitude are circles nearly concentric; the meridians, curves bending towards the poles and the rhumb-lines also curves.

The merits of this chart consist in this, that the distances between places upon the same rhumb, are all measured by the same scale of equal parts, and the distance of any two places in the arch of a great circle, is nearly represented in this chart by a straight line.—Hence, land maps made according to this projection, would indubitably have great advantages above those made any other way. See MAP.

But for sea charts, and the uses of navigation, it is yet controverted, whether the globular chart be preferable to mercator's, where the meridians, parallels, and particularly the rhumb-lines, are all straight lines; inasmuch as straight lines are found more easy to draw, and manage than curves, especially such as the rhumb-lines on the globular chart are.—This projection is not new, though not much taken notice of till of late. It is mentioned by Ptolemy, in his Geography; as also by Blundeville in his Exercises.

GLOBULAR sailing; see Great circle SAILING.

GLOBULE, GLOBULUS, a little globe; or otherwise called a spherule. See GLOBE.

Thus the red particles of the blood are called globules of the blood, on account of their redness, and smallness. The microscope discovers the blood to consist of red, globular particles, swimming in a limpid, transparent water, or serum; and these, when at a due distance, may be discerned to attract each other, and unite into larger globules, like the spheres of quick-silver.

The Cartesians call the particles broken off the matter of their first element, globules of the second element. See ELEMENT, CARTESIAN, &c.

GLOBULUS Nasi, is used for the lower flexible, cartilaginous part of the nose.

G L O

GLORIA Patri, in the liturgy, a formula of words repeated at the end of each psalm, and on other occasions, to give glory to the holy trinity; called also the doxology. See DOXOLOGY.

It is thus denominated, because beginning in the Latin office with these words, gloria Patri, q. d. glory be to the Father, &c. Pope Damascus is commonly held to have first ordered the rehearsal, or rather singing the gloria Patri at the ends of psalms. Baronius, indeed, will have it to have been used in the times of the apostles: but its use, then, he allows to have been more obscure; and that it did not become popular till after the rise of arianism, when it was made a kind of symbol of orthodoxy.

The fifth canon of the council of Vaison, held in 529, decrees, "that the name of the pope shall always be rehearsed in the churches of France, and after the gloria Patri, shall be added sicut erat in principio, as is done at Rome, in Africa, &c. on account of the heretics, who say that the Son of God had his beginning in time." Fleury.

GLORIA in excelsis, is also a kind of hymn rehearsed in divine service, beginning with the words gloria in excelsis Deo, & in terra pax hominibus. &c. Glory be to God on high, on earth peace, &c.

GLOSS*, GLOSSA, a comment on the text of any author, to explain his sense more fully, and at large; whether in the same language, or in any other.

* The word, according to some, comes from the Greek γλωσσα, tongue; the office of a gloss being to explain the text; as that of the tongue is to discover the mind. Others derive it from the Latin glos, a filter-in-law; which among the lawyers sometimes stands for filter; the gloss being, as it were, filter to the text.—

Nic. de Lyra composed a postil or gloss on the bible in six volumes, folio.—The French say proverbially of an ill comment, that it is *glose d'Orléans, plus obscure que le texte.*

Gloss is also used for a literal translation; or an interpretation of an author in another language, word for word.

Young scholars need an interlineary gloss for the understanding of Juvenal, Horace, Sallust, Perseus, &c.

Gloss is also used in matters of commerce, &c. for the lustre of a silk, stuff, or the like.

GLOSSARY, GLOSSARIUM, a kind of dictionary for explaining the obscure, antient, and barbarous words, and phrases of an altered, corrupted, or refined language.

Spelman's glossary, intitled *Archæologium*, is an excellent work; though that author did not begin to study in this way till fifty years of age.—M du Cange's Latin glossary in three volumes, and his Greek glossary in two volumes folio, are excellent performances, full of uncommon erudition.—Lindembroek has a glossary on the laws of Charlemaign, &c.

GLOSSOCOMON*, Γλωσσόκομον, a chirurgeon's instrument, antiently used in setting broken, and dislocated thighs and legs; as also in extending those which remained too short after setting.

* The word is formed of the Greek Γλωσσα, tongue, and κομω, to have care; and was properly and primarily given by the antients to a little box, wherein they kept the reeds of their haubois, &c.

The glossocomon is described as consisting of an hollow trunk, wherein the thigh, or leg is laid: at the bottom hereof is a kind of wheel; and towards the top are two pulleys on each side. Several thongs of leather are tied both above and below the fractured place. Those below are fastened to the axis of the wheel, which they are near: Those above go over the pulleys to come to the axis, which they are likewise fastened to; so that the same turning of the wheel, both draws the part of the leg, or thigh, which is above the fracture, upwards; and that below, downwards.

GLOSSOCOMON, in mechanics, is a name given by Hiero to a machine composed of divers dented wheels, with pinions serving to raise huge burdens.

GLOSSOPETRA, or GLOTTOPETRA, in natural history, a kind of extraneous fossil somewhat in form of a serpent's tongue; frequently found in the island of Malta, and divers other parts.

Naturalists have been much divided as to the nature, and origin of these bodies.—Steno, *de corpore solido intra solidum contento*; Ol. Wormius, *differt. de glossopetra*; and Reylichius *de glossopetris Lunenburgensibus*, treat of them at large.

The vulgar notion is, that they are the tongues of serpents petrified; and hence their name, which is a compound of Γλωσσα, tongue, and πέτρα, stone.—Hence also their traditionally virtue in curing the bites of serpents.

The people relate that since the viper which bit St. Paul without doing him any harm, all the serpents of the island of Malta have had the same virtue: and that the glossopetrae are the tongues of those formerly dead.—But this is palpable false, which the sole figure of the glossopetra refutes; they having very little of the shape of a serpent's tongue; beside that they are too big.

The general opinion of naturalists is that they are the teeth of fishes, left at land by the waters of the deluge; and since petrified.

They

They even specify the very kind of fish; and take it to be that which Theophrastus, and the Greek writers call *καρχarias* and the moderns, the *shark* or *sea-dog*.

Camerarius cannot persuade himself that the *glossopetra* found in England, Malta, and around Montpellier, were ever the teeth of a sea-dog, or any other fish. The chief difficulty, he suggests, is the small quantity of volatile salt and oil which they afford by distillation. To which Dr. Woodward answers, in defence of the common system, that having lain so long buried under ground, 'tis no wonder they should have lost the best part of their volatile principles. It is certain that human bones and skulls long interred, do not afford near the quantity of those principles, that they would have done immediately after the person's death.

Another scruple proposed by Camerarius is, that the *glossopetra*, when exposed to the naked fire, turn to a coal, and not to a calc; contrary to what is asserted by Fabius Columna. Dr. Woodward answers, that it is likely enough the *glossopetra*, in burning, may assume the form of coal, before it arrive at that of a calc. See Supplement, article LAMIODONTES.

GLOTTIS, in anatomy, a cleft, or chink in the larynx, serving for the formation of the voice.

The *glottis* is in form of a little tongue; whence its name, from *γλωττα* tongue. For the same reason the Latins call it *lingula*, i. e. little tongue.

Through this chink the air descends, and ascends in respiring, speaking, singing, &c. It has an apparatus of muscles, whereby we contract and enlarge it; and hence all the variety of tones of the voice.

The *glottis* is covered and defended with a thin, soft cartilage called the *epiglottis*.

GLOTTOPETRA, see the article GLOSSOPETRA.

GLOVE, *Chirabacca*, a habit, or covering for the hand, and wrist; used both for warmth, decency, and as a shelter from the weather.

Gloves, are distinguished, with respect to commerce, into leather gloves, silk gloves, thread gloves, cotton gloves, worsted gloves, &c.

There are also gloves of velvet, satin, taffaty, &c. Leather gloves are made of shammy, kid, lamb, doe, elk, buff, &c. There are also perfumed gloves; washed, glazed, waxed gloves; and white, black, buff-colour, &c. gloves; single, lined, top'd, laced, fringed with gold, silver, silk, fur, &c.

It is a proverb, that for a glove to be good, and well made, three kingdoms must contribute to it: Spain, to dress the leather; France, to cut it; and England, to sew it. But, of late, the French seem to have appropriated the functions of the other two; the gloves of the French manufacture being now said to have the advantage in point of dressing and sewing, as much as of cutting.

To throw the GLOVE, was a practice or ceremony very usual among our forefathers; being the challenge, whereby another was deputed to single combat. It is still retained at the coronation of our kings, when the king's champion casts his glove in Westminster-Hall.

Favyn apposes the custom to have arose from the eastern nations, who in all their sales, and deliveries of lands, goods, &c. used to give the purchaser their glove by way of livery, or investiture. To this effect he quotes Ruth iv. 7. where the Chaldee paraphrase calls *glove*, what the common version renders by *stone*. He adds, that the Rabbins interpret by *glove*, that passage in the civith Psalm, in *Idumeam extendam calcamentum meum*, over *Edom* will I cast out my shoe. Accordingly, among us, he who took up the *glove*, declared thereby his acceptance of the challenge; and as a part of the ceremony, continues Favyn, took the *glove* off his own right-hand, and cast it upon the ground, to be taken up by the challenger. This had the force of a mutual engagement on each side, to meet at the time and place which should be appointed by the king, parliament, or judges.

The same author asserts, that the custom which still obtains of blessing gloves in the coronation of the kings of France, is a reman of the eastern practice of giving possession, with the *glove*, l. xvi. p. 107, &c.

Antiently it was prohibited the judges to wear gloves on the bench. And at present in the stables of most princes, it is not safe going in without pulling off the gloves.

GLUE, GLUTEN, a viscid, tenacious matter serving as a cement to bind, or connect divers things together.

There are divers kinds of *glues* made use of in the divers arts; as the common *glue*; *glove glue*; *parchment glue*. But the two last are more properly called *sizes*.

The common or *fish glue* is a commodity used by numerous kinds of artificers; as joiners, cabinet-makers, cale-makers, haters, book-binders, &c. And the consumption thereof is very considerable. The best is that made in England, in square pieces, of a ruddy, brown colour. Flanders *glue* is held the next after the English.

Glue is made of the skins of all kinds of beasts, as oxen, cows, calves, sheep, &c. The older the beast is, the better is the *glue* that is made of its hide. Indeed, it is rare they use whole skins for this purpose; those being capable of being applied to

better purpose: But they make use of the shavings, parings, or scraps thereof: and sometimes they make it of the feet, sinews, nerves, &c. of beasts.

That made of whole skins is the best; and that of sinews &c. the worst: and hence chiefly arises the difference of *glues*; and the advantage of the English and Flemish *glues*; for, as our tanners generally make the *glue* themselves; they are not sparing of the parings of the skins, which they never sell: whereas, in France, &c. the *glue-makers* being a peculiar kind of manufacturers, and having no parings but what they buy, make use chiefly of sinews, feet, &c.

Method of making GLUE.—To make *glue* of parings, they first steep them two or three days in water; then washing them well out, they boil them to the consistence of a thick gelly. This done, they pass the gelly, while yet hot, through oser baskets, to separate from it any impurities; and in order to purify it still further, they let it rest some time. When the ordures, or foreign matters are precipitated to the bottom of the vessel; they melt and boil it a second time.

This done, they pour it into flat frames, or moulds; whence it is taken out, when pretty hard and solid, and then cut into square pieces, or cakes. Nothing now remains, but to dry it in the wind, on a sort of coarse net, and afterwards to string it, to finish the drying.

The *glue* made of feet, sinews, &c. is managed after the same manner; with this only difference, that they bone and scour the feet, and don't lay them to steep.

The best *glue* is that which is oldest: the surest test of goodness is to lay a piece to steep three or four days in water; if it swell considerably without melting, and when taken out resume its former dryness, it is excellent.

Fish GLUE, is a sort of *glue* made of the nervous and mucilaginous parts of a large fish, found chiefly in the Russian seas. These parts being boiled, bear a near resemblance to that viscid matter found on the skins of codfish. When boiled to the consistence of a gelly, they spread it on a leaf of paper, and form it into cakes; in which state it is sent to us.

Fish *glue* is of considerable use in medicine, and divers other arts; where it is better known under the names of *fish-glass* and *ichthyocolla*.

GLUTEUS, in anatomy, is a name common to three muscles, whose office is to extend the thigh.—The first,

GLUTEUS major, or the greater, arises semicircularly from the os coccygis, the spines of the sacrum, the spine of the ilium, and a strong ligament which runs between the sacrum, and tubercle of the ilium; and descending, is inserted into the linea aspera, four fingers breadth below the great trochanter. See Tab. Anat. (Myol.) fig. 1. n. 51. fig. 6. n. 33.

GLUTEUS medius, or the middle one, called minor, or less, arises from the spine of the ilium, under the former, and is inserted into the superior and external part of the great trochanter. See Tab. Anat. (Myol.) fig. 1. n. 50. fig. 2. n. 33. fig. 6. n. fig. 7. n. 13.

GLUTEUS minimus, or least, arises from the lower part of the external side of the ilium, under the former, and is inserted at the superior part of the great trochanter. See Tab. Anat. (Myol.) fig. 7. n. 2.

GLUTINATIVE, AGGLUTINATIVE, or CONGLUTINATIVE, in medicine, and pharmacy. See CONGLUTINATIVE.

GLYCONIAN, GLYCONIUS, in the Greek and Latin poetry. A *Glyconian* verse is that consisting of two feet and a syllable. At least this is Scaliger's opinion, who adds, that the *Glyconian* verse was also called the *Euripidean* verse. See VERSE.

Others hold that the *Glyconian* verse consisted of three feet; a spondee, and two dactyls; or rather, a spondee, choriambus, and an iambus, or apyrrhic; which opinion is the most followed.

Sic te diva potens cyprî, is a *Glyconian* verse.

GLYCYRRHIZA, in medicine, liquorice. See LIQUORICE.

GLYPHE *, or GLYPHIS, in sculpture and architecture, a general name for any cavity, or canal, whether round, or terminating in an angle; used as an ornament, in any part. See Tab. Archit. fig. 28. lit. x. 2.

* The Greek word is, γλυφή, which literally signifies graving, niching.

ΓΛΥΦΙΣ is properly a notch, or indenture made in graving; or more properly, it is the notch in the end of an arrow, in which the string goes.

GLYSTER; see the article CLYSTER.

GNOSES, GNOÏTI, a name which the cabalists give to certain invisible people, whom they suppose to inhabit the inner parts of the earth, and to fill it to the centre.

They are represented as very small of stature, tractable, and friendly to men; and are made the guardians of mines, quarries, hidden treasures, &c. Vigenere calls them *gnomies*. The females of this species are called *gnomides*.

Vigneul de Marville in his *Mélange de Histoire & de Littérature*, t. 1. p. 100. gives a relation of a conference with a philosopher of this class, who held that an infinity of spirits inhabited each of the four elements, fire, air, water, and earth, under the denomination of *salamanders*, *syphis*, *audins*, and

gnomes;

gnomes; that the *gnomes* are employed in working, or actuating the machines or brutes upon carti.

He added, that some philosphers of that sect, held that these spirits were of two sexes, for the two sexes of beasts, or moving machines; that they were even more or less perfect as the brutes were; and that there was an infinite number of exceedingly small ones, to actuate the infinite number of insects, and animalcula, both those that are visible, and those which are too small to come under our senses; that all these spirits in general govern their respective machines according to the disposition of the parts, or organs, the humours, temperaments, &c. that they do not lay hold of all machines indifferently, but of those suited to their own character, element, &c. that a haughty one, for instance, seizes a Spanish gennet; a cruel one, a tyger, &c.

GNOME, Γνωμον, or *Chria*, is also used for a short, pithy, and sententious observation, reflexion, or the like: which is worthy to be treasured up, and remembered.

Such is that of Juvenal, — *Orandum est ut sit mens sana in corpore sano*. — The writers of rhetorics distinguish several kinds of *gnomes*, according as they turn on words, on actions, or both; denominating them *verbal*, *active*, and *mixed gnomes*, or *chriae*.

GNOMON*, in dialling, is the style, pin, or cock of a dial; the shadow whereof pointeth out the hours.

* The word is Greek γνομων, which literally imports somewhat that makes a thing known; by reason the style, or pin, indicates or makes the hour, &c. known.

The *gnomon* of every dial is supposed to represent the axis of the world; and therefore the two ends or extremities thereof, must directly answer to the north and south poles.

GNOMON, in geometry. If a parallelogram be divided into four lesser ones, by two lines intersecting each other; and one of these parallelograms be retrenched, or taken away; the other three will make a *gnomon*, ordinarily called a *square*.

Or, a *gnomon*, in a parallelogram, may be said to be a figure formed of the two complements, together with either of the parallelograms about the diameter. Thus, in the parallelogram AB, *Tab. Geometry*, fig. 5. the *gnomon* is M + x + z + N; or M + N + X + Z.

GNOMON, in astronomy, denotes an instrument, or apparatus for measuring the meridian altitudes and declinations of the sun, and stars.

Those conversant in observations, prefer the *gnomon*, by some called the *astronomical gnomon*, to the smaller quadrants, both as more accurate, easier made, and more easily applied.

Accordingly, both antients and moderns have made use of *gnomons*, for the making of their more considerable observations: Ulugh Beigh, King of Parthia, &c. used a *gnomon*, in the year 1437, which was one hundred and eighty Roman feet high: that erected by Ignatius Dantes, in the church of St. Petronius at Bologna, in the year 1576, was sixty-seven feet high: M. Cassini erected another twenty foot high, in the same church, in the year 1655.

To erect an astronomical **GNOMON**, and observe the meridian altitude of the sun by the same — Erect a perpendicular style, of a considerable height, on the meridian line: note the point where the shadow of the *gnomon* terminates when projected along the meridian line: measure the distance of that extreme from the *gnomon*, i. e. the length of the shadow. Thus having the height of the *gnomon*, and the length of the shadow; the meridian altitude of the sun is easily found.

Suppose, *g. gr. TS (Tab. Optics*, fig. 13.) the *gnomon*, and TV the length of the shadow. Here, on the rectangled triangle STV, having the two sides TV and TS; the angle V, which is the quantity of the sun's altitude, is found out by this analogy: as the length of the shadow TV: is to the altitude of the *gnomon* TS: so is the whole sine: to the tangent of the sun's altitude above the horizon.

Or, more accurately, thus — Make a circular perforation in a brass plate, to transmit enough of the sun's rays to exhibit his image on the floor: fix it parallel to the horizon in a high place, proper for observation: then let fall a line and plummet, wherewith to measure the height of the perforation from the floor. Take care the floor be perfectly level, and exactly horizontal; and let it be whitened over, to exhibit the fun more distinctly. Draw a meridian line thereon, passing through the foot of the *gnomon*, i. e. through the point the plummet points out: note the extreme points of the fun's diameter on the meridian line K and L, and from each subtract a right line equal to the semi-diameter of the aperture, viz. KH (*Tab. Astron*, fig. 57.) on one side, and LI on the other. Then will HL be the image of the sun's diameter, which bisected in B, gives the point on which the rays fall from the centre of the fun.

Now having given the right line AB, and the altitude of the *gnomon*, with the angle A, which is right; the angle ABG, or the apparent altitude of the sun's centre, is easily found: for, assuming one of the given sides AB for radius: AG will be the tangent of the angle B. Then say, as the sine of AB: is to the angle AG: so is one whole sine: to the tangent of the angle B.

GNOMONIC column. See the article COLUMN.

Vol. I.

GNOMONIC polyhedron. See the article POLYHEDRON.

GNOMONICA, Γνωμονική, or **GNOMONICS**, the art of dialling; or of drawing fun and moon dials, &c. on any given plane.

It is thus called, as it shews how to find the hour of the day, &c. by the shadow of a *gnomon*, or style.

GNOSIMACHI*, an antient sect in religion, whose distinguishing character was, that they were professed enemies of all studied knowledge in divinity.

* The word is Greek; γνωσιμαχία, *g. d.* an enemy of wisdom, or knowledge.

Damascenus says that they were perfectly averse to all the *gnosis* of christianity, i. e. to all the science, or technical knowledge thereof. They held it an useless labour to seek for *gnosis* in the holy scriptures; and said that God requires nothing of men but good works; that it were, therefore, much better to walk with more simplicity, and not to be so solicitous about the dogmata of the *gnostic* life.

Some authors take the word *gnosis* to have a further meaning, and think that, in the first ages of christianity, it signified much the same with what we call *spirituality*; and the *gnostic* life, Γνωστική ζωή. — In which sense the *gnosimachi* must have been such as were enemies of the spiritual life; who contended for the doing of good works in all simplicity; and blamed such as aimed to render themselves more perfect by meditation; a deeper knowledge and insight into the doctrines and mysteries of religion, and the sublimer, and more abstracted exercises.

GNOSTICKS*, antient heretics, famous from the first rise of christianity; principally in the east.

* The word is formed of the Latin *gnoscitur*, and that of the Greek γνωσκω, knowing, learned; witty, enlightened, spiritual; of γνωστης, I know.

The name *gnostic* was adopted by those of this sect, as if they were the only persons who had the true knowledge of Christianity. Accordingly, they looked on all other christians as simple, ignorant, and barbarous persons, who explained and interpreted the sacred writings in a too low, literal, and unedifying signification.

At first, the *gnostics* were only the philosophes, and wits of those times; who formed themselves a peculiar system of theology, agreeable to the philosophy of Pythagoras and Plato; to which they accommodated all their interpretations of scripture. But

GNOSTICKS afterwards became a general name, comprehending divers sects, and parties of heretics, who rose in the first centuries; and who, though they differed among themselves as to circumstances, yet all agreed in some common principles. — Such were the Valentinians, Simonians, Carpocratians, Nicolaitans, &c.

GNOSTICKS was sometimes also more peculiarly attributed to the successors of the first Nicolaitans, and Carpocratians, in the second century, upon their laying aside the names of the first authors. Such as would be thoroughly acquainted with all their doctrines, reveries, and visions, may consult St. Irenaeus, Tertullian, Clemens Alexandrinus, Origen, and St. Epiphanius; particularly the first of these writers, who relates their sentiments at large, and confutes them at the same time: indeed, he dwells more expressly on the Valentinians, than on any other sort of *gnostics*; but he shews the general principles whereon all their mistaken opinions were founded, and the method they followed, in explaining scripture.

He accuses them with introducing into religion certain vain and ridiculous genealogies, i. e. a kind of divine processions, or emanations; which had no other foundation, but in their own wild imagination.

In effect, the *gnostics* confessed that these *aeons*, or emanations, were no where expressly delivered in the sacred writings; but insisted at the same time, that Jesus Christ had intimated them in parables, to such as could understand him.

They built their theology not only on the gospels, and the epistles of St. Paul; but also on the law of Moses, and the prophets. These last laws were peculiarly serviceable to them, on account of the allegories and allusions which they abound withal; which are capable of different interpretations.

They set a great value on the beginning of the gospel of St. John; where they fancied they saw a great deal of their *aeons*, or emanations under the word, the *logos*, the *light*, &c. They divided all nature into three kinds of beings; viz. *body*, of material; *psychic*, or animal; and *pneumatic*, or spiritual.

On the like principle they also distinguished three sorts of men; material, animal, and spiritual. — The first, who were material, and incapable of knowledge, inevitably perished both soul and body: the third, such as the *gnostics* themselves pretended to be, were all certainly saved: the *psychics*, or animal, who were the middle between the other two, were capable either of being saved, or damned, according to their good, or evil actions.

G O B

The appellation *GNOSTIC* sometimes also occurs in a good sense, in the antient ecclesiastical writers, and particularly Clemens Alexandrinus, who, in the person of his *gnostic*, describes the characters and qualities of a perfect christian. — This point he labours in the seventh book of his *Stromata*, where he shews that none but the *gnostic*, or learned person, has any true religion. He affirms, that were it possible for the knowledge of God to be separated from eternal salvation ; the *gnostic* would make no scruple to chuse the knowledge : and that if God should promise him impunity in doing of any thing he has once spoken against, or offer him heaven on those terms, he would never alter a whit of his measures.

In this sense that father uses *gnostics*, in opposition to the heretics of the same name; affirming, that the true *gnostic* is grown old in the study of the holy scripture; and that he preserves the orthodox doctrine of the apostles, and of the church: whereas the false *gnostic* abandons all the apostolical traditions, as imagining himself wiser than the apostles.

At length the name *gnostic*, which originally was the most glorious, became infamous, by the idle opinions, and dissolute lives of the persons who bore it; much as, in the present age, has fared with the name *quietist*, *pictist*, &c.

GO, is sometimes used in law, in a special signification.—Thus to go *without day*, and, to go to God, denote as much as to be dismissed the court, and to be acquitted.

GOAD, *Stimulus*, a flick armed at one end with a pointed iron, to prick, and urge on a horse, ox, or the like.

In speaking of horses, we more commonly use the French name *valet*; reserving *goad* for oxen.

GOAL, or rather GAOL. See the article GAOL.

GOATS-EYE. See the article EYE.

GOBELINS, a celebrated manufactory, established at Paris, in the Fauxbourg St. Marcel; for the making of tapestry, and other furniture, for the use of the crown.

The house where this manufactory is carried on, was built by two brothers, Giles and John Gobelins, both excellent dyers. And the first who brought to Paris the secret of dying that beautiful scarlet colour still known by their name; as well as the little river Bievre, on whose banks they fixed their dye-house; and which is now known by no other name than that of the river of the Gobelins. . . .

It was in the year 1667, that this place, till then called *Gobelins's folly*, changed its name into that of *hotel royal des Gobelins*, in consequence of an edict of Louis XIV.

Monf. Colbert, having re-established, and with new magnificence enriched and completed the king's palaces, particularly the Louvre and Tuilleries, began to think of making furniture suitable to the grandeur of those buildings : with this view he called together all the ablest workmen in the divers arts and manufactures throughout the kingdom ; particularly painters, tapestry-makers, sculptors, goldsmiths, ebenists, &c. and by splendid offers, pensions, privileges, &c. called others from foreign nations.

And to render the intended establishment more firm and lasting, he brought the king to purchase the *Gobelins*, for them to work in; and drew up a system of laws, or policy; in seventeen articles.

By these it is provided that the new manufactory shall be under the administration of the super-intendant of the King's buildings, arts, &c. that the ordinary masters thereof shall take cognizance of all actions, or processes brought against any of the persons in the said manufactory, their servants and dependants: that no other tapestry work shall be imported from any other country, &c.

The *Gobelins* has ever since remained the first manufactory of this kind in the world. The quantity of the finest and noblest works that have been produced by it; and the number of the best workmen bred up therein, are incredible. In effect, the present flourishing condition of the arts and manufactures of France is in a great measure owing thereto.

Tapestry work, in particular, is their glory. During the superintendence of M. Colbert, and his successors, M. de Louvois, the making of tapestry is said to have been practised to a degree of perfection, scarce inferior to what was before done by the English and Flemish.

The battles of Alexander, the four seasons, the four elements, the king's palaces, and a series of the principal actions of the life of Louis XIV. from the time of his marriage to the first conquest of Franche Comte, done from the designs of M. le Brun, director of the manufactory of the *Gobelins*, are master-pieces in their kind.

GOBLET *, or Gobelet, a kind of drinking-cup, or bowl, ordinarily of a round figure, and without either foot, or handle.

* The word is French, *gobelet*; which Salmasius and others derive from the barbarous Latin, *cupa*: Budeus deduces it from the Greek, *κυπελλον*, a sort of cup.

GOBLETS, made of the wood tamarisc, are ranked among medi-

G O D

cinal drugs ; in regard the liquors infused a while therein, are supposed to acquire a quality which renders them good in diseases of the spleen.

GOBONE', or GOEONY, in heraldry, the same as *compa-*
né.

GOD*, an immaterial, intelligent, and free being; of perfect goodness, wisdom, and power; who made the universe, and continues to support it, as well as to govern and direct it by his providence.

* The Rabbins, and Hebraists, particularly St. Jerom, and the interpreters reckon up ten different names of God in scripture; which are אלה, *El*, אֱלֹהִים, *Elohim*, אֱלֹהֵי, *Elohi*, or in the singular, אֵל, *Eloah*, עֲבֹדָה, *Tseboath*, יְעֹזֵר, *Elior*, אֱהִי, *Ejeh*, אֲדֹנָי, *Adonai*, יְיָ, *Jah*, שְׁדַי, *Shaddai*, יְהוָה, *Jeboah*: but it is wrong to divide אֵלֹהֵי from עֲבֹדָה,

they should be but one name יהוה צבאות, *Eloahs Eboahs*, i. e. *God of hosts*. — Of these names there are three which express the efficacy of *God*, and are proper names, viz. *אֱלֹהִים*, *Elohim*, *El*, *Jah*, and *יהוה*, *Jeboah*: the others are only names of attributes. St. Jerome gives a particular explanation of these ten names; in his epistle to Marcella: and Buxtorf the younger has an express dissertation on the same; *Disputatio de nominibus Dei*. The Jesuit Soucier has three several discourses on the three names, *El*, *Shaddai*, and *Jeboah*, printed at Paris, 1715. — The Hebrews call the name of *God* אֱלֹהֵינוּ *Eloheינו*, and the Greeks, adding this example, *Τετραεικοντα*; as consisting of four letters, which it is observed *is* in most languages; thus in the Hebrew, *God* is called *יהוה*, *Jeboah*; in Greek, *Θεός*, in Latin, *Deus*; in Spanish, *Dios*; in Italian, *Iddio*; in French, *Dieu*; in the ancient Gaulish, *Diu*; in ancient German, *Diut*; in the Slavonic, *Buch*; in Arabic, *Allah*; in the Polish, *Buug*; in the Pannonian, *Asz*; in the Egyptian, *Tern*; in the Persian, *Sire*; in the language of the Magi, *Orfi*. But a distinction ought here to be made, between the name *God*, and the name of *God*; it being the latter, not the former, that in the Hebrew consists of four letters. The name or word *God*, in the Hebrew, is *אֱלֹהִים*, *Eloah*, which consists but of three letters; or in the plural *אֱלֹהִים*, *Elohim*, which consists of five. The name of *God* is *יהוה*, *Jeboah*; which is the true *טעם* *טעם* *טעם*, or name of four letters, among the Hebrews and Greeks. But it is not this name that answers to the Hebrew *Θεός*, Latin *Deus*, English *God*, &c. In reality none of these languages have any proper name of *God*, as *יהוה*, *Jeboah*, is in the Hebrew.

By his immateriality, intelligence, and freedom, *God* is distinguished from *fate, nature, destiny, necessity, chance, anima mundi*, and from all the other fictitious beings, acknowledged by the Stoics, Pantheists, Spinofists, and other sorts of atheists.

The knowledge of God, his nature, attributes, word, and works, with the relations between him and his creatures, make the subject of the extensive science called *theology*.

In scripture, *God* is defined by, I am that I am ; alpha and omega ; the beginning and end of all things.

Among philosophers he is defined a being of infinite perfection; or in whom there is no defect of any thing which we conceive might raise, improve, or exalt his nature.

Among men, he is chiefly considered as the first cause, the first being, who has existed from the beginning, has created the world, or who subsists necessarily, or of himself.

Sir Isaac Newton chuses to confider, and define *God*, not as is usually done, from his perfection, his nature, existence, or the like : but from his dominion. — “ The word *God* (ac-

"corresponding to him) is a relative term, and has a regard to
"vants: it is true, it denotes a being eternal, infinite, and
"absolutely perfect: but a being—however eternal, infinite,

“ God.

“The word *God* (the same author believes) frequently signifies *Lord*: but every lord is not *God*: it is the dominion of a spiritual being or lord, that constitutes *God*; true dominion, true *God*, Supreme, the Supreme; feigned, the false.”

"From such true dominion it follows, that the true God is living, intelligent, and powerful; and from his other perfec-

ing, intelligent, and powerful ; and from his other perfections, that he is supreme, or supremely perfect : he is eternal, and infinite ; omnipotent, and omniscient : that is, he

“endures from eternity to eternity, and is present from infinity, to infinity.
“He governs all things that exist, and knows all things

“ that are to be known : he is not eternity, or infinity, but
 “ eternal and infinite : he is not duration, or space, but he
 “ endures, and is present : he endures always, and is present

“ every where; and by existing always and every where,
“ he constitutes the very things duration and space, eternity and
“ infinity.

“ Since every particle of space is always, and every indivisible
 “ moment of duration every where, the creator and lord of all
 “ things can never be *nunquam*, or *nusquam*.

“ He

"He is omnipresent; not only virtually; but also substantially; for power without substance cannot subsist.
 "All things are contained, and move in him; but without any mutual passion: he suffers nothing from the motions of bodies; nor do they undergo any resistance from his omnipresence.

"It is confessed that God exists necessarily; and by the same necessity he exists always, and every where.—Hence also he must be perfectly similar; all eye, all ear, all brain, all arm, all the power of perceiving, understanding, and acting; but after a manner not at all corporeal, after a manner not like that of men, after a manner wholly to us unknown.

"He is destitute of all body, and all bodily shape; and therefore cannot be seen, heard, nor touched; nor ought to be worshipped under the representation of any thing corporeal.

"We have ideas of the attributes of God, but do not know the substance even of any thing: we see only the figures, and colours of bodies; hear only sounds, touch only the outward surfaces, smell only odours, and taste tastes; and do not, cannot, by any sense, or any reflex act know their inward substances, and much less can we have any notion of the substance of God.

"We know him by his properties, and attributes; by the most wise, and excellent structure of things, and by final causes; but we adore, and worship him only on account of his dominion: for God, setting aside dominion, providence, and final causes, is nothing else but fate, and nature." *Newt. Philof. Nat. Princip. Math. in calc.*

An ingenious divine has wrought these thoughts of that admirable philosopher into form, and ripened them into a more express system; in a discourse on this subject.—"The great principle or proposition he lays down, is, that God is not rightly defined a being absolutely perfect, but a spiritual being endowed with absolute dominion.—Not that he denies the self-existent being to be infinitely perfect; but only he holds, that it is his dominion, not his perfection, that is intended by the word God."

The self-existent being, he observes, may be considered either absolutely, or relatively: absolutely, as he is in his own nature, and as he is considered by the metaphysician: relatively, as he stands related to his creatures, and as he is considered by the religionist, his worshipper: Now, in treating of the definition of God, we intend a nominal, not a real definition; not what the nature of that self-existent being is, which we call God; but what it is that we mean by the word God: Which, on this system, is that self-existent being, considered not absolutely, but relatively; not as he is abstractedly in his own nature, but as he stands related to the universe, whose sovereign lord he is.

It is added, that the names given this being in most languages, denote, not his abstract, metaphysical, and absolute idea: but his religious, popular, and relative one.

Indeed, every worshipper of God will allow that he worships that self-existent being for no other reason, but because he is God; that is, because he is the proper lord and sovereign: for one would be under no obligation to worship a being, though absolutely perfect, that had no dominion over him. A perfect being without dominion, would be only an object of contemplation, and admiration; not of worship: for worship is only a payment of homage, an acknowledgment of subjection; which, where there is no dominion, cannot be due, and is therefore always due in proportion to the degree of dominion.

The word God then signifies Lord, and not a being absolutely perfect: thus when I say, my God, the God of the universe, it seems plain, that the notion of God is relative, not absolute, that is, includes dominion, not absolute perfection; and if I were to express the same in any other words, could I do otherwise than thus, my Lord, the Lord of the universe; and not thus, my perfect being, the perfect being of the universe?

Indeed, it seems impossible to prove the existence of a God, in the sense affixed to that name a priori, or any otherwise than from his dominion; that is, by arguing from the effect to the cause. The following propositions, it is true, are undeniably demonstrable a priori. 1^o That there is a self-existent, i. e. necessarily existent being; because the universe could not produce itself. 2^o That a necessarily existent being must be eternal, and omnipresent, that is, co-extended with infinite duration, and infinite space; because whatever exists by an absolute necessity of nature, has no relation to difference of time, place, &c. and consequently must exist always and every where. 3^o This being must be perfectly similar, simple, and uncompounded, without the least variety, or difference imaginable, or possible, because absolute necessity is every where and always the same. From which proposition it also follows, as a corollary, that this being is immutable.

It is apparent therefore, a priori, that there is a self-existent being, which is not matter; and that this being is eternal, omnipresent, similar, and unchangeable, by necessary connexion between self-existence, and these attributes; but it is impossible to shew any necessary connexion between self-existence and understanding; and if so, it is impossible to prove that the self-existent being is intelligent a priori, or any otherwise than by arguing from the effect to the cause; that is, from the consideration of the frame of the universe, the laws of nature, and final causes. *Maxwel. Disc. concern. GOD.*

Cicero in his treatise de Natura Deorum puts this ridiculous argument against the existence of a God in the mouth of Cotta: "How shall we conceive any thing of a God, when we cannot possibly attribute any virtue to him? Shall we say he has prudence? No: for prudence consisting in making a choice, between good and evil, what need has God of such choice, when he is by his own nature incapable of any evil? Shall we say he has understanding and reason? No: for understanding and reason only serve to discover things unknown to us, by things that are known; but there can be nothing unknown to God. Nor can we attribute justice to God; that being a thing which only relates to human society: nor temperance; since he has no pleasure to refrain: nor courage, in regard he is not susceptible of any pain, labour, or fatigue, nor exposed to any danger. How then can a thing be God, which has neither virtue, nor understanding?"

God, is also used in speaking of the false deities of the heathens; many of which were only creatures, to which divine honours and worship were superstitiously paid.

The Greeks and Latins, it is observable, did not mean by the name God an all-perfect being, whereof eternity, infinity, omnipresence, &c. were essential attributes; with them, the word only implied an excellent and superior nature; and accordingly they give the appellation Gods to all beings of a rank, or class higher and more perfect than that of men.

Thus, men themselves, according to their system, might become Gods, after death; inasmuch as their souls might attain to a degree of excellence superior to what they were capable of in life.

The first divines, father Bossu observes, were the poets: the two functions, though now separated, were originally combined, or rather were one and the same thing.

Now the great variety of attributes in God, that is, the number of relations, capacities, and circumstances wherein they had occasion to consider him; put these poets, &c. under a necessity of making a partition, and to separate the divine attributes into several persons; by reason the weakness of the human mind could not conceive so much power and action in the simplicity of one single divine nature.

Thus the omnipotence of God came to be represented under the person and appellation of Jupiter; the wisdom of God, under that of Minerva; the justice of God, under that of Juno.

The first idols, or false Gods that are said to have been adored were the stars, sun, moon, &c. in regard of the light, heat, and other benefits we derive from them.

Afterwards, the earth came to be deified for furnishing fruits necessary for the subsistence of men and animals: then fire and water became objects of divine worship, for their usefulness to human life. See FIRE, and WATER.

When things were thus got in the train, Gods, by degrees, became multiplied to infinity; and there was scarce any thing but the weakness, or caprice of some devotee or other, elevated into the rank; things useless, or even destructive, not excepted.

To authorize their own crimes, and justify their vices and debaucheries, men constituted criminal, vicious, and licentious Gods, unjust, rapacious, and tyrannical Gods, covetous and thievish Gods, drunken Gods, impudent Gods, cruel and bloody Gods.

The principal of the ancient Gods, whom the Romans called *Dii majorum gentium*, and which Cicero calls *caelestia Gadi*, Varro, *selekti Gadi*, Ovid, *nobiles Deos*, others, *consentes Deos*; were Jupiter, Juno, Vesta, Minerva, Ceres, Diana, Venus, Mars, Mercury, Neptune, Vulcan, and Apollo.

Jupiter is considered as the God of heaven; Neptune as God of the sea; Mars, as the God of war; Apollo of eloquence, poetry, and physic; Mercury of thieves; Bacchus of wine; Cupid of love, &c.

A second sort of Gods, called *demi gods*, *semi-dii*, *dii minorum gentium*, *insulgetes*, or Gods adopted, were men canonized and deified.—As the greater Gods had possession of heaven by their own right, these secondary deities had it by right and donation; being translated into heaven for that they had lived as Gods upon earth.

The heathen Gods may be all reduced to the following classes.

1^o Created spirits, angels, or demons; whence good and evil Gods; Genii, Larcs, Lemures, Typhones, guardian Gods; infernal Gods, &c.

2^o Heavenly bodies; as the sun, moon; and other planets, also the fixed stars, constellations, &c.

3^o Elements, as air, earth, ocean, op^o, vesta; the rivers, fountains, &c.

4^o Meteors; thus the Persians adored the wind; thunder and lightning were honoured under the name of Geryon. And several nations of India and America have made themselves Gods of the same. Castor, Pollux, Helena, and Iris have also been preferred from meteors to be Gods; and the like has been practised in regard to comets; witness that which appeared at the murder of Cæsar. Socrates deified the clouds, if we may give credit to Aristophanes; and the primitive christians, Tertullian assures us, were reproached with the same thing.

5^o They erected minerals, or fossils into deities; such was the Bætylus; the Finlanders adored stones; the Scythians iron; and many nations silver and gold.

6^o Plants have been made Gods; thus leeks and onions were deities in Egypt: The Sclavi, Lithuanians, Celte, Vandals and Peruvians adored trees, and forests: The antient Gauls Britons, Druids, bore a particular devotion to the oak; and it was no other than wheat, corn, feed, &c. that the antients adored under the names of Ceres, and Proserpina.

7^o They took themselves Gods from among the waters: The Syrians, and Egyptians adored fishes; the Oxyrhynchites, Latopolitani, Siennite, and inhabitants of Eliphantis had each a fish for their God; and the Tritons, Nereids, Syrens, &c. what were they but fishes? Several nations have adored serpents, particularly the Egyptians, Prussians, Lithuanians, Samogitians, &c.

8^o Insects, as flies, and ants had their priests and votaries; these among the Theffalians, and those in Acarnania, where bullocks were offered to them.

9^o Among birds, the stork, raven, sparrowhawk, ibis, eagle, griffon, and lapwing have had divine honours; the last in Mexico, the rest in Egypt, and at Thebes.

10^o Four footed beasts have had their altars, as the bull, dog, cat, wolf, baboon, lion, and crocodile in Egypt and elsewhere; the hog in the island of Crete; rats and mice in the Troas, and at Tenedos; weasels at Thebes, and the porcupine throughout all Zoroaster's school.

11^o Nothing was more common than to place men among the number of deities; and from Belus, or Ball, to the Roman emperors before Constantine, the instances of this kind are innumerable. Frequently they did not wait so long as their deaths for the apotheosis. Nebuchadnezzar procured his statue to be worshipped while living: and Virgil shews that Augustus had altars and sacrifices offered to him, Eclog. i. ver. 6, 7. As we learn from other hands, that he had priests called *Augustales*; and temples, at Lyons, Narbona, and several other places, and he must be allowed the first of the Romans, in whose behalf idolatry was carried to such a pitch. The Æthiopians deemed all their kings, Gods: The Velleda of the Germans; the Janus of the Hungarians; and the Thaut, Woden, and Asa of the northern nations were indisputably men.

12^o Not men only, but every thing that relates to man has also been deified; as labour, rest, sleep, youth, age, death, virtues, vices, occasion, time, place, numbers, among the Pythagoreans; the generative power, under the name of Priapus: infancy alone had a cloud of deities; as Vegetanus, Levana, Rumina, Edusa, Potina, Cuba, Cumina, Carna, Ofilago, Stalutinus, Pabulinus, &c.

They also adored the gods health, fever, fear, love, pain, indignation, shame, impudence, opinion, renown, prudence, science, art, fidelity, felicity, calumny, liberty, money, war, peace, victory, triumph, &c.

Lastly, nature, the universe, or *to pan*, was reputed a great god.

Hesiod has a poem under the title of *Θεογονία*, i. e. the generation of the Gods; wherein he explains their genealogy and descent, sets forth who was the first and principal; who next descended from him, and what issue each had: the whole making a sort of system of heathen theology.

Beside this popular theology, each philosopher had his separate system; as may be seen from the *Timæus* of Plato, and Cicero, *de natura deorum*.

Justin Martyr, Tertullian in his *Apologetics*, and in his book *contra Gentis*; Arnobius, Minucius Felix, Lactantius, Eusebius, *Prepar. & Demonst. Evangel.* St. Augustin *De Civit. Dei*, and Theodoret *advers. Gentis*, shew the vanity of the heathen Gods.

It is very difficult to discover the real sentiments of the heathens, with respect to their Gods: they are exceedingly intricate and confused, and even frequently contradictory. They admitted so many superior and inferior Gods, who shared the empire, that all was full of Gods. Varro reckons up no less than thirty thousand adored within a small extent of ground, and yet their number was every day growing. The way to

heaven was so easy for the great men of those days, that Juvenal brings in Atlas complaining he was ready to sink under the load of such a number of new Gods as were daily placed in the heavens; yet father Mourguies seems to have proved, that all the philosophers of antiquity have acknowledged that there was but one God. *Plan. Theol. del. Selt. Spavani. de la Grece.*

<p>Act of God; Peace of God; Son of God; Truce of God; Worship of God;</p>	<p>} See</p>	<p>} DISABILITY. PEACE. SON. TRUCE. WORSHIP.</p>
--	--------------	--

GOD-BOTE, in our antient Saxon customs, an ecclesiastical or church fine; for crimes and offences committed against God.

GODDESS, *Dea, Diva*, a heathen deity, to whom they attributed the female sex.

The antients had almost as many goddesses as gods: Such were Juno, the goddess of air; Diana, the goddess of woods, and chastity; Proserpina, the goddess of hell; Venus of beauty; Thetis, of the sea: such also were victory, fortune, &c.

Nay, they were not contented to make women gods, and admit both sexes into the roll; but they had also hermaphrodite gods: thus Minerva, according to several of the learned, was both man and woman, and worshipped both under the appellation of Lunus, and Luna. Mithras the Persian deity, was both god and goddess; and the sexes of Venus and Vulcan are very dubious: whence, in the invocations of those deities, they used this formula, *Be thou god or goddess*; as we learn from A. Gellius.

It was a privilege peculiar to goddesses, that they might be represented on medals, naked: the imagination, it was supposed, must be awed, and kept from taking liberties, by the consideration of the divine character.

GOD-FATHERS, and GOD-MOTHERS, persons who direct, and attend at the baptism of infants, or other persons; and who give the name.

The number of god-fathers, and god-mothers, is now reduced to three in the church of England, and to two in that of Rome: antiently, they had as many as they pleased.

The Romanists have also god-fathers and god-mothers at their confirmation. They even give god-fathers, &c. to bells, at their baptism.

Among the antients it was the custom for persons of quality to have others of like quality cut their childrens hair, the first time; by which they became reputed a sort of god-fathers. And the like was practised with regard to the hair of the beard.

GOD-FATHER was also a name antiently given to a kind of seconds, who attended and assisted the knights in tournaments, or single combats.

The god-fathers of duels were a kind of advocates, who were chosen by the two parties, to represent the reasons of their combat to the judges.

Something of this kind was long retained at solemn carroufals. There were two, or more, in each quadrille. See *QUADRILLE*.

The institution of god-fathers, and god-mothers, *patrini*, and *matrimi*, is originally Roman: they are said to have been people, who in the games of the circus attended the chariots, shews, and images of the gods. Cicero makes mention of them in his oration *de Haruspicum responsis*.—Their office was much like that of the children in some romish ceremonies, who are dressed in the habit of angels, to strew flowers, bear incense pots, lights, &c. and accompany the relics, and images of saints.

GOD-GILD, in our antient customs, that which is offered to God, or for his service.

GOLD, *Aurum*, a yellow metal; the heaviest, purest, most ductile, and shining, and on those accounts the most valuable of all metals.

The chemists call gold *sol*, the sun, to denote its pre-eminence over the other metals which are called by the names of the planets: its symbol, or character is O, which in their hieroglyphical way of writing, denotes perfection, simplicity, solidity, &c.

The weight of gold is to that of water, as, 19636 to 1000.—A cubic inch of pure gold weighs twelve ounces, two drachms, fifty-two grains; and the cubic inch of silver six ounces, five drachms, twenty-eight grains. The pound weight, or twelve ounces troy of gold is divided into twenty-four carats.

The value of gold is to that of silver as fourteen to one; antiently it was only as twelve to one. Indeed, this proportion varies as gold is more or less plentiful: for Suetonius relates, that Cæsar brought such a quantity of gold from Italy, that the pound of gold was only worth seven pounds and a half of silver. Standard gold is worth 41*l.* 10*s.* sterling the pound weight: standard silver is worth 3*l.* the pound; or 5*s.* the ounce. See *STANDARD*; see also *SILVER*, and *MONEY*.

The first characteristic, or property of *gold* is that it is the heaviest of all bodies. So that whoever would make *gold*, must be able to add to the weight of other matters, and make them equiponderate with *gold*.

In every mass of matter, therefore, heavier than mercury, there must of necessity be a share of *gold*; there being no body in nature of intermediate gravity; i. e. no body whose gravity is to that of *gold*, more than as fourteen to nineteen.

Its second character is, that of all known bodies it is the most ductile and malleable, and of all bodies its parts have the greatest degree of attraction, i. e. they cohere with the greatest force. Our gold-beaters, and wire-drawers furnish us with proof of this property. They every day reduce *gold* into leaves, or lamella, inconceivable thin; yet without leaving the least aperture, or chasm, visible to the best microscope, or even pervious to the light. See this property considered more at large under the article DUCTILITY.

This tenacity, or cohesive force of *gold*, depends altogether on its being free from sulphur: for mix but a single grain of common sulphur with one thousand times the weight of *gold*, and the mass ceases to be malleable.

The third character of *gold* is its fixedness in the fire: in which it exceeds all other bodies. This property seems to result from the homogeneity, and equality of its parts, which equally aid, and support each other, and have equal pores, or interstices through which the fiery corpuscles find an easy passage. The prince of Mirandola, Mr. Boyle, and most other chemists, furnish divers experiments to illustrate this wonderful fixity. After laying a quantity of *gold* two months in the intensest heat imaginable, it is taken out without any sensible diminution of weight.

It must be added, however, that in the foci of the large burning glasses of Mess. Tschirnhausen, and Vilette, even *gold* itself volatilizes and evaporates. After this manner, we are told from the royal academy at Paris, a quantity of pure *gold* was vitrified; being first fused into a sort of calx, which emitted fumes, and lost of its weight. But the same calx fused again with a quantity of grease, was restored into *gold*.

Its fourth character is, not to be dissoluble by any known menstruum in nature, except aqua regia, and mercury.

The basis of aqua regia is sea salt, which is the only salt we know of that has any effect on *gold*. But this salt has its effect in what form or manner soever applied, whether as a fluid, or a solid; in substance, or in spirit.

Mr. Boyle made a menstruum of butter of antimony, which dissolved *gold* with great facility; and hence concluded that *gold* might be dissolved without sea salt: but by mistake, the effective part even of this menstruum being still sea salt; which is an ingredient in sublimate of mercury, wherewith butter of antimony is made.

The seventh character is, that it readily, and spontaneously, as by some magnetic virtue, attracts, and absorbs mercury; though what Mr. lord Bacon writes, viz. that *gold*, in imbibing mercury, increases in specific gravity, we doubt, is but ill warranted. It is more than probable it must be increased in bulk, more than in weight, and consequently must be specifically lighter.

It may be added, that as soon as the mercury enters the *gold*, the metal becomes soft, like a paste.

The eighth character is, that it withstands the violence both of lead and antimony, i. e. being fused in the coppel along with either of those matters, it does not dissipate and fly off with them in fume, but remains fixed, and unchanged.

All other metals, except *gold*, and silver melted with lead, perith with it, and evaporate by fire; and in antimony, all other metals, except *gold*, even silver itself, undergo the same fate. Thus, if a mass consisting of *gold*, silver, stones, copper, &c. be fused together with antimony, the several matters become separated, and all but the *gold* rises to the surface in form of a scoria, and is blown off with bellows: but the *gold* remains behind, much purified, as having lost all its heterogeneous parts along with the other metals. And hence antimony is used as the test of *gold*.

The ninth character is, that of all bodies it is the simplest (the primary elements being here excepted.) By simple we here mean that whose minutest part has all the physical properties of the whole mass. Thus, if a grain of *gold* be dissolved in aqua regia; and a single drop of the solution be taken, a quantity of *gold* may be separated therefrom, which shall only be the millionth part of the grain, and yet shall have all the characters of *gold*. Or, if you fuse a grain of *gold* with a large mass of silver, and mix the two together, so that the *gold* becomes equally diffused through the whole mass; you will have in every particle of the mass a particle of perfect *gold*. Accordingly, dissolve any part of the mixture in aqua fortis, and a quantity of *gold* will precipitate to the bottom, bearing the same proportion to the grain that the

VOL. I.

part dissolved did to the whole mass. On which principle depends the art of assaying. See ESSAY.

All the known parts of the earth afford this precious metal; though with a deal of difference, in point of purity, and abundance: Europe, so fertile in other respects, comes short of all other quarters in *gold*. America furnishes the most; and particularly the mines of Peru, and Chili. That of Asia is esteemed the finest, particularly that of Menaricabo in the East-Indies: though the Spaniards assure us that they get *gold* out of some of their Peruvian mines, twenty-three carats fine before it be purified. Add, that the *gold* of Axima, on the coast of Africa, is found from twenty-two to twenty-three carats.

Glauber, an eminent chemist, asserts that there is not any sand, or stone, but *gold* may be procured from; limestone only excepted: the misfortune is, that the expence of separating it, much surmounts the profits.

Gold is chiefly found in mines: though there is some also found in the sand, and mud of rivers, and torrents; particularly in Guinea. This last is in form of a fine dust, and is called *amalgamum*, *gold-dust*. Glauber tells us that there is a third sort of *gold*, scarce found any where but in the drains of the mountains of Chili, which they separate from the earth by washing; whence the places where it is found, or separated are called *lavadero's*.

This earth is usually reddish, and very fine, at about six foot deep it is mixed with grains of large dust; and from hence commences the stratum, or bed of *gold*. Between are banks of soft blueish stone, mixed with yellow threads, which yet are not *gold*, but only pyrites, or marcasite of *gold*.

When they have discovered any of this earth, they endeavour to bring rivulets to it (which in those mountains are very frequent) in order, by force thereof, to tear off the upper earth, and lay the golden stratum bare. This they forward by loosening it, and digging with spades, &c. As soon as the golden earth is uncovered, they turn off the water; and dig up the soil by force of arm; and loading it on mules, carry it to the *lavadero's*, i. e. a sort of basins of water, where the earth undergoing divers repeated lotions, in different waters, the earthy, and impure part is all separated and carried off by the stream, and the *gold* left at bottom.

This method of getting *gold* is immensely gainful; the expences being but trifling, compared with those accruing in the common way by machines, fire, and quicksilver: the richest of these *lavadero's* is that de l'Esplanca del Rey, twelve leagues from the Concepcion, a port of the South Sea. —Thuringia, and some other places along the Rhine, are the only places in Europe, where *gold* is got in this manner.

The *gold* of mines is of two kinds; the one in small pieces, or grains of various forms, and weights. Of this sort, among the specimens sent by Columbus into Spain, to let them see the richness of his discovery, there were some of eighteen ounces weight; and the relations of those days assure us, that in 1502 there were others found of thirty two pounds weight.

The other kind of *gold* is dug up in stony glebes, which is what they call the *mineral*, or *ore* of *gold*: these glebes are of various colours, and lie usually one hundred and fifty, or one hundred and sixty fathom deep. Along with the *gold* they usually contain some other mineral matter, as antimony, vitriol, sulphur, copper, or silver; particularly the last; without some share of which it is scarce ever found.

Manner of separating GOLD.—They first break the metalline stone with iron mallets, pretty small; then carry it to the mills, where it is ground into a very fine powder; and lastly pass it through several brass-wire sieves one after another, the last as fine as any of our silk sieves.

The powder thus prepared is laid in wooden troughs with a proper quantity of mercury and water, and there left to knead and saturate in the sun and air for twice twenty four hours. After this the water, with the recrementitious earth is drove out of the tubs by means of other hot waters, poured thereon. This done there remains nothing but a mass of mercury with all the *gold* that was in the ore. The mercury they separate from it by distillation in large alembicks. The *gold*, in this state, is called *virgin gold*; as well as that found in the sand of rivers, or that in grains in the mines; in regard none of them have passed the fire. After this, they usually fuse it in crucibles, and cast it into plates, or ingots.

Manner of refining GOLD.—There are three principal manners of refining *gold*; the first with antimony; the second with sublimate; and the third with aqua fortis. This last, which is called *departing*, or *parting*, is already described under the article DEPART, and the two former see under REFINING.

Beside these three, there are other methods of refining *gold*; particularly that called *expellation*, which is performed with lead and ashes; and that called *cementation*, by means of a composition of brick dust, common salt, sal ammoniac, sal gemma,

gemma, and urine. See COPPEL, CEMENT, and CEMENTATION.

The assaying of GOLD, is performed with the touchstone, but more securely by fire. See TOUCHSTONE, and ESSAYING.

For the making of GOLD, see PHILOSOPHERS STONE, and TRANSMUTATION.

GOLD WIRE, is a cylindrical ingot of silver, superficially gilt, or covered with gold, at the fire; and afterwards drawn successively through a great number of little round holes of a wire-drawing iron, each less than the other, till it be sometimes no bigger than a hair of the head. See WIRE.

It may be observed, that before the wire be reduced to this excessive fineness, it is drawn through above an hundred and forty different holes; and that each time they draw it, it is rubbed fresh over with new wax, both to facilitate its passage, and to prevent the silver's appearing through.

It is amazing to what degree of fineness the gold is here drawn; and yet it still keeps firm together, and never shews the least signs of the silver underneath it. The reader may see a computation hereof, as also a more particular account of the manner of proceeding, under the article DUCTILITY of gold.

GOLD WIRE flattened, is the former wire flattened between two rollers of polished steel, to fit it to be spun on silk, or to be used flat as it is, without spinning, in certain stuffs, laces, embroideries, &c.

GOLD THREAD, or *spun GOLD*, is a flattened gold wrapped, or laid over a thread of silk, by twisting it with a wheel, and iron bobbins.

The methods of managing and drawing gold and silver both real and seeming in all these kinds, are very curious, and of great use in commerce.

Manner of forming GOLD WIRE, and GOLD THREAD, both round and flat.—First, an ingot of silver of twenty-four pound is forged into a cylinder of about an inch in diameter: then it is drawn through eight or ten holes of a large, coarse, wire-drawing iron, both to finish the roundness, and to reduce it to about three fourths of its former diameter. This done, they file it very carefully all over, to take off any filth remaining of the forge: then they cut it in the middle, and thus make two equal ingots thereof; each about twenty-six inches long; which they draw through several new holes to take off any inequalities the file may have left, and to render it as smooth, and equable as possible.

The ingot thus far prepared they heat it in a charcoal fire: then, taking some gold leaves, each of about four inches square, and weighing twelve grains; they join four, eight, twelve, or sixteen of these together, as the wire is intended to be more, or less gilt; and when they are so joined as only to form a single leaf, they rub the ingots, reeking hot, with a burnisher.

These leaves being thus prepared, they apply over the whole surface of the ingot to the number of six, over each other burnishing or rubbing them well down with the blood-stone, to close and smoothen them.

When gilt, the ingots are laid a-new in a coal fire; and when raised to a certain degree of heat, they go over them a second time with the blood-stone, both to folder the gold more perfectly, and to finish the polishing.

The gilding finished, it remains to draw the ingot into wire. In order to this, they pass it through twenty holes of a moderate drawing iron, by which it is brought to the thickness of the tag of a lace: from this time, the ingot loses its name, and commences *gold wire*. Twenty holes more of a lesser iron, leave it small enough for the least iron; the finest holes of which last, scarce exceeding the hair of the head, finish the work.

To dispose the wire to be spun on silk, they pass it between two rollers of a little mill: these rollers are of nicely polished steel, and about three inches in diameter. They are set very close to each other, and turned by means of a handle fastened to one of them, which gives motion to the other. The gold wire in passing between the two, is rendered quite flat; but without losing any thing of its gilding; and is rendered so exceedingly thin, and flexible, that it is easily spun on silk thread, by means of a hand-wheel; and so wound on a spool, or bobbin.

GOLD LEAF, or *beaten GOLD*, is gold beaten with a hammer, into exceedingly thin leaves.

It is prodigious to consider the fineness they will thus reduce a body of gold to: it is computed, that an ounce may be beaten into sixteen hundred leaves, each three inches square; in which state it takes up more than 159092 times its former space.

This gold they beat on a block of marble, commonly black marble, about a foot square, and usually raised three foot high: They make use of three sorts of hammers, formed like mallets, of polished iron. The first, which weighs three or four pounds, serves to chafe, or drive; the second, of eleven or twelve pounds, to close; and the third, which weighs fourteen or fifteen pounds, to stretch and finish.

They also make use of four moulds, of different sizes; viz. two of vellum, the smallest whereof consists of forty or

fifty leaves, and the larger, of two hundred: the other two, consisting each of five hundred leaves, are made of bullocks guts, well scoured and prepared. See MOULD.

The method of preparing, and beating GOLD.—They first melt a quantity of pure gold, and form it into an ingot: this they reduce, by forging, into a plate about the thickness of a sheet of paper: which done, they cut the plate into little pieces about an inch square, and lay them in the first, or smallest mould, to begin to stretch them. After they have been hammered here a while with the smallest hammer, they cut each of them into four; and put them in the second mould to be extended further.

Upon taking them hence, they cut them again into four, and put them into the third mould; out of which they are taken, divided into four, as before, and laid in the last, or finishing mould; where they are beaten to the degree of thinness required.

The leaves thus finished, they take them out of the mould, and dispose them in little paper books prepared with a little red bole, for the gold to stick to: each book ordinarily contains twenty-five gold leaves.

There are two sizes of these books: twenty-five leaves of the smallest only weighs five or six grains; and the same number of the largest nine, or ten grains.

It must be observed that gold is beaten more, or less, according to the kind, or quality of the work it is intended for: that for the gold-wire-drawers to gild their ingots withal, is left much thicker, than that for gilding the frames of pictures, &c. withal.

Shell GOLD is that used by the illuminers; and wherewithal we write gold letters.—It is made of the parings of leaf gold, and even of the leaves themselves, reduced into an impalpable powder, by grinding on a marble, with honey. After leaving it to infuse some time in aqua fortis, they put it in shells, where it sticks. To use it, they dilute it with gum water, or soap water.

Burnished GOLD, is that smoothen'd, or polished with a steel instrument called a *burnisher*, if it be wrought gold, or gilding on metal; or with a wolf's tooth, if it be gilding in water.

Million of GOLD, is a phrase often used to signify a million of crowns. See CROWN.

Tun of GOLD, is a kind of money of account, used by the Dutch, and in some other countries; containing an hundred thousand florins.

A hundred pounds of, or in, gold is found to weigh two pound ten ounces: the same sum in silver, weighs twenty-six pound, four ounces. Twenty-two pence, in copper farthings and half-pence, weigh one pound avoirdupois.

A tun of gold, at 4 l. the ounce, amounts to 96000 l. a tun of silver, at 5 s. 2 d. the ounce, to 6200 l. A pound sterling of gold, to 48 l. An ounce is worth 4 l. The penny-weight 4 s. One grain, 2 d. A pound of sterling silver amounts to 3 l. 2 s. An ounce is worth 5 s. 2 d. The penny-weight, 3 d. and something more; one grain, a half-penny. A pound of silver avoirdupois comes to 3 l. 5 s. 3 d. halfpenny.

GOLD COIN, or *Species of GOLD*. See COIN.

Mosaic GOLD, is gold applied in pannels on a proper ground, distributed into squares, lozenges, and other compartments; part whereof is shadowed to raise, or heighten the rest. See MOSAIC.

VIRGIN GOLD, is pure gold, just as it is taken out of the mines before it has undergone any action, or preparation of fire: whence the Greeks call it *αργυρος*. See VIRGIN. Such is the *αυροχρυσος*, or gold dust, and that got by lotion in the lavadero's in Chili: it is added, that there are masses, or lumps of pure gold found in the mines, particularly those of Hungary. Accordingly, in the emperor's collection are still preserved, several plates of gold, said to have been thus found.

Virgin gold is sometimes very pale, and so soft that it may be moulded into any figure with the hand: it even takes an impression from a seal, like the softest wax. To harden it, as also to heighten its colour, they mix emery with it.

Pure, or pure GOLD, is that purged by fire of all its impurities, and all alloy.—The Latins call it *aurum purum*, *aurum primum*, *aurum orbizum*, and *aurum colatum*.

The moderns frequently call it gold of twenty-four carats; but, in reality, there is no such thing as gold so very pure; and there is always wanting at least a quarter of a carat. Gold of twenty-two carats has one part of silver, and another of copper: that of twenty-three carats has half a part, i. e. half a twenty-fourth of each.

Boutrouer maintains, that the electrum of the antients was gold of nineteen carats; or four parts gold, and a fifth silver.—From an ordinance of king John of France, it appears that the gold then struck at Paris was of nineteen carats; and yet it is added that it was the best and finest gold then known on earth. In England, at this time, the standard of crown gold is twenty-two carats.

GOLD CHAIN, see the article CHAIN.

Cloth of GOLD, } See **CLOTH of Gold**.
GOLD money, } See **MONEY**.

Queen GOLD, see the article *QUEEN*.

Potable GOLD, *aurum potabile*, see *POTABLE gold*.

Fulminating GOLD, *aurum fulminans*, see *AURUM*.

GOLD, in medicine, and chemistry—the chemists make several preparations of gold for medicinal uses; as salts, mercuries, and tinctures of gold; but it is a point not yet well agreed on, whether gold have any real property whereby it may be of use in medicine.

The most ancient writers among physicians are all silent on the matter; the Arabs are the first who mention it in this quality.—Avicenna attributes extraordinary virtues to it; but he speaks on conjecture more than experiment. And yet it is pretty certain gold must have an effect: a quantity of gold filings being taken by a person in a bolus, he was very well purged thereby: but this might be owing to the great weight of its particles, which impinging violently against the glands of the intestines, promoted their vibrations, and thus expressed the humour secreted therein. Borrh, in a letter to Bartholin, relates, that having heated an ingot of fine gold several times red hot, and extinguished it as often in water, he found the weight of the ingot considerably diminished; upon which, proceeding to evaporate the water, he drew a little quantity of gold from it. Hence it appears, that the subtle parts of the gold pass into the liquors it is extinguished in; and hence, it is argued, it may have considerable effects on the body.

Notwithstanding the small number of experiments whereon the medicinal efficacy of gold is founded; the alchemists will have it that this metal contains the radical balm of life, for the retrieving of health and youth, and the removal of all diseases. Gold, according to them, contains a sulphur friendly to nature, like that of the sun, which animates the whole universe: and on this principle they have formed a thousand airy projects for an universal remedy.

In effect, 'tis probable the Arabs and alchemists were only brought to attribute all these virtues to gold, from their perceiving certain qualities therein, which they supposed it must communicate to other bodies. Thus, *e. gr.* gold being commonly said to be incapable of being destroyed; it is hence concluded to be proper to preserve animal matters, and defend them from putrefaction: which is just as reasonable as some physicians prescribing the blood of an ass as an appeasing remedy, by reason the ass is a very peaceable animal. See *AURUM POTABILE*.

GOLD, in heraldry, is one of the metals; more usually called by the French name, *or*. See *METAL*, and *OR*.

GOLDEN, something that has a relation to gold, or consists of gold, is valuable like gold, or the like. See *GOLD*.

GOLDEN BULL, *bulia aurea*, see the article *BULL*.

GOLDEN CALF, was a figure of a calf, which the Israelites cast in that metal, and set up in the wilderness, to worship; during Moses's absence in the mount; and which that legislator, at his return, burnt, ground to powder, and mixed with the water the people were to drink of; as related *Exod. xxxii*. The commentators have been greatly divided on this article: the pulverizing of gold, and rendering it potable, is an operation in chemistry, of the last difficulty; and it is hard to conceive how it should be done at that time, before chemistry was ever heard of, and in a wilderness too! Many therefore, suppose it done by a miracle: and the rest, who allow of nothing supernatural in it, advance nothing but conjectures, as to the manner of the process.

Moses could not have done it by simple calcination, nor amalgamation, nor antimony, nor calcination; nor is there one of those operations, that quadrates with the text.

M. Stahl has endeavoured to remove this difficulty. The method Moses made use of, in making his *aurum potabile*, according to this author, was the same with that which now obtains; only instead of tartar, he made use of the Egyptian natron, which is common enough throughout the east.

GOLDEN FLEECE, in the ancient mythology, was the skin, or fleece of the ram, upon which Phryxus and Hella are supposed to have swam over the sea to Colchis; and which being sacrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazen-hoof'd bulls, and a monstrous dragon that never slept; but at last taken and carried off by Jason, and the Argonauts.

Many authors have endeavoured to shew that this fable is an allegorical representation of some real history, particularly of the philosopher's stone.

Order of the Golden FLEECE, is a military order instituted by Philip the Good, duke of Burgundy, in 1429. See *ORDER*. It took its denomination from a representation of the golden fleece, bore by the knights on their collars, which consisted of flints and steels. The king of Spain is now grand master of the order, in quality of duke of Burgundy: the number of knights is fixed to thirty-one.

It is usually said to have been instituted on occasion of an immense profit which that prince made by wool; though others will have a chemical mystery couched under it, as under that famous one of the ancients, which the adept contend to be no other than the secret of the elixir, wrote on the fleece of a sheep.

Oliver de la Marche writes that he had suggested to Philip I. archduke of Austria, that the order was instituted by his grandfather Philip the Good, duke of Burgundy, with a view to that of Jason; and that John Germain, bishop of Chalons, chancellor of the order, upon this occasion made him change his opinion, and assured the young prince that the order had been instituted with a view to the fleece of Gideon. William bishop of Tournay, chancellor likewise of the order, pretends that the duke of Burgundy had in view both the golden fleece of Jason, and Jacob's fleece, *i. e.* the speckled sheep belonging to this patriarch, according to agreement made with his father-in-law Laban. Which sentiment gave birth to a great work of this prelate in two parts: in the first, under the symbol of the fleece of Jason, is represented the virtue of magnanimity, which a knight ought to possess; and under the symbol of the fleece of Jacob, he represents the virtue of justice.

Paradin is of the same mind, and tells us that the duke designed to insinuate that the fabulous conquest which Jason is said to have made of the golden fleece in Colchis, was nothing else but the conquest of virtue, which gains a noble victory over those horrible monsters vice, and our evil inclinations.

GOLDEN NUMBER, in chronology, a number shewing what year of the moon's cycle, any given year is. See *CYCLE of the moon*, and *NUMBER*.

To find the **GOLDEN NUMBER** of any year since Christ.—Since the lunar cycle commences with the year before our Saviour's birth; to the year of our Lord add 1: then dividing the sum by 19; the sum remaining after the division is the golden number required: if there be nothing remaining, the golden number is 19. Suppose, *e. gr.* the golden number of the year 1725, were required: $1725 + 1 = 1726$. And 1726, divided by nineteen, gives a quotient of nine, and leaves a remainder of sixteen, which is the golden number of that year.

The golden number is used in the Julian calendar, to shew on what days the new moons fall: in succession of time, however, it must be observed, that the golden numbers, through the defect of the lunar cycle, recede, and do no longer shew the true time of new moons, &c.

Hence, in the Gregorian reformation of the calendar, the golden number is thrown out; and the epoch introduced in lieu thereof.

GOLDEN PREBENDARY of Hereford, see *PREBENDARY*.

GOLDEN RULE, in arithmetic, a rule or praxis, of great use, and extent in the art of numbers; whereby we find a fourth proportional to three quantities given.

The golden rule is also called the *Rule of Three*, and *Rule of Proportion*. See its nature and use under the article *RULE of THREE*.

GOLDEN sulphur of antimony, } See { *ANTIMONY*,
Order of the Golden Stile. } See { *STOLE*.

GOLPS, in heraldry, are roundles, or torseaux of a purple colour.

GOMPHOSIS *, in anatomy, a kind of articulation of the bones, wherein one is chased; or fitted immovably into another, after the manner of a peg, or nail. See *ARTICULATION*.

* The word is Greek γομφος, formed of γομφος, clavus, a nail, or peg.

The teeth are set in the jaws by gomphosis. See *TOOTH*, and *MAXILLA*.

GONAGRA *, in medicine, the gout in the knee. See *GOUT*.

* The word is composed of γονυ knee, and αγκυα captiva, seizing.

GONARCHA, a term in the ancient dialling.—Mr. Perrault, in his notes on Vitruvius, lib. ix. c. 9. takes the gonarcha to have been a dial drawn on divers surfaces, or planes; some of which being horizontal, others vertical, others oblique, &c. formed divers angles *.

* Whence the appellation; from γονυ, knee, or γωνια, angle.

GONDOLA *, a little, flat boat, very long and narrow; chiefly used at Venice, to row on the canals. See *BOAT*.

* The word is Italian, gondola: Du Cange derives it from the vulgar Greek κοντιλας, a bark, or little ship; Lancelot deduces it from γωνία, a term in Athenæus for a sort of vase.

The middle sized gondolas are upwards of thirty foot long, and four broad: they always terminate at each end in a very sharp point, which is raised perpendicularly the full height of a man.

The address of the Venetian gondoliers, in passing along their narrow canals, is very remarkable: there are usually two to each gondola; and they row by pushing before them. The foreman rests his ear on the left side of the gondola: the hindman is placed on the stern, that he may see the head over the tilt, or covering of the gondola; and rests his ear, which is very long, on the right side of the gondola.

GONFALON, or *GONFANON*, a kind of round tent, bore as a canopy, at the head of the processions of the principal churches at Rome, in case of rain; its verge, or banner, serving for a shelter, where there is not a great deal of attendance.

GONORRHOEA *, *Toropissa*, in medicine, an involuntary flux or dripping of seed, or other humour, by the penis; without erection, or titillation.

• The word is formed of the Greek *goni*, *genitura*, seed, and *rhoea*, I flow.

The *Gonorrhoea* is of two kinds; the one *simple*, the other *virulent*.

Simple **GONORRHOEA**, or that without virus, or malignity, takes its rise from violent exercises, and drainings; the immoderate use of hot foods, and particularly fermented liquors, as wine, beer, cyder, &c. It is cured by indulging rest, nourishing foods, broths, &c.

This species is again divided into two; the one *true*, the *gonorrhoea vera*, wherein the humour discharged is real seed: the other *spurious*, the *gonorrhoea notha*, wherein the dripping humour is not seed, but a matter from the glands about the prostates. See **PROSTATES**.

This latter kind bears some resemblance to the fluor albus, or whites, in women; and frequently remains a long time, without much diminution of the patient's strength. Some call it a *catarrhal gonorrhoea*. Its seat is in the glands of the prostates, which are either too much relaxed or ulcerated.

Virulent **GONORRHOEA**, *gonorrhoea virulenta*, arises from some impure commerce, and is the first stage of the venereal disease; being what we properly call a *clap*.

The parts here primarily affected, are the prostates in men, and lacunae in women, which being ulcerated by some contagious matter received in coition, emit, first, a whitish, watery liquor, with an acute pain: this afterwards grows yellowish, then sharper, and at length greenish or bluish, and frequently foetid. It is attended with a tension and inflammation of the yard, and an ardor urinae, or sharpness of urine, which gives a painful sensation in the emission; the urinary passage being torn and excoriated by the acrimony of the humour.

Hence arise tumors of the prepuce, and glans, with ulcers on the fame; and sometimes in the urethra.

The cause of the virulent *gonorrhoea*, according to M. Littré, is some sharp or acid humour, heated, rarified, and raised at the time of coition, from the internal parts of the pudendum of a woman infected, and lodged in the urethra of the man. It has different seats in the body: sometimes it only fixes on Cowper's mucous glands; sometimes on the prostates; and sometimes on the vesiculae seminales: sometimes it possesses two; and sometimes all three of these places at once.

From this diversity of seats of the *gonorrhoea virulenta*, M. Littré makes two sorts; *simple*, which only affects one of the three parts; and *compound*, or complicated, where several are affected.

That seated in the mucous glands, he observes, may remain simple, through the whole course of the disease, by reason the mouths of those glands open into the urethra an inch and half on this side the prostates, and also look down towards the glans; so that their liquor is easily discharged. The other two sorts mutually produce each other; by reason the ducts of the vesiculae seminales terminate in the urethra in the middle of those of the prostates; so that there is an easy communication between them.

That seated in the mucous glands, is much the rarest case, and is the easiest cured. The cure is effected by emollient cataplasms, and fomentations upon the part, and a half-bath. *Mém. de l'Acad. ann. 1771.*

For the other species, more powerful means are to be used.—The principal remedies are mercurial purges, an emulsion of green hempseed, cuttle-fish-bone, turpentine, sacch. saturni, &c. We have likewise great commendations of green precipitate of mercury, and mercur. dulcis. Balf. saturni terebinthinatum, prepared with a gentle fire, of sacch. saturni, and oil of turpentine, is much applauded where the heat is great about the reins and genitals; as also camphor. An infusion of cantharides in wine, is the nostrum of a noted Dutch physician. Resin of the wood guaiacum is also recommended; and balsam of cupaiba is held a sort of specific: to which must be added antimonium diaphoreticum, bezoardicum minerale, water wherein mercury has been boiled; injections of lime-water, mercurius dulcis, saccharum saturni, &c.

Pitcairn's method of curing the *Gonorrhoea virulenta*, is as follows: in the beginning of the disease, he purges with a laxative pitisan of fenna, salt of tartar, and melilot flowers; and gives the patient whey for his drink. After three, or four days spent in this purging, if the scalding of the urine, and the flux, be abated, and the colour and confidence of the matter improved; he administers bolus's of turpentine, and rhaponticum, for six or seven days; and if they keep the body loose, so much the better. By all means, astringents to be avoided; the *Gonorrhoea* being scarce ever known to degenerate into a pox, unless too hastily stopped. Pitcairn in MS. Du Blegny directs the cure of the *Gonorrhoea*, to begin with a gentle cathartic of cassia, fenna, crystal mineral, tamarinds, althaea, and rhubarb, administered every other day: then,

diuretics, particularly those of turpentine; and lastly, gentle astringents; as mineral waters, crocus martis astringens, tincture of roses, tincture of coral in cochineal, &c.

A pyralism, or salivation, never cures a *Gonorrhoea*.

GOOD, or **GOODNESS**, denotes whatever tends, or conduces to preserve, or improve human nature, or society; in opposition to *evil*, which tends to destroy, injure, or impair the same.

Hence *Good* is divided by the philosophers into, 1^o, *bonum sui*, private *good*; which is that whereby a thing tends to preserve, &c. itself; under which comes that popular division of *goods* of body, mind, and fortune.

2^o, *Bonum communis*, whatever promotes the interest and welfare of society; as all the civil offices, &c.

GOOD, in metaphysics, or *metaphysical Good*, called also *absolute*, or *real Good*, and *Good per se*, is the essential perfection, or integrity of a thing, whereby it has every thing that belongs to its nature.

In this sense all things that are, are *good*; inasmuch as they have the perfections naturally belonging to things of their kind. Thus, a thinking substance is *good*, or perfect, as it has all the essential attributes of thought: so an extended substance is *good*, as it possesses all the parts necessary to constitute it such.

In effect, as it is absurd to imagine a being without its essence; so is it, to imagine a being without the requisites of its essence: so that it appears an error in some philosophers, who divide beings into good or perfect, and evil or imperfect. See **ESSENCE**.

Others define metaphysical, or transcendental *goodness*, by congruency with the divine will; as making that the measure of all real *goodness*.

Physical, or *natural Good*, is that whereby a thing possesses all things necessary to its *bona esse*, i. e. its well being, or second perfection; and to the performance of its functions, and uses.

In this sense, physical *goodness* coincides with physical perfection.

To this are required the several powers and faculties, in their proper degree; a due situation, figure, and proportion of parts, &c.

Note, beside absolute physical *goodness*, there may be a *relative* one; as in foods, which to one man are salutary, to another poison, &c. To this head also belong the things *good pro tempore*, or according to circumstances; as the amputation of a mortified limb, &c.

Moral, or *ethical Good*, is the agreement of a thinking, reasonable being, and of the habits, acts, and inclinations thereof, with the dictates of right reason, and the will of the creator, as discovered by natural light. See **VIRTUE**.

In order to this, it is not enough that a thing done, said, thought, desired, be just and *good*; but it must be done, thought, &c. well, i. e. from good principles, and to good ends.

Others define moral *good* more largely. *Moral*, which they also call *relative good*, according to them, is something that is good to another, or that tends somewhat to the perfection thereof.—In this sense they divide it into three kinds, *bonestum*, *jucundum*, and *utile*.

The first, *bonum honestum*, is what agrees with right reason; and is desirable for itself; as all things virtuous: *a. gr.* to love God, respect our parents, &c. It is considered without any regard to pleasure; not but that there is a sincere pleasure annexed to it. Zeno, and the Stoics allow of no other *goods*; those of the body, &c. they call *commoda*, conveniences, not *goods*.

Bonum jucundum, is that which is good, as it tends to give us pleasure, and is desired on that account: but without any repugnancy to virtue, or right reason: as music, to the ears; painting, to the eyes, &c.

Bonum utile, or *commodum*, is that which is good on account of something else for which it is desired; as money, riches, &c.

Chief, or *supreme Good*, *summum bonum*; see **SUMMUM BONUM**.

Philosophers are divided as to what the *chief good* of man consists in; whether in the *goods* of fortune, of body, or of mind. Some hold riches and honours the supreme *good*; others, as Aristippus, and the Cyrenaic school, bodily pleasures; and others, as Zeno and the Stoics, virtue.

GOOD will, } See } **COMMON place**
GOOD works, } **MERIT**, and **SUPEREROGATION**.

GOOD bearing, *bonus gestus*, in a law sense, is particularly used for an exact carriage, or behaviour of a subject towards the king, and his liege people; to which some men, upon their misbehaviour, are bound.

He that is bound to this, Lambard says, is more strictly bound than to the peace; because, whereas the peace is not broken without an affray, battery, or such like, this surety *de bona gestu* may be forfeited by the number of a man's company, or by his, or their weapons, or arms.

GOR

Good *aller*, } see { **ALLER.**
Good *behaviour*, } **GOOD abearing, and PEACE.**
Good *taste*, } **TASTE.**

GOODS, *bona*, in law, and particularly the civil law, include all kinds of effects, riches, lands, possessions, &c.

There are two kinds of *goods*; *moveable, res moventes*, or *mobiles*; and *immoveable, res non moventes* or *immobiles*.

It is a maxim in the civil jurisprudence, that he who confiscates the body, confiscates the *goods*; meaning that all the effects of a person condemned to a capital punishment, or perpetual banishment, are forfeited to the king.

A man is said to bind himself *body and goods*; meaning that besides his *goods* he obliges his person, and submits to remain in prison, provided he do not execute his promise.

Goods, again, are divided into 1^o, *proper, paternal, patrimonial, hereditary*; 2^o, *acquired, or acquiescitis, alio quam hereditatis jure acquisita*; and 3^o, *conquests; viro & uxori sante societate acquisita*.

Goods again are divided into *real and personal*. See **REAL**, and **PERSONAL**.—And lastly, into *noble, or free*; and *servile, or base*. See **FREE**, **BASE**, &c.

Goods belonging to the domain of the crown, *ad fiscum spectantia*, cannot be alienated for ever; unless it be done by way of exchange: they may be sold under the faculty of perpetual redemption.

Adventitious GOODS, *adventitia*, are those which arise otherwise than by succession from father or mother; or from direct ancestor to descendant.

Dotal GOODS, *dotalia*, those accruing from a dowry, and which the husband is not allowed to alienate. See **DOWRY**.

Fugitious GOODS; see the article **FUGITIVE**.

Paraphernal GOODS, *paraphernalia*, are those which the wife gives her husband to enjoy, on condition of withdrawing them when she pleases.

Prohibited GOODS; see the article **PROHIBITED**.

Professitious GOODS, *professitia*, are those arising by direct succession.

Receptitious GOODS, were those which the wife might reserve the full property of to herself, and enjoy them independently of her husband: so called in distinction from *dotal*, and *paraphernal goods*.

Vacant GOODS, *vacantia*, are those abandoned, or left at large, either by reason the heir renounces them, or that the defunct has no heir.

Allotting of *Goods*, } see { **ALLOTING.**
Consignment of *Goods*, } **CONSIGNMENT.**
Running of *Goods*, } **RUNNING.**

GORDIAN, a term in history.—**GORDIAN knot** was a knot made in the leathers, or harness of the chariot of Gordius, king of Phrygia, and father of Midas; so very intricate, that there was no finding where it began, or ended.

The inhabitants had a tradition, that the oracle had declared that he should be master of Asia who could untie this knot. Alexander having undertaken it, and fearing that if he should not be able to effect it, it would be deemed an ill augury, and prove a check in the way of his conquests; cut it asunder with his sword: and thus, says Quintus Curtius, either accomplished the oracle, or eluded it.

Some will have the phrase derived from Gordius, who tied the fatal knot; others, from Gordio, a city in Phrygia, where the knot was made.

GORE, in heraldry, denotes one of the regular abatements, used, according to Gwillim, to denote a coward. See **ABATEMENT**.

It consists of two arches, or curve lines, drawn, one from the sinister chief, the other from the sinister base, and meeting in an acute angle in the middle of the fess-point; as represented in *Tab. Herald*, fig. 64.

GOREL, a name, or title, given to the prince of Georgia.—*The Gorel* is always a Mahometan. The Sophi of Persia obliges him to observe the religion of the Alcoran, in order to preserve the dignity of *Gorel* in his family.

GORGE, in falconry, is the uppermost bag, or stomach of a hawk, or falcon; being that which receives the food the first.

The *gorge, ingluviæ*, is the same in birds of prey with what we call the *crow, or crop*.—When the bird is fed, he is said to be *gorged*.

GORGE, in architecture, denotes a sort of concave moulding, wider, but not so deep as a scotia; used chiefly in frames, chambranles, &c. See *Tab. Archit.* fig. 6, and 8. See also **SCOTIA**.

GORGE of a chimney, is the part between the chambranle, and the crowning of the mantle.—Of this there are divers forms, straight, perpendicular, in form of a bell, &c.

GORGE is sometimes also used for a moulding that is concave in the upper part, and convex at bottom; more properly called *gula*, and *cygnatium*. See **GULA**, and **CYGNATUM**.

GORGE is also used for the neck of a column; more properly called *collarino*, and *gorgerin*. See **GORGERIN**, &c.

GOT

GORGE, in fortification, the entrance of a bastion; or of a ravelin, or other out-work. See **BASTION**, **RAVELIN**, &c.

The **GORGE of a bastion** is what remains of the sides of the polygon of a place, after retrenching the curtains: in which case it makes an angle in the centre of the bastion.—Such is *AHD Tab. Fortif.* fig. 1.

In flat bastions, the *gorge* is a right line on the curtain, reaching between the two flanks.

GORGE of a half-moon, or ravelin, is the space between the two ends of their faces next the place.

Gorge of the other out-works, is the interval betwixt their sides next the ditch.

All the *gorges* are to be made destitute of parapets; otherwise, the besiegers having taken possession of a work might make use thereof to defend themselves from the shot of the place: so that they are only fortified with paliadoes, to prevent a surprise.

Half the GORGE, demi-GORGE, that part of the polygon between the flank and the centre of the bastion, as *AH*. See **DEMI-gorge**.

GORGED, in heraldry, is when a crown, coronet, or the like thing is bore about the neck of a lion, a swan, &c. In that case they say, the lion, or cygnet, is *gorged* with a ducal coronet, &c.

Gorged is also used when the gorge, or neck, of a peacock, swan, or the like bird, is of a different colour, or metal from the rest.

GORGED, among farriers, &c. signifies as much as swelled.—In which sense they say, the legs of a horse are *gorged*; the pattern joint is *gorged*: you must walk him out to *disgorge* his shoulder.

GORGERIN, a part of the ancient armour; being that which covered the throat, or neck of a person armed at all points.

GORGERIN, or **GORGE**, in architecture, the little frieze in the doric capital, between the astragal, at the top of the shaft of the column, and the annulets.—See *Tab. Archit.* fig. 24. lit. o. fig. 28.

Some call it *collarino*. Vitruvius gives it the name *hypotrachelium*.

GOTHIC, or **GOTHICK**, something that has a relation to the Goths, an ancient people, originally inhabiting that part of Sweden called *Gothland*; whence they spread themselves over Greece, Dalmatia, Bulgaria, Italy, Spain, &c.

We say, the *gothic manner, gothic ignorance*: the tyrant Maximian was of *gothic race*.

GOTHIC Bible; see the article **BIBLE**.

GOTHIC character, or writing, is a character, or manner of writing, which, in the main, is the same with the Roman, only that it is very full of angles, turns, and bendings; especially at the beginning and ending of each letter.

The manuscripts in *gothic* characters are not very ancient.—Ulphilas, bishop of the Goths, was the first inventor of the *gothic* characters; and the first that translated the bible into the *gothic* tongue.

The runic characters are also frequently called *gothic* characters. See Mabillon, *de re Diplomat.* l. i. c. 2.—But they who take the *gothic* characters to be the same with the runic, are mistaken; as is shewn by Ol. Wormius, Junius in his preface to the gospels wrote in *gothic* letters, and Dr. Hicks on the runic tongue.

GOTHIC architecture, is that which deviates from the proportions, characters, &c. of the antique.

The *gothic* architecture it frequently very solid, heavy, and massive; and sometimes, on the contrary, exceedingly light, delicate, and rich. An abundance of little, whimsical, impertinent ornaments, are its most usual character.

Authors distinguish two kinds of *gothic* architecture; the one ancient, the other modern.—The *ancient* is that which the Goths brought with them from the north, in the fifth century: the edifices built in this manner were exceedingly massive, heavy, and coarse.

Those of the *modern gothic* run into the other extreme, being light, delicate, and rich to a fault: witness Westminster abbey, the cathedral of Litchfield, the cross of Coventry, &c.

The last kind continued long in use, especially in Italy, viz. from the thirteenth century, to the restoration of the antique building in the sixteenth. All the ancient cathedrals are in this kind.

The inventors of the *gothic* architecture thought, no doubt, they had far surpassed the Greek architects: a Greek building has not a single ornament but what adds a beauty to the whole. The parts necessary to sustain, or shelter it, as the columns, corniches, &c. derive all their beauty from their proportions: every thing is simple, measured, and restrained to the use it is intended for. No daring, out of the way strokes; nothing quaint to impose on the eye: the proportions are so just, that nothing appears very grand of itself, though the whole be grand. On the contrary, in the *gothic* archi-

architecture, we see huge vaults raised on slender pillars, which one would expect every minute to tumble down, though they will stand for many ages. Every thing is crammed with windows, roses, crosses, figures, &c.

GOTHIC column, is any round pillar, in a gothic building, either too thick, or too small for its height.

There are some found even twenty diameters high; without either diminution, or swelling.

GOTHIC medals; see the article MEDAL.

GOUD, or **GAUD**; see the article WELD.

GOVERNMENT, a quality, or office, which gives a man power, or right, to command, or rule over a place, a city, a province, a kingdom, or the like; either supremely, or by deputation.

Government is either *general*, and supreme, as that of a whole kingdom, empire, sovereign state, &c. or *particular*, and subordinate; which again is subdivided into *civil*, *military*, and *ecclesiastical*.

The *government* of the king's household belongs to the lord steward.

Our cities, corporations, and boroughs are usually *governed* by mayors, with aldermen, and common-council-men.

The king was called to the *government* of England, by the free voices of the parliament, and the people. Such a lord bought the *government* of such a province, island, &c. The East India company nominate to the *government* of Fort St. George, &c.

GOVERNMENT is also used for the country, city, or place, to which the power of governing, or commanding, is extended.

Sanfon has given us maps of France, divided into its several *governments*. There are thirty-eight *governments*, or provinces in that kingdom, independent of each other. Beside these, there is another division into *governments*, called *grand governments*, whereof there are twelve, *viz.* those of the isle of France, Burgundy, Normandy, Brittany, Picardy, Dauphiny, &c. which are not proper provinces, commanded each by its several governor, but rather so many classes of governors, or *governments*, contrived for the better, and easier regulating the feats, &c. of so many governors, bailiffs, prevoists, &c. as were obliged to assist at the holding of the general estates.

GOVERNMENT, again, is used for the manner, or form of governing, i. e. for the policy of a country, state, &c.

In this sense *governments* are divided into *monarchies*, *aristocracies*, and *democracies*.

The *government* of France is *monarchic*; that of Venice, *aristocratic*; and that of the United Provinces *democratic*: The *government* of England is *mixt*, being *monarchical*, *aristocratic*, and *democratic* all in one.

GOVERNMENT, in grammar, is understood of that construction of nouns, and verbs, wherein they require some alteration to be made in others joined, or constructed with them.

Construption is divided into two parts; that of *concord*; and that of *government*; called also *regimen*. See CONCORD.—The rules, or measures of *government*, or *regimen*, see under the article REGIMEN.

GOVERNOUR, an officer vested by a king, or sovereign prince, with the command and administration of a province, place, &c.

Such a *governour* being charged with mis-administration, was recalled, and brought to his trial.—A *governour* represents the king; and not only commands the garrison, troops, &c. but the citizens, &c.—A *governour* of a fortified place was antiently required to hold out three attacks, before he surrendered.

GOVERNOUR is also frequently used for a president, or superintendent.

Thus we say, the *governour* of the bank; the *governour* and directors of the South-Sea company; the *governor* of an hospital, &c.

GOUGE, an instrument used by diverse artificers; being a sort of round, hollow chisel; serving to cut holes, channels, grooves, &c. in wood, stone, &c.

GOUST, *Gout*, a French term, for what the Italians call *gusto*, and we, *taste*. See TASTE.

GOUT, *arthritis*, in medicine, a painful disease, occasioned by a flux of sharp humor, upon the joints of the body.

Some physicians define the *gout*, an inflammation, swelling, and painfulness of the joints.—Its origin is usually attributed to wine, venery, gluttony, and idleness.

The *gout* is supposed to arise from two causes: a redundancy of humors, and a weakness of the joints. Its proper seat is in the limbs; not in the trunk of the body: in the latter case it frequently proves mortal, not in the former.

Musgrave makes the apoplexy a *gout*, because arising from the abundance of pituita, or phlegm. According as this redundant pituita throws itself on the lungs, the liver, or any other part, it

makes, according to him, an apopleptic *gout*, a *gout* of the liver, of the lungs, of the spleen, &c.

The *gout* may be considered as a painful, periodical, and critical paroxysm, tending to free the body of an offensive, or corrosive matter, by throwing it upon the extremities; breathing it out insensibly; or continuing it so as to render it harmless, or capable of circulating freely along with the juices, till by collecting again, gradually increasing, or separating from the blood, it causes another paroxysm.

The *gout* is either *regular*, or *irregular*.—*Regular*, when it appears to be seated in the extremities of the body, returns at stated periods, and with a gradual increase and decline of the symptoms.—*Irregular*, when the paroxysms are frequent, and uncertain; when the symptoms vary, or happen promiscuously, and the disease appears to be seated in the internal parts of the body; as the stomach, brain, &c. leaving the extreme parts, as the hands, feet, &c. free from pain.

According as different parts are affected by this distemper, it goes by several different names: when it seizes the feet, it is called *podagra*; when the knees, *gonagra*; when the hands, *chiragra*; and when the hip joints, *sciatica*, &c. See PODAGRA, CHIRAGRA, SCIATICA, &c.

Sometimes it attacks the whole body at the same time, and then it is called the *general* or *universal* *gout*.

The *gout* may be hereditary, or natural to the constitution, proceeding from a too great constriction of the capillary vessels, whence the gouty humor is more easily lodged, or detained in them. It may also proceed from high living, crapula's, and eating such things as are hard of digestion; a sedentary life, drinking too freely of tartarous wines; irregular living, excess in venery; an obstructed perspiration, and a suppression of the natural evacuations.

The immediate cause of the *gout* appears to be an alkaline, or acrimonious matter in the blood; which being separated from it at particular times, falls upon the joints, but most frequently upon the feet, and hands; which, if it be repelled, or if the blood be overcharged therewith, so that a crisis cannot be procured in the extremities (as generally happens in old age) it falls upon the nobler parts; and then produces the irregular *gout*.

The regular *gout* chiefly and immediately affects the tendons, nerves, membranes, and ligaments of the body, about the joints.—Sometimes a cold shivering fit precedes it, and generally a fever accompanies its first appearance, which soon goes off, and returns by intervals. A slight pain is felt in the joints, where the crisis is performed, which increases gradually; and in the podagra generally fixes first on the great toe; thence proceeding to the tarsus and metatarsus; sometimes, especially in old age, it attacks the knees and hands; and wherever it is, by distending and irritating the parts, it causes a violent pain, not unlike to that of a dislocated bone. When the pain is at its state, there appears an inflammation and swelling; both which increase as the pain increases; and upon their remission, the paroxysm is ended; though the tenderness and swelling in severe fits, will sometimes remain a longer time, and cause an uneasiness upon motion.

It is observed, that women, children, and young men, are seldom troubled with the *gout*, unless it be hereditary; and that it rarely attacks before the patient is thirty-five, or forty years old, and sometimes not till the decline of life; that the corpulent are more subject to it, than those who are spare, and lean; that the pain increases towards night, and decreases towards the morning; that the longer the intervals between the paroxysms, the more severe they prove, and the longer they generally continue.

The disease usually returns twice a year, *viz.* in the spring, and autumn; and in the latter the paroxysm is sometimes two, or three months, before it comes to a period: though its duration is at other times not above three or four weeks.

These are called *cardinal paroxysms*, to distinguish them from others of less duration, which happen between the spring and autumn. The more high-coloured the urine, and the less sediment it deposits; the further is the disease from the state of *concoction*, as it is termed. According to the violence and continuance of the fever, the paroxysm proves more or less severe.

In constitutions much broke or shattered with the *gout*, there are usually stony, or chalky concretions formed in the joints of the fingers, or toes, and thence translated to the viscera; which case is often attended with irregular, frequent, and short paroxysms in the extremities. In the decline of life, when the usual fits do not happen; or if the gouty matter be suddenly repelled from the extremities by an improper regimen, or medicines; it usually seizes the internal parts, and frequently the stomach, head, intestines, &c. causing want of appetite, reaching to vomit, indigestion, a cachexia, the jaundice, asthma, diarrhæa; and at last, so obstructs the fine capillary, nervous tubes (especially those of the stomach, and brain) as possibly to hinder the flux of the animal spirits: upon which death suddenly ensues.

Sydenham gives us an accurate history of a regular fit of the

GOWN, robe, a long upper garment, wore by lawyers, divines,

GRA

All sovereigns use the phrase *Grace* of God; as emperors, kings, princes, &c. Antiently dukes, counts, and even lords talked in the same style. In the new collection of Fath. Martene we meet with a mere seigneur, or lord, qualified by the *Grace* of God seigneur de Combourn. Louis XI. forbade the duke of Brittany to style himself by the *Grace* of God.

GRACE is also a title of dignity, attributed to princes of inferior rank, and who are not qualified for that of highness.

Till the time of king James I. the kings of England were addressed under the title of *Grace*, as they now are under that of majesty.

Our English dukes and archbishops are still addressed to under the title of *Grace*. But that title is most frequent in Upper Germany, and particularly Austria; where it is born by the Barons, as being inferior to that of excellence.

GRACES, GRATIE, charites, in the heathen theology, were a set of fabulous deities, three in number, who attended on Venus. See *God*.

Their names are Aglaia, Thalia, and Euphrosine; and they were supposed to be the daughters of Jupiter. *Vossius de Idol.* l. xiii. c. 15.

Some will have the *Graces* to have been four, and make them the same with the *hours*, or rather with the four seasons of the year. See *HOURS*.

A marble in the king of Prussia's cabinet represents the three *Graces* in the usual manner, with a fourth, seated, and covered with a large veil, with the words underneath, *AD SORES IIII*. Yet Monf. Beger will by no means allow the *Graces* to have been four: the company there present, he understands to be the three *Graces*, and Venus, who was their sister, as being daughter of Jupiter and Dione.

They were always supposed to have hold of each other's hands, and never parted. They were painted naked, to shew that the *Graces* borrow nothing from art, and that they have no other beauties but what are natural.

Yet, in the first ages, they were not represented naked, as appears from Pausanias, l. vi. and l. ix. who describes their temple and statues. They were of wood, all but their head, feet, and hands, which were white marble. Their robe, or gown was gilt; one of them held in her hand a rose, another a dye, and the third a sprig of myrtle.

The poets feign the *Graces* to have been very small of stature; to intimate, that the things which charm, and delight us, are frequently little matters; as, a gesture, a laugh, a careless air, or the like.

GRACILIS, in anatomy, a muscle of the leg, thus called from its slender shape.—See *Tab. Anat.* (Myol.) fig. 1. n. 54. fig. 2. n. 37. fig. 6. n. 37.

It arises partly tendinous, and partly fleshy, from the os pubis internally, between the first and second heads of the triceps; and in its descent on the inside of the thigh, grows narrow, and becomes tendinous a little below the sartorius, and is thus inserted into the tibia. It assists in bringing the thigh and leg inwards.

GRADATION, the act of ascending step by step, to any pitch or eminence: from the Latin *gradus*, degree, step.

GRADATION, in rhetoric, is when a series of considerations or proofs is brought, rising by degrees, and improving each on the other.

Such is that in Cicero to Herennius: *Africano industria virtutem, virtus gloriam, gloria æmulos comparavit.*

GRADATION, in logic, is an argumentation, consisting of four, or more propositions, so disposed, as that the attribute of the first, is the subject of the second; and the attribute of the second, the subject of the third; and so on, till the last attribute come to be predicated of the subject of the first proposition. As in Porphyry's tree: man is an animal; an animal is a living thing; a living thing is a body; a body is a substance: therefore man is a substance.

An argument of this kind is liable to a world of fallacies; both from the ambiguity of words, and things; e. gr. Peter is a man; man is an animal; animal is a genus; genus is an universal: therefore Peter is an universal.

GRADATION, in chemistry, is a kind of process belonging to metals.—It consists in gradually raising, or exalting them to a higher degree of purity, and goodness, so as both to increase their weight, colour, confidence, &c.

GRADATION, in architecture, signifies an artful disposition of parts, rising, as it were, by steps, or degrees, after the manner of an amphitheatre; so that those placed before, do no disservice, but rather service to those behind.

The painters also use the word *Gradation* for an insensible change of colour, by the diminution of the tints, and shades.

GRADUAL*, **GRADUALE**, was antiently a church-book, containing divers prayers, rehearsed, or sung after the epistle.

* In some of our antient writers it is read *gradile, graduale, &c.*

After reading the epistle, the chantor ascended the ambo with his *Gradual*, and rehearsed the prayers, &c. therein; being

GRA

answered by the choir: whence the name *Gradual*, on account of the steps, or degrees of the ambo. See *AMBO*.

In the Romish church, *Gradual* is an appellation still given to a verse which they sing after the epistle, and which was antiently rehearsed on the steps of the altar: though Ugutio gives us another account, and says it took its denomination *Gradual*, because sung in a gradual ascent from note to note. Magri speaks differently still, and will have it to have taken its name, because sung while the deacon went up the steps to the pulpit, to sing the gospel.

GRADUAL, GRADUALIS, is also applied to the fifteen psalms sung, among the Hebrews, on the fifteen steps of the temple.—Others are rather of opinion, that they were thus denominated, because the fingers raised their voice by degrees, from the first to the last.

Cardinal Bona, in his treatise of divine psalmody, says, the fifteen *gradual* psalms are intended to represent to the mind, that we only arrive at the perfection of goodness, or holiness, by degrees: he goes on to lay down the fifteen degrees of virtue, corresponding to the fifteen psalms; five of them are for beginners; five for proficients; and the rest for the perfect.

GRADUATE, a person who has the degrees in any faculty.

A *Graduate* in physic, in divinity, &c. See *FACULTY, DOCTOR, &c.*—In France, one third of the benefices of the kingdom are appropriated to *Graduates*, viz. all that become vacant in the months of January, and July, April, and October.

This privilege of *Graduates* is no older than the fifteenth century: it being observed that men of learning were much neglected by the collators, and patrons of churches, complaint therefore was made to the council of Basil, where this decree was made; which was afterwards confirmed by the Pragmatic sanction, and again by the concordat.

GRADUATION, is used in mathematics, for the act of *graduating*, or dividing any thing into degrees.

The *Graduation* of this quadrant, theodolite, or the like, is just and clean.

GRADUS gemonii; see the article *GEMONII*.

GRÆCUM—*album GRÆCUM*; see *ALBUM*.

GRAFT*, or **GRAFF**, in agriculture and gardening, a little shoot, cion, bud, or eye of a tree, inserted into another tree, to make it yield fruit of the same nature and kind, as those of the tree whence the *Graft* is taken.

* The word is formed of the French *greffe*, which signifies the same thing; and *greffe*, in this sense, is supposed to have been derived from the resemblance the shoot bears to the point of a penknife, which was antiently called *greffe*. Du Cange goes farther, and derives the antient *greffe* from *graphium*; *Menage*, from *graphium*, a Latin word, signifying a little style, or iron bodkin, one end whereof was pointed, and served to write withal on waxen tablets; and the other flat, serving to efface, or rub out what was wrote.

A *graft*, is a little portion of a tree, inclosed in a cleft, or incision made in another, in order to correct, qualify, or improve the taste of its fruit; or even to make it bear a different sort of fruit.

GRAFTING, or **GRAFFING**, or **INGRAFTING**, in agriculture, and gardening. See *ENGRAFTING*.

GRAFTING wax. See the article *WAX, &c.*

GRAIN, GRANUM, primarily denotes a fruit, or seed, growing in a spica, or ear.

In this sense, *Grain* comprehends all sorts of corn; as wheat, rye, barley, oats, &c.

GRAIN is also applied to the fruits or seeds of divers plants; as a grain of millet, of pepper, &c.

The kingdom of heaven is compared to a *Grain* of mustard seed.

GRAIN is also extended to a minute body, or parcel of a body pulverized.—In which sense we say, a *Grain* of sand, a *Grain* of salt, a *Grain* of gunpowder, &c.

GRAIN denotes also a small weight, used in estimating divers substances.

The *Grain* is the smallest of all the weights known in England.—It is taken from the weight of a *Grain* of wheat, gathered out of the middle of the ear, and well dried. Twenty-four grains make a penny-weight, and twenty penny-weights an ounce.

The *Grain* is troy-weight, and used in the weighing of gold, silver, jewels, bread, and liquors.

Among the antients, the *Grain* was the fourth part of the siliqua, or twelfth of the obolus, and the seventy-second of the drachma. It coincided with lens.

Fernelius, l. iv. c. 6. *Method. Medend.* affirms it as a thing known and certain, that the *Grain* is of the same weight, every where; but he is mistaken. Mr Greaves, in his treatise of the Roman foot, has shewn, that 179 Dutch *Grains*, which Snellius had found to be the weight of a Philip of gold, only amount to 134½ English *Grains*. Add, that Monf. Perrault has computed the French *Grain* to be less than the English;

English; and yet bigger than the Dutch: to the English, it is as 158 to 134½; and to that of Holland, as 158 to 179.

The grain used by the apothecaries, is the same with that of the goldsmiths; though they make a difference in the weights raised therefrom. Thus, 20 grains, with them, make a scruple, 3; 3 scruples, a drachm, 3; 8 drachms, an ounce, 3, &c.

The carat used in estimating the fineness of gold, as well as in weighing diamonds and precious stones, is also divided into four grains.

GRAIN is also used for the figure, or representation of *grains* on stones, stuffs, leathers, &c.—Thus we say, morocco has a bolder and richer, that is, a larger grain, than shagreen. In some marbles, the grain is very fine; in others coarser. Steel is known by its grain, which is much finer than that of iron.

Cochineal GRAIN, } fee { COCHINEAL.
Scarlet GRAIN, } fee { SCARLET.
GRAINED medals, } fee { MEDAL.
Gross GRAINED stuff, } fee { CROSS grained.

GRAINING board, is a board used by the curriers, to give the grain to their leather.

It is made with teeth, or notches, running quite a-crofs; into which, the soft, moistened, suppled leather being pressed, its surface readily takes the impression.

GRAMINEA, in antiquity, is applied to a crown formed of grass, *gramen*, bestowed, by the Romans, on certain of their generals, in consideration of their having saved, or rescued an army.

The grassy crown, *corona graminea*, was but rarely conferred; and for some signal exploit; when, through the courage or dexterity of a general, an army reduced to the last extremities had been saved, or delivered, and the enemy put to flight.

GRAMINEOUS herbs, among botanists, are such as have a long, narrow leaf, with no foot stalk.

GRAMMAR, the art of speaking properly; that is, of expressing one's thoughts, by signs mutually agreed on for that purpose.

The signs, here found most convenient, are articulate sounds; but, as these are transient, others have been invented more permanent, viz. *grammata*, γράμματα, letters, whence the name *grammar*.

Grammar is more accurately defined, after Mr. Johnson, the art of expressing the relations of things in construction, with due quantity in speaking, and orthography in writing, according to the custom of those whose language we learn. See LANGUAGE.

Grammar is divided by some authors into four parts, *orthography*, *prosody*, *etymology*, and *syntax*.

Others chuse to divide *grammar* somewhat more obviously into the doctrine of letters, or sounds, which coincides with orthography and orthoëpy; that of syllables, their accent, time, &c. which falls in with prosody; that of words, their kinds, derivations, changes, analogy, &c. which amounts to etymology; and that of sentences, which considers the placing, or joining of words together, called *syntax*.

The chief business of *grammar*, is to decline, conjugate, construct, and spell nouns, verbs, and other parts of speech.—It teaches the propriety, and natural force of each part of discourse; and the reason of all expressions used therein.

Some have called *grammar* the door, or gate of the arts and sciences; by reason none of these are attainable, but by means hereof.—*Grammar*, according to Quintilian, is that to eloquence, which the foundation is to the building; they who despise it, as only dealing in low, trivial things, are exceedingly mistaken: it has really more solidity than these.

The authors of the *Art of thinking* consider *grammar*, as not less necessary to try, and exercise the abilities of the most knowing, than to form the minds of beginners: the advantages of *grammar* are well set forth by Perizonius, in the preface to his edition of Sanctius's *Minerva*, Amsterdam, 1714.

Diogenes Laertius relates, after one Hermippus, that Epicurus was the first who gave the rules of *grammar* for the Greek tongue; but that Plato was the first who had taken the thing into consideration, and that he had even made some discoveries on that subject.

At Rome, Crates, surnamed Mallotes, cotemporary with Aristarchus, gave the first lectures on *grammar* to the Romans, during the time of his being ambassador for king Attalus, to the commonwealth, between the second and third Punic wars, soon after Ennius's death. Before him, it was not known at Rome what *grammar* meant. Polydore Vergil de Invent. rer. l. i. c. 7.

Grammar is the same in all languages, as to its general principles, and notions, which it borrows from philology to explain the order and manner wherein we express our ideas by words: but, as each language has its particular turns, its

Vol. I.

several character, and genius, different from the genius and character of other languages; hence arise as many *grammars* as languages.—An example will suffice to shew this: we say in English, draw a straight line; not, a line straight: in French, they say, tirer ligne droite, a line straight, not droite ligne, a straight line: and in Latin there is a liberty to say it either the one way, or the other; rectam lineam, or lineam rectam, duere. And if there be a language which in the phrase abovementioned follows the same analogy as the English, it differs from it on a hundred other occasions.

Hence Dr. Wallis very justly finds fault with our English grammarians, where he says, that all of them, forcing our English tongue too much to the Latin method, have delivered many useless things concerning cases, genders, and declensions of nouns; tenses, moods, and conjugations of verbs; as also the government of nouns and verbs, which our language has nothing to do with.

GRAMMAR is also used for a book containing the rules of grammar, which obtain in any language. See LANGUAGE.

The ancient grammars, are; for the Hebrew, that of rabbi Juda Chug, which is commonly held the first Hebrew grammar that appeared; though it is certain, rabbi Saadiah Haggagan, who lived before rabbi Juda, composed two works in the same kind: one, expressly of grammar; and the other of the elegancies of the Hebrew tongue.

For the Greek, the oldest grammar is that of Gaza: the Latin ones, are the works of Martianus Capella, Priscian, and Alconius Pedianus.

The best of the modern grammars, are, 1° For the Hebrew, that of Pagninus, the edition of Hen. Stevens, or le Preux at Geneva, in 1592; that of Petrus Martinus at Rochel 1592; that of Buxtorf; that of Ludovicus Deus, in three languages; that of Sixtinus Amama, which is a collection from Martinus and Buxtorf; that of Bellarmine with the notes of Muis; that of F. Sglancher is useful for beginners.—2° For the Chaldee, the best are those of Martinus, Buxtorf, and Lud. Deus, in three languages.—3° For the Syriac, those of Amira, Myricæus, Waserus, and Beveridge; with the Chaldee and Syriac ones of Buxtorf, of Lud. Deus in three languages, and that of Lemben.—4° For the Coptic, the Prodromus Coptus, and Lingua Aegyptiaca Restituta of Kircher.—5° For the Arabic, that of Erpenius, and that of Golius, which is only Erpenius's a little augmented.—6° For the Ethiopic, that of J. Ludolphus.—7° For the Persian, that of Lud. Deus.—8° For the Armenian, those of Schroder, and Galanus.—9° For the Greek, those of Mart. Rulandus, Sylburgius, F. Mocquet, Vossius, Busby, and Port Royal.—10° For the Latin, those of Despauter, the Minerva of Sanctius, those of Vossius, and Sprat; that of Port Royal, which is only a collection from the rest; and that of Lowe, the most exact of all.—11° For the Italian, those of Berger, Lanfredini, Port Royal, and Veneroni.—12° For the Spanish, those of Salazar, Port Royal, the abbot de Vairac, &c.—13° For the Portuguese, that of Pereira.—14° For the French, those of the abbe Regnier, and F. Buffier.—15° For the High Dutch, those of Claius, Heriburgensis, Schottelius, Boedicher, and Steinbach.—16° For the English, those of Wallis, Brightland, and Greenwood.

Characters in GRAMMAR; see the article CHARACTER.

GRAMMARIAN, GRAMMATICUS, a person well versed in grammar; or who teaches grammar.

The denomination *grammarian*, is, like that of critic, now frequently used as a term of reproach; a mere *grammarian*; a dry, plodding *grammarian*, &c.—The *grammarian* is conceived as a person wholly attentive to the minutiae of language; industriously employed about words, and phrases; and incapable of perceiving the beauties, the delicacy, fineness, extent, &c. of a sentiment.

Scaliger, however, considered *grammarians* in another light. Utinam essent, says he, bonus grammaticus: sufficit enim ei, qui omnes auctores probe vult intelligere, esse grammaticum.

The title *grammarian*, it is certain, was antiently a title of honour; being given not only to such as applied themselves to grammar, or excelled in philology; but to all who were reputed learned in any art, or faculty whatever, as is shewn by Ger. Vossius, in his book of grammar.

The word was properly a title of literature and erudition, and was frequently given to persons who excelled in all, or many arts, called also *polyhistor*.

Thus, Philoponus, a famous philosopher in Justinian's time, remarkable for the extent, and variety of his knowledge, was surnamed *grammaticus*, as appears from Photius's *Bibliotheca*. So Saxo, the Danish historian, in the thirteenth century, got the appellation *grammaticus*: and as late as the year 1580, Thomas d'Averla, a celebrated Neapolitan lawyer, was surnamed the *grammarian*.

The title *grammarian* was antiently bestowed on those we now call critics, men of learning, erudition, letters, &c. and particularly such as wrote well, and politely in every kind.

It is in this sense that Suetonius entitles his book which he wrote on the best Latin authors, *Of the celebrated grammarians*; and that Cornelius Nepos calls the commentators on the orators, and poets, *grammarians*; and lastly, it is in this sense the appellation is attributed by the ancients to Apion, Philoponus, and Solinus.

The most celebrated *grammarians* of the second century were Aper, Pollio, Eutychius, Proculus, Athenæus, Julius Pollux, Macrobius, and Aulus Gellius: the works of these last authors are an assemblage of abundance of very different things, and subjects, relating to the criticism of the ancient writers, and the polite literature.

If the name have lost its ancient honour, it is through the fault of those who have assumed it; by their treating of grammar in a low, pedantic, dogmatic manner; reducing it to words and syllables; and dwelling altogether on trifling, puerile remarks, and censures: whereas its ancient office was to make an accurate, and thorough examen of an author; to enter into all his views, to point out the beauties, and the defects thereof; to distinguish the true beauties from the false; and the genuine productions of an author, from the supposititious: that is, a *grammarian* was then, what we call a *critic* now.

Those who only taught to read, understand, and explain authors, were called *grammatists*, *grammatistæ*; in contradistinction from *grammatici*: though, in course of time, the *grammatistæ* have rose into the place of *grammatici*; who are now preferred to that of *critici*.

GRAMMATICAL, something relating to grammar. See **GRAMMAR**.

We say, *grammatical construction*; *grammatical signification*; &c. Idioms, as anglicisms, latinisms, grecisms, gallicisms, &c. deviate from *grammatical* strictness. Such a phrase is not *grammatically* just; it is an idiom.

GRAMMATICAL criticism; see the article **CRITICISM**.

GRANADIER, **GRENADIER**, or **GRANADEER**, a soldier who is armed with a sword, a firelock flung, and a pouch full of hand-granado's to be thrown among the enemy.

There are companies of *foot granadiers*, and *horse granadiers*, or *granadiers of horse*, by the French called *granadiers volants*, or *flying granadiers*, who are mounted on horseback, but fight on foot.

Every battalion of foot, of late years, has generally a company of *granadiers* belonging to it; or else four or five *granadiers* belong to each company of the battalion; which, on occasion, are drawn out, and form a company of themselves. These always take the right of the battalion; and are the first in attacks.

To each troop of horse-guards, Chamberlayn tells us, there is added, by establishment, a troop of *granadiers*, consisting of sixty-four men, beside officers, commanded by the captain of the troop of guard.

One division of *granadiers* mounts with a division of the troop; they also go out on small parties from the guard; perform centinels duty, &c.

GRANADO*, or **GRANADA**, in the military art, a hollow ball or shell, of iron, brass, or even glass, or potters earth, filled with gunpowder, and fitted with a fuzee to give it fire.

* The name *granado* takes its rise hence, that it is filled with grains of powder, as a pomegranate is with kernels.

Of these there are two kinds; the one large, the other small: the first are to be thrown at the enemy by a mortar, properly called *bombs*; see **BOMB**.—The latter to be cast with the hand; and thence denominated *hand-granado's*.

Casimir, indeed, makes another distinction; where the ball, or shell is round, whatever the size be, he calls it a *granado*; and where oval, or cylindrical, a *bomb*: but custom allows only the former division.

The best way, Casimir observes, to secure a man's self from the effect of a *granado*, is, to lie flat down on the ground, before it burst.

Historians relate, that at the siege of Ostend there were above fifty thousand *granado's* thrown in one month into the city: and that the citizens threw above twenty thousand into the works of the besiegers.

The common, or hand *granado*, is a little, hollow ball of iron, tin, wood, pasteboard, or other matter, filled with strong powder, lighted with a fuzee, and thus thrown by hand into places where men stand thick; and particularly into trenches, and lodgments.

Their composition is the same with that of **BOMBS**; which see.—For size, they are usually about the bigness of an iron bullet, and weigh about three pounds: as to dimensions, they are commonly in thickness one eighth, one ninth, or one tenth of their diameter; their aperture, or orifice about $\frac{1}{2}$ wide, as prescribed by Casimir.

Thunus observes, that the first time *granado's* were used, was at the siege of Wachtendonck, a town near Gueldres;

and that the inventor was an inhabitant of Venlo, who in making an experiment of the effect thereof, occasioned two thirds of that city to be burnt; the fire being kindled by the fall of a *granado*.

Bombs were known long before the invention of *granado's*.—The ancients had a sort of ollæ, or firepots, somewhat of the same nature with our *granado's*, but they were much less perfect.

Casimir mentions a sort of *blind granado's*, without any aperture, or fuzee, as not needing to be lighted; but being thrown with a mortar, take fire of themselves whenever they fall on any hard, solid object.

GRANARY, a place to lay, or store corn in, particularly for keeping.

Sir Henry Wotton advises, to make it look towards the north, as much as may be; because that quarter is most cool and temperate.

Mr. Woulidge observes, that the best *granaries* are built of brick, with quarters of timber wrought in the inside, whereto to nail the boards, with which the inside of the *granary* must be lined to close to the bricks, that there be no room for vermin to shelter themselves. There may be many stories one above another, and let them be near the one to the other; for the shallower corn lieth the better, and it is the easier turned.

Some have had two *granaries*, the one above the other, and filled the upper with wheat, or other corn: this upper one had a small hole in the floor, by which the corn descended into the lower one, like the sand in an hour glass; and when it was all come down into the lower *granary*, it was then carried up again into the upper one; and so it was kept continually in motion: which is a great preservation to the corn.—A large *granary*, full of square wooden pipes, may also keep corn from heating. See *Supplement*, article **GRANARY**.

GRANATE, popularly called **GARNET**, a gem, or precious stone, of a high red colour; thus called from the resemblance it bears to that of the kernel of a pomegranate.

Granates are either *oriental*, or *occidental*: the first are brought from divers parts of the East Indies; the second from Spain, Bohemia, and Silesia.

Those from the *east*, are distinguished by their colour into three kinds: the first, of a deep brownish red, like black clotted blood; of which kind there are some as big as an hen's egg: the second, are nearly of the colour of a hyacinth, with which it were easy to confound them, but for their superior redness. The last, having a mixture of violet with their red, are called by the Italians, *rubini della rocha*.

The *occidental granates* are of divers reds, according to the places they are found in. Those of Spain imitate the colour of the kernel of a pomegranate: those of Bohemia have a golden cast with their red, glittering like a live coal: those of Silesia are the darkest of all, and seldom thoroughly transparent.

Of the *occidental granates*, those of Bohemia are the most valued: some even give them the preference to the oriental kind. They are found near Prague; not in any particular mines, but picked up by peasants in the fields, from among the sands, and pebbles.

The *granate* is of some use in medicine: its powder is sometimes an ingredient in the cordial electuaries. The ancients held it excellent against heaviness, and melancholy. See *Supplement*, article **GARNET**.

GRAND, a term rather French than English, though used on many occasions in our language. It has the same import with *great*; being formed of the Latin *grandis*.

In this sense, we say, the *grand master* of an order; the *grand master* of Malta; of the free masons, &c.

So also, the *grand signor*, the *grand visier*, &c. *Grand father*, *Grand mother*, &c.

In the French polity and customs, there are divers officers thus denominated, which we frequently retain in English; as *grand almoner*, *grand ecuyer*, *grand chambellan*, *grand voyer*, &c.

GRAND assize; see the article **ASSIZE**.

GRAND cape; see the articles **CAPE** and **ATTACHMENT**.

GRAND distrefs, *distress magna*, a writ of distrefs so called on account of its extent, which reaches to all the goods and chattels of the party within the county.

This writ lies in two cases: either when the tenant, or defendant is attached, and appears not, but makes default; or where the tenant, or defendant hath once appeared, and after makes default.—On such occasions, this writ lies by common law, in lieu of a petit cape.

GRAND guffe, is a term used by painters, to express, that there is something in the picture very great, and extraordinary, calculated to surprize, please, and instruct.

Where this is found, they say, the painter was a man of the *grand guffe*: and they use the words sublime, and marvellous, when they speak of a picture in much the same sense.

GRAND

GRA

GRAND *elixir*, See ELIXIR.
GRAND *guard*, See GUARD.
GRAND *jury*, See JURY.
GRAND *prior*, See PRIOR.
GRAND *provost of France*, See PROVOST.
GRAND *sergeanty*, See CHIVALRY, and SERJEANTY.
GRANDEE, is understood of a lord, of the first rank, or prime quality.

In Spain, the term *grandees*, is used absolutely to denote the prime lords of the court, to whom the king has once given leave to be covered in his presence: there are some *grandees* for life only; made by the king's saying, simply, Be covered. Others, are *grandees* by descent; made by the king's saying, Be covered for thyself, and heirs. These last are reputed far above the former.

There are some who have three, or four *grandeships* in their family.

GRANGE*, an ancient term for a barn; or place wherein to lay up, and thrash corn.

* The word is formed of the Latin *granea* or of *grannum*, grain, corn, &c. Hence also *granger*, or *grangier*, a grange keeper, or farmer.

GRANGE is also used, in a more extensive sense, for a whole farm; with all the appendages of stables for horses, stalls for cattle, &c. and for an inn.

GRANI*, in our ancient writers, mustachoes, or whiskers of a beard.

* The word seems formed from the ancient British, or Irish, *grann*, a beard.

It is given for a reason why the cup is refused to the laity, *Quia barbat, & prolixos habent granos, dum peculum inter epulas sumunt, prius liquore pilos inficiunt quam oris infundunt.*

GRANITE, GRANITA, or GRANITES, a sort of marble; extremely hard, rough, and difficultly wrought, and polish'd; thus called as being sprinkled over with a great number of little stains, resembling grains of sand.

There are three sorts of granite: that of Egypt; that of Italy; and that of Dauphiny.—The first redish, variegated with white and black. It is found in very large pieces; and is that chiefly used by the Egyptians, in their obelisks, and pyramids, on the tombs of their great men. There are columns of this stone above forty foot high. The granite of Italy is softer than that of Egypt; especially in the quarry, where it cuts with much more ease. There is also a sort of green granite, which is a species of serpentine, spotted with green, and white spots.

The granite of Dauphiny, a quarry whereof has of late years been found, is only a very hard sort of flint. See Supplement, article GRANITA.

GRANIVOROUS, an epithet, or denomination given to such animals as feed upon corn, or any other grain, or seeds. *Granivorous* animals are chiefly of the bird kind. See BIRD. These have a peculiar provision for the digesting of so dry and hard a food.

GRANT, in law, a gift in writing, of something incorporeal, not lying in livery, and which cannot apply be passed, or conveyed by word only; as rents, reversions, services, advowsons in gross, tithes, &c.

Or, it is a gift made by such persons as cannot give but by deed; as the king and all bodies politic. See DONATION. This difference is often, in speech, neglected; and the word *grant* taken generally for every gift whatsoever, made of any thing, by any person.

In this sense he that granteth is named *granter*, and he to whom it is made, the *grantee*.

A thing is said to lie in *grant*, which cannot be assigned without deed.

GRANULATED oil, see the article OIL.

GRANULATION, in chemistry, an operation performed on metals, whereby they are reduced into small grains, or globules.

It is done by melting them; and when in fusion, casting them into cold water; in which they congeal into granules, as required; and are hereby rendered more easy to be dissolved.—The best way is to pour the fluid metal through a colander, or a new birchen broom.

We also say, the *granulation* of gun-powder. See GUN powder.

GRAPE, see the articles VINE, RAISIN, and WINE.

GRAPHOIDES, or GRAPHIOIDES, Γραφιοειδης, in anatomy, an appendage of the bones of the temples, long, small, sharp, and a little crooked, like a cock's spur; called also *thyoides*.

The same name is sometimes also applied, to the musculus digastricus.

Likewise, to an extension of the brain, resembling a writing-pen.

GRAPHOMETER, a name which some authors, particularly the French, give to a surveying instrument, by us commonly called a *semicircle*.

GRAPPLE, in the manage—A horse is said to *grapple* with one, or both legs, when he catches, or raises them more

GRA

hastily, and higher than ordinarily; as if he were curvetting.

GRASS *plots* and *walks*, make a considerable article in gardening, &c.

Grass, or *grass-plots* are had either by sowing of hayseed, or laying of turf: for the first, which is the cheapest way, the seed of the finest upland pastures is to be chose, well sifted and cleaned.

For the second, the turf should be cut on a down, or green, or common, or sheep-walk, where the *grass* is short and fine; if there be any knobs, or roughnesses, the place must be cleaned and rolled after a shower, before it be cut up. The turf is cut in squares, marked out with lines, raised with a knife, and rolled up: about three inches thick. The quarters, or verges are to be prepared with a fine coat of poor earth to lay the turf on; and after laying, the turf must be well watered, rolled, &c.

Small pieces of *grass* work, as knots, shell-work, and volutes of parterres, cut-work, verges about balcons, &c. must always be laid with turf.

To sow *grass* for plots, &c. the ground ought to be first dug or broke with a spade, then dressed, laid even, raked fine, and covered an inch thick with good mould to facilitate the growth of the seed. Then the seed is to be sown pretty thick, that it may come up close and short; and lastly, to be raked up, and covered. The best season is the latter end of August: when it is well come up, it must be mowed, and this often repeated; since the oftener it is mowed, the thicker and handsomer it grows. It must be also rolled from time to time.

Five leaved GRASS, in heraldry, see the article FIVE-leaved.

GRATICULATION, a term some writers use for the dividing a draught, or design into squares, in order to the reducing it thereby.

GRATIOLE, a medicinal plant, resembling hyssop; of considerable virtues; though little known in the ordinary practice, as being supposed dangerous of application. In English it is called *hedge-hyssop*, and *god's grace*.

Its most noted effects are to evacuate hydropic waters, both upwards and downwards, taken either in infusion, or decoction; to cleanse wounds, and to kill worms.—Its bark, taken in powder, is said to be scarce inferior in virtue to ipecacuanha for dysenteries.

It is of a very bitter taste; whence, probably, its vermifugous power; and its root is astringent, whence its use in the dysentery.

M. Boulduc made an extract of this plant, which purged gently, and was very diuretic: another extract made of the feces, or refuse, proved much more efficacious. *Hist. de l'Acad. an. 1705.*

GRAVE, in music, is applied to a sound, which is in a low, or deep tone.

The thicker the chord, or string, the more *grave* the tone, or note; and the smaller, the acuter.

Notes are supposed to be the more *graves*, in proportion as the vibrations of the chord are less quick.

GRAVE, in grammar, a species of accent opposite to acute.

The *grave* accent is expressed thus (`) and shews that the voice is to be depressed, and the syllable over which it is placed, pronounced in a low, deep tone.

GRAVE is also an ingredient in the composition of divers terms in history, and policy *. Thus we say, Landgrave, Burgrave, Margrave, Palgrave, &c. See PALE grave, &c.

* The word, in this sense, is formed of the German *graf*, signifying comes, count; called in the barbarous Latin, *gravius*, and *graphio*.

GRAVE is also used for a tomb, wherein a person defunct is interred.

GRAVEDO, a heaviness, or listlessness, which accompanies a lessened transpiration, or taking cold, as it is commonly called. Hence also, the case being frequently accompanied with a running of the nose, and eyes, *gravedo* and *coriza* are sometimes used promiscuously.

GRAVEL*, in natural history, coarser sand, found at the bottom, and the sides of rivers.

* The word is formed of the French *gravier*; which Du Cange derives from the barbarous Latin *graveria*, signifying the same.

Monf. Perault and Dr. Woodward lay down the difference between sand, and *gravel*.—The first, is small, and consists of finer, even grains: the latter is bigger, and consists of little pebbles, and flints of various kinds, and mixed with the sand and the finer fragments of other stones.

Gravel is chiefly used in laying yards, courts, and walks in gardens.

GRAVEL, in medicine, a disease of the bladder, and kidneys, occasioned by a sandy, or gritty matter gathered therein, which cohering into a stony mass, prevents the due secretion, and excretion of the urine.

The *gravel* is generally considered as the same disease with the calculus, or stone.

Gravel soil; see the article SOIL.

GRAVEL walk, in gardening.—To lay, or form a walk with gravel, all the good soil is to be pared away, below the roots of any grass, or weeds; then the place to be filled two or three inches with coarse gravel unsorted, laying it highest in the middle; then rolling it; a new stratum of finer gravel to be thrown on, two, or three inches thick: and the rolling to be repeated again and again.

Note, the sides next the beds should be laid a foot and an half, or two foot with turf, from whence the heat of the sun cannot be reflected as it is from gravel, to the prejudice of the neighbouring flowers.

GRAVELLING, among farriers, a disorder incident to travelling horses, occasioned by little gravel-stones getting in between the hoof and the shoe, which settling to the quick, frets, and festers the part.

It is cured by pulling off the shoe, drawing the place to the quick, picking out all the gravel, and stopping up the foot with horse-grease, and turpentine poured in hot.

GRAVER, a steel instrument, serving to engrave on metals.

The graver consists of four sides, or faces; and the point usually terminates in a lozenge. The other end is fitted into a wooden handle.

Beside engravers, the seal-cutters, locksmiths, gunsmiths, goldsmiths, armourers, spurriers, &c. likewise make use of gravers.

GRAVING, the act, or art of cutting lines, figures, and other designs on metals; more properly called *engraving*. See **ENGRAVING**.

GRAVITATION, the exercise of *gravity*, or the pressure a body exerts on another body underneath it by the power of gravity.

It is one of the laws of nature, discovered by Sir Isaac Newton, and now received by most philosophers, that every particle of matter in nature gravitates towards every other particle; which law is the hinge whereon the whole Newtonian philosophy turns. See **NEWTONIAN philosophy**.

What we call *gravitation*, with respect to the *gravitating* body, is properly called *attraction* with respect to the body *gravitated* to.

The planets, both primary and secondary, as also the comets, do all *gravitate* toward the sun, and toward each other; and the sun toward them; and that in proportion to the quantity of matter in each.

The peripatetics, &c. hold that bodies only *gravitate* when out of their natural places; and that *gravitation* ceases when they are restored to the same; the intention of nature being then fulfilled. The final cause of this faculty, they hold, is only to bring elementary bodies to their proper places where they may rest.—But the moderns shew that bodies exercise *gravity* even when at rest, and in their proper places.

This is particularly shewn of fluids; and it is one of the laws of hydrostatics, demonstrated by Mr. Boyle, and others, that fluids *gravitate in proprio loco*, the upper parts pressing on the lower, &c.

For the laws of *gravitation* of bodies in fluids specifically lighter or heavier than themselves; see **SPECIFIC gravity**, **FLUID**, &c.

Center of GRAVITATION, }
Line of GRAVITATION, } see { CENTER.
Plane of GRAVITATION, } { PLANE.

GRAVITY, in physics, the natural tendency, or inclination of bodies toward a centre.

In this sense *gravity* coincides with *centripetal force*. See **CENTRIPETAL force**.

Gravity is defined by others, more generally, to be the natural tendency of one body towards another; and by others more generally still, the mutual tendency of each body, and each particle of a body towards all others: in which sense the word coincides with what we more usually call *attraction*.

The terms *gravity*, *centripetal force*, *weight*, and *attraction*, do, in effect, all denote the same thing; only in different views, and relations: which different relations, however, authors are apt to confound; and accordingly, the four are frequently used promiscuously.

In propriety, when we consider a body as tending towards the earth, the force wherewith it tends we call *gravity*, *force of gravity*, or *gravitating force*: the same force, when we consider it as immediately tending to the centre of the earth, we call *centripetal force*: the same, when we consider the earth, or body toward which it tends, we call *attraction*, or *attractive force*; and when we consider it, in respect of an obstacle, or a body in the way of its tendency, upon which it acts, we call it *weight*.

Philosophers conceive very differently of *gravity*: its nature, use, phenomena, cause, effects, and extent have afforded various speculations in all ages.

Some consider it as an active property, or innate vis in bodies, whereby they endeavour to join their centre. Others hold *gravity* in this sense, to be an occult quality, and as such to be excluded out of all sound philosophy.

Sir Isaac Newton, though he frequently calls it a *vis*, power, or property in bodies; yet explains himself, that all he intends by the word, is the effect, or the phenomenon. He does not consider the principle, the cause whereby bodies tend downwards, but the tendency itself, which is no occult quality, but a sensible phenomenon; be its cause what it will, whether a property essential to body, as some make it; or superadded to it, as others; or even an impulse of some body from without, as others.

It is a law of nature long observed, that all bodies near the earth, have a *gravity*, or a tendency towards the centre of the earth; which law, the moderns, and particularly the immortal Sir Isaac Newton, have found, from certain observation, to be much more extensive, and to hold universally with respect to all the known bodies in nature.

It is now, therefore, acknowledged a principle or law of nature, that all bodies, and all the particles of all bodies, *gravitate* towards each other, mutually: from which single principle, Sir Isaac Newton has happily deduced all the great phenomena of nature. See **NEWTONIAN philosophy**.

Hence *gravity* may be distinguished into *particular*, and *general*.

Particular GRAVITY is that whereby heavy bodies descend towards the centre of the earth. See **EARTH**.

Phenomena, or properties of particular GRAVITY.—1° All circumterrestrial bodies do hereby tend towards a point, which is either accurately, or very nearly the centre of magnitude of the terraqueous globe.

2° This point, or centre is fixed within the earth; or at least hath been so ever since we have had any authentic history.—For a consequence of its shifting, though ever so little, would be the overflowing of the low lands, on that side of the globe towards which it approached. Dr. Halley suggests, it would well account for the universal deluge, to have the centre of gravitation removed for a time towards the middle of the then inhabited world: for the change of place but the 2000th part of the radius of our earth would be sufficient to lay the tops of the highest hills under water. See **DELUGE**.

3° In all places which are equi-distant from the centre of the earth, the force of *gravity* is nearly equal.—Indeed all places of the earth's surface are not at equal distances from the centre; because the equatorial parts are something higher than the polar parts: the difference between the earth's diameter and axis being about thirty-four English miles, which hath been proved by the necessity of making the pendulum shorter in those places, before it will swing seconds.

4° *Gravity* equally affects all bodies, without regard either to their bulk, figure, or matter: so that, abstracting from the resistance of the medium, the most compact and loose, the greatest and smallest bodies would descend equal spaces in equal times; as appears from the quick descent of very light bodies in the exhausted receiver.

Hence, a very great difference may be observed betwixt *gravity* and magnetism; the latter affecting only iron, and that towards its poles; the former, all bodies alike, and that in every part. Hence it follows, that *gravity*, in all bodies, is proportionable, to their quantity of matter; so that all bodies consist of matters equally heavy.

Hence also may be concluded that there is no such thing as positive levity; those things which appear light, being only comparatively so.

If several things ascend, and swim in fluids, it is only because they are not, bulk for bulk, so heavy as those fluids; nor is there any reason, why cork, for instance, should be said to be light, because it swims on water, any more than iron, because it will swim on mercury.

5° This power encreases as we descend, and decreases as we ascend from the centre of the earth, and that in the proportion of the squares of the distances therefrom reciprocally; so as, for instance, at a double distance, to have but a quarter of the force, &c.

6° As all bodies *gravitate* towards the earth; so, does the earth, equally *gravitate* towards all bodies, i. e. the action of *gravity* is mutual on each side, and equal. See **REACTION**. Hence also the attractive powers of bodies, at equal distances from the centre, are as the quantities of matter in the bodies.

Hence also it appears that the attractive force of the entire bodies consists of the attractive force of the parts: for by the adding, or taking away any part of the matter of a body, its *gravity* is encreased, or diminished in the proportion of the quantity of such particle to the entire mass.

General, or universal GRAVITY.—The existence of the same principle of *gravity* in the great regions of the heavens, as well as on earth, is easily proved.

That all motion is naturally rectilinear, is allowed by all; those bodies, therefore, which move in curves, must be retained therein by some power continually acting on them. Hence, the planets being found to revolve in curvilinear

orbits,

orbits, we infer that there is some power, by whose constant influence, they are prevented from flying off in tangents.

Again, it is proved by mathematicians, that all bodies moving in any curve line described in a plane, and which by radii drawn to any certain point, describe areas about the point proportionable to the times; are impelled, or acted on by some power tending towards that point: now it is shewn by the astronomers, that the primary planets round the sun, and the secondary planets, round the primary ones, do describe areas proportionable to the times. Consequently, the power whereby they are retained in their orbits, is directed towards the bodies placed in the centres thereof.

Lastly, it is demonstrated, that if several bodies revolve with an equable motion in several concentric circles, and the squares of their periodical times be as the cubes of the distances from the common centre; the centripetal forces of the revolving bodies will be reciprocally as the squares of the distances. Or, if bodies revolve in orbits approaching to circles, and the apices of those orbits be at rest; the centripetal forces of the revolving bodies will be reciprocally as the squares of the distances.

Now, the astronomers all agree, that both these cases obtain in all the planets: whence it follows, that the centripetal powers of all the planets are reciprocally as the squares of the distances from the centres of the orbits. See PLANET.

Upon the whole, it appears, that the planets are retained in their orbits by some power which is continually acting on them: that this power is directed toward the centre of their orbits: that the intensity, or efficacy of this power encreases upon an approach toward the centre, and diminishes at its recede from the same; and that it increases in the same proportion as the distance diminishes; and diminishes in the same as the distance encreases. — Now, by comparing this centripetal force of the planets, with the force of Gravity on earth, they will be found perfectly alike.

This we shall illustrate in the case of the moon, the nearest to us of all the planets. — The rectilinear spaces described in any given time by a falling body, urged by any powers, reckoning from the beginning of its descent, are proportionable to those powers. Consequently, the centripetal force of the moon revolving in its orbit, will be to the force of Gravity on the surface of the earth; as the space which the moon would describe in falling, any little time, by her centripetal force towards the earth, had she no circular motion at all, to the space a body near the earth would describe in falling, by its gravity towards the same.

Now, by an actual calculus of those two spaces, it appears, that the first of them is to the second, *i. e.* the centripetal force of the moon revolving in her orbit, is to the force of Gravity on the surface of the earth, as the square of the earth's semidiameter, to the square of the semidiameter of her orbit: which is the same ratio as that of the moon's centripetal force in her orbit, to the same force near the surface of the earth.

The moon's centripetal force, therefore, is equal to the force of Gravity. These forces, consequently, are not different, but they are one and the same: for, were they different, bodies acted on by the two powers conjointly, would fall towards the earth, with a velocity double to that arising from the sole power of Gravity.

It is evident, therefore, that the moon's centripetal force, whereby she is retained in her orbit, and prevented from running off in tangents; is the very power of Gravity of the earth, extended thither.

The moon, therefore, gravitates towards the earth; and the earth reciprocally towards the moon: which is further confirmed by the phenomena of the tides. See TIDES.

The like reasoning might be applied to the other planets. — For, as the revolutions of the primary planets round the sun, and those of the satellites of Jupiter and Saturn round their primaries, are phenomena of the same kind as the revolution of the moon round the earth; as the centripetal powers of the primary are directed towards the centre of the sun, and those of the satellites, towards the centre of their primaries; and lastly, as all these powers are reciprocally as the squares of the distances from the centres, it may safely be concluded that the power and cause is the same in all.

Therefore, as the moon gravitates towards the earth, and the earth towards the moon; so do all the secondaries to their primary ones; the primaries to their secondary ones; so, also, do the primary ones to the sun, and the sun to the primary ones.

Phænomena, or properties of universal GRAVITY. — I. All the several particles of all bodies in nature gravitate to all the particles of all other bodies.

To what has been urged in proof hereof, from the analogy between the motions of the several bodies in our system; it may be added, that saturn is actually observed by astronomers to change its course when nearest to jupiter; and jupiter, also, is found to disturb the motion of the satellites of saturn. So that the gravitation of those bodies is matter of actual observation.

VOL. I.

2. The quantity of this Gravity at equal distances, is always proportional to the quantity of matter in the gravitating bodies.

— For, the powers of Gravity, are as the quantities of motion they generate; which quantities, in unequal bodies, equally swift, are to each other as the quantities of matter. Consequently, since unequal bodies, which are equally swift, are to each other as the quantities of matter; therefore, in regard unequal bodies at the same distance from the attracting body are found to move equally swift, by Gravity, it is evident, the forces of Gravity are proportionable to the quantities of matter.

3. The proportion of the increase, or decrease, of Gravity in the approach, or removal of bodies from each other, is this; that the force is reciprocally in a duplicate ratio, *i. e.* it is as the squares, of the distance. — Thus, suppose a body of an hundred pounds, at the distance of ten diameters from the earth; the same body, if its distance were but half so great, would have quadruple the weight: if its distance were but one third of the former, its weight would be nine times as great, &c. Hence we gather the following corollaries. 1^o, That at equal distances from the centre of homogeneous bodies, the Gravity is directly as the quantity of matter, and inversely as the square of the diameter. 2^o, That on the surfaces of equal, spherical, and homogeneous bodies, the Gravities are as the densities. 3^o, That on the surfaces of spherical, homogeneous, equally dense, but unequal bodies, the Gravities are inversely as the squares of the diameters. 4^o, That if both the densities and diameters differ, the Gravities on the surfaces will be in a ratio compounded of the densities and the diameters. Lastly, that a body placed any where, within a hollow sphere, which is homogeneous, and every where of the same thickness, will have no Gravity wheresoever it be placed; the opposite Gravities always precisely destroying each other. For the particular laws of the descent of bodies, by the force of Gravity, see DESCENT of bodies, and CENTRIPETAL force.

Cause of GRAVITY. — We have various theories advanced by the philosophers of various ages to account for this grand principle of gravitation. The antients, who were only acquainted with particular Gravity, or the tendency of sublimar bodies towards the earth, aimed no further than at a system which might answer the more obvious phenomena of the same; but the moderns, as their principle is higher and more extensive, so should their theory be.

Aristotle and the peripatetics, content themselves to refer Gravity or weight to a native inclination in heavy bodies to be in their proper place or sphere, the centre of the earth.

Copernicus ascribes it to an innate principle in all parts of matter, whereby, when separated from their wholes, they endeavour to return to them again the nearest way.

But neither of these systems assigns any physical cause of this great effect: they only amount to this, that bodies descend, because they are inclined to descend.

Gassendus, Kepler, Gilbert, and others, ascribe Gravity to a certain magnetic attraction of the earth. — These authors conceive the earth to be one great magnet continually emitting effluvia, which lay hold on all bodies, and draw them toward the earth. But this, we have observed, is inconsistent with the several phenomena.

Des Cartes, and his followers, Rohault, &c. attribute Gravity to an external impulse, or trusion of some subtle matter. — By the rotation of the earth, say they, all the parts and appendages thereof necessarily endeavour to recede from the centre of rotation: but they cannot, all, actually recede, as there is no vacuum or space to receive them.

If now, we suppose the earth ABCD, *Tab. Mechanic. fig. 8.* and L a terrestrial body placed in the pyramidal space, AEB: it follows, that the matter in this pyramid will have so much less endeavour to recede from the centre, as the body L has a less endeavour than the fluid matter whose place it possesses. Hence it will follow, that the matter of adjacent pyramids receding with more force; that in the pyramid AEB, and particularly the body L will be thereby driven toward the centre for the same reasons as cork, though a heavy body, ascends in water.

This hypothesis, though ingenious enough, yet, as it is founded on the supposition of a plenum, it is overturned by what has been since proved of the existence of a vacuum.

Dr. Hook inclines to an opinion much like that of Des Cartes: Gravity, he thinks, deducible from the action of a most subtle medium, which easily pervades and penetrates the most solid bodies; and which, by some motion it has, detaches all earthly bodies from it, toward the centre of the earth.

Vossius, and many others, give partly into the Cartesian notion, and suppose Gravity to arise from the diurnal rotation of the earth round its axis.

Dr. Halley, despairing of any satisfactory theory, chuses to have immediate recourse to the agency of the almighty. — So Dr. Clark, from a view of several properties of Gravity, concludes, that it is no adventitious effect of any motion, or subtle matter, but an original and general law impressed by the Almighty on all matter,

matter, and preserved therein by some efficient power penetrating the very solid and intimate substance thereof; as being found always proportionable, not to the surfaces of bodies or corpufcles, but to their folid quantity and contents.—It fhould, therefore be no more enquired, why bodies gravitate, than how they came to be firft put in motion! *Annot. in Robault. Phyf. P. I. c. xi. § 16.*

Dr. S. Gravefende, in his *Introduct. ad Philofoph. Newton.* contends, that the caufe of *Gravity* is utterly unknown; and that we are to look on it no otherwife than as a law of nature, originally and immediately impreffed by the creator, without any dependance on any fecond law or caufe at all. Of this he thinks the three following confiderations fufficient proof.

1^o, That *Gravity* requires the prefece of the gravitating or attracling body: fo the fatellites of jupiter, *e. gr.* gravitate towards jupiter, wherever he be.

2^o, That the diftance being fuppofed the fame, the velocity wherewith bodies are moved, by the force of *Gravity*, depends on the quantity of matter in the attracling body: and that the velocity is not changed, let the mafs of the gravitating body be what it will.

3^o, That if *Gravity* do depend on any known law of motion, it muft be fome impulle from an extraneous body; whence, as *Gravity* is continual, a continual ftroke muft alfo be required.

Now, if there be any fuch matter continually ftriking on bodies, it muft be fluid, and fubtle enough to penetrate the fubftance of all bodies: but how fhall a body fubtle enough to penetrate the fubftance of the hardeft bodies, and fo rare as not fenfibly to hinder the motion of bodies, be able to impel vaft bodies towards each other with fuch force? how does this force increafe in the ratio of the mafs of the body toward which the other body is moved? Whence is it that all bodies, fuppofing the fame diftance, and the fame body gravitated to, move with the fame velocity? Can a fluid, which only acts on the furface either of the bodies themfelves, or of their internal particles, communicate fuch a quantity of motion to bodies, which in all bodies fhall exactly follow the proportion of the quantity of matter in them?

Mr. Cotes goes yet further; giving a view of Sir Ifaac Newton's philofophy, he afferts that *Gravity* is to be ranked among the primary qualities of all bodies; and deemed as effential to matter, as extension, mobility, or impenetrability. *Præfat. ad Newton. Princip.*

But this author may feem to have overfhot the mark. His great mafter, Sir Ifaac Newton himfelf, difclaims the notion; and to fhew that he does not take *Gravity* to be effential to bodies, he gives us his opinion about the caufe; chufing to propofe it by way of query, as not being yet fufficiently fatisfied about it by experiments.

This query we fhall fubjoin at large.—After having fhewn that there is a medium in nature vaftly more fubtle than air, by whole vibrations light communicates heat to bodies, and is itfelf put into alternate fits of eafy reflexion and eafy tranfmiffion, and found propagated; and by the different denfities whereof the refraction and reflexion of light is performed.

—He proceeds to enquire.

“Is not this medium much rarer within the denfe bodies of the funs, ftars, planets, and comets, than in the empty celeftial fpaces between them? and in paffing from them to great diftances, doth it not grow denfer and denfer perpetually, and thereby caufe the *Gravity* of thofe great bodies towards one another, and of their parts towards the bodies; every body endeavouring to recede from the denfer parts of the medium towards the rarer?”

“For if this medium be fuppofed rarer within the fun's body, than at its furface, and rarer there than at the hundredth part of an inch from his body, and rarer there than at the fiftieth part of an inch from his body, and rarer there than at the orb of faturn; I fee no reafon why the increafe of denfity fhould flop any where, and not rather be continued through all diftances from the fun to faturn, and beyond.”

“And though this increafe of denfity may at great diftances be exceeding flow; yet if the elastic force of this medium be exceeding great, it may fuffice to impel bodies from the denfer parts of the medium towards the rarer with all that power which we call *Gravity*.”

“And that the elastic force of this medium is exceeding great, may be gathered from the fwiftness of its vibrations. Sounds move about 1140 Englifh feet in a fecond of time, and in feven or eight minutes of time, they move about one hundred Englifh miles: light moves from the fun to us in about feven, or eight minutes of time, which diftance is about 7000000 Englifh miles, fuppofing the horizontal parallax of the fun to be about twelve feconds; and the vibrations, or pulfes of this medium, that they may caufe the alternate fits of eafy tranfmiffion, and eafy reflexion, muft be fwifter than light, and by confequence, above 700000 fwifter than founds; and therefore the elastic force of this medium, in proportion to its denfity, muft be above 700000 x 700000 (that is, above 490000000000) times greater than the elaf-

“fic force of the air, is in proportion to its denfity: for the velocities of the pulfes of elastic mediums, are in a fubduplicate ratio of the elasticities and the rarities of the mediums taken together.”

“As magnetifm is ftronger in fmall loadftones than in great ones, in proportion to their bulk; and *Gravity* is ftronger on the furface of fmall planets, than thofe of great ones, in proportion to their bulk; and fmall bodies are agitated much more by electric attraclion than great ones: fo the finallness of the rays of light may contribute very much to the power of the agent by which they are refracted; and if any one fhould fuppofe that æther (like our air) may contain particles which endeavour to recede from one another (for I do not know what this æther is) and that its particles are exceedingly fmaller than thofe of air, or even than thofe of light; the exceeding finallness of fuch particles may contribute to the greatnefs of the force by which they recede from one another, and thereby make that medium exceedingly more rare and elastic than air, and of confequence exceedingly lefs able to refift the motions of projectiles, and exceedingly more able to prefs upon grofs bodies by endeavouring to expand itfelf.” *Optics, p. 325, &c.*

GRAVITY, in mechanics, denotes the conatus, or tendency of bodies toward the centre of the earth.

That part of mechanics which confiders the motion of bodies arifing from *Gravity*, is peculiarly called *ftatics*. See *STATICS*.

Gravity, in this view, is diftinguifhed into *absolute*, and *relative*.

Absolute GRAVITY, is that wherewith a body descends freely through an unrefifting medium.

The laws of *absolute Gravity*; fee under the article *DESCENT of bodies*.

Relative GRAVITY, is that wherewith a body descends after having fpent part of its weight in overcoming fome refiftance.

Such is that wherewith a body descends along an inclined plane, where fome part is employed in overcoming the refiftance, or friclion of the plane.

The laws of *relative Gravity*, fee under the articles *inclined PLANE*, *DESCENT*, *FLUID*, *RESISTANCE*, &c.

Centre of GRAVITY; fee *CENTRE of Gravity*.

Diameter of GRAVITY; fee *DIAMETER of Gravity*.

Paracentric follicitation of GRAVITY; fee *PARACENTRIC*.

Plane of GRAVITY; fee *PLANE of gravity*.

Retardation from GRAVITY; fee *RETARDATION*.

GRAVITY, in hydroftatics.—The laws of bodies *gravitating* in fluids, make the bufinefs of hydroftatics. See *HYDROSTATICS*.

Gravity is here divided into *absolute* and *specific*.

Absolute, or true GRAVITY, is the whole force wherewith the body tends downward.

Specific GRAVITY, called alfo *relative, comparative, and apparent GRAVITY*, is the excefs of *Gravity* in any body, above that of an equal quantity or bulk of another.

For the laws of *specific Gravity*, with the methods of determining it both in folids and fluids; fee *SPECIFIC gravity*, and *HYDROSTATICAL balance*.

GRAVITY of the air; fee *WEIGHT of the air*: fee alfo *AIR* and *PRESSURE*.

GRAVITY, in mufic, is an affection of found, whereby it becomes denominated *grave, lew, or flat*.

Gravity ftands in oppofition to *acuteness*, which is that affection of found, whereby it is denominated *acute, fharp, or high*.

The relation of *Gravity* and *acuteness*, is the principal thing concerned in mufic; the diftinctnefs, and determinateness of which relation, gives found the denomination of *harmonical, or mufical*.

The degrees of *Gravity*, &c. depend on the nature of the fonorous body itfelf, and the particular figure and quantity thereof: though, in fome cafes, they likewife depend on the part of the body where it is ftruck. Thus, *e. gr.* the founds of two bells of different metals, and the fame fhape and dimenfions, being ftruck in the fame place, will differ as to *acuteness* and *Gravity*; and two bells of the fame metal will differ in *acuteness*, if they differ in fhape or magnitude, or be ftruck in different parts.

So in chords, all other things beings equal, if they differ either in matter, or dimenfions, or tenfion, they will alfo differ in *gravity*.

Thus again, the found of a piece of gold is much graver than that of a piece of filver of the fame fhape and dimenfions; and, in this cafe the tones are; *cæteris paribus*, proportional to the *specific gravities*: fo a folid fphere of brals, two foot in diameter, will found graver than another of one foot diameter; and here the tones are proportional to the quantities of matter, or the *absolute weights*.

But it muft be obferved, that *acuteness* and *gravity*, as alfo loudnefs and lownefs, are but relative things. We commonly call

tall a found *acute* and loud, in respect to another which is *grave*, or low with respect to the former: so that the same found may be both *grave* and acute, and also loud and low, in different comparisons.

The degrees of acuteness, and *gravity*, make the different tones, or tunes of a voice, or found: so we say one found is in tune with another, when they are in the same degree of *gravity*.

The immediate cause, or means of this diversity of tone lies very deep. The modern musicians fix it on the different velocity of the vibrations of the sonorous body: in which sense *gravity* may be defined, a relative property of found, which, with respect to some other, is the effect of a lesser number of vibrations accomplished in the same time, or of vibrations of a longer duration.—In which sense also, acuteness is the effect of a greater number of vibrations, or vibrations of a shorter duration.

If two, or more founds be compared in the relation of *gravity*, &c. they are either *equal*, or *unequal*, in the degree of tune.—Such as are *equal*, are called *unisons*. See **UNISON**.

The *unequal* including, as it were, a distance between each other, constitute what we call an *interval* in music; which is properly the difference, in point of *gravity*, between two founds.

Upon this inequality, or difference, does the whole effect depend; and in respect hereof, it is that these intervals are divided into *concord*, and *discord*.

GRAVY, in cookery, &c. the juices of flesh, or fish, obtained therefrom by coction, elixation, frixion, or the like.

The procuring of *gravies* is no inconsiderable part of cookery, inasmuch as these are required to heighten the gusto, and relish of most dishes. There are divers processes for *beef gravy*; one of the shortest and simplest, is to cut a pound or two of lean beef flakes into slices, beat them well, fry them till brown, and then add a pint of strong broth, and an onion; letting the whole boil a little, and then straining it for use.

To make *mutton gravy*, they roast a shoulder of mutton a little more than half, cut it with a knife, squeeze out the *gravy* with a press; then moisten the meat again with broth, and press it a second time: adding a little salt, they then keep it for use.

Veal-gravy is chiefly had by cutting flakes off a fillet, beating them, and stewing them with sliced onions, carrots, and parsnips; and at last adding strong broth, parsley, &c. letting them stew a-fresh, and straining them for use.

To make *fish gravy*, carps and tenches are slit length-ways, and stewed with butter, onions, carrots, &c. till brown; then a little flower is put in, and stewed till brown. Lastly, some fish-broth is strained in through a cloth, and the whole seasoned with salt, lemon, cloves, and favoury herbs.

GRAY, or **GREY**, a mixed colour, partaking of the two extremes, black and white.

In the mane they make several sorts of *grays*: as, the *branded* or *blackened gray*, which has spots quite black, dispersed here and there.—The *dappled gray*, which has spots of a darker colour than the rest of the body.—The *light* or *silver gray*, wherein there is but a small mixture of black hairs.—The *fad* or *iron gray*, which has but a small mixture of white.—And the *brownish* or *sandy-coloured gray*, where there are bay-coloured hairs mixed with the black.

GRAY-bound, } see **BOUND**.

GRAY order, } see **ORDER**.

GREASE, among farriers, &c. a swelling and gourdiness of the legs of a horse, very frequently happening after a journey.

If the *grease* be an attendant of some other disease, it will be in vain to attempt the cure before the disease be removed that is the original cause of it: and therefore, if it be a hectic, the yellows, or the farcin, &c. the directions given for those diseases are to be followed, and in the mean time proper applications are to be used outwardly for the *grease*.

If the *grease* proceed from common and ordinary accidents, and the horse has no other distemper upon him; then applications that are peculiar to that distemper are to be followed:—If the horse has been well fed and pampered, begin the cure with bleeding and purging, so as to diminish the redundancy of the humours; but these ought to be used with moderation, and it may be better to effect it with spare diet and daily labour. After moderate evacuations, it may be proper to make a rowel on the inside of the thigh, or in the belly; and to keep it open for a month, or longer, as there shall be occasion; and in the mean time to give the horse the cinnabar or antimonial balls.

GREAT, a term of comparison, denoting a thing to have more extension than some other to which it is referred. See **COMPARISON**.

Thus we say a *great space*: a *great distance*: a *great figure*: a *great body*, &c.

GREAT is likewise used figuratively, in matters of morality, &c. to signify ample, noble, elevated, extraordinary, important, &c.

Thus we say, *Shakespeare was a great genius*: queen *Elizabeth* had a *great soul*: *Cromwell* was a man of *great designs*: *Da Vinci*, a *great painter*: *Galileo a great philosopher*: *Boslu* a *great critic*, &c.

GREAT is also a title or quality appropriated to certain princes, and other illustrious personages.

Thus we say the *great Turk*: the *great Mogul*: the *great chaut* of *Tartary*: the *great duke* of *Florence*, &c.

GREAT is also a surname bestowed on several kings and emperors.

Thus we say, *Alexander the Great*: *Cyrus the Great*: *Charles the Great*, or *Charlemagne*: *Henry the Great* of *France*, &c. So the English frequently say, *Edward the Great*, or the *Great Edward*: *William the Great*, meaning king *William III.* or the *Great William*. The French say, *Louis the Great*, *le Grand*, speaking of the late *Louis XIV.* *Gyles* of *Paris*, says *Charlemagne*, first got the surname *Great* from the tallness and eminence of his stature. *Helgaud* adds, that *Hugh the Great* of *France* was thus denominated on account of his great piety, goodness, &c.

GREAT is also applied to several officers, who have pre-eminence over others.

Thus we say, the lord *great chamberlain*: the *great marshal* of *Poland*, &c.

GREAT circles of the sphere, are such as divide the sphere into two equal parts or hemispheres; or whose planes pass through the centre of the sphere: in contradistinction from the lesser circles, which cut the sphere into unequal parts, &c.

The equator, meridian, ecliptic, verticals, &c. are *great* or *greater circles* of the sphere; and the parallels, tropics, &c. lesser circles. See **EQUATOR**, **MERIDIAN**, &c.

GRECIAN Coins, see the article **COINS**.

GREE*; in our law-books, signifies agreement, contentment, or good liking.—Thus to make *gree* to the parties, is to satisfy them for an offence done. “Judgment shall be put in suspense, till *gree* be made to the king of his debt.” *Stat. 25 Edward III.*

* The word is formed from the French *gré*, good will, good liking, or allowance.

GREEK, **GRECIAN**; something belonging to the people of Greece.

GREEK, absolutely so called, or the *GREEK language*, or *antient GREEK*, is the language spoken by the antient Grecians, and still preserved in the works of their authors, as *Plato*, *Aristotle*, *Ilocrates*, *Demosthenes*, *Thucydides*, *Xenophon*, *Homer*, *Hesiod*, *Sophocles*, *Euripides*, &c.

The *Greek* has been preserved entire longer than any other language known, notwithstanding all the revolutions that have happened in the country where it was spoke. See **ENGLISH**. Yet, from the time of the removal of the seat of empire to Constantinople, in the fourth century, it has been gradually altering: the alterations at first did not affect the analogy of the tongue, the construction, inflections, &c. There were only new words, new riches acquired, by taking in the names of new dignities and offices, and the terms of art it was before unacquainted with: but, at length, the incursions of the Barbarians, and especially the invasion of the Turks, wrought much more considerable alterations. See **modern GREEK**.

The *Greek* has a great copia or flock of words: its inflexions are as remarkable for their variety, as those of most of the other European tongues, for their simplicity.

It has three numbers, singular, dual, and plural, and abundance of tenses in its verbs, which makes a variety in discourse, prevents a certain driness which always accompanies a too great uniformity, and renders the language peculiarly fit for all kinds of verse.

The use of the participles of the aoristus, and preterit, together with the compound words, wherein it abounds, give it a peculiar force and brevity, without taking any thing from its perspicuity.

GRE

The proper names in the *Greek* language, are significative, as in the oriental, as well as in most of the modern languages, where the learned still find some, though remote, character of their origin.

The *Greek* was the language of a polite people, who had a great taste for arts and sciences, which they cultivated with success. In the living tongues, are still preferred a vast number of *Greek* terms of art: some defended to us from the *Grecians*, and other formed a-new. When a new invention, machine, rite, order, instrument, &c. has been discovered, recourse has commonly been had to the *Greek* for a name; the facility wherewith words are there compounded, readily affording us names expressive of the use, effect, &c. of such instruments. Hence *aræometer*, *thermometer*, *barometer*, *micrometer*, *hæarithm*, *telescope*, *microscope*, *lozodromy*, &c.

Modern or vulgar GREEK, is the language now spoke in Greece.

There have been few books writ in this language, from the taking of Constantinople by the Turks; scarce any thing but some catechisms, and the like pieces, composed or translated into the vulgar *Greek*, by the Latin missionaries.

The native *Greeks* are contented to speak the language without cultivating it. The misery they are reduced to under the dominion of the *Turks*, renders them ignorant of necessity; the *Turkish* politics not allowing any of the subjects of their estates, to apply themselves to the arts and sciences.

Whether it be out of a principle of religion, or politics, or barbarism, they have industriously destroyed all the monuments of ancient Rome; despising the study of a language which might have rendered them polite, their empire happy and flourishing, and have made the people forget their former masters, and even their ancient liberty.

In this, widely different from the Romans, those ancient conquerors of Greece, who after they had subdued the country, applied themselves to learn the language; in order to imbibe their politeness, delicacy, and taste for arts and sciences.

It is not easy to assign the precise difference between the *vulgar* and the *antient Greek*. It confists in the terminations of nouns, pronouns, verbs, and other parts of speech, which make a difference between those two languages much like that observed between some of the dialects of the Italian or Spanish: we instance in those languages, as being the most known; but we might have said the same of the Hebrew, Slavonic, &c. dialects.

Beside, the modern *Greek* has divers new words not in the ancient; particularly several particles which appear as expletives, and which were introduced to characterise certain tenses of verbs, and other expressions, which would have had the same meaning without such particles, had custom dispensed with them; divers names of dignities and offices, unknown to the ancient *Greeks*; and abundance of words borrowed from the vulgar tongues of the neighbouring nations.

Accordingly one may distinguish three ages of the *Greek tongue*: the first ends at the time when Constantinople became the capital of the Roman empire; not but there were several books, especially of the fathers of the church, wrote with great purity after that time: but as religion, law, and policy,

both civil and military, began then to introduce new words into the language, it seems necessary to begin the second age of the *Greek* tongue from that epocha; which lasted to the taking of Constantinople by the Turks, where the last age commences.

GREEK bible, } { BIBLE.

GREEK church, is that part of the christian church which is established in Greece; extending likewise to some other parts of Turkey.

It is thus called in Europe, Asia, and Africa, in contradistinction from the *Latin*, or *Romish* church; as also the *Eastern* church, in distinction from the *Western*.

The Romanists call the *Greek church*, the *Greek schism*, because the Greeks do not allow the authority of the pope, but depend wholly, as to matters of religion, on their own patriarchs. They have treated them as schismatics ever since the revolt, as they call it, of the patriarch Photius.

The learned are divided as to the peculiar doctrines and sentiments of the *Greek* church. It is certain many errors are usually charged on them, which they are free of. The point has been warmly contested between Cauc^{us}, archbishop of Corfu, and the Sieur de Moni, on the one side; and Lucas Hofstadius, and Leo Allatius, a *Greek*, on the other; the two first accusing, the last excusing them. Cauc^{us}, &c. will have them agree with the protestants, in rejecting abundance of the rules and observances established in the Romish church; while Allatius, &c. endeavours to find the same observances among the *Greeks*, as among the Latins, only under other forms, and with other circumstances.

Of the seven Latin sacraments, says Caucus, the *Greeks* only admit of five : confirmation and extreme unction, they set aside. Allatius, on the contrary, insists, that they do not properly

GRE

set them aside, but only differ as to the manner of administering them. Instead of confirming long after baptism, they always join baptism and confirmation together: beside that confirmation among them, is conferred by the ordinary priests. The like error is charged on Caucas, with regard to extreme unction.

But it is to be here added, that from the answer of Jeremy, patriarch of Constantinople, to the divines of Wirtemberg, it appears, that the *Greeks*, like the reformed, do really own no more than two sacraments instituted by Christ, viz. baptism and the eucharist.

The *Greeks*, says the same *Caucus*, offer no worship to the eucharist : Allatus replies, it is true, they do not adore it, as the *Romanists* do, immediately after the speaking those words, *this is my body*, yet do they really adore it after the words wherein consecration consists, viz. after the prayer called the invocation of the holy Spirit.

As to confession, Caucus is certainly in the right, that they do not hold it to be of divine appointment, but only of positive, or ecclesiastical right; which they likewise affirm of all the other sacraments, except the two above-mentioned: yet have they the use of auricular confession.

As to marriage, Caucus is just to them, in saying, that they do not esteem it an indissoluble band; they maintain with great zeal, the necessity and validity of divorce.

As to the primacy of the pope, Cauc^{us} does them justice in saying they deny it. It is certain the *Greeks*, Melchites, and other orientals, do not allow the primacy of the pope over the other patriarchs, in the sense it is allowed of among the Latins.

Nor do they allow of more than seven general councils. All those held by the Latins, since Photius, they set aside.

GREEN, one of the original colours of the rays of light.

If urine, citron juice, or spirit of vitriol, be cast on a *green* ribbon, it becomes blue; by reason the yellow of the green-
ing-weed is thereby exhale and consumed; so that nothing but
blue remains behind.

Grass and herbs, and even all vegetables in places exposed to the open air, are *green*; and those in subterraneous places, or places inaccessible to the air, white and yellow. Thus, when wheat, or the like, germinates under ground, it is white or yellow; and what is in the open air, *green*: though this too is yellow before it be *green*.

Artificial GREENS are very rarely simple colours, but produced by the mixture of yellow and blue.

Two powders, the one blue, and the other yellow, well mixed, appear perfectly green; though when viewed with a microscope, we observe a chequer of blue and yellow.

The dyers make divers shades, or casts of green, as *light green*, *yellow green*, *grass green*, *laurel green*, *sea green*, *dark green*, *parrot green*, and *celadon green*.

All the *greens* are first dyed in blue, then taken down with woad, verdegrease, &c. and then *greened* with the weed, there being no one ingredient that will give *green* alone.

Mountain GREEN, or *Hungary GREEN*, is a sort of *greenish* powder found in little grains, like sand, among the mountains of Kernaufent in Hungary, and those of Moldavia.

Though some hold that this mountain green is fictitious, and the same with what the antients called *flus aris*, prepared by calting water, or rather wine, on copper red-hot from the furnace, and catching the fumes thereof on copper plates laid over for the purpose; or by diffolving copper plates in wine, much as in making verdegrease. The painters make use of this colour for a *grafs green*. It is sometimes counterfeited by grinding verdegrease with cerule.

GREENCLOTH, a board, or court of justice, held in the computing-house of the king's household, for the taking cognizance of all matters of government and justice within the king's court royal; and for correcting all the servants therein, that shall any way offend.

To this court also belongs the authority of maintaining the peace for twelve miles round the king's court, wherever it shall be, excepting at London.

The judge of this court is the lord steward, assisted by the treasurer, comptroller, cofferer, clerks of the *greencloth*, &c. It takes its name *greencloth*, from a green cloth spread over the board where they sit, whereon are the arms of the computing-house.

Clerks of the GREENCLOTH, are two officers of the board of *greencloth*, who attend there, and have business assigned them by the board.—All bills of comptrolments relating to the office, are summed up, and allowed by the clerks comptrollers, and audited by the clerks of the *greencloth*.

They also appoint the king's, queen's and household's diet, and keep all records, leigers, and papers relating thereto; make up bills, parcels, and debentures for salaries, &c. and provisions and necessities for the officers of the pantry, buttery, cellar, &c.

GREENHOUSE, or *conservatory*; a house of shelter in a garden; contrived for preserving the more tender and curious exotic plants, which will not bear the winter's cold abroad in our climate.

Greenhouses, as now built, serve not only as conservatories, but likewise as ornaments of gardens; being usually large and beautiful structures, in form of galleries, wherein the plants are handsomely ranged in cases for the purpose.

The *greenhouse*, Mr. Mortimer directs to be open to the south, or very little declining therefrom: the height and breadth to be about twelve foot, and length according to the number of plants intended to be kept therein. It should be situate on the driest ground, and so contrived, as that nothing may obstruct the sun's rays in winter. In the building it, care must be taken, not to plaster it on the inside with lime and hair: dampness being observed to continue longer on such plaster, than on bricks or waincot. To preserve it the more from moisture and colds, an artificial heat is to be used: in order to this, some hang up fires, and others place pans of coals in holes in the ground. The better way is, to have a stove behind the *greenhouse*, and to convey the heat thereof through trills, made under the floor for that purpose. The best method of all, according to Bradley, is the new stove invented by M. Gauger, and published in English by Dr. Defaguliers.

Some have fashies, casements, and doors of glass; others prefer moveable canvas doors, to be taken off, and put on at pleasure.

The pots and cases with plants in them, are to be ranged in the *greenhouse* so, as not to incommode one another, or hinder any from readily receiving both sun, air, &c. As to the management of the plants herein, Mortimer recommends the opening of the mould about them, from time to time, and sprinkling a little fresh mould in them, and a little warm dung on that; as also to water them when the leaves begin to wither and curl, and not oftener, which would make them fade and be sickly; and to take off such leaves as wither and grow dry.

Bradley advises, that in the colder parts of England, the front of the *greenhouse* be built in a sweep, or semicircle, to receive the sun's rays, one part or other of it, all day: that all the windows, &c. in the front have close, thick, wooden shutters, to be shut every night in winter, for fear of frost, nipping winds, &c.—Dutch tiles he thinks the best lining for the walls, as being dry, and reflecting a great deal of heat; and square tiles for the pavement, which readily imbibe the wet, and never sweat, as marble and the harder stones do.—The plants in the *greenhouse* are not to fill above a quarter part of the space thereof; the rest being left vacant for the air to circulate about the plants. If the house be crowded with plants, the effluvia they are continually emitting by perspiration, and the vapours from the mould, will condense the air, and cause dampness. The plants are to be disposed, as much as possible, about the middle parts of the *greenhouse*, where they will be safer from the cold, which is usually greatest near the glasses and walls: the tenderest plants to be disposed nearest to where the heat comes in.

It is a general rule among gardeners, to set exotic plants into the *greenhouse*, about the second week in September, and to take them out again about the middle of May; though there should be some distinction made herein; the tenderest sorts from places near the line, as the aloes, &c. being to be confined longer to the *greenhouse*, than oranges, myrtles, &c.

VOL. I.

GRI

GREENLAND fishery; see the article *Whale FISHERY*.

GREENWICH hospital; see the article *HOSPITAL*.

GREGORIAN calendar is that which shews the new and full moon, with the time of Easter, and the moveable feasts depending thereon, by means of epochs disposed through the several months of the Gregorian year.

The *Gregorian* calendar, therefore, differs from the *Julian*, both in the form of the year, and in that it uses epochs, instead of golden numbers.

This reformation of the calendar was made in 1582, by order of pope Gregory XIII. and with the advice of Aloysius Lilius, and other mathematicians: at the same time, ten days were cut off from that year, and cast away, to bring the equinoxes to their antient feat, viz. the 21st of March. And to keep them constantly there, the same pope introduced a new form of year.

GREGORIAN chant; see the article *CHANT*.

GREGORIAN year, is the *Julian* year corrected, or modelled, in such manner, as that three secular years, which in the *Julian* account are bissextile, are here common years, and only every fourth secular year, is made a bissextile year.

The *Gregorian* year, though it comes nearer to nature and truth, than the *Julian*, is not strictly just: in four hundred years it gets one hour and twenty minutes; and consequently in seven thousand two hundred, a whole day.

The *Gregorian* year, is that now used in most countries of Europe; England, most of the United Provinces, Sweden, and Denmark, excepted; where the *Julian* year still obtains.

From this difference arises the distinction of the *old*, or *Julian*, and *new* or *Gregorian* style.

The old style is now eleven days behind the new: so that the same day which in the *Gregorian* account is the eleventh day of any month, in the *Julian* is only the first.

GREGORIAN epocha, is the epocha, or time whence the *Gregorian* calendar, or computation took place.

The year 1726, is the 144th year of the *Gregorian* epocha.

GRENADA,
GRENADIER, } see { GRANADO.
GRANADIER.
GRENATE, } GRANATE.

GRESHAM-college; see the article *COLLEGE*.

GREVE*, **GEREFA**, among our antient writers, is a denomination of power and authority; signifying as much as *comes*, or *vicescomes*. See the articles *COUNT*, and *VICOUNT*.

* The word is formed from the Anglo-Saxon *grith*, peace. Thus Hoveden, *Greve dicitur, id est quod jure debeat grith, i. e. pacem ex illis facere, qui patria inferunt viam, i. e. miseriam vel malum.*

Lambard makes *greve* the same with *reeve*.

Hence also the words *shireve*, *portreeve*, &c. which were antiently written *sciregerefa*, *portgerefa*, &c.

GREY, } see { GRAY.

GREYHOUND, } GRAYHOUND.

GRIFFON, **GRYPHUS**, γρυψ, in natural history, the name of an imaginary bird of prey, of the eagle kind.

The antients speak fabulously of the *griffon*; they represent it with four legs, wings, and a beak; the upper part representing an eagle, and the lower a lion; they supposed it to watch over gold mines, hidden treasures, &c.

The animal was consecrated to the sun; and the antient painters represented the chariot of the sun as drawn by *griffons*.—M. Spanheim observes the same of those of Jupiter and Nemesis.

We find mention of the *griffon* in holy scripture; but are not to understand the text of that chimerical animal just described, which no body ever saw but in painting and armories, notwithstanding what Servius, in his comment on the eighth eclogue of Virgil and Isidore, says of it.—The *griffon*, in scripture, is that species of eagle, called in Latin *effrugas*, the osprey, and פֶּרֶס, *peres* of the verb פָּרַס, *paras* to break.

God prohibited the Jews to eat divers kinds of birds of prey, as the kite, vultur, &c. and the divers species of eagles, which are distinguished in Latin by the names of *aquila*, *gryps*, *halietur*.—Pausanias, in *Arcaidicis*, says the *griffon* has his skin spotted like a leopard.

The *griffon*, we mean the fabulous one, is frequently seen on antient medals; and is still bore in coat armour. Or, a *griffon* rampant, with wings displayed, sable, is born by the family of Morgan in Monmouthshire, &c.

Guillim blazons it *rampant*; alledging that any very fierce animal may be so blazoned, as well as a lion.—Sylvester, Morgan, and others, use the term *jeffiant* instead of *rampant*.

GRILLADE, in cookery, meat broiled on the gridiron; thus called from the French *griller*, to broil.

The word is also used for the browning of any dish, by rubbing a hot iron over it.—To *grill* oysters, is to put them into scollop-shells, season them with salt, pepper, and parsley shred, and pour their own liquor to them; covering them

with grated bread; stewing them half an hour on the fire, and browning them with a red-hot iron.—Shrimps are *grilled* after the same manner.

GRINDING, *trituration*, the act of breaking, or comminuting a solid body, and reducing it into powder, dust, flour, farina, or the like.

Grinding is one of the species of dissolution.—The painters colours are *ground* on a marble, or porphyry, either with oil or gum water.

Some late physicians contend, that digestion is performed by *grinding* the food in the stomach.—It is alledged, that every part in the body is a vessel, or vessels; that all the vessels have a motion of systole and diastole; and that all the operations of the body consist in the attrition, or *grinding* of the humours or matters contained in such vessels.

GRINDING is also used for the rubbing, or wearing off, the irregular or otherwise redundant parts of the surface of a body, and reducing it to the destined figure, whether that be flat, concave, or the like.

The *grinding of glasses* is a considerable art, and as such, necessarily requires to be here insisted on; especially that off optic glasses.

Method of GRINDING optic glasses.—For convex glasses, the first step is to provide a dish, or bafon, within whose cavity the glass is to be formed.

In order to this, they take a piece of brass, copper, iron, or wood, and form it into a segment of a circle, having the radius of the bafon, or dish intended. This done, a bafon is forged by a smith, either of iron or copper; having its cavity exactly fitting or corresponding to the segment above mentioned: though sometimes they chuse to have the bafon cast; in which case, the rules elsewhere delivered for concave mirrors, are to be here observed.

The figure of the bafon thus roughly formed, is to be finished in the pewterers lathe; or on a stone mould A, *Tab. Miscellany*, fig. 12. fixed to an iron axis, with a pinion B C, moveable by a wheel D E, and that by a winch or handle F. The bafon being ground on the mould, till it exactly fit in all parts, they take it off, and cementing it to a wooden block (loaden, if need be, with lead) strew it over with fine sifted sand, and thus *grind* it over again on the mould, till all the furrows or scratches be quite taken away.

Lastly, they *grind* large pieces of glass in a bafon, with fine sand between; till such time as its surface being well smoothed, there is no longer any opposition to the motion.

Note, the dish is known to be perfectly finished, when a hair being stretched over it, its shadow projected in the cavity, especially in a camera obscura, does not appear any way distorted.

The bafon finished, they proceed to chuse glasses for the purpose: in order to this, lay them on clean paper, and observe what colours are projected thereon; for the same are the colours of the glasses. Always set aside those of the darker colours, and chuse the brighter: but as the whitest and brightest have usually veins; and beside, in tract of time, by the humidity of the air, are apt to rust, and lose their polish; for this reason Huygens recommends those a little yellowish, reddish, or greenish; Hevelius, the blueish. A glass is found to be free from bubbles, sands, veins, knots, and spires, by holding it to the sun, and receiving the rays through it on a white paper; for the flaws abovementioned, will each project a shadow thereon.

If, instead of lenticular, or at least spherical glasses, you make use of plate glass; it must be divided, and cut with a diamond, into squares, and if it be too thick to break otherwise, you may do it by laying it on a table covered with a cloth, in such manner, as that the side or part to be severed hang over the edge: for being struck with an iron instrument, in this situation it easily breaks in the direction of the line drawn by the diamond. Having thus got a square piece, describe two concentric circles thereon, with a pair of compasses, one of whose legs carries a diamond; the diameter of the inner circle, to be equal to the breadth of the intended lens, and that of the outer somewhat more; and break off the corners, as above directed; and the lesser inequalities take off on a grind-stone, or the like. Examine now whether the piece of glass be every where equally thick; if it be not, reduce it to such equality by *grinding* it on an iron plate with sand and water. Lastly, glue or cement the glass thus prepared to a wooden handle N M O, fig. 13. with a cement made of pitch, and a fourth part of rosin; or one part of wax, and eleven of colophony. Care to be taken that the base, or bottom of the handle N O, be equal to the glass; and that the centre of the glass and handle meet together. Smaller lens's, as those used for microscopes, are fixed on with sealing-wax.

Now, to grind the glass, and bring it to the convexity required; smear over the dish equally with fine sifted sand moistened with water; then taking the handle with the glass thereon, work it on the bafon sometimes this way, and some-

times that, to prevent the form of the bafon from being disturbed; never leaning too hard thereon. When the glass has got the figure of the bafon, clean it well of all the sand, and filth adhering; and sprinkle the bafon over with emery moistened in water; *grinding* the glass thereon, till all the roughnesses and inequalities are taken away. After this, the fine sand used in hour-glasses may be of service, applied and used as before; remembering to take out the sand when too much worn, and substitute new in its stead. Some in lieu hereof, chuse several sorts of emery, each finer than other, or even the powder of flints calcined and pounded. Lastly, grind the same glass in another bafon, or dish, which is a segment of a lesser sphere, making use of the like sand as before; till it have got a pretty high rim, or margin, all around. In regard the preffion is not here determined accurately enough upon the middle of the glass, by the mere guidance of the hand; some have chose to make use of the following machine, especially for *grinding* object-glasses.

Fix the dish H I, fig. 14. on a horizontal table; exactly over its centre let the aperture D be, through which pass an iron arm five, or six inches long, fastened to the staff A B. Let the other extreme of the staff be fitted into a hole cut in the dish, and fastened therein. Now to grind the glass, instead of the dish, take hold of the said staff, and work with sand, &c. as before.

Huygens tells us, that he always first used coarse emery, then a finer powder of the same, which would be fifty seconds in sinking to the bottom of a vessel of water, putting in fresh every half or quarter of an hour. Sometimes too, he used emery of fifty seconds, for $\frac{1}{2}$ of an hour; then emery of four hundred seconds, for $\frac{1}{3}$ of an hour; and lastly, emery of forty-five minutes for $\frac{1}{4}$ of an hour. The same effect is had from powder of flints, broke in an iron mortar, mixed with water, and stirred sometimes with a wooden spatula, taking the powder as it precipitates in some certain time to the bottom of the vessel, by decanting the water.—What remains is, to polish the glass.

GRINDING is also used for a coarser, and less accurate method of smoothing or polishing the surface of a body; particularly glass for looking glasses, &c.

In the new method of working large plates of glass for looking-glasses, coach-glasses, &c. by moulding, and, as it were, casting them, somewhat after the manner of metals, described under the article GLASS: the surface being left uneven, it remains to be ground and polished.

In order to this, the plate of glass is laid horizontally on a stone in manner of a table; and to secure it the better, plastered down with mortar, or stucco, that the effort of the workman, or of the machine used therein, may not shake or displace it. To sustain it, there is a strong wooden frame that surrounds it an inch or two higher than the glass. The bottom, or base of the *grinding* engine, is another rough glass, about half the dimensions of the former: On this is a wooden plank, cemented thereto; and upon this are proper weights applied to promote the triture; the plank or table, being fastened to a wheel, which gives it motion.—This wheel, which is at least five or six inches diameter, is made of a very hard but light wood, and is wrought by two workmen placed against each other, who push and pull it alternately: and sometimes, when the work requires it, they turn it round. By such means, a constant mutual attrition is produced between the two glasses, which is favoured by water and sands of several kinds bestowed between; sand still finer and finer being applied, as the *grinding* is more advanced: at last emery is used. We need not add, that as the upper or incumbent glass polishes and grows smoother, it must be shifted from time to time, and others put in its place.

It is to be noted, that only the largest size glasses are thus ground with a mill; for the middling and smaller sorts are wrought by the hand, to which end there are four wooden handles at the four corners of the upper stone, or carriage, for the workmen to take hold of, and give it motion.—What remains to the perfection of glass, comes under the denomination of polishing.

GRIP, or **GRIPPE**, in husbandry, is a small ditch cut a-croß a meadow, or ploughed land; in order to drain it.—It also signifies an handful; as, a *gripe* of corn.

GRIPPE of a ship, is the compass or sharpness of her stem under water; chiefly towards the bottom of her stem.

The design of shaping her so, is to make her *gripe* the more, or keep a good wind; for which purpose sometimes a false stem is put on upon the true one.

GRIPPE is also a sea-phraze for a ship's being apt to run her head or nose too much into the wind: in such case they say, the *gripes*; of which there are two causes: 1^o Overloading her a-head, the weight of which presses her head so down, that it is not apt to fall off from the wind. 2^o The staying or feting her masts too much aft; which will always be a fault in a small ship that draws much water, and will cause her to be continually running into the wind. Though in stately ships, if the masts be not stayed far aft, they will never keep a good wind.

GRIPES, *termina ventris*, in medicine, a sort of cholick, or painful disorder of the lower belly, occasioned by some sharp pungent matters vellicating the parts, or by wind pent up in the intestines.

The *gripes* are a very common symptom in young children, and may be caused by the aliment they use, which is considerably different from what they had been accustomed to in the uterus.

The retention of a part of the meconium may also give occasion hereto, as being somewhat acrimonious. This disorder sometimes proves so violent, as to throw the child into universal convulsions, or to cause what is vulgarly called *convulsions of the bowels*.

GRIST denotes corn ground, or ready for grinding: See **CORN**, &c.

GROANING, in hunting, a term used for the cry or noise of a buck.

GROAT, an English money of account, equal to four pence.

Other nations, as the Dutch, Poles, Saxons, Bohemians, French, &c. have likewise their *groats*, *groots*, *groches*, *gros*, &c.

We had no silver money in the Saxon times bigger than a penny; nor after the conquest, till Edward III. who about the year 1351, coined groffes, i. e. *groats*, or great pieces, which went for 4 d. a piece; and so the matter stood till the reign of Henry VIII. who, in 1504, first coined shillings.

GROCCERS, by the stat. 37 Edward II. cap. 5. is used for those who engross merchandize. See **ENGROSSING**.

GRAM, in the manufactory, a sort of stuff, all silk; being in reality no more than a taffety, coarser and thicker than ordinary.

GROOM*, denotes a servant in some inferior post:—In which sense it amounts to the same with the old word, *garçon*, and the French *garçon*.

* The word is formed from the Flemish, *grom*, *puer*, a boy.

GROOM is the denomination of several officers and servants in the king's household.

There are *grooms* of the almonry, *grooms* of the compting-house, *grooms* of the chamber, the privy-chamber, *grooms* of the robes, of the wardrobe, &c.

GROOM of the stole; see the article **STOLE**.

GROOM porter is an officer of the household, whose business is to see the king's lodging furnished with tables, chairs, stools, and firing; as also to provide cards, dice, &c. and to decide disputes arising at cards, dice, bowling, &c.

GROOM is more particularly used for a servant, appointed to attend on horses in the stables. See **EQVEERY**.

GROS, a foreign money, in divers countries, answering to our *groat*.

A pound *gros*, *livre de gros*. See **POUND** and **LIVRE**.

GROSS, or **GROSSUS**, in our ancient law writers, denotes a thing absolute, and not depending on another.—Thus, *villain in gros*, villanus in grossio, was a servant, who did not belong to the land, but immediately to the person of the lord; or a servile person not appendant, or annexed to the land or manour, and to go along with the tenures as appurtenant to it, but like the other personal goods and chattels of his lord, at his lord's pleasure and disposal.

So an advowson in *gros*, is a right of patronage not annexed to the fee or manour, but belonging to the patron himself, distinct from the manour.

Common in Gross; see the article **COMMON**.

GROSS weight, is the weight of merchandizes, and goods with their dust and dross, as also of the bag, cask, chest, &c. wherein they are contained; out of which *gross-weight*, allowance is to be made for tare and tret.

GROSS average; see the article **AVERAGE**.

GROSS is also used for the quantity of twelve dozen.

GROSSA, a groat—*concessa est regi una grossa, que continet quatuor denarios, de quolibet viro et muliere*. Knighton, anno 1378.

GROSSE-BOIS, in our ancient law-books, signifies such wood as hath been, or is, either by the common law, or custom of the country, reputed timber.

GROTESQUE, **GROTESCO**, or **GROTTESQUE**, a wild whimsical figure, or design of a painter, or engraver; having something ridiculous, extravagant, and even monstrous in it. The name arises hence, that figures of this kind were anciently much used to adorn the grotto's wherein the tombs of eminent persons, or families, were inclosed. Such was that of Ovid, whose grotto was discovered near Rome about seventy years ago.

Calot, a celebrated engraver of Lorrain, had a wonderful genius for designing *grotesques*: the like is said of Leonardo da Vinci. We also extend the word *grotesque* to any thing whimsical, or wildly pleasant, in a person's dress, discourse, &c.—Masquerade habits are the more valued, the more *grotesque* they are: our theatres present us with entertainments in *grotesque* characters, i. e. persons quaintly dressed; as harlequins, scar-

mouches, &c. Planudes has given us a very *grotesque* picture of Æscop. Aristoph and the Italian poets are full of *grotesque* descriptions.

GROTESQUE-work, **GROTESK-work**, or **GROTTESCO**, denotes a work, or composition in painting, and sculpture, in the *grotesque* manner or taste; consisting either of things which are merely imaginary, and have no existence in nature, or of things things turned and distorted out of the way of nature, so as to raise surprise, and ridicule.

Grotesque-work is much the same with what we sometimes also call *antique* and *morisco*.

GROTESQUES, or **GROTESKS**, are particularly used for little fanciful ornaments, of animals, compounded with foliages, fruit, &c.

Such are those painted by Raphael in the apartments of the Vatican, and those carved by Michael Angelo in the ceilings of the Portico of the capitol.—Vitruvius calls compartments of this kind *harpaginutuli*.

GROTTO*, or **GROTTA**, in natural history, a large deep cavern or den in a mountain or rock.

* The word is Italian, *grotta*, formed, according to Menage, &c. from the Latin *crypta*: Du Cange observes, that *grotta* was used in the same sense in the corrupt Latin.

The ancient anachorets retired into dens, and *grotto's*, to apply themselves the more attentively to meditation. Okay-hole, Elden-hole, Pool's-hole, and the Devil's A—fc in the Peak, are famous among the natural caverns or *grotto's* of our country.

Elden-hole is a huge profound perpendicular chasm, three miles from Buxton, ranked among the natural wonders of the Peak. Its depth is unknown, and is pretended to be unfathomable. Cotton tells us he sounded 884 yards, yet the plummet still drew. But he might easily be deceived, unless his plummet were very heavy; the weight of a rope of that length might well make the landing of the plummet scarce perceivable. *Phil. Transf. N° 407. p. 24.*

Peak's-hole, and Pool's-hole, called also the Devil's A—fc, are two remarkable horizontal springs under mountains; the one near Cattleton, the other just by Buxton.—They seem to have owed their origin to the springs which have their current through them: when the water had forced its way through the horizontal fissures of the strata, and had carried the loose earth away with it, the loose stones must fall down of course: and where the strata had few or no fissures, they remained intire; and so formed there very irregular arches, which are now so much wondered at.—The water which passes through Pool's-hole is impregnated with particles of limestone, and has incruited the whole cave in such a manner that it appears as one solid rock.—Martyn, in *Phil. Transf. N° 407. p. 27, & seq.*

In *grotto's* are frequently found crystals of the rock, stalactites, and other natural conglaciations, and those often of an amazing beauty.

M. Homberg conjectures, from several circumstances, that the marble pillars in the *grotto* of Antiparos, vegetate or grow.

That author looks on this *grotto* as a garden, whereof the pieces of marble are the plants; and endeavours to shew that they could only be produced by some vegetative principle. *Mem. Acad. anno 1702.*

At Foligno in Italy, is another *grotto*, consisting of pillars and orders of architecture of marble, with their ornaments, &c. scarce inferior to those of art; but they all grow downwards: so that if this too be a garden, the plants are turned upside down. *Mem. de l'Acad. anno 1711.*

The Zirchnitzer-sea, or lake, in Carniola, famous for being full of water, fish, &c. the best part of the year, and quite dry, and bearing grass, corn, &c. the rest; proceeds from some subterraneous *grotto*, or lake; as is made highly probable by Mr. Valvaio. *Philosoph. Transf. N° 191.*

We have several *grotto's* famous in natural history; as,

GROTTA del Cane, a little cavern near Pozzuoli, four leagues from Naples, the steams whereof are of a mephitical or noxious quality; whence also it is called *Bocca venenosa*, the poisonous mouth. See **MEPHITES**.

Two miles from Naples, says Dr. Mead, just by the Lago de Agnano, is a celebrated mofeta, commonly called *la Grotta del Cani*, equally destructive to all within the reach of its vapours.

It is a small *grotto* about eight foot high, twelve long, and six broad; from the ground arises a thin, subtile, warm fume, visible enough to a discerning eye, which does not spring up in little parcels here and there, but in one continued stream, covering the whole surface of the bottom of the cave; having this remarkable difference from common vapours, that it does not, like smoke, disperse itself into the air, but quickly after its rise, falls back again, and returns to the earth; the colour of the sides of the *grotto* being the measure of its ascent: for so far it is of a darkish green, but higher only common earth. And as I myself found no inconvenience by standing in it, so no animal, if its head be above this mark, is the least injured. But when, as the manner

manner is, a dog, or any other creature, is forcibly kept below it; or by reason of its smallness, cannot hold its head above it; it presently loses all motion, falls down as dead, or in a swoon, the limbs convulsed and trembling, till at last no more signs of life appear, than a very weak and almost insensible beating of the heart and arteries; which if the animal be left a little longer, quickly ceases too, and then the case is irrecoverable; but if it be snatched out, and laid in the open air, soon comes to life again, and sooner if thrown into the adjacent lake.

The fumes of the *grotto*, the same author argues, are no real poison, but act chiefly by their gravity; else the creatures could not recover so soon; or, if they did, some symptoms, as faintness, &c. would be the consequence of it. He adds, that in creatures killed therewith, when dissected, no marks of infection appear; and that the attack proceeds from a want of air, by which the circulation tends to an entire stoppage, and this so much the more, as the animal inspires a fluid of a quite different nature from the air, and so no ways fit to supply its place.

Taking the animal out while yet alive, and throwing it into the neighbouring lake, it recovers: this is owing to the coldness of the water, which promotes the contraction of the fibres, and so assists the retarded circulation; the small portion of the air which remains in the vesiculae, after every expiration, may be sufficient to drive out the noxious fluid. After the same manner, cold water acts in a deliquium animi: the lake of Agnano has no other virtue in it than others.

GROTTA dei serpi, is a subterraneous cavern near the village of Saffa, eight miles from the city of Braccano in Italy; described by Kircher thus:

The *grotta dei serpi*, is big enough to hold two persons; it is perforated with several fistular apertures, somewhat in manner of a sieve; out of which, at the beginning of the spring season, issues a numerous brood of young snakes of divers colours, but all free of any particular poisonous quality.

In this cave they exposed their lepers, paralytics, arthritics, and elephantiac patients quite naked; where, the warmth of the subterraneous streams resolving them into sweat, and the serpents clinging variously all around, licking and sucking them, they became so thoroughly freed of all their vitious humours, that upon repeating the operation for some time, they became perfectly restored.

This cave Kircher visited himself, and found it warm, and every way agreeable to the description given of it. He saw the holes, and heard a murmuring, hissing noise in them. Though he missed seeing the serpents, it not being the season of their creeping out, yet he saw a great number of their exuviae, or sloughs, and an elm growing hard by laden with them.

The discovery of this cave, was by the cure of a leper going from Rome to some baths near this place; who losing his way, and being benighted, happened upon this cave, and finding it very warm pulled off his cloaths, and being weary and sleepy, had the good fortune not to feel the serpents about him till they had wrought his cure. *Museum Wormian.*

MILKY GROTTA, *crypta lactea*, a mile distant from the antient village of Bethlehem; is said to have been thus denominated, on occasion of the blessed virgin, who let fall some drops of milk in giving suck to the little Jesus in this *grotto*.—And hence it has been commonly supposed, that the earth of this cavern has the virtue of restoring milk to women that are grown dry, and even of curing fevers.

Accordingly, they are always digging in it, and the earth is sold at a good rate to such as have faith enough to give credit to the fable.—An altar has been built on the place, and a church just by it. See *Supplement, article CAVERN*.

GROTTO is also used for a little artificial edifice made in a garden, in imitation of a natural *grotto*.

The outides of these *grotto's* are usually adorned with rustic architecture, and their inside with shell-work, furnished likewise with various jet-d'eau, or fountains, &c.

The *grotto* at Versailles is an excellent piece of building.—Solomon de Caux has an express treatise of *grotto's* and fountains.

GROVE, in agriculture, &c. a little thick wood.

The antient Romans had a sort of *groves* near several of their temples, which were consecrated to some god, and called *luci*, by antiphrasis, *id non lucendo*, as being shady and dark. In large and magnificent gardens a *grove* is usually a plot of trees, inclosed with palisades, consisting of tall trees, as elms, horse-chestnuts, &c. the tops whereof make a tuft or plump, and shade the ground below.

At the foot of the tall trees, which generally run all along the palisades at equal distance, other lesser trees are often planted, whose tufts form a resemblance of a sort of copse within the former.

GROUND, in agriculture, a piece of land, or soil; or a portion of earth, whether fit or unfit to be tilled, and cultivated.

All sorts of *ground* may be reduced to boggy, or marshy, chal-

ky, gravelly, and stony. See **MARSH**, **CHALK**, **SAND**, **GRAVEL**, &c.

<i>Batable GROUND,</i>	} see	BATABLE.
<i>Breaking GROUND,</i>		BREAKING.
<i>Commanding GROUND,</i>		COMMANDING.
<i>Manuring GROUND,</i>		MANURING.
<i>GROUND niche,</i>	} see	NICHE.
<i>Oazy GROUND,</i>		OAZY.
<i>GROUND Pasture,</i>		PASTURE.
<i>GROUND fill, or GROUND plate.</i>		SELL.

GROUND, in painting, is the surface, upon which the figures, and other objects, are raised or represented. See **PAINTING**.

Ground is properly understood of such parts of the piece as have nothing painted on them, but retain the original colour, upon which the other colours are applied to make the representations.

A drapery, piece of building, or the like, are said to serve as a *ground* to a figure, when the figure is painted on the drapery or building.

In the like sense, we also say the *ground* of a piece of tapestry, of an embroidery, of a medal, coin, &c.

The **GROUND** of a shield, or escutcheon, in heraldry, is properly called the *field*.

GROUND, in etching, denotes a gummy composition, smeared over the surface of the metal to be etched, to prevent the aqua fortis from eating, or having effect, except in places where this *ground* is cut through, or pared off, with the points of needles.

GROUND tackle, a sea term, denoting a ship's anchor, cables, &c. with whatever is necessary to make her ride safe at anchor in a proper *ground*.

GROUND work, in building; see **FOUNDATION**.

GROUNDING of a ship, is the bringing her on *ground*, to be trimmed, made clean, or to have some leak stopped in her.

GROUP*, or **GROUPE**, in painting and sculpture, an assemblage or knot of two or more figures of men, beasts, fruits, or the like, which have some apparent relation to each other.

* The word is French, formed of the Italian *gruppo*, a knot or cluster.

In a good painting, it is necessary that all the figures be divided into two or three *groups*, or separate collections. Such and such a thing make a *group*, with such and such others of different nature and kind. The antique Laomedon is a fine *group* of three beautiful figures.

A *group* has somewhat in it of the nature of a symphony or concert of voices: as, in the one the voices must sustain each other, in order to fill the ear with an agreeable harmony from the whole; whence, if any part were to cease, something would necessarily be missed: so, in the other, if the parts or figures be not well balanced, something will be found disagreeable.

There are two sorts of *groups*, or two manners of considering *groups*; with regard to the design, and to the clear obscure. The first is common both to works of painting, and those of sculpture; the latter is peculiar to painting.

Groups, with regard to the design, are combinations of divers figures, which have relation to each other, either on account of the action, or of their proximity, or of the effect they have.

These we conceive, in some measure, as representing so many different subjects, or at least so many distinct parts or members of one greater subject.

Groups, with regard to the clear obscure, are bodies of figures wherein the lights and shadows are diffused in such manner that they strike the eye together, and naturally lead it to consider them in one view.

In architecture we sometimes say a **GROUP** of columns, speaking of three or four columns joined together on the same pedestal.—When there are but two together, we say a *couple*, not a *group* of columns.

In music, a **GROUP** is one of the kinds of diminutions of long notes, which in the writing forms a sort of *group*, or cluster. The *group* usually consists of four crotchets, quavers, or semi-quavers tied together, at the discretion of the composer.

GROUPADES is corruptly used, in the manage, for *croupades*. See **CROUPADE**.

GROUPED column; see the article **COLUMN**.

GROUPE; see the article **GROUP**.

GRUBBING a cock, a term used by cock-fighters, for the cutting off the feathers under the wings.—It is a thing not allowed by cockpit law, nor to cut off his feathers in any handling place.

GRUBBS, in medicine, a white unctuous kind of pimples or little tumors, arising upon the face, chiefly the alae of the nose.

They are usually owing to hard drinking, and an obstructed perspiration; though natural in some constitutions.—They begin with a small black point, which gradually spreads; and sometimes the matter tends to suppurations, upon which the heads

heads of the eruptions grow white or yellow.—They are usually reputed salutary; whence to check their growth suddenly, has proved of ill consequence. They are cured by evacuation, and acrimonious lotions.

GRUME, GRUMUS, in medicine, &c. a little mass or lump of blood, milk, or other fluid, which is coagulated, thickened, hardened, &c.

Phthical people frequently spit up *grumes*, i. e. clots of blood. *Grumes* of milk, are what we popularly call *curds*.

GRUMOUS blood, denotes that state or consistence of the blood, wherein it is too viscid, and thick, for a due, brisk circulation: the effects whereof are, that it stagnates in the capillary vessels, and produces divers diseases.

GRUS, in antiquity, a dance performed yearly by the young Athenians, around the temple of Apollo, on the day of the Delia.

The motions and figures of this dance were very intricate, and variously interwove; some of them being intended to express the windings of the labyrinth, wherein the Minotaur was killed by Theseus.

GRY, a measure containing one tenth of a line. See **LINE**.

A line is $\frac{1}{10}$ of a digit; and a digit $\frac{1}{10}$ of a foot; and a philosophical foot $\frac{1}{10}$ of a pendulum, whose diadromes, or vibrations, in the latitude of forty-five degrees, are each equal to one second of time, or one sixtieth of a minute.

GRYPHUS, a kind of enigma; or an artful obscure description of a thing. See **ÆNIGMA**.

GUADUM, in natural history, an herb, by the ancient Romans called *glastum*, and *vitrum*; by the Greeks *ifatis*; by the Britains *guadum*; and by us now, *wood*. See **WOOD**.

The ancient Britains, Cæsar informs us, painted their faces with this herb, to appear the more terrible to their enemies. And Pliny relates, that the same was practised by the women in divers sacrifices.

GUAIAC, GUAIACUM, a medicinal wood, brought from the Indies, and much used in venereal disorders; called also *lignum vitæ*; and by the Spaniards, *ligno santo*. See **WOOD**.

Guaiac grows equally in the East and West Indies: that of the latter is brought in large pieces, some of them weighing four or five hundred pound; by which it is by the druggists distinguished from the former.

The *guaiac* tree is of the height of our walnut-tree; and is distinguished into two kinds, male and female; only differing as their leaves are more or less round; being all equally green, the flowers blue, and of a starry form; and having a little orange coloured fruit, about the size of a small nut, at the tip thereof.

The wood *guaiac* is extremely hard and heavy, and on that account is often used as ebony, in mosaic work, &c. as also for the making of button moulds.

But its principal use is in medicine, being found to warm, dry, rarify, attenuate, attract and promote sweats and urine. The usual way of applying it, is in decoction.

The best is that in large pieces, of a dusky colour, fresh, gummy, heavy, of an agreeable smell, and a brisk pungent taste; the bark sticking close to the wood.

The bark of *guaiac* is held of as much virtue, as the wood itself; the rind is of no efficacy; so that to make a sudorific decoction or pilon of the wood, they first pare off all the white part, which in reality is the rind; and only chip or rasp the hard, solid part, which is black, heavy, and resinous.—The chirurgeons frequently substitute box-wood, instead of *guaiac*, and, it is said, with equal success.

The resin drawn from *guaiac*, is held much more effectual in venereal cases, than either the wood, or bark. It is brought us in large pieces, not unlike common resin; but very different in respect of smell: the former, when cast on the coals, yielding a very agreeable balsamic fume.

GUANNAGIUM; see the article **WANNAGE**.

GUARANTEE, or warrantee, in law, a term relative to *warrant*, or *warranter*; properly signifying him whom the warranter undertakes to indemnify, or secure from damage.

GUARANTEE, is more frequently used for a warranter, or a person who undertakes and obliges himself to see a second person perform, what he has stipulated to the third.

GUARANTEE of a treaty, is a prince, or power, pitched on by the contracting parties, to see, or engage, that each side shall perform the articles.

The *warrantees* of the treaty of Oliva, of Westphalia, &c.

The ancient lords were obliged to *guaranty* the lands of their vassals, i. e. to defend them against their enemies; otherwise they lost their fee, and their vassals were no longer bound to do them homage and service.—Kings alone did not forfeit their fiefs by not *guarantying* them; and yet we read that Borel, count of Barcelona, threatened the king of France, Hugh Capet, to swear fealty to the Saracens, in case he did not *guaranty* him; and under Lewis the Young, the count of Champagne did homage to the emperor, on the like account. See **FEU**.

VOL. I.

To *guaranty* a fee, had likewise another meaning, being used to denote, that where a fee was divided between the eldest son, and the younger, the eldest did homage to the lord both for himself and all the rest; and by that homage *guarantied* the whole.

GUARD, or **GARD**, in its general sense, implies defence, custody, or conservation of any thing; the act of observing what passes, to prevent surprise; or the care and precaution taken to hinder any thing's being done contrary to the intention and desire of another.

* The word is formed of the French, *garde*, and that of the corrupt Latin *guarda*; and that of the German *wahren*, to keep, to defend.

GUARD is also used in a figurative sense, for the act or service of guarding, and the persons appointed for that purpose.

Thus we say, to be upon *guard*, to set the *guard*, mount the *guard*. Also, a strong *guard*, an attempt on the *guard*; 2000 men are necessary for the *guard* of the city, &c.

So again, those to whom the king commits the safety of his person, are called his *guard*, *life guard*, *body guard*.

And so, those who have the education and guardianship of infants, or idiots, are called their *guards*, or *wards*.

GUARD, or **GARD** is also applied to a writ relating to the office of ward, whereof there are three kinds: one called *droit de garde*, the second *ejément de garde*, the third *ravissement de garde*. See **WARD**, and **GUARDIAN**.

GUARD, in the military sense, is properly the duty or service done by the soldiers, to secure the army or place, from the attempts and surprizes of an enemy.—Of this there are divers kinds, as

Advanced GUARD, a party of horse or foot which marches before a corps, to give notice of approaching danger.

When an army is upon the march, the grand *guards*, which should mount that day, serve as an advanced *guard* to the army.

That small body also of fifteen or twenty horse, commanded by a lieutenant, beyond, but within sight of the main, or before the grand *guard* of a camp, are called the *advanced guard*.

Grand GUARD: this consists of three or four squadrons of horse, commanded by a field officer, and posted before the camp on the right and left wing, towards the enemy; for the security of the camp.

In a camp, every battalion posts a small *guard*, commanded by a subaltern officer, about one hundred yards before its front. This is called the *quarter guard*.

That small *guard* of foot, which a regiment of horse mounts in their front, under a corporal, is called the *standard guard*.

Main GUARD, is that from whence all the other *guards* are detached.—Those who are to mount the main *guard*, meet at the respective captains quarters, and from thence they go to the parade; where, after the whole *guard* is drawn up, the small *guards* are detached for the posts and magazines; and then the subaltern officers draw lots for their *guards*, and are commanded by the captain of the main *guard*.

Picket GUARD, is a number of horse and foot, who keep themselves always in a readiness in case of an alarm; the horses being saddled, and the riders booted all the while: the foot draw up at the head of the battalion at the beating of the tattoo, but afterwards return to their tents, where they remain in a readiness to march on any sudden alarm.

This *guard* is to make resistance in case of an attack, till the army can get ready.

Rear GUARD, }
Safe GUARD, } See { REAR guard.
Van GUARD, } { SAFE guard.
 } { VAN guard.

GUARD is more particularly understood of a soldier, as a musqueteer, archer, or the like, detached from a company or corps, to protect, detain, or secure any person, or to survey his actions.

A *guard* was set over each party, to prevent the duels taking place.

GUARDS is also understood of the troops or companies kept up to guard the king: called also *royal guards*, *life guards*, *gardes du corps*, &c.

There are also usually bodies of *guards* to wait on the princes of the blood, in the same capacity.

The *guards* are distinguished into *horse*, *foot*, *grenadiers*, and *yeomen*.

The English *horse GUARDS* are distinguished by troops: first, &c. troop of horse *guards*.

The *foot GUARDS* are distinguished by regiments: first regiment, Coldstream regiment, royal regiment of foot *guards*.

Guards, no doubt, are as ancient as monarchy. The remotest antiquity affords instances hereof. The scripture mentions those of Saul the first king of the people of God, 1 Sam. xix. 11. and those of Achish king of the Philistines, 1 Sam.

xxviii. The Grecian kings had also their *guards*: Justin mentions those of Pisistratus, tyrant of Athens, lib. xi. c. 8. those of the tyrants of the same city, established by Lyfander, lib. v. c. 8. those of Agis, king of Sparta, lib. xii. c. 1. those of Alexander, lib. xxii. c. 8. those of the Ptolemy, kings of Egypt, lib. xvi. c. 2. &c. Tarquin the Proud is said to have been the first who took guards at Rome. Dionys. Halicarnassensis, lib. iv. And yet we find that Romulus formed himself a *guard*, consisting at first of twelve lictors, and afterwards of three hundred soldiers, whom he called *celeris*.

The Roman emperors had, for their *guard*, the prætorian cohorts, established by Augustus, as Dion and Suetonius relate: Those of the emperors of Constantinople were called *buccellarii*.

Captain of the *guards*, colonel of the *guards*, brigadier of the *guards*, exempt of the *guards*, &c. See CAPTAIN, COLONEL, BRIGADIER, &c.

Yeoman of the GUARDS; see YEOMAN of the *guards*.

The French *guards* are divided into those *within*, and those *without* the palace: the first consists of the *gardes du corps*, or body guard; part whereof are *gardes de la manche*, q. d. of the sleeve; of the hundred Swisses; and the *guards* of the gate.

The *guards without*, are the gens d'armes, light horse, musqueteers, and two regiments of guards, the one French, the other Swiss. See GENDARMES.

The *garde du corps*, or *life guard*, consists of four companies of horse; the first was antiently Scotch, and still retains the name; though it now consists wholly of Frenchmen. Not only the name, but they also retain the antient phrase or formula of answering when called upon, *I am here*.

The *Scotch guard* was first established in France by Charles VII, who chose himself a *guard* out of such Scots as were sent by the earls of Buchan, Douglas, and other Scotch lords, to drive out the English.

Prætorian GUARDS, } See { PRÆTORIAN.
White GUARDS, } { SCHOLARES.

Counter GUARD, in fortification; see COUNTER *guard*.

GUARDS, in fencing, an action or posture proper to defend or screen the body from the efforts, or attacks of an enemy's sword.

There are four general *guards* of the sword; to conceive which, it will be necessary to imagine a circle drawn on an upright wall, and divided into four cardinal points, viz. top, bottom, right, and left.

Now, when the point of the sword is directed to the bottom point of the circle, and consequently the head of the sword tilted up to the top point, with the body inclining forwards; this is called *prime*, or the *first guard*.—The *second guard*, which some improperly call the *third*, is when the point of the sword is directed to the right or second point of the same circle, a quadrant distant from the first, with the fort of the sword turned to the right, and the body raised proportionably. *Tierce*, or the *third guard*, is performed by directing the sword's point to the uppermost point of the same circle diametrically opposite to that of *prime*: in which case the body, arm, and sword, are in their natural disposition, being the mean between the extremes of their motion.—*Quart*, or the *fourth guard*, is when the point of the sword is directed to the fourth point of the circle, defending to the right as far as one fourth of tierce, with the external side of the arm and the flat of the sword turned towards the ground; and the body out of the line to the right, and the fort of the sword towards the line to the left.

—There is also *Quint*, or a kind of *fifth guard*, being the return of the point of the sword on the right, after traversing the circle, to the point of the *prime* whence it had departed; and yet with a different disposition of the body, arm, and sword.

These *guards* are also called by the masters, *figures* and *postures*; and the common centre of all their motions is to be in the shoulder.

In all these kinds of *guards*, there are high *advanced*, high *retired*, and high *intermediate guards*, when disposed before the upper part of the body, either with the arm quite extended, quite withdrawn, or in a mean state.—*Mean advanced guard*, or simply *mean guard*, is when the sword is disposed before the middle part of the body.—*Low advanced*, *retired*, or *intermediate guards*, are those where the arm and sword are advanced, withdrawn, or between the two extremes, before the lower part of the body.

Some will have *prime* the principal *guard*; others, *quint*; others, with better reason, *tierce*, in regard it consists of right lines, which are more easily defended than oblique ones, such as those of *prime*, *second*, *quart*, and *quint*.

GUARDS, in astronomy, is a name sometimes applied to the two stars nearest the pole, being in the hind part of the chariot, at the tail of the little bear.

Their longitude, latitude, &c. see among those of the other stars in the constellation *URSA minor*.—One of them is the pole star.

GUARDANT, or *GAIRDANT*, in heraldry, a term applied

to a beast when born in a coat of arms full faced, or with his face turned towards the spectator, and thus appearing in a posture of guard, and defence.

Heralds say, a lion is never fo represented, but a leopard always. *GUARDIAN*, or *GARDIAN*, he to whom the charge or custody of any person or thing is committed.

The notion of *guardian* angels is very antient in the east. See ANGEL.

In the convents of Franciscans, the officer is called *guardian*, who in the others is called *superior*.

In the order of the garter, the officer, who in other military orders, is called *grand-master*, is called the *sovereign guardian* of the order.

GUARDIAN, *GARDEYN*, in law, is a person entrusted with the education, tuition, &c. of such as are not of sufficient discretion to guide themselves, and their own affairs; as children, and idiots.

The word *guardian*, with us, includes the offices both of the tutor, and curator of the civilians: the tutor, for instance, had the government of a youth till he arrived at fourteen years of age. And the curator had the disposition and ordering of his effects thence forward, till twenty-five years of age; or the charge of a lunatic, during his lunacy. All which purposes our guardian alone answers.

We have three kinds of *guardians*: one appointed by the father in his will; another by the judge afterwards; and a third cast upon a minor by the custom of the land: but the antient law relating to *guardians* is much altered by stat. 12. Car. II. which ordains, that “Where any person has a child under the age of twenty-one years, and unmarried at the time of his death, it shall be lawful for the father of the child, whether born at the time of his decease, or yet in ventre de femme, either by deed or will, to dispose of the custody and tuition of such child while under age, or for any lesser time, to any person, popish recusants excepted: which disposition shall be good against all persons claiming such child as *guardian* in focage, or otherwise. And in case the father appoint no *guardian*, the ordinary may appoint one to look to his goods and chattels till the age of fourteen; at which time the child may chuse a *guardian* himself. And for his lands, the next of kin on that side by which the lands descend, may be *guardian*, as heretofore in case of a tenure in socage.”

GUARDIAN of the spiritualities, is he to whom the spiritual jurisdiction of a diocese is committed, during the time of the vacancy of the see.

This *guardian* may be either such *in law*, i. e. *jure magistratus*, as the archbishop is of any diocese within his province; or by delegation, as he whom the archbishop, or vicar-general, does for the time depute.

The dean and chapter of Canterbury, are *guardians* both for the diocese, and the whole province, during a vacancy of the archbishopric.

GUARDIAN, or *warden* of the Cinque ports, is an officer who has the jurisdiction of the Cinque ports, with all the power that the admiral of England has in other places. Camden relates, that the Romans after they had settled themselves, and their empire in our island, appointed a magistrate or governor over the east parts where the Cinque ports lie, with the title of *Comes litoris Saxonici per Britanniam*; having another who bore the like title, on the opposite side of the sea. Their business was to strengthen the sea coast with munition against the outrages and robberies of the Barbarians. And that antiquary takes our warden of the Cinque ports to have been erected in imitation hereof. *Britannia*, p. 228.

GUARDIAN of the peace. See CONSERVATOR of the *peace*.

GUDGEON. See FISHING.

GUELPHS, or *GURLYS*, a celebrated faction in Italy, antagonists of the GIBELINS.

The *Guelphs* and *Gibelins* filled Italy with blood and carnage for many years. The *Guelphs* stood for the pope, against the emperor. Their rise is referred by some to be the time of Conrad III. in the twelfth century: by others to that of Frederic I. and by others to that of his successor Frederic II. in the thirteenth century.

The name *Guelph* is commonly said to have been formed from *Welfe*, *Welfs*, on the following occasion: the emperor Conrad III. having taken the duchy of Bavaria from Welfe VI. brother of Henry duke of Bavaria, Welfe, assisted by the forces of Roger king of Sicily, made war on Conrad, and thus gave birth to the faction of the *Guelphs*.

Others derive the name *Guelphs* from the German *Wolf*, on account of the grievous evils committed by that cruel faction: others deduce the denomination from that of a German called *Guefse*, who lived at Pistoja; adding, that his brother, named *Gibel*, gave his name to the *Gibelins*: under which head the reader will find a more ample account of the origin and history of those celebrated factions.

GUERITE, in fortification, a centry-box, being a small tower of wood, or stone, placed usually on the point of a bastion,

bastion, or on the angles of the shoulder; to hold a sentinel, who is to take care of the ditch, and watch out against a surprise.—

GUEST-TAKERS, or **GIST-TAKERS**. See **AGISTORS**.

GUET; see the article **WATCH**.

GUIDAGE, **GUIDAGIUM**, in ancient law writers, that payed for safe conduct through unknown ways, or a strange country.

GUEULE, in architecture; see **GULE**.

GUIDON, a sort of flag, or standard bore by the king's life-guard; being broad at one extreme, and almost pointed at the other, and slit or divided into two.

The *guidon* is the ensign or flag of a troop of horse-guards. See **GUARD**.

GUIDON also denotes the officer who bears the *guidon*.—The *guidon* is that in the horse-guards, which the ensign is in the foot. The *guidon* of a troop of horse takes place next below the cornet.

GUIDONS, **GUIDONES**, or *schola guidonum*, was a company of priests established by Charlemaign at Rome, to conduct and guide pilgrims to Jerusalem, to visit the holy places; they were also to assist them in case they fell sick, and to perform the last offices to them in case they died.

GUIDONIS glandula; see **GLANDULA**.

GUILD, **GILD**, or **GELD**. See **GILD**, and **GELD**.

GUILD-HALL, or **GILD-HALL**, the great court of judicature for the city of London.

In it are kept the mayor's court, the sheriff's court, the court of husting, court of conscience, court of common-council, chamberlain's court, &c.

Here also the judges sit upon nisi prius, &c. See **HUSTING**.

GUILT *rents*; see the article **GILD**.

GUINEA, a gold coin struck, and current in England.

The value or rate of *guineas* has varied: it was first struck on the footing of twenty shillings; by the scarcity of gold was afterwards advanced to twenty-one shillings and six-pence; but it is now sunk to twenty-one shillings.

The pound weight troy of gold is cut into forty-four parts and an half; each part makes a *guinea*. See **GOLD**.

This coin took its denomination *guinea*, by reason the gold whereof the first were struck, was brought from that part of Africa called *Guinea*; for which reason it likewise bore the impression of an elephant.

GUINEA company; see the article **COMPANY**.

GUINEA pepper; see the article **PEPPER**.

GIIRON; see the article **GIRON**.

GULA, in anatomy, the oesophagus or gullet; that conduit by which animals take down food into the stomach.

GULÆ vaginalis; see the article **VAGINALIS**.

GULA, **GUEULE**, or **GOLA**, in architecture, a wavy member, whose contour resembles the letter S; called by the Greeks *cyamium*, q. d. a little wave; and by our workmen an *ogee*.—See *Tab. Arch.* fig. 8, and 26.

This member is of two kinds, *recta* and *inversa*.—The *first*, and principal, has its cavity above, and convexity below. This always makes the top of the corona of the cornice, jetting over the drip of the cornice like a wave ready to fall. It is called *gula recta*, and by the French *doucine*. Sometimes it is absolutely called the *entablature*, as being the first or uppermost member thereof.

The *second* is just the reverse of the former, its cavity being at the bottom; so that it appears inverted, with regard to the former. This is used in the architrave, and sometimes in the cornice, along with the former, only separated by a reglet.

Some derive the word from the resemblance these members bear to the *gula*, or throat of a man: others from the herald's term *gules*; as supposing the moulding formed from the ancient manner of wearing their garments, which consisted of slips or swaths, alternately furr and stuff of various colours; the intervals between which were called *gules* or *guales*.

GULES*, in heraldry, signifies the colour red.

* The word is French, *guales*, which Fa. Monet derives from the Hebrew *gulud*, and *guludith*, a reddish pellice or skin appearing on a wound when it begins to heal; but F. Menestrier reproaches him, that there are no such words in the Hebrew tongue. This, however, is not strictly true: all the eastern languages, the Hebrew, Chaldee, Syriac, and Arabs, say גולד, *Guld*, for cutis, pellis; whence the Arabic *gulud*. And in the general, the word *gules* signifies red among most of the oriental nations: the Arabs and Persians give the name to the rose.—Others, with Nicod, derive the name *gules* from *gula*, the throats of animals, being generally red; or from the Latin *culculum*, which is the κόκκιος of the Greeks, or scarlet grain.

The same colour, in the coats of noblemen, is, by some called *ruby*; and in those of sovereign princes *mars*: but this is no standing practice.

In engraving, *gules* is expressed by perpendicular strokes drawn from the top of the escutcheon to the bottom; it is also marked with the letter G.

This colour is reputed a symbol of chaffty, valour, hardiness, generosity; and represents blood-colour, cinnabar, and true scarlet. It is the first of all colours used in armoury; and is of that account, that antiently it was prohibited any person to wear *gules* in his coat armour, unless he were a prince, or had permission from the prince.

Spelman, in his *Apologia*, says that this colour was particularly honoured by the Romans, as it had been before by the Trojans; and that they painted the bodies of their gods, and of their generals that triumphed, with vermilion. Under the consuls, the Roman soldiers wore red; whence they were denominated *Ruffi*. Joan. de Bado aureo adds, that the red dye which the Greeks call *pharician*, and we *scarlet*, was first used by the Romans, to prevent seeing the blood issue from wounds in fight.

In effect, *gules* has always been esteemed an imperial colour; the emperors were clothed, shod, and had their apartments furnished with red; their edicts, dispatches, signatures, and seals, were of red ink, and red wax; whence the name *rubrics*.

GULF; see the article **GULPH**.

GULLET; see the article **OSOPHAGUS**.

GULPH*, or **GULF**, in geography, an arm or part of the ocean running up within the land.

* The word comes from the French *golfe*, and that from the Italian *golfo*, which signify the same. Some deduce these farther from the Greek *κόλπος*; which Guichart again derives from the Hebrew גול, *gob*; Du Cange derives them from the barbarous Latin *gulsum*, or *gulfus*, which signify the same thing.

Such is the *gulph* of Venice, called also the *Adriatic sea*; the *gulph* of Lyons, the *gulph* of Mexico, of Florida, &c.

A *gulph* is strictly distinguished from a *sea*, in that the latter is larger; see **SEA**. From a *bay*, or *sinus*, it is again distinguished by its being greater than the same.

Some will have it essential to a *gulph*, to run into the land through a freight or narrow passage.

The sea is always most dangerous near *gulphs*, by reason of the currents being penned up by the shores.

GUM, **GUMMI**, a vegetable juice exuding through the pores of certain plants, and there hardening into a tenacious, transparent mass.

Gum is properly one of the juices of the bark: it is drawn thence by the sun's warmth, in form of a glutinous humour; and by the same cause is afterwards inspissated, concocted, and rendered tenacious.

The chemical character of *gums*, whereby they are distinguished from *resin*, and other vegetable juices, is, that they are dissoluble in water, and at the same time inflammable by fire. But this character, it is to be observed, excludes a great part of those commonly called *gums*.

In the general, *gums* are more viscid, and less friable, and are generally dissoluble in any aqueous menstruum; whereas *resins* are more sulphurous, and require a spirituous, or oily dissolvent. Boerhaave considers a *gum* as a sort of saponaceous fat; which, beside its oily principle in common with a *resin*, has some other ingredient that renders it miscible with water.

Gums are different, according to the different trees, roots, &c. which they oze from. Some authors distinguish them into *aqueous*, and *resinous gums*: the first, those dissoluble in water, wine, and the like fluids; the second, those only dissoluble in oil. To these two some add a third anomalous kind, *viz.* those soluble with much difficulty, either in water or oil.

Among the class of *gums* are usually ranked, *gum arabic*, gamboge, adraganth, ammoniac, assa fetida, euphorbium, manna, myrrh, and tucamahacha. See each described under its proper article.

Theophrastus speaks of a way of multiplying plants, performed *per lachrymas*, by means of the *gum* or *resin*; but Agricola takes this to be only practicable where there are seeds accidentally fallen into the *gum*.

GUM-ANIME, is a resinous juice oozing from a tree by the Portuguese called *courbari*, growing in divers parts of America. This *gum* is very hard and transparent, of an agreeable smell, not unlike amber: it does not dissolve in water, and consequently is not properly accounted a *gum*. In lieu of this, they frequently substitute copal.

GUM-ARABIC, called also *Thebaic*, *Saracenic*, *Babylonian*, and *Acathine*, from the places, or the tree, which produce it, is the juice of a little tree growing in Egypt, of the *Acacia* kind, called in Latin *Acacia vera*. It is very transparent, glutinous upon the tongue, almost insipid to the taste, and often twisted somewhat in manner of a worm.

It is esteemed good to incrustate, to stop the pores, blunt the points

GUN

points of too pungent medicines, and temper the acrimony of the trachea in coughs, &c.

GUM-gutta, or *gutta-gamba*, or *ghitta-gambu*, popularly *gamboge*, is a resinous gum brought from the kingdom of Siam, &c. in large pieces fashioned not unlike lard, brittle, and very yellow.

It oozes from incisions made in a kind of prickly shrub, which climbs up the neighbouring trees. It purges violently both upwards and downwards; and is particularly used in dropsies, the itch, &c. but it is dangerous. It serves also to make a yellow colour, for painting in miniature.

GUM-fenaga, or *feneca*, is the gum ordinarily sold by the druggists for gum-arabic, which it resembles very nearly both as to form and virtue: it is either white, bordering on yellow, or of a deep amber colour, transparent &c. It oozes out of a prickly shrub common enough in Africa. The gum is brought to us from Senegal, whence its name.

GUM, among gardeners, is a disease incident to fruit trees, of the stone kind, as peaches, plumbs, apricots, cherries, &c. The *gum* is a kind of gangrene, arising from a corruption of the sap, which extravasates and hardens. It usually begins on some naked or broken part, and spreads itself to the rest. To avoid its spreading, M. Quintinie directs to cut off the morbid branch two or three inches below the part affected.

This *gum* is no more than a thick, distempered, viscid juice, which not being able to make its way through the fibres of the body of the tree, to feed and supply them, is obliged, by the protrusion of other succeeding juice, to burst its vessels, which lie between the wood and bark, and to ooze out upon the bark.

When the distemper surrounds the branch, it admits of no remedy: when it is only on one side of a bough, the *gum* must be taken off to the quick of it, and then some cow-dung clapped on the wound, and the part covered over with a linen cloth, and tied down.

GUM-water; see the article **WATER**.

GUMMI-refina, **GUMMO-refina**, or **GUM-refin**, is a hardened juice of a middle nature between a gum and a resin, being both dissoluble in aqueous menstrua like a gum; and in oleaginous ones like a resin.—Such are camphor, storax, &c.

Some naturalists make a class of *irregular gummo resins*, being such as dissolve, though with difficulty, and not perfectly, both in aqueous and oleaginous liquors; as bdellium, myrrh, &c.

GUN, a fire arm, or weapon of offence, which forcibly discharges a ball, shot, or other offensive matter, through a cylindrical barrel, by means of gun-powder.

Gun is a general name, under which are included divers, or even most species of fire arms.—They may be divided into *great* and *small*.

Great Guns, called by the general name *cannon*, make what we also call *ordnance*, or *artillery*; under which come the several forts of cannon, as cannon-royal, demi-cannon, &c. culverins, demi culverins, fakers, minions, falcons, &c. See **ORDNANCE**; see also **CANNON**, **CULVERIN**, &c.

Small Guns include muskets, musketoons, carabines, blunderbusses, fowling-pieces, &c.

Pistols and mortars are almost the only kinds of regular weapons charged with gunpowder, that are excepted from the denomination of *guns*.

For the history and invention of *guns*, see **CANNON**, and **GUN-POWDER**.

For the use and application of *guns*, see **GUNNERY**.

Bed of a GUN,	} see	BED.
Carriage of a GUN,		CARRIAGE.
Chase GUNS,		CHASE guns.
Chase of a GUN,	}	CHASE.

GUNNERS, officers of the tower, and other garrisons, whose business is to manage and look after the ordnance mounted on the lines, and batteries, which are all fixed and ready with cartouches and ball, for service, on the shortest warning.

One or more of them are on duty day and night; they carry a field staff, and a large powder horn in a string over the left shoulder: in which equipage they march by the guns.

Master GUNNER of England, is an officer appointed to teach and instruct all such as desire to learn the art of gunnery, and to administer to every scholar an oath; which, beside the duty of allegiance, obliges him not to serve any foreign prince or state without leave; nor to teach the art of gunnery to any, but such as have taken the said oath; and to certify to the master of the ordnance, the sufficiency of any person recommended to be one of his majesty's gunners.

The *gunner*, Sir J. Moor observes, should know his pieces, and their names, which are taken from the height of the bore, the

GUN

names of the several parts of a piece of ordnance, how to terziate his gun, and how to dispart it, &c.

GUNNERS level; see the article **LEVEL**.

GUNNERY, the art of shooting with guns and mortars, &c. of charging, directing, and exploding those fire-arms to the best advantage.—See *Tab. Fortif.* fig. 16.

Gunnery is sometimes considered as a part of the military art, and sometimes as a part of pyrotechny.

To the art of *gunnery* belongs the knowledge of the force, and effect of gun-powder, the dimensions of pieces, and the proportions of the powder and ball they carry; with the methods of managing, charging, pointing, plunging, &c.

Some parts of *gunnery* are brought under mathematical consideration, which, among mathematicians, are called absolutely by the name *gunnery*, viz. the method of elevating or raising the piece to any given angle, and of computing its range; or of raising and directing it so, as it may hit a mark or object proposed.

The instruments chiefly used in this part of *gunnery*, are the calipers, or gunners compasses, quadrant, and level; the methods of applying which see under the articles **CALIPER**, **LEVEL**; and **QUADRANT**.

The line or path in which the bullet flies, whatever direction or elevation the piece is in, is found to be the same with that of all other projectiles, viz. a parabola.

Hence, the particular laws observed in the motion or flight of the ball, its velocity, extent, &c. with the rules for hitting objects, are delivered under the article **PROJECTILE**.

Maltus, an English engineer, is mentioned as the person who first taught the regular use of mortars, in the year 1634; but all his knowledge was experimental and tentative; he knew nothing of the curve the shot describes in its passage, nor of the difference of range at different elevations. And most of the gunners and engineers employed about batteries, &c. to this day go by no better rules; if the range does not hit right, they raise or lower the piece, till they bring it to a truth: and yet there are certain rules, founded on geometry, for all these things: most of which we owe to Galileo, engineer to the grand duke of Tuscany, and his disciple Torricellius.

A ball or bomb going out of a piece, we find, never proceeds in a straight line towards the place it is levelled at, but it always begins to rise from its line of direction the moment it is out of the mouth of the piece.—This some account for thus: the grains of powder nearest the breech, taking fire first, press forward, by their precipitated motion, not only the ball, but likewise those grains which follow the ball along the bottom of the piece; where successively taking fire, they strike, as it were, the ball underneath, which because of a necessary vent, has not the same diameter as the diameter of the bore; and so insensibly raise the ball towards the upper edge of the mouth of the piece, against which it so rubs in going out, that pieces very much used, and whose metal is soft, are observed to have a considerable canal there, gradually dug by the friction of balls. Thus the ball going from the cannon, as from the point of the parabola *E*, *Tab. Fortif.* fig. 16. raises itself, in its progress, to the vertex *G*; after which it descends by a mixed motion.

Ranges made from the elevation of forty-five degrees are the greatest; and those made from elevations equally distant from forty-five degrees are equal; that is, a piece of cannon, or a mortar, levelled to the fortieth degree, will throw a ball, or bomb, the same distance, as when they are elevated to the fiftieth degree, and as many at thirty as sixty, and so of others.

It has been shewn, that to find the different ranges of a piece of artillery in all elevations, we must, 1. Make a very exact experiment by firing off a piece of cannon, or mortar, at an angle well known, and measuring the range made, with all the exactness possible; for by one experiment well made, we may come at the knowledge of all others, in the following manner.

To find the range of a piece, at any other elevation required, say, as the sine of double the angle under which the experiment is made: is to the sine of double the angle of any elevation proposed: :: so is the range known by the experiment to the other required.

GUNPOWDER a composition of salt-petre, sulphur, and charcoal mixed together, and usually granulated; which easily takes fire, and when fired rarefies or expands with great vehemence, by means of its elastic force.

It is to this powder we owe all the action, and effect of guns, ordnance, &c. so that the modern military art, fortification, &c. depend wholly thereon.

The invention of *gunpowder* is ascribed, by Polydore Vergil, to a chemist, who having accidentally put some of this composition in a mortar, and covered it with stone; it happened to take fire, and blew up the last h

Thevet says, the person here spoke of, was a monk of Fribourg, named Constantine Anclzen: but Belleforet and other authors, with more probability, hold it to be Bartholdus Schwartz, or the black: at least it is affirmed, that he first taught the use of it to the Venetians, in the year 1380, during the war with the Genoese; and that it was first employed in a place antiently called *Poffa Clodia*, now *Chioggia*, against Laurence de Medicis, and that all Italy made complaints against it, as a manifest contravention of fair warfare.

But what contradicts this account, and shews gunpowder to be of an older era, is, that Peter Mexia, in his *Various Readings*, mentions, that the Moors being besieged in 1343, by Alphonsus XI. king of Castile, discharged a sort of iron mortars upon them, which made a noise like thunder: which is seconded by what Don Pedro, bishop of Leon, relates in his chronicle of king Alphonsus who reduced Toledo, viz. that in a sea combat between the king of Tunis, and the Moorish king of Seville, above four hundred years ago, those of Tunis had certain iron tuns or barrels, wherewith they threw thunder-bolts of fire. Du Cange adds, that there is mention made of gunpowder in the registers of the chambers of accounts in France as early as the year 1338.

To say no more, it appears that our Roger Bacon knew of gunpowder one hundred and fifty years before Schwartz was born: that excellent fryar mentions the composition in express terms, in his treatise *De nullitate magie*, published at Oxford in 1216. "You may raise thunder and lightning at pleasure," says he, by only taking sulphur, nitre, and charcoal, which "singly have no effect, but mixed together, and confined in "a close place, cause a noise and explosion greater than that of "a clap of thunder."

Preparation of GUNPOWDER.—There are divers compositions of gunpowder, with respect to the proportions of the three ingredients, to be met withal in pyrotechnical writers: but the process of making it up is much the same in all.

The sulphur and salt-petre being purified, and reduced to powder, are put, with the charcoal dust, in a mortar, moistened with water or spirit of wine, or the like, and pounded twenty-four hours together; taking care to wet the mass from time to time, to prevent its taking fire: lastly, squeezing it through a sieve, it is formed into little grains, or globules; which being dried, the powder is complete; and the least spark being struck thereon from a steel and flint, the whole will be immediately inflamed, and burst out with extreme violence.

The effect is not hard to account for: the charcoal part of the grain whereon the spark falls, catching fire like tinder, the sulphur and nitre are readily melted, and the former also breaks into flame; and at the same time the contiguous grains undergo the same fate. Now it is known that salt-petre, when ignited, rarefies to a prodigious degree.

Sir Isaac Newton reasons thus on the point: the charcoal and sulphur in gunpowder, easily take fire, and kindle the nitre; and the spirit of the nitre being thereby rarefied into vapour, rushes out with an explosion much after the manner that the vapour of water rushes out of an æolipile; the sulphur also being volatile, is converted into vapour, and augments the explosion: add that the acid vapour of the sulphur, namely, that which diffils under a bell into oil of sulphur, entering violently into the fixt body of the nitre, lets loose the spirit of the nitre, and excites a greater fermentation, whereby the heat is farther augmented, and the fixt body of the nitre is also rarefied into fume, and the explosion is thereby made more vehement and quick.

For if salt of tartar be mixed with gunpowder, and that mixture be warmed till it takes fire, the explosion will be greatly more violent and quick than that of gunpowder alone, which cannot proceed from any other cause than the action of the vapour of the gunpowder upon the salt of tartar, whereby that salt is rarefied. See *Pulvis Fulminans*.

The explosion of gunpowder arises, therefore, from the violent action whereby all the mixture being quickly and vehemently heated, is rarefied and converted into fume and vapour; which vapour, by the violence of that action, becoming to hot as to fire, appears in the form of flame.

M. de la Hire ascribes all the force and effect of gunpowder to the spring or elasticity of the air included in the several grains thereof, and in the intervals or spaces between the grains: the powder being kindled, sets the springs of so many little parcels of air a playing, and dilates them all at once; whence the effect: the powder itself only serving to light a fire which may put the air in action; after which the whole is done by the air alone.

Gunpowder is a commodity of such consequence, both in respect of speculation, of war, and of commerce (the consumption thereof being incredible) that it will deserve a more particular detail.—To make gunpowder duly, then, regard is to be had, that the salt-petre be pure, and in fine large crystals or shavings: otherwise, it is to be purified, by taking away its fixt or common salt, and earthy part, thus: dissolve ten pounds of nitre in a sufficient quantity of fair water, settle, filtrate, and evaporate it in a glazed vessel, to the diminution

of half, or till a pellicle appear on it: the vessel may then be taken off from the fire, and set in a cellar: in twenty-four hours the crystals will shoot, which separate from the liquor; and after the like manner may the liquor be crystallized several times, till all the salt be drawn forth: this done, put it into a kettle, and that on a furnace with a moderate fire, which gradually increase till it begins to smoke, evaporate, lose its humidity, and grow very white: it must be kept continually stirring with a ladle, for fear it should return to its former figure, whereby its greatness will be taken away; after that, so much water is to be poured into the kettle as will cover the nitre; and when it is dissolved and reduced to the consistency of a thick liquor, it must be stirred with a ladle, without intermission, till all the moisture is again evaporated, and it be reduced to a dry and white meal.

The like regard is to be had to the sulphur, chusing that which is in large lumps, clear, and perfectly yellow; not very hard, nor compact, but porous; nor yet too much shining; and if, when set on the fire, it freely burns away all, leaving little or no residuum matter, it is a sign of its goodness: so likewise if it be pressed between two iron plates that are hot enough to make it run, and in the running appear yellow, and that which remains of a reddish colour, it may be concluded to be fit for the purpose.—But in case the same be foul and impure, it may be purified in this manner: melt the sulphur in a large iron ladle, or pot, over a very gentle coal fire, well kindled, but not flaming; then scum off all that rises on the top, and swims upon the sulphur; take it presently after from the fire, and strain it through a double linen cloth, letting it pass at leisure; so will it be pure, the gross filthy matter remaining behind in the cloth.

For the charcoal, the third ingredient, such should be chosen as is large, clear, and free from knots, well burnt, and cleaving.

There are three kinds of powder, viz. cannon powder, musket powder, and pistol powder; of each of these again there are two sorts, a stronger, and a weaker; all which differences arise only from the various proportions.

The proportions are thus: in the stronger cannon powder, to every hundred pounds of salt-petre, twenty-five pounds of sulphur are generally allowed, with the same quantity of charcoal; and in the weaker cannon powder, to every hundred pounds of salt-petre, twenty pounds of sulphur, and twenty-four of charcoal. As for the stronger musket powder, an hundred pounds of salt-petre require eighteen pounds of sulphur, and twenty of charcoal; and in the weaker there go to an hundred pounds of salt-petre, fifteen of sulphur, and eighteen of charcoal. In the stronger pistol powder, an hundred pounds of salt-petre require twelve of sulphur, and fifteen of coal; whereas the weaker has an hundred pounds of salt-petre, only ten of sulphur, but eighteen of charcoal.

Other authors prescribe different proportions: Semienowitz, for mortars, directs an hundred pounds of salt-petre, twenty-five of sulphur, and as many of charcoal; for great guns, an hundred pounds of salt-petre, fifteen of sulphur, and eighteen of charcoal: for muskets and pistols, an hundred pounds of salt-petre, eight of sulphur, and ten of charcoal.

Miethius extols the proportion of one pound of salt-petre to three ounces of charcoal; and two, or two and a quarter of sulphur: than which, he affirms, no gunpowder can possibly be stronger.

He adds, that the usual practice of making the gunpowder weaker for mortars, than guns, as in the example above, is without any foundation, and renders the expence needlessly much greater: for, whereas, to load a large mortar twenty-four pounds of common powder is required, and consequently to load it ten times, two hundred and forty pounds; he shews by calculation, that the same effect would be had by one hundred and eighty pounds of the strong powder.

As to the process of making the GUNPOWDER.—All the ingredients are first to be finely powdered, then moistened with fair water, or vinegar, or spirit of wine, or with water and spirit of wine mixed together, or urine, which is usual; afterwards all must be well beat for the space of twenty-four hours at least, and then granulated after the following manner: a sieve is to be prepared with a bottom of thick parchment made full of round holes, and the former beaten mass moistened before-hand with twenty ounces of spirit of wine, twelve of spirit of wine vinegar, thirteen of spirit of wine, two of spirit of sal ammoniac, and one ounce of camphire dissolved in spirit of wine: and let all these be mingled together. Otherwise, take forty ounces of brandy, and one of camphire, and let them be mixed and dissolved for the said purpose: when the whole compound is made up into balls as big as eggs, put them into the sieve, and with them a wooden ball; which move up and down about the sieve, so that it may break the balls of powder, and make it pass through the little holes in corns.

For greater quantities, mills are usually provided, by means of which, more work may be performed in one day, than a man can do in an hundred. See *MILL*.

Gunpowder may also be made of several colours, but the *black* is the most serviceable of any.

To make white powder proceed thus.—Take ten pounds of saltpetre, one of sulphur, and two of the saw-dust of elder, or the like wood, powdered fine; mix them together, and use the former method. Or thus, with ten pounds of nitre, and a pound and a half of sulphur dried and finely powdered, mix two pounds of saw-dust, &c. or, instead of that, rotten wood dried and powdered, with two pounds and three ounces of salt of tartar; whereof make powder to be kept close from the air. It is also to be noted, that in making of *pistol powder*, if you would have it stronger, it should be stirred up several times while in the mortar, and moistened with water distilled from orange or lemon peels, or some other oily vegetable substance in an alembic, and then beaten for twenty hours, as aforesaid.

Corn powder is of so much greater force than when in dust or meal, that it is generally concluded, the larger grains are stronger than the smaller: for which reason, *cannon powder* is granulated larger than other powders; and therefore powder in loading should not be beat home into the piece, so as to bruise the grains. There are three ways to prove the goodness of *gunpowder*.

1. By sight; for if it be too black, it is too moist, or has too much charcoal in it; so also if rubbed upon white paper, it blackens it more than good powder does: but if it be of a kind of azure colour, somewhat inclining to red, it is a sign of good powder.

2. By touching: for if in crushing it with your fingers ends, the grains break easily and turn into dust, without feeling hard, it has too much coal in it; or if, in pressing under your fingers upon a smooth hard board, some grains feel harder than the rest, or, as it were, dent your fingers ends, the sulphur is not well mixed with the nitre, and the powder is naught.

3. By burning, wherein little heaps of powder are laid upon white paper three inches or more asunder, and one of them fired; which, if it only fires all away, and that suddenly, and almost imperceptibly, without firing the rest, and make a small thundering noise, and a white smoke rises in the air almost like a circle, the powder is good; if it leaves black marks, it has too much coal, or is not well burnt: if it leaves a greenness, the sulphur or nitre are not well cleansed or ordered. Again, if two or three corns be laid on paper an inch distant, and fire be put to one of them, and they all fire at once, leaving no sign behind, but a white smoky colour in the place, and the paper not touched, the powder is good. So also if fired in a man's hand, and it burns not: but if black knots appear, which burn downwards in the place where proof was made, after firing, it is not strong enough, but wants nitre.

To recover damaged powder, the method of the powder merchants is this; they put part of the powder on a sailcloth, to which they add an equal weight of what is really good; and with a shovel mingle it well together, dry it in the sun, and barrel it up, keeping it in a dry and proper place.

Others again, if it be very bad, restore it by moistening it with vinegar, water, urine, or brandy; then they beat it fine, scarce it, and to every pound of powder, add an ounce, an ounce and half, or two ounces (according as it is decayed) of melted saltpetre; afterwards these ingredients are to be moistened and mixed well, so that nothing can be discerned in the composition; which may be known by cutting the mass, and then they granulate it as aforesaid.

In case the powder be in a manner quite spoiled, the only way is to extract the saltpetre with water, according to the usual manner, by boiling, filtering, evaporating, and crystallizing; and then with fresh sulphur and charcoal, to make it up anew again.

GUN-SHOT wounds; see the article **WOUND**.

GUNTER'S-LINE, called also *line of lines*, and *line of numbers*, is a graduated line usually placed on scales, rules, sectors, &c.

This line is only the logarithms transferred upon a ruler, from the tables, so as to answer much the same purposes, instrumentally, as the logarithms themselves do arithmetically. What the logarithms do by addition and subtraction, is done in this line by turning a pair of compasses this way and that.

This line has been contrived various ways, for the advantage of having it as long as possible. As, first, on the two-foot ruler, contrived by Edmund Gunter, and called *Gunter's scale*; whence also the line itself took its popular denomination *Gunter's line*.

After this, Wingate doubled the line, or laid it together, so as one might either work right on, or a-cross. Then it was projected in a circle, by Oughtred, and made to slide by the same author: and lastly, it was projected in a kind of spiral, by Brown.

The method of using or applying it, is much the same in all; except that in Gunter's and Wingate's way, common compasses are used; in Oughtred's and Brown's, flat compasses, or an opening index; and in the sliding rules, no compasses at all.

Description of GUNTER'S line. The line is usually divided into an hundred parts, whereof every tenth is numbered, beginning with 1 and ending with 10: so that if the first great

division 1; signify one tenth of any whole number or integer, the next, 2, will signify two tenths; 3 three tenths, &c. and the intermediate divisions so many 100th parts of the same integer, or tenths of one of the former tenths. For numbers greater than 10, the sub-divisions must signify integers, and the greater divisions 10 integers, so that the whole line will express 100 integers; and if you would have it still more, then the sub-divisions to be each 10 integers, and each great divisions 100, so that the whole be 1000; and after the same manner, may it be extended to 10000, by making each sub-division 100.

A whole number, under four figures, being given, to find the point on the line of numbers that represents the same. Look for the first figure of the number among the large figured divisions; this leads you to the first figure of your number. For the second, count so many tenths from that division forwards, as that second figure amounts to. For the third figure, count from the last tenth so many centesims as the third figure contains: and so for the fourth figure, count from the last centesim so many thousands as the fourth figure has units, or is in value; that will be the point where the number propounded is, on the line of numbers.

For an example. To find the point representing the number 1728, for 1000 take the first grand division marked 1 on the line; then for 7 reckon seven tenths forwards, this is 700; for 2, reckon two centesims from the seventh tenth, 20; and for 8, estimate the following centesim to be divided into 10 parts, if it be not expressed, which in lines of ordinary length cannot be done; and 8 of that supposed 10 parts, is the precise point for 1728, the number propounded to be found; and the like of any other number.

To find a fraction, consider that the line properly only expresses decimal fractions, as thus, $\frac{1}{10}$, or $\frac{2}{10}$, or $\frac{3}{10}$, &c. and nearer the rule cannot well come than as one inch: one tenth, one hundred, or one thousand part of an inch: so that for other fractions, as quarters, half quarters, &c. you must either estimate them as near as you can reasonably, or else reduce them into decimals.

Use of GUNTER'S-LINE. 1^o Two numbers being given, to find a third geometrically proportional to them; and to three a fourth number, to four a fifth, &c. Extend the compasses on the line from one number to another; then that extent applied upwards or downwards, as you would either increase or diminish the number from either of the numbers, the moveable point will fall on the third proportional number required. Again, the same extent applied the same way from the third, will give a fourth; and from the fourth a fifth, &c.

For example: let the two numbers 2 and 4 be proposed to find a third proportional, &c. to them; extend the compasses on the first part of the line of numbers, from 2 to 4; which done, and the same extent being applied upwards from 4, the moveable point will fall on 8, the third proportional required; and from 8 it will reach to 16, the fourth proportional; and from 16 to 32, the fifth, &c. Contrariwise, if you would diminish, as from 4 to 2, the moveable point will fall on 1, and from 1 to $\frac{1}{2}$, or .5; and from .5 to .25, &c.

But, generally, in this, and in most other works, make use of the small divisions in the middle of the line; that you may the better estimate the fractions of the numbers you make use of; for how much you miss in setting the compasses to the first and second term, so much the more you will err in the fourth; therefore the middle part will be most useful. For example; as 8 to 11, so is 12 to 16, .50, if you imagine one integer to be divided but into 10 parts, as they are on the line on a two foot rule.

2^o One number being given to be multiplied by another, to find the product. Extend the compasses from 1 to the multiplier; and the same extent applied the same way from the multiplicand, will make the moveable point fall on the product: thus, if 6 be given to be multiplied by 5; extending the compasses from 1 to 5, the same extent will reach from 6 to 30, the product sought.

3^o One number being given to be divided by another, to find the quotient. Extend the compasses from the divisor, e. gr. 25, to 1, and the same extent will reach from the dividend, e. gr. 750, to the quotient 30; or extend the compasses from the divisor to the dividend, the same extent will reach the same way from 1 to the quotient.

4^o Three numbers being given, to find a fourth in direct proportion. Extend the compasses from the first number, suppose 7, to the second, v. g. 14: that done, the same extent applied the same way from the third, 22, will reach to the fourth proportional sought, viz. 44.

5^o Three numbers being given, to find a fourth in inverse proportion. Extend the compasses from the first of the given numbers, suppose 60, to the second of the same denomination, viz. 30; if that distance be applied from the third number backwards, 5, it will reach to the fourth number sought, 2.5.

6^o Three numbers being given, to find a fourth in duplicate proportion. If the denominations of the first and second terms be lines, extend the compasses from the first term to the second,

of the same denomination: this done, that extent being applied twice the same way from the third term, the moveable point will fall on the fourth term required. *E. gr.* the area of a circle, whose diameter is 14, being 154, what will the content of a circle be, whose diameter is 28; applying that extent the same way from 154 twice, the moveable point will fall on 616, the fourth proportional or area sought.

7^o, To find a mean proportional between two given numbers. — Bisect the distance between the given numbers, the point of bisection will fall on the mean proportional sought. Thus the quotient of the two extremes divided by one another, extremes being 8 and 32, the middle point between them will be found 16.

8^o, To find two mean proportionals between two given lines. — Trisect the space between the two given extremes; the two points of trisection will give the two means required. — Thus if 8 and 27 be the two given extremes, the two means will be found 12 and 18.

9^o, To find the square root of any number under 1000000. — The square root of a number is always a mean proportion between 1, and the number whose root is required; yet with this general caution, that if the figures of the number be even, that is 2, 4, 6, 8, 10, &c. then you must look for the unit at the beginning of the line, and the number in the second part or radius, and the root in the first part; or rather, reckon 10 at the end to be unity; and then both root and square will fall backwards towards the middle in the second length or part of the line. — If they be odd, the middle 1 will be most convenient to be counted unity, and both root and square will be found from thence forwards towards 10. — On this principle the square root of 9 will be found to be 3; the square root of 64, to be 8, &c.

10^o, To find the cube root of any number under 1000000000. — The cube root is always the first of two mean proportionals between 1 and the number given, and therefore to be found by trisecting the space between them. Thus the cube root of 1728 will be found 12; the root of 17280, nearly 26; the root of 172800 almost 56.

Though the point on the line representing all the square numbers is in one place, yet by altering the unit, it produces various points and numbers for their respective roots. — The rule to find this, is to put dots, or to suppose them put over the first figure to the left hand, the fourth figure, the seventh, and the tenth: if then the last dot on the left hand falls on the last figure, as it does in 1728, the unit must be placed at 1 in the middle of the line, and the root, the square, and the cube, will all fall forwards towards the end of the line.

If it fall on the last but 1, as in 17280, the unit must be placed at 1 in the beginning of the line, and the cube in the second length; or the unit may be placed at 10 at the end of the line; and then the root, the square, and cube, will all fall backwards, and be found in the second part between the middle and the end of the line. — Thus will the cube root of 8 be found 2; that of 27, 3; that of 64, 4; that of 125, 5; that of 216, 6, &c.

For the particular uses of *Gunter's line* in the measuring of timber, gauging of vessels, &c. see SLIDING-RULE. For other uses in geometry, trigonometry, &c. see SECTOR, and GUNTER'S SCALE.

GUNTER'S QUADRANT, is a quadrant made of wood, brass, or some other substance; being a kind of stereographic projection on the plane of the equinoctial, the eye supposed in one of the poles: so that the tropic, ecliptic, and horizon, are arches of circles, but the hour-circles all curves, drawn by means of several altitudes of the sun, for some particular latitude every day in the year.

The use of this instrument is to find the hour of the day, the sun's azimuth, &c. and other common problems of the globe; as also to take the altitude of an object in degrees.

See its description and use more at large under the article *Gunter's QUADRANT*.

GUNTER'S SCALE, also called by navigators absolutely the *gunter*, is a large plane scale, with divers lines thereon; of great use in working questions in navigation, &c. See SCALE, and SAILING.

On one side the scale, represented *Tab. Trigonon. fig. 35.* are the line of numbers, marked numbers; the line of artificial lines, marked *lines*; the line of artificial tangents, marked *tangents*; the line of artificial versed sines, marked *V. S.* the artificial sines of the rhumbs, marked *S. R.* the artificial tangents of the rhumbs, marked *T. R.* the meridian line in mercator's chart, marked *Merid.* and equal parts, marked *E. P.*

To which, on the shorter scales of a foot long, are usually added lines of latitudes, hours, and inclinations of meridians. On the backside of the scale are the lines usually found on a plane scale. The lines of artificial lines, tangents, and numbers, are so fitted on this scale, that by means of a pair of compasses, any problem, whether in right-lined or spherical trigonometry, may be solved very expeditiously, and with tolerable exactness; whence the instrument becomes extremely useful in all parts of mathematics where trigonometry is concerned; as navigation, dialling, astronomy. See TRIGONOMETRY, &c.

The same lines are also occasionally laid down on rulers to slide by each other; hence called *sliding-gunters*; so as to be used without compasses: but he that understands how to use them with, may, by what we have said of Everard's and Coggeshall's sliding-rules, use them without. See SLIDING-RULE.

Use of GUNTER'S SCALE. — 1^o, The base of a right-lined right-angled triangle being given, 30 miles, and the opposite angle thereto 26 degrees; to find the length of the hypotenuse. — The trigonometrical canon or proportion is thus. — As the sine of the angle, 26 degrees, is to the base 30 miles, so is radius to the length of the hypotenuse. — Set one foot of the compasses, therefore, on the 26th degree of the line of the sines; and extend the other to 30 on the line of numbers, and the compasses remaining thus opened, set one foot on 90 degrees, or the end of the line of sines, and extend the other on the line of numbers: this will give 68 miles and a half, for the length of the hypotenuse sought.

2^o, The base of a right-angled triangle being given, 25 miles, and the perpendicular 15; to find the angle opposite to the perpendicular. — As the base 25 miles is to the perpendicular 15 miles, so is radius to the tangent of the angle sought. — Extend the compasses, then, on the line of numbers, from 15 the perpendicular given, to 25 the base given; and the same extent will reach the contrary way, on the line of tangents, from 45 degrees, to 31 degrees, the angle sought.

3^o, The base of a right-angled triangle being given, suppose 20 miles, and the angle opposite to the perpendicular 50 degrees, to find the perpendicular. — As radius is to the tangent of the given angle 50 degrees, so is the base 20 miles to the perpendicular sought. — Extend the compasses then on the line of tangents, from the tangent of 45 degrees to the tangent of 50 degrees; and the same extent will reach on the line of numbers the contrary way, from the given base 20 miles, to the required perpendicular 23 $\frac{1}{2}$ miles.

Note, the extent on the line of numbers is here taken from 20 to 23 $\frac{1}{2}$ forwards; that the tangent of 50 degrees may be as far beyond the tangent of 45 degrees, as its complement forty degrees wants of forty-five degrees.

4^o, The base of a right-angled triangle being given, suppose 35 miles, and the perpendicular 48 miles; to find the angle opposite to the perpendicular.

As the base 35 miles is to the perpendicular 48 miles, so is radius to the tangent of the angle sought. — Extend the compasses from 35 on the line of numbers, to 48; the same extent will reach the contrary way on the line of tangents, from the tangent of 45 deg. to the tangent of 36 deg. 5 min. or 53 deg. 55 min. — To know which of those angles the angle sought is equal to, consider that the perpendicular of the triangle being greater than the base, and both the angles opposite to the perpendicular, and the base, making 90 deg. the angle opposite to the perpendicular, will be greater than the angle opposite to the base; and consequently the angle 53 deg. 55 min. will be the angle sought.

5^o, The hypotenuse of a right-angled spherical triangle being given, suppose 60 degrees, and one of the sides 20 degrees, to find the angle opposite to that side. — As the sine of the hypotenuse 60 deg. is to radius, so is the sine of the given side 20 deg. to the sine of the angle sought. — Extend the compasses on the line of sines, from 60 deg. to the radius, or 90 deg. and the same extent will reach on the line of sines the same way, from 20 deg. the given side to 23 deg. 10 min. the quantity of the angle sought.

6^o, The course and distance of a ship being given, to find the difference of latitude and departure. — Suppose a ship sails from the latitude of 50 deg. 10 min. north, S. S. W. 48.5 miles: as radius is to the distance sailed 48.5 miles, so is the sine of the course, which is two points, or the second rhumb, from the meridian, to the departure. — Extend the compasses from 8 on the artificial fine rhumb-line, to 48.5 on the line of numbers; the same extent will reach the same way from the second rhumb, on the line of artificial sines of the rhumbs, to the departure westing 18.6 miles.

Again, as radius is to the distance sailed 48.5 miles, so is the cosine of the course 67 deg. 30 min. to the difference of latitude. — Extend your compasses from the radius, on the line of sines, to 48.5 miles on the line of numbers; the same extent will reach the same way, from 67 deg. 30 min. on the line of sines, to 44.8 on the line of numbers; which converted into degrees, by allowing 60 miles to a degree, and subtracted from the given north latitude 50 deg. 10 min. leaves the remainder 49 deg. 25 min. the present latitude.

7^o, The difference of latitude and departure from the meridian being given; to find the course and distance. — A ship from the latitude 59 deg. north, sails north-eastward till she has altered her latitude 1 deg. 10 min. or 70 miles, and is departed from the meridian 57.5 miles, to find the course and distance. — As the difference of latitude 70 miles is to radius, so is the departure 57.5 miles to the tangent of the course 39 deg. 20 min. or three points and a half from the meridian. — Extend the compasses from the fourth rhumb, on the line of artificial tangents of the rhumbs, to 70 miles on the line of numbers, the

the same extent will reach from 57.5 on the line of numbers, to the third rhumb and a half on the line of artificial tangents of the rhumbs.

Again; as the sine of the course 39 deg. 20 min. is to the departure 57.5 miles, so is the radius to the distance 90.6 miles.—Extend the compasses from the third rhumb and a half, on the artificial lines of the rhumbs, to 57.5 miles on the line of numbers; that extent will reach from the sine of the eighth rhumb, on the lines of the rhumbs, to 90.6 miles on the line of numbers.

80 *Three sides of an oblique spherical triangle being given, to find the angle opposite to the greatest.*—Suppose the side AB, fig. 36, be 40 deg. the side BC 60 deg. and the side AC 96 deg. to find the angle ABC. Add the three sides together, and from half the sum subtract the greater side AC, and note the remainder: thus, *e. gr.* the sum will be 196 deg. half of which is 98 deg. from which subtracting 96 deg. the remainder is two deg.

Then extend the compasses from the sine of 90 deg. to that of the side AB 40 deg. and applying this extent to the sine of the other side BC 60 deg. you will find it reach to a fourth sine 24 deg.

Again; from this fourth sine extend the compasses to the sine of half the sum, *i. e.* the sine of 72 deg. the complement of 98 deg. to 180; this second extent will reach from the sine of the difference 2 deg. to the sine of 3 deg. 24 min. against which, on the versed lines, stands 151 deg. 50 min. the quantity of the angle sought.

GUSSET, in heraldry, denotes one of the abatements of honour; appropriated to lascivious, effeminate, or wanton persons.—It is formed of a line drawn from the dexter, or sinister angle of the chief, and descending diagonally to the chief point; from whence another line falls perpendicularly upon the base: as represented *Tab. Herald.* fig. 65.

GUST; see TASTE and GOUT.

GUST*, is used by Bradon and other antient writers, for a stranger, or guest, who lodges with a person the second night. See UNCUT.

* In the laws of St. Edward, published by Lambard, the word is written *gust*.

GUSTATION; see the article TASTING.

GUSTO *grand*; see the article GRAND.

GUTTA, a Latin term for what in English we call drop. See DROP.

GUTTA *Anglicana*, *English drops*, *volatile English drops*, or *Goddard's drops*, a name of a medicinal liquor prepared from divers ingredients; of sovereign efficacy against coagulations of the blood, malignant fevers, and particularly the small-pox, obstructions, epilepsies, drowsy diseases, vapours, &c.

The inventor of these celebrated drops was Dr. Goddard, a physician of London. The secret of their composition was purchased by King Charles II. at the price of 5000 l. sterl. whence they were denominated *gutta Anglicana*.

This costly receipt, we shall here gratify the reader withal, *à meilleur marche*: "Take five pounds of human cranium of a person hanged, or dead of some violent death, two pounds of dried vipers, two pounds of hart's-horn, and two of ivory; mince the whole small, put it in two or three retorts, and distill it in a reverberatory furnace, with the same precautions as are ordinarily used in distilling hart's-horn and vipers, to extract their volatile salt. When the vessels or receivers are cold, unlute them, and shake them well, in order to loosen the volatile salt from the sides of the vessels. Pour the whole into a large glass cucurbit, and filtrate it through a brown paper, in order to separate the oil, which is here useless: put the filtrated liquor in a glass retort, and place it in a sand heat, and fit another glass retort thereto, as a recipient: take care all things be well luted, and make a cohobation of the said matters at three times. But, by the way, add all the salt before separated from the receivers; and after the said three cohobations, unlute the retorts, and pour the whole into a matras with a long neck, to which fit a suitable capital, and a receiver; lute all the joinings on each side with a wet bladder, and set the vessel in a sand heat: by this means, the volatile salt will be sublimed, and stick to the capital, and upper part of the matras. Continue the fire till spirit enough hath rose to fuse and dissolve the salt which arose first: then take all the fire out of the furnace, that the distillation may proceed no further; which is a circumstance of the last importance; without which the medicine would be weakened by too much phlegm." Biet, in *Mém. de Trev.* an 1713.

As to the dose of this remedy, they begin with seven or eight drops, increasing by degrees, to forty or fifty, on pressing occasions, as in apoplexies, lethargies, weaknesses, &c.

The real composition of the *gutta*, however, is somewhat controverted. Dr. Lister assures us, that he had the secret communicated to him by King Charles II. and that it is no other than the volatile spirit of raw silk rectified with oil of cinnamon, or some other essential oil. See SILK.

The same author assures us, he had found by experience that the *gutta Anglicana* were not in any respect preferable to the common volatile spirits of hart's-horn and sal ammoniac, except that the smell is more supportable.—*Mém. de l'Acad. des Scien.* an. 1700.

GUTTÆ, in architecture, are ornaments in form of little cones, used in the plafond of the doric cornice, or on the architrave, underneath the triglyphs; representing a fort of drops, or bells; they are usually six in number. See *Tab. Archit.* fig. 28. lit. e and O. They are sometimes also called *lachrymæ*, tears; and *campane*, or *campanule*, bells. Leon Baptista Alberti calls them *naili*.

GUTTA-SERENA, is a disease of the eyes, being an entire privation of sight, without any apparent fault or disorder of the part, excepting that the pupil looks somewhat larger and blacker than before.

Its cause is supposed to be a compression or obstruction of the optic nerves, which prevents the due flux of the animal spirits into the retina. Pitcairn ascribes it to an indisposition of the retina, occasioned by the vessels thereof being too much distended with blood.

The *gutta-serena* is one of the most dangerous and untractable of all the diseases of the eyes. The cure, according to Pitcairn, is to be attempted with mercurials, and sometimes even with salivation, and with decoctions of guaiacum.

The *muçæ volantes* are a pathognomonic sign of a growing *gutta-serena*. The Greeks call it *amaurosis*.

GUTTE; see the article GUTTY.

GUTTERS, in building, a kind of canals in the roofs of buildings, serving to drain, receive, and carry off the rain waters. See ROOF.

GUTTER *styles*; see the article TYLE.

GUTTURAL letters, are those pronounced, or formed, as it were, in the throat.

Dr. Wallis distinguishes the vowels in our language, into labial, palatine, and guttural; according to the three several degrees of opening of the mouth to pronounce them, larger, middle, and less. On this footing he makes three guttural vowels, and three labial, and as many palatines.

GUTTUS, a Latin term, used among antiquaries, for a sort of vase used in the Roman sacrifices, to take the wine and sprinkle it, *guttatim*, drop by drop, upon the victim.

Viginere on T. Livy, gives the figure of the *guttus*, as represented on divers medals and other antient monuments.

GUTTY, or GUTTE, in heraldry, is when a thing is represented as charged or sprinkled with drops.

In blazon, the colour of the drops is to be named: thus, *guty* of sable, of gules, &c.

Some authors will have red drops called *guty de sang*, or drops of blood; black ones, *guty de poix*, of pitch; white, *guty d'eau*, of water, &c.

GUY's hospital; see the article HOSPITAL.

GUZES, in heraldry, roundles of a fanguin, or murky colour. GYMNASIARCH*, GYMNASIARCHA, in antiquity, the master, or director of a gymnasium.

* The word is Greek, γυμνασιάρχης, compounded of γυμνασιον, and αρχη, government.

The Greeks did not rank the *gymnasiarcha* among the number of magistrates; though his office was of great consideration, as having the care of all their youth, who were trusted to him to be formed to exercises of the body.

He had two principal officers under him, who were to assist him in the government of the gymnasium: the first named *xyfistarch*, and the second *gymnasiasta*. The former was master of the athlete, and presided over the wrestling. See XYSTARCH, ATHLETA, &c. The latter had the direction of all the other exercises; taking care they were performed in due time and manner; that they were not too severe; that the youth attempted nothing beyond their strength; and that nothing were done that might be injurious to their health.

These had several subaltern officers or servants under them, for the service and instruction of the youth committed to them.

GYMNASIUM*, a place fitted for performing exercises of the body.

* The word is Greek, γυμνασιον, formed of γυμνωε, naked; by reason they antiently put off their clothes, to practise with the more freedom.

Among the antients, *gymnasium*, was a public edifice destined for exercise, and where people were taught, and regularly disciplined therein, under proper masters.

If we may credit Solon in Lucian's *Anacharsis*, and Cicero de *Orat.* lib. 2. the Greeks were the first who had *gymnasia*; and among the Greeks the Lacedæmonians: after them the Athenians; from whom the Romans borrowed them.

There were three principal *gymnasiums* at Athens; the *academy*, where Plato taught; the *lyceum*, noted for Aristotle's lectures; and the *cyngages*, allotted for the populace.

Vitruvius describes the structure and form of the antient *gymnasiums*, lib. v. c. 11.—They were called *gymnasia*, because the champions performed naked; and *palaestra*, from wrestling, which was one of the most usual exercises there: cause

the Romans sometimes also called them *thermae*, because the baths and bagnios made a principal part thereof.

It appears that they did not perform their exercises quite naked, so early as the time of Homer, but always in drawers; which they did not lay aside before the thirty-second olympiad. One Orsippus is said to have been the first who introduced the practice; for having been worsted by means of his drawers undoing, and entangling him, he threw them quite aside; and the rest afterwards imitated him.

The *gymnasia* consisted of several members or apartments. M. Burette, after Vitruvius, recites no less than twelve, viz. 1^o, The exterior *portico's*, where the philosophers, rhetoricians, mathematicians, physicians, and other virtuosi, read public lectures, and where they also disputed, and rehearsed their performances. 2^o, The *ephebeum*, where the youth assembled very early, to learn their exercises in private, without any spectators. 3^o, The *coryceum*, *apodyteron*, or *gymnasterion*, a kind of wardrobe, where they stripped, either to bathe, or exercise. 4^o, The *eleuthesium*, *alisterion*, or *unctorium*, appointed for the unctions which either preceded or followed the use of the bath, wrestling, pancratia, &c. 5^o, The *conisterium*, or *conistra*, in which they covered themselves with sand, or dust, to dry up the oil, or sweat. 6^o, The *palaestra*, properly so called, where they practised wrestling, the pugilate, pancratia, and divers other exercises. 7^o, The *sphaeristaeum*, or tennis court, reserved for exercises wherein they used balls. 8^o, Large unpaved alleys, which comprehended the space between the portico's and the walls wherewith the edifice was surrounded. 9^o, The *xylis*, which were portico's for the wrestlers in winter or bad weather. 10^o, Other *xylis*, or open alleys, allotted for summer and fine weather; some of which were quite open, and others planted with trees. 11^o, The *baths*, consisting of several different apartments. See BATH. 12^o, The *stadium*, a large space, of a semicircular form, covered with sand, and surrounded with seats for the spectators. See STADIUM.

For the administration of the *gymnasia*, there were divers officers; the principal were, 1^o, The *gymnasiarcha*, who was the director and super-intendant of the whole. 2^o, The *xytharcha*, who presided in the *xylus*, or stadium. 3^o, The *gymnasia*, or master of the exercises, who understood their different effects, and could accommodate them to the different complexions of the athletes. 4^o, The *paedotriba*, whose business was mechanically to teach the exercises, without understanding their theory or use. Under these four officers were a number of subalterns, whose names distinguished their different functions.

For the kinds of exercises practised in the *gymnasia*, they may be reduced to two general classes, as they depend either on the action of the body alone, or as they require external agents, or instruments. The former are chiefly of two kinds; *orchestice*, and *palaestice*.

The *orchestice* comprehended, 1^o, *Dancing*. 2^o, *Cubistice*, or the art of tumbling. 3^o, *Sphaeristica*, or tennis, including all the exercises with pile, or balls.

The *palaestice* comprised all exercises under the denomination *palaestra*; as wrestling, boxing, pancratia, *hoplomachia*, running, leaping, throwing the discus, the exercise of the javelin, and that of the hoop, denominated by the Greeks *repega*, which consisted in rolling an iron hoop, five or six foot in diameter, beset with iron rings, the noise of which apprising the people to give way, afforded them also an amusement. Both strength and skill were requisite in directing this hoop, which was to be driven with an iron rod.

To these must also be added the exercises belonging to the medicinal gymnastics: as, 1^o, *Walking*. 2^o, *Vociferation*, or shouting. 3^o, *Holding one's breath*.

The bodily exercises which depend on external agents, may be reduced to mounting the horse, riding in a chaise, litter, or other wheeled vehicle; racking in beds, or cradles, and sometimes swinging: to which may be added, the art of swimming. Hoffman enumerates no less than fifty-five sorts of *gymnastic* exercises.

GYMNASTICKS, **GYMNASTICE**, or the **GYMNASTIC ART**, denotes the art of performing exercises of the body, whether for defence, health, or diversion.

The *gymnastic art* is divided into three species, or branches; *military*, *medicinal*, and *athletic* or *sportive*.

Several modern writers have treated of this art, as Mercurialis, de arte *Gymnastica*; Faber, in *Agonistica*. Joubert, de *Gymnasticis*; Cagnatius, de *Sanit. tuenda*. Vossius, de *Quatuor Artibus Popularibus*. Mercurius, de *Orchestra*; Fuller, in *Medicina Gymnastica*; and M. Burette, in several dissertations on the ancient *Dancing*, *Sphaeristica*, *Athletica*, *Wrestling*, *Pugillate*, *Discus*, &c.

M. Burette has given the history of *gymnastics*, in the *Memoirs of the Royal Academy of Inscriptions*.—According to him, this art is coeval with the world. In reality, we can hardly suppose mankind to have ever been without some sort of exercises of the body; which the defence of their persons, the preservation of

health, and even recreation, and mirth, would necessarily lead them to. See EXERCISE.

On the first establishment of society, men, being apprised of the necessity of military exercises, for repelling the insults of their neighbours, instituted games, and proposed prizes, to animate their youth to combats of divers kinds. See GAMES. And as running, leaping, strength and dexterity of arm, in throwing the javelin, driving a ball, or tossing a quoit, together with wrestling, &c. were exercises suited to the manner of fighting in those days; so the youth vied to excel in them, in the presence of the aged, who sat their judges, and dispensed prizes to the conquerors: till what was originally only amusement, became at length a matter of such importance, as to interest famous cities and entire nations in its practice.

Hence arose an emulation and eagerness to excel, in hopes one day of being proclaimed and crowned conquerors in the public games, which was the highest honour a mortal could arrive at. Nay, they went so far as to imagine, that even gods and demigods were not infensible of what men were to captivate withal; and in consequence hereof, to introduce the greatest part of these exercises into their religious ceremonies, the worship of their gods, and the funeral honours done the manes of the dead.

Though it be hard to determine the precise epocha of the *gymnastic art*, yet it appears from several passages in Homer, and particularly the xxiii^d book of the *Iliad*, where he describes the games celebrated at the funeral of Patroclus, that it was not unknown at the time of the Trojan war.—From that description, which is the earliest monument now extant of the Grecian *gymnastics*, it appears that they had chariot races, boxing, wrestling, foot races, gladiators, throwing the discus, drawing the bow, and hurling the javelin; and it should seem from the particular account Homer gives of these exercises, that even then the *gymnastic art* wanted little of perfection: so that when Galen says, there was no *gymnastic art* in Homer's days, and that it began to appear no earlier than Plato, he is to be understood of the medicinal *Gymnastics* only. This last, indeed, had its rise later; because, while men continued sober and laborious, they had no occasion for it. But when luxury and idleness had reduced them to the sad necessity of applying to physicians; these who had found that nothing contributed so much to the preservation and re-establishment of health, as exercises proportioned to the different complexions, ages, and sexes, did not fail to remit them to the practice of *gymnastics*.

According to Plato, one Herodotus, prior a little time to Hippocrates, was the first who introduced this art into physic; and his successors, convinced by experience of its usefulness, applied themselves in earnest to improve it. Hippocrates, in his book of *Regimen*, has given instances of it, where he treats of exercise in general, and of the particular effects of walking, with regard to health; also of the different sorts of races, either on foot or horseback, leaping, wrestling, the exercise of the suspended ball, called *corycus*, chironomy, unctions, frictions, rolling in the sand, &c.

But as physicians did not adopt all the exercises of the *gymnastic art* into their practice, it became divided between them and the masters of martial and athletic exercises, who kept schools, the number of which was greatly increased in Greece.

At length the Romans also caught the same taste, and adopting the military and athletic exercises of the Greeks, they improved and advanced them to the utmost pitch of magnificence, not to say extravagance. But the declension of the empire involved the arts in its ruin; and, among others, *Gymnastics* and medicine; which last unhappily then relinquished the title it had to the former, and has neglected to resume it ever since.

GYMNIC, **GYMNICUS**, something belonging to the exercises of the body.

Gymnic games, *ludi gymnici*, are those wherein the body is exercised; such are wrestling, running, dancing, the use of the lance, quoit-playing, &c.

It was these made the chief diversions of the Olympic, Nemæan, Pythian, and Isthmian solemnities; being called by the Greeks Παιδαγωγία, and the Latins *quingentium*. See OLYMPIC, NEMÆAN, PITHIAN, ISTHMIAN, &c. See also PENTATHLON.

GYMNOPÆDIA*, a kind of dance, in use among the ancient Lacedæmonians; performed during their sacrifices, by young persons who danced naked, singing at the same time a hymn in honour of Apollo.

* The word is also written *gymnopædie*. It is compounded of γυμνός, naked, and παις, child.

One Terpander is recorded as the inventor of the *Gymnopædia*. Athenæus describes it as a Bacchic dance, performed by youths stripped quite naked, with certain interrupted, though agreeable motions and gestures of the body; the arms and legs being flourished and directed after a peculiar manner, representing a sort of real wrestling.

GYMNOSOPHISTS*, a set of Indian philosophers, famous in antiquity; so denominated from their going barefooted.

* The word is formed of the Greek γυμνός, g. d. a sophist, or philosopher, who goes naked.

This name was given to the Indian philosophers, whom the excessive heat of the country obliged to go naked; as that of *peripateticks* was given those who philosophized walking. *Lucretius*, *Vives*, &c. will not have *gymnosophists* to have been the name of any particular sect, but a common name of all the philosophers in the Indies; and hence they divide them into *Brachmans* and *Germani*.

Among the *Germani*, called also by *Porphyry*, *samanai*, and by *Clemens Alexand.* *sermanai*, some were called *hylobii*; by *Clemens Alexand.* *allobii*, as inhabiting the woods; which last seem to come nearest to the notion of *gymnosophists*. *Clemens* relates, that these *allobii* neither inhabit cities nor towns, are clothed mostly with the leaves of trees, eat acorns and berries, and drink water out of their hands, abstaining from marriage and procreation.

Apuleius, *Florid.* lib. 1. describes the *gymnosophists* thus: "They are all devoted to the study of wisdom, both the elder masters, and the younger pupils; and what to me appears the most amiable thing in their character, is, that they have an aversion to idleness and indolence: accordingly, as soon as the table is spread, before a bit of victuals be brought, the youths are all called together from their several places and offices, and the masters examine them what good they have done since the sun-rise. Here one relates something he has discovered by meditation; another has learned something by demonstration: and as for those who have nothing to allege why they should dine, they are turned out to work fasting."

The great leader of the *gymnosophists*, according to *Jerom*, was one *Buddas*, called by *Clemens*, *Butta*; who is ranked by *Suidas* among the *Brachmans*. That last author makes *Buddas* the præceptor of *Manes* the *Persian*, the founder of the *gymnosophists*.

GYNÆCEUM*, *Γυναικειον*, among the ancients, the apartment of the women; or a separate place in the inner part of the house, where the women kept themselves retired, employed in their spinning, out of the sight of the men.

* The word is compounded of the Greek, *gyn*, a woman, and *oikos*, an house.

Under the Roman emperors there was a particular establishment of *gynæcea*; being a kind of manufactories managed chiefly by women, for the making of clothes, furniture, &c. for the emperor's household. Mention is made of these *gynæcea*, in the *Theodosian* and *Justinian* code, and by divers other authors. In imitation hereof, divers of the modern manufactories, particularly those of silk, where a number of women and maids are associated and formed into a body, are called *gynæcea*.

GYNÆCIARIUS, a workman employed in the *gynæceum*. In the ancient *gynæcea* there were men to weave, and shape; the rest, as spinning, &c. being performed by women.

Criminals were sometimes condemned to serve in the *gynæcea*, much as now in the galleys. Frequently, also, this was a kind of service which princes exacted of their subjects, or vassals, both men and women, whom they made to work for them in their *gynæcea*.

GYNÆCOCRATUMENI*, an ancient people of *Sarmatia Europæa*, inhabiting the eastern banks of the river *Tanais*, near its opening into the *Palus Mæotis*; thus called, as

authors relate, because they had no women among them: or rather, because under the dominion of women.

* The word is formed of *gyn*, woman; and *κρατουμενος*, vanquished; of *κρατω*, I overcome; *g. d.* overcome by women.

Fa. Hardouin, in his notes on *Pliny*, says they were thus called, by reason, after a battle which they lost against the *Amazons* on the banks of the *Thermodoon*, they were obliged to have a venereal commerce with them, in order to get them children: *Et quod victricibus obsequantur ad procurandum eis sobolem.*

Hardouin calls them the husbands of the *Amazons*, *Amazonum connubia*. For, as that author observes, the word *unde* must be retrenched from *Pliny*; having been foisted into the text by people who were not masters of the authors meaning, *unde Amazonum connubia*.

They who take the *Amazons* for a fabulous people, will conclude the fame of the *Gynæcocratumenians*. See *AMAZON*.

GYNÆCOCRACY*, *Γυναικρατία*, a petticoat government; or a state where women have, or may have, the supreme command.

* The word is formed of *gyn*, *γυναικος*, woman, and *κρατος*, authority, power, government.

In this sense, *England* and *Spain* are *gynæcocracies*: the French value themselves, and think they are greatly happy that their monarchy is not *gynæcocratic*.

GYNÆCONOMUS*, the name of a magistrate of *Athens*, who had the censure, and inspection of the women.

* The word is compounded of the Greek *gyn*, *γυναικος*, woman; and *νομος*, law.

There were ten *gynæconomi*: their business was to inform themselves of the lives and manners of the ladies of that city, and to punish such as misbehaved themselves, or transgressed the common bounds of modesty and decency.

They had a list hanging out, of the names of all those whom they had censured, or condemned to any mulct, forfeiture, penance, or other penalty.

GYNGLIMUS, in anatomy, &c. See *GLINGLYMUS*.

GYPSUM, *Γυψος*, in natural history, a talky sort of stone, found in quarries; which being burnt, and diluted, or wrought up with water, serves to make what we call *perget*, or *plaster of Paris*.

GYPSUM, or **GYPSE**, is also used for a coarse sort of talk; or a shining transparent stone chiefly found in the quarries of *Montmartre*, near *Paris*, among the *plaster stones*.

The generality confound this with the former, on account of the conformity of its name with the Latin *gypsum*; but unhappily enough; as the French *gyp*, or *gypse*, is not fit for the making of the common *plaster*.

This stone being calcined in a kiln, beaten in a mortar, and sifted, and mixed up with gum, or size water and colours, serves to counterfeit marble, which it does to that perfection, that both the eye and touch may be deceived.

The method of preparing it, will be shewn under the article *MOsaic*.

GYROMANCY*, *Γυρομαντία*, a kind of divination, performed by walking round, or in a circle. See *DIVINATION*.

* The word is compounded of the Greek *γυρος*, circle, and *μαντις*, divination.

H A B

This writ sometimes also issues out of the records of a fine, directed to the sheriff of the county, where the lands lie; commanding him to give to the cognizee, or to his heirs, seisin of the land, whereof the fine is levied.

The writ lies within the year after the fine, or judgment, upon the *fine facias*; and may be made in divers forms.

There is also a writ called *HABERE facias seisinam, ubi rex habuit annum, diem & vestrum*; which lies for the delivery of lands to the lord of the fee, after the king had taken his due of a person's lands, who was convicted of felony.

HABERE facias visum, is a writ that lies in divers cases, as in dower, formodon, &c. where a view is to be taken of the land, or tenements in question.

HABERGION*, or **HAUBERGEON**, **HABERGETUM**, a coat of mail; an antient piece of defensive armour, in form of a coat, descending from the neck to the middle; and formed of little iron rings, or meshes, linked into each other.

* The word is also written *haberge*, *bauberge*, *haubere*, *haubert*, *haubter*, *haubert*, and *hauberk*. Spelman takes it to have been formed from the antient French *haull*, high, and *berg*, armour, covering; as serving to defend the upper part of the body. Du Cange and Skinner choose to derive it from the Belgic *hab*, or Teutonic *heltz*, neck, and *bergen*, to cover:—As if it were a peculiar defence for the neck. Others will have it formed of *al*, *ella*, q. d. all, and *bergen*, to cover; as importing it a cover for the whole body.

HABILIMENTS of war, in our antient statutes, signify armour, harness, utensils, or other provisions for war; without which there is supposed no ability to maintain war.

HABIT, in philosophy, an aptitude, or disposition, either of mind or body, acquired by a frequent repetition of the same act.

Some of the Schoolmen call this a *qualitative habit*, *habitus qualitativus*; and define it a quality adventitious to a thing, fitting and disposing it either to act or suffer.

Others define *habit* an affection of mind or body, persisting by long use and continuance.—In which sense *habit*, a constant *habit*, is distinguished from *diabitus*, a present disposition, liable soon to alter.

Habits may be distinguished into those of the mind, and of the body.—Thus virtue is called an *habit* of the mind; strength, an *habit* of the body.

All natural *habits*, whether of body or mind, are no other than the body and mind themselves, considered as either acting or suffering; or they are modes of the body or mind, wherein either perseveres, till effaced by some contrary mode.

Aristotle enumerates five *habits* of the mind, *viz.* understanding, knowledge, wisdom, prudence, and art: which division the later writers set aside, and only admit of three intellectual *habits*, *viz.* science, prudence, and art: agreeable to the three kinds of objects, about which the mind has occasion to be facilitated; which are either theoretical, practical, or effective. Virtues and vices are considered by philosophers under the notion of good and bad *habits*.

The archbishop of Cambray defines *habits*, in the general, to be certain impressions left in the mind; by means whereof, we find a greater ease, readiness, and inclination to do any thing formerly done, by having the idea ready at hand to direct us how it was done before.—Thus, *e. g.* we form a *habit* of sobriety, by having always before us the inconveniences of excess; the reflections whereof, being often repeated, render the exercise of that virtue continually more and more easy.

F. Malebranche gives a more mechanical theory of the *habits*.—His principle is, that they consist in a facility which the spirits have acquired, of passing easily from one part of the body to another. He argues thus: If the mind act on, and move the body, it is, in all probability, by means of a flock of animal spirits lodged in the brain, ready to be sent at the motion of the will, by means of the nerves which open or terminate in the brain, into the muscles of the body.

Now, an influx of spirits into a muscle, occasions a swelling, and, of consequence a shortning of the muscle; and consequently a motion of the part that muscle is fastned to.

Farther, the spirits do not always find all the roads open and free, which they are to pass through; whence that difficulty we perceive of moving the fingers with that quickness necessary to play on a musical instrument; or of moving the muscles necessary to pronounce the words of a foreign language. But, by degrees, the spirits, by their continual flux, smoothen the ways; so that at length they meet with no resistance at all. Now it is in this facility the spirits find of passing, when directed into the members of the body, that *habits* consist.

On this hypothesis, it is easy accounting for an infinity of phenomena relating to the *habits*.—Why, for instance, children acquire new *habits* with more ease than grown persons? Why it is difficult getting rid of inveterate *habits*? Whence that incredible quickness in the pronunciation of words, even without thinking of them; as is particularly observable in those long accustomed to formula's, &c.

On this footing, the faculty of memory appears to have very much the nature of a *habit*; inasmuch that in one sense it may pass for a *habit*.

H A D

HABIT, in medicine, is what we otherwise call the temperament, or constitution of the body; whether obtained by birth, or occasioned by the manner of living.

An ill, distempered *habit*, without any particular apparent disease, the physicians usually call a *cachexia*, or *cachymia*.

A thing is said to *enter the habit*, when it becomes intimately diffused throughout the body, and is conveyed to the remotest stages of circulation.

HABIT is also used for a dress, or garb; or the composition of garments wherewith a person is covered.

In this sense we say, the *habit* of an ecclesiastic; of a religious, &c. the military *habit*, &c.

The ecclesiastical *habit* only commenced about the time of Gregory the great, *i. e.* it only began at that time to be distinguished from the lay *habit*, *viz.* in the sixth century.—

The establishment of the barbarous nations was the occasion thereof: for the laymen took the *habit* of the nations they had submitted to, but the priests kept to the Roman dress.

The abbot Boileau has an express treatise *On the ecclesiastical habit*; wherein he maintains, contrary to the common opinion and custom, that the ecclesiastical *habit* should be a short one, and that a short *habit* is more decent than a long one.

HABIT is particularly used for the uniform garments of the religious, conformable to the rule and order whereof they make profession.

The *habit* of S. Benedict, of S. Augustine, &c.

In this sense, we say absolutely, such a person has taken the *habit*; meaning, he has entered upon a novitiate in a certain order.—So, he is said to quit the *habit*, when he renounces the order. See **NOVIATIE**, **VOWS**, &c.

The *habits* of the several religious, are not supposed to have been calculated for singularity or novelty: the founders of the orders, who were at first chiefly inhabitants of deserts and solitudes, gave their monks the *habit* usual among the country people. Accordingly, the primitive *habits* of S. Anthony, S. Hilarion, S. Benedict, &c. are described by the antient writers, as consisting chiefly of sheep-skins, the common dress of the peasants, shepherds, and mountaineers of that time: and the same they gave their disciples.

The orders established in and about cities, and inhabited places, took the *habit* wore by the other ecclesiastics at the time of their institution.—Thus, S. Dominic gave his disciples the *habit* of regular canons, which he himself had always wore to that time. And the like may be said of the Jesuits, Barnabites, Theatins, Oratorians, &c. who took the common *habit* of the ecclesiastics at the time of their foundation. And what makes them differ so much from each other, as well as from the ecclesiastical *habit* of the present times, is, that they have always kept invariably to the same form; whereas the ecclesiastics have been changing their mode on every occasion.

HABITATION, a dwelling-place, or house. See **HOUSE**.

HABITATION, is sometimes also used for *cohabitation*. See **COHABITATION**.

HABITUAL, something that is become, or turned into an habit, or habitude.

Thus we say, an *habitual* or inveterate disease; *habitual* sin, &c. An *habitual* disposition is the same thing with an habitude itself.

HABITUAL Grace, is conveyed to us by baptism, and afterwards augmented and improved by the eucharist, and other appointed means.

The Romish divines hold *habitual grace* only necessary in order to be saved; and actual grace to the doing any thing meritorious.

HABITUDE, **HABITUDO**, in the schools, signifies the respect or relation which one thing bears to another. See **RELATION**.

In this sense, *habitude* is one of Aristotle's categories.

Some of the more precise and accurate schoolmen, consider *habitude* as a genus; and subdivide it into two species. Where it is considered as quiescent, they call it *respect*; where as moved, *relation*: To which some add a third species, considered in respect of figure, which they call *mode*.

HABITUDE is also used in philosophy, for what we popularly call *habit*, *viz.* a certain disposition or aptitude, for the performing, or suffering of certain things; contracted by reiterated acts of the same kind.

HACHES, and **HACHING**. See **HATCHING**.

HACKNEY. See the article **HAQUENY**.

HACKNEY Coach. See the article **HACKNEY COACH**.

HADRIANEA, or **HADRIANALIA**, in antiquity, games instituted in honour of the emperor Hadrian, or Adrian.

There were two sorts of *Hadrianalia*, the one held every year, and the other every five years.

HÆMATITES*, **AIMATITE**, in natural history, the *blood-stone*; a kind of ruddy mineral Substance; thus called, either on account of its resembling dry, curdled blood, or of the faculty it has of staining blood.

* The word is formed from the Greek *haima*, *sanguis*, blood.

Pliny reckons five kinds of blood-stone, viz. the *Ethiopic*, the *androdama*, the *Arabic*, the *elatites*, or *millites*, and the *schistos*; besides that commonly called in his time the *magnes hematites*, from the property it had of attracting iron.

The five sorts differ chiefly in point of hardness: the best, according to Dioscorides, is that which is friable, hard, black, and smooth, without either gritty parts, or veins.

That commonly used by the painters is factitious; being made of Armenian bole, and other drugs.

The common native, or fossil kind, comes from Egypt, Bohemia, &c. It has divers uses in medicine; being held cooling and astringent, and in that quality prescribed in hæmorrhages.—It is given in substance, in form of a fine powder.

The gilders use it for burnishers, to polish their gold withal. Bauschius has an express treatise on the *Lapis hematites*. See supplement: article *HÆMATITES*. See there also *Elatites*, and *Androdamas*.

HÆMATOSIS *, in medicine, the action whereby the chyle is converted into blood; called also *sanguification*. See *SANGUIIFICATION*.

* The word is formed of the Greek *αἷμα*, *sanguis*, blood.

The chief of the vital actions, are the chylosis, and hæmatosis.

HÆMOPHYYSIS *, *ἡμωφύσις*, corruptly also called *HÆMORTOSIS*, and *ἡμωρτοσις*, in medicine, a spitting of blood; occasioned by the rupture or erosion of some vessel of the lungs; and accompanied, usually, with a cough, and a sense of pressure on the breast.

* The word comes from *αἷμα*, *blood*; and *φύσις*, *to spit*.

The *hæmoptysis* differs from a vomiting of blood, in that in the *hæmoptysis*, the blood comes from the lungs, and for that reason is florid and frothy; whereas in the vomiting of blood, it comes from the stomach, and is blackish.

The *hæmoptysis*, is usually occasion'd by violent shouts, or cries; by strains, falls, or vehement coughs; by the suppression of some ordinary evacuation, or by the abundance of some sharp corrosive humor.

The *hæmoptysis* is either *accidental* or *habitual*.—The latter is a symptom of the phthisis. It is best cured, according to Morton, by the cortex: it is stopped by astringents, as *Armen. bol. sang. dracon. lapis hemat.* &c. See supplement: article *HÆMOPTOSE*.

HÆMORRHAGE *, *ἡμωρραγία*, in medicine, a flux of blood at any part of the body; arising either from a rupture of the vessels, as when they are too full, or too much pressed; or from an erosion of the same, as when the blood is too sharp and corrosive.

* The word is compounded of the Greek *αἷμα*, *sanguis*, blood; and *ῥαγναι*, *frango*, *rumpo*, *erumpo*, I break, burst forth, &c.

The *hæmorrhage*, properly speaking, as understood by the Greeks, was only a flux of blood at the nose; but the moderns extend the name to any kind of flux of blood, whether by the nose, mouth, lungs, stomach, intestines, fundament, matrix, or whatever part.

Hypochondriac, scorbutic, and cachectic persons, are liable to various and immoderate hæmorrhages.—The cure of hæmorrhages arising from a plethora, is by evacuations, and particularly phlebotomy, to cause a revulsion.—That which arises from an increased velocity of thin acrimonious blood, is to be attacked by coolers, and agglutinants.

The principal simple remedies in hæmorrhages, are album græcum, spirit or oil of vitriol, chalcantum rubified, colophony pulverized, oil of turpentine, decoction of catechu, and cortex peruv.

A ligature on the limb has frequently a good effect: as have also the *elect. Boylean. pulvis Galeni*; *elect. Symplic. tinctur. rosar. epithem. de sacchar. saturn.* &c.

An hæmorrhage at the anus, is more usually called a *dysentery*. See *DYSENTERY*.

HÆMORRHOIDAL, an epithet given to the veins and arteries of the intestinum rectum, and the fundament, as being the seat of the hæmorrhoids, or piles.

The hæmorrhoidal arteries are two; the one *internal*, the other *external*.

The *internal* is a branch of the lower mesenteric, which running along the rectum, terminates at the fundament.—The *external* springs from the hypogastric artery.

The hæmorrhoidal veins are also *internal* and *external*.

The *internal* carries back the blood of the rectum and fundament, which it embraces regularly; and is inserted sometimes into the splenic branch of the porta, and sometimes into the mesenteric. The *external* brings back the blood from the muculous parts about the fundament, and terminates in the hypogastric vein.

HÆMORRHOIDS *, in medicine, a disease of the fundament, popularly called the *piles*.

* The word is formed of the Greek *αἰμαρρῶσις*, *sanguinis profusio*, flux of blood; which is compounded of *αἷμα*, *blood*, and *ῥεω*, I flow.

The hæmorrhoids are a painful, periodical tumor, in the lower part of the intestinum rectum; usually appearing externally in the anus.—They may be considered as a sort of varicose tumours in the hæmorrhoidal veins; arising from the too great abundance of morbid blood therein.

The disease is either *simple*, as when the veins alone are tumified; or *compound*, as when the neighbouring parts become also infected, or an excrescence arises therefrom; as a *ficus*, *crista Galli*, *emphyloma*, or the like.

Hæmorrhoids again are either open, *fluentes*; that is, such as yield blood; or blind, *cæcæ*, where the parts are only tumid.—In the first, the vessels of the rectum are open; in the latter, there is some obstruction which occasions them to swell.

The hæmorrhoids sometimes are internal, and cause great pain in going to stool; especially if the feces be indurated: after which they often appear externally, and blood is seen upon the excrements.

Etmuller is careful in distinguishing the genuine hæmorrhoidal flux, from a bloody diarrhoea; frequent in scorbutic cases.

—The hæmorrhoids are usually opened by the attrition of the excrements in a stool, so that the blood flows at the same time with the excrements; but if it flows promiscuously before as well as after the excrements, and without pain, it is a scorbutic flux.

Where the flux is excessive, phlebotomy, and cupping are good, by way of revulsion; and internally, astringents and opiates.—Upon a suppression of the usual flux, without removing the cause, the open hæmorrhoids degenerate into the blind ones: in which case they must be opened again with aloeatics, &c. Tamarinds are held excellent to alluvage the flux: chalybeates strike at the cause of the evil: scrophularia, onion and leek are much commended in it. See supplement: article *HÆMORRHOIDS*.

HÆREDE *abdito*, is a writ which antiently lay for the lord, who, having by right the wardship of his tenant under age, could not come by his body, as being conveyed away by another.

HÆREDE *deliberando alii qui habet custodiam terræ*, a writ directed to the sheriff, willing him to command one that had the body of him who was ward to another, to deliver him to him whose ward he was on account of his land. See *WARD*.

HÆREDIPETA, in our antient law-books, the next heir. See *HEIR*.

Et nullus hæredipeta suo propinquo vel extraneo periculo sine custodia committatur. Leg. H. I. cap. 70.

HÆREDITAS. See the article *ANCEYANCE*.

HÆRESIARCH, **HÆRESIARCHA**, of the Greek *ἡρεσιάρχης*, an arch heretic. See *HERETIC*.

HÆRESIS, *Heresy*. See the article *HERESY*.

HÆRETICO *Camburendo*, a writ which antiently lay against an heretic, who having once been convicted of heresy by his bishop, and having abjured it, afterwards falling into it again, or into some other, is thereupon committed to the secular power.

Sir Edward Coke was of opinion, that this writ did not lie in his time: but it is now formally taken away by statute Car. II.

HÆRETICUS, *Heretic*. See the article *HERETIC*.

HAGARD *, in falconry, a hawk, or falcon, not taken in the nest; but after she had been inured to liberty, and preying for herself.

* The word is French, and signifies *fierce*; some derive it from the Latin *agreste*, wild: others from the German *bag*, inclosure, fortified place.—Whence M. Huet observes, the word *hagard* is sometimes applied to a man who becomes hardy and proud, in confidence of the strength of the place he is in.

Hagard hawks are hard to tame, and bring under discipline. See *HAWK*, and *FALCON*.

HAGIOGRAPHIA *, a name given to part of the books of scripture, called by the Jews *cetuvim*. See *BIBLE*.

* The word is compounded of *ἅγιος*, holy; and *γραφία*, I write.—The name is very antient: S. Jerom makes frequent mention of it,—before him, St. Epiphanius called these books simply, *ἱεράγρα*.

The Jews divide the sacred writings into three classes: the Law which comprehends the five books of Moses; the Prophets, which they call *neviim*; and the *cetuvim*, *כתובים* called by the Greeks, &c. *Hagiographia*; comprehending the book of Psalms, Proverbs, Job, Daniel, Esther, Chronicles, Canticles, Ruth, the Lamentations, Ecclesiastes, and Esther.

The Jews sometimes call these books the Writings, by way of eminence, as being wrote by immediate inspiration of the holy Spirit.—Thus says Kimchi, in his preface to the Psalms, Maimonides in *More Nevoch*. and Elias Levita in his *Thibsi*, under the word *כתוב*.

They distinguish the *Hagiographers*, however, from the Prophets; in that the authors of the former did not receive the

matters contained in them by the way called Prophecy, which consists in dreams, visions, whippers, extasies, &c. but by mere inspiration, and direction of the Spirit.

HAGIOSIDERON*, or **HAGIOSIDIRON**.—The Greeks who are under the dominion of the Turks, being prohibited the use of bells, make use of an iron wherewith to call people to church, called *hagiosideron*.

* The word is Greek, *ἁγιοςιδιρον*; compounded of *ἅγιος*, holy; and *σιδηρον*, iron.

Magius gives us the description of an *hagiosideron* he had seen.—It is a plate of iron, about three inches broad, and sixteen long, fastned by the middle to a chain, or cord, whereby it is suspended at the church-door. On this they strike with an iron hammer, with some measure and cadence, so as to make no disagreeable noise.

They also carry an *hagiosideron*, before the priest in a procession of the sacrament to any sick person, beating on it from time to time, to advertise the people to adore it; much as in the Romish church they do with a bell.

HAIL, *Grando*, in physiology, an aqueous concretion, in form of white, or pellucid spherules, descending out of the atmosphere.

Hail is conceived to be formed of drops of rain, frozen in their passage through the middle region.

Others take it for the fragment of a frozen cloud, half melted, and thus precipitated, and congealed again.

Accordingly, the Cartesians define *hail* to be a cloud, either wholly, or in part liquified; which tending downward by its own gravity, is, in its passage, froze again by the action of some very cold wind; and thus precipitated, for the most part in round transparent globes.—They add, that if the cloud have been totally liquified, the *hailstones* are pellucid; otherwise they are only partly so.

Hail assumes various figures, according to the degrees of heat or cold of the air, which it passes through in its descent: sometimes it is round, sometimes angular, triangular, pyramidal, &c. sometimes thin and flat, star-like, with six equal points, &c.

Hail is observed frequently to attend thunder and lightning; the nitre that contributes to the one, having likewise a large share in the production of the other.

Natural histories furnish us with a great variety of instances of extraordinary showers of *hail*.—In the Philosophical Transactions, Dr. Halley, and others relate, that in Cheshire, Lancashire, &c. April 29, 1697. a thick black cloud, coming from Carnarvonshire, disposed the vapours to congeal in such a manner, that for about the breadth of two miles, which was the limit of the cloud, in its progress for the space of sixty miles, it did inconceivable damage: not only killing all sorts of fowls, and other small animals, but splitting trees, knocking down horses and men, and even ploughing up the earth; so that the *hailstones* buried themselves under ground, an inch, or an inch and a half deep.—The *hailstones*, many of which weighed five ounces, and some half a pound, and were five or six inches about, they were of various figures, some round, others half round; some smooth, others embossed and crenelated: the icy substance of them was very transparent and hard; but there was a snowy kernel in the middle of every one of them.

In Hertfordshire, May 4. the same year, after a severe storm of thunder and lightning, a shower of *hail* succeeded, which far exceeded the former: some persons were killed by it, their bodies beat all black and blue: vast oaks were split, and fields of rye cut down as with a scythe. The stones were measured from ten to thirteen or fourteen inches about. Their figures were various, some oval, others picked, some flat. *Philosoph. Transact.* N^o. 229.

At Lille in Flanders, in 1686. there fell *hailstones* of a very large size; some of which contained in the middle a dark brown matter, which thrown on the fire gave a very great report. *Philosoph. Transact.* N^o. 203.

Mezzeray, speaking of the war of Louis XII. in Italy, in the year 1510. relates, that there was for some time an horrible darkness, thicker than that of night; after which the clouds broke into thunder and lightning, and there fell a shower of *hailstones*, or rather (as he calls them) pebble stones, which destroyed all the fish, birds, and beasts of the country.—It was attended with a strong smell of sulphur; and the stones were of a bluish colour: some of them weighing an hundred pounds. *Hist. de France*, Tom. II. p. 339.

HAILE, a sea-term, signifying either to call to a ship, to know from whence she comes, and whither she is bound, or else to salute her, and wish her well.

HAIR, small filaments, issuing out of the pores of the skins of animals; and serving most of them as a tegument, or covering.

In lieu of *hair*, the nakedness of some animals is covered with feathers, or wool.

Hair is found on all parts of the human body, except the soles of the feet, and the palms of the hands.—But it grows longest

est on the head, chin, breast, in the armpits, and about the privities.

Physicians distinguish the *hair* into several kinds, and give it divers denominations; but this only in Greek and Latin.—The *hair* of the head they call *capillus*: that of women particularly, *coma*, from *capasso*, to dress and adjust: and that of men *caesaries*, from *caedendo*, because often cut: that of the back of the head, *juba*, and *crines*: that hanging behind the ears, *cincinni*; *q. d.* curled and buckled.

The antients held the *hair* a sort of excrement, fed only with excrementitious matters, and no proper part of a living body.

—They supposed it generated of the fuliginous parts of the blood, exhaled by the heat of the body to the surface, and there condensed in passing through the pores.—Their chief reasons were, that the *hair* being cut, will grow again apace, even in extreme old age, and when life is very low: that in hectic and consumptive people, where the rest of the body is continually emaciating and attenuating, the *hair* shall thrive very well: nay, and that it will grow even on dead carcases.—They add, that *hair* does not feed and grow like the other parts, by introfuction, i. e. by a juice circulating within it; but like the nails by juxtaposition, each part near the root thrusting forward that immediately before it.

But the moderns are agreed that every *hair* does properly and truly live, and receive nutriment to fill and dilate it like the other parts: This they argue hence, that the roots do not turn gray in aged persons sooner than the extremities, but the whole changes colour at once. And the like is observed in boys, &c. which shews that there is a direct communication; and that all the parts are affected alike.—We are told of instances of persons, who by intense grief, or fear, have grown gray in a night's time.

It may be observed, however, that, in propriety, the life and growth of *hairs* is of a different kind from that of the rest of the body; and is not immediately derived therefrom, or reciprocated therewith.—It is rather of the nature of vegetation. They grow as plants do out of the earth; or as some plants shoot from the parts of others; from which though they draw their nourishment, yet each has, as it were, its several life and a distinct oeconomy.—They derive their food from some juices in the body, but not from the nutritious juices of it; whence they may live, though the body be starved.

The *hairs*, examined by the microscope, appear to be fistulous bodies like horns. Their tubulous structure is also confirmed from the disease called *plica polonica*, wherein the blood oozes out at their extremities.

Each *hair* is found to consist of five or six other lesser ones, all wrapped up in one common tegument: they are knotted like some sorts of grass, and send out branches at the joints.—They have each a round bulbous root, which lies pretty deep in the skin, being implanted in the pyramidal papillae; and by this they imbibe, or secrete, their proper food from the adjacent humors. Their extremities split or divide into two or three branches, especially when kept dry, and left to grow too long; so that what to the naked eye appears only a single *hair*, to the microscope seems a brush.

They turn gray on the fore-part of the head, and particularly about the temples, sooner than behind; the back-part affording them the proper juice longer than the rest.—For the like reason they also fall soonest from the crown of the head.

Their size, or thickness, depends on the magnitude of the pores they issue from.—If those be small, these are fine: if the pores be straight, the *hairs* are straight: if those be oblique or sinuous, the *hair* is curled.

They ordinarily appear in general round, or cylindrical; but the microscope also discovers triangular, and square ones; which diversity of figures arises from that of the pores; to which the *hair's* always accommodate themselves. Their length depends on the quantity of the proper humor to feed them; and their colour on the quality of that humor: whence at different stages of life the colour usually differs.

The *hair* of a mouse, viewed by Mr. Derham with a microscope, seemed to be one single transparent tube, with a pith made up of fibrous substances, running in dark lines, in some *hairs* transversely, in others spirally. The darker medullary parts, or lines, he observes, were no other than small fibres convolved round, and lying closer together, than in the other parts of the *hair*. They run from the bottom to the top of the *hair*; and, he imagines, may serve to make a gentle evacuation of some humor out of the body. (See *Tab. Nat. Hist.* fig. 28.) Hence, the *hair* of hairy animals, this author suggests, may not only serve as a fence against cold, &c. but as an organ of insensible perspiration.

It was esteemed a notable honour among the antient Gauls, to have long *hair*; and hence came the appellation *Gallia comata*. For this reason Julius Cæsar, upon subduing the Gauls, made them cut off their *hair*, as a token of submission.—It was with a view to this, that such as afterwards quitted the world, to go and live in cloisters, procured their *hair* to be shaven off; to shew that they bid adieu to all earthly ornaments, and made a vow of perpetual subjection to their superiors.

Greg. de Tours assures us, that in the royal family of France,

it was a long time the peculiar mark and privilege of kings and princes of the blood, to wear long *hair*, artfully dressed and curled: every body else were obliged to be polled, or cut round, in sign of inferiority and obedience. Some writers assure us, that there were once different cuts of the *hair* for all the different qualities and conditions; from the prince, who wore it at full length, to the slave or villain, who was quite cropt. Hottoman treats at large of this privilege of the kings of France, *France Gallia*, c. 11.

To cut off the *hair* of a son of France, under the first race of kings, was to declare him excluded from the right of succeeding to the crown, and reduced to the condition of a subject. F. Daniel, *Hist. de France*, Tom. 1.

In the eighth century, it was the custom of people of quality, to have their childrens *hair* cut the first time, by persons they had a particular honour and esteem for; who, in virtue of this ceremony, were reputed a sort of spiritual parents, or godfathers to them. Though this practice appears to have been more ancient; inasmuch as we read that Constantine sent the pope the *hair* of his son Heraclius, as a token that he desired him to be his adoptive father.

The parade of long *hair* became still more and more obnoxious in the progress of Christianity; as something utterly inconsistent with the profession of persons who bore the cross. Hence numerous injunctions and canons to the contrary.—Pope Anicetus is commonly supposed to have been the first who forbade the clergy to wear long *hair*; but the prohibition is of an older standing in the churches of the east; and the letter wherein that decree is wrote, is of a much later date than that pope.—The clerical tonsure is related by Isidore Hispalensis, as of apostolical institution.

Long *hair* was antiently held so odious, that there is a canon still extant of the year 1096, importing, that such as wore long *hair*, should be excluded coming into church while living; and not be prayed for when dead.

We have a furious declamation of Luitprand against the emperor Phocas, for wearing long *hair*, after the manner of all the other emperors of the east, except Theophilus, who being bald, enjoined all his subjects to shave their heads.

The French historians and antiquaries, have been very exact in recording the heads of *hair* of their several kings.—Charlemain wore it very short, his son shorter; Charles the bald had none at all. Under Hugh Capet it began to appear again; this the ecclesiastics took in dudgeon, and excommunicated all who let their *hair* grow. Peter Lombard expostulated the matter so warmly with Charles the young, that he cut off his own *hair*; and his successors for some generations wore it very short.—A professor of Utrecht, in 1650, wrote expressly on the question, Whether it be lawful for men to wear long *hair*? and concluded for the negative.—Another divine, named Reeves, who had wrote for the affirmative, replied to him.

The Greeks, and after their example the Romans, wore false *hair*. See PERRUKE.

Wulfenrus, in the *Philosophical Collections*, gives an account of a woman buried at Norimberg, whose grave being opened forty three years after her death, there was *hair* found issuing forth plentifully through the clefts of the coffin; inasmuch that there was reason to imagine, the coffin had some time been covered all over with *hair*.—The cover being removed, the whole corps appeared in its perfect shape; but from the crown of the head to the sole of the foot, covered over with a thick-set *hair*, long and curled.—The sexton going to handle the upper part of the head with his fingers, the whole structure fell at once; leaving nothing in his hand but an handful of *hair*: There was neither skull nor any other bone left; yet the *hair* was solid, and strong enough.

Mr. Arnold, in the same collection, gives a relation of a man hanged for theft, who in a little time, while he yet hung upon the Gibbet, had his body strangely covered over with *hair*.

Dr. Tyfon adds, that though the outward surface of the body be the usual place where the *hair* grows; yet it has been sometimes found on the tongue, in the heart, the breasts, kidneys, &c. but that there is scarce any inward part more subject to it than the ovary, or testicles of females. Hooke, *Philosoph. Collect.* N^o 2.

HAIR makes a very considerable article in commerce; especially since the mode of perukes has obtained.

The *hair* of the growth of the northern countries, as England, &c. is valued much beyond that of the more southern ones, as Italy, Spain, the south parts of France, &c.

The merits of a good *hair* consist in its being well fed, and neither too coarse nor too slender; the bigness rendering it less susceptible of the artificial curl, and disposing it rather to frizzle; and the smallness making its curl of too short duration.—Its length should be about twenty-five inches; the more it falls short of this, the less value it bears.

There is no certain price for *hair*, but it is sold from five shillings to five pound an ounce, according to its quality.—The gray is the most coveted.

VOL. I.

The scarceness of gray and white *hair*, has put the dealers in that commodity upon methods of reducing other colours thereto.—This is done by spreading the *hair* to bleach on the grafs, like linen; after first washing it out in a lixivious water.

This lye, with the force of the sun and air, brings the *hair* to so perfect a whiteness, that the most experienced person may be deceived therein: there being scarce any way of detecting the artifice, but by building and drying it; which leaves the *hair* of the colour of a dead walnut-tree leaf.

There is also a method of dying *hair* with bismuth; which renders such white *hair* as borders too much upon the yellow, of a bright silver colour.—Boiling is the proof of this too; the bismuth not being able to stand it.

Hair which does not curl or buckle naturally, is brought to it by art; by first boiling and then baking it in the following manner: After having picked and sorted the *hair*, and disposed it in parcels, according to the lengths; they roll them up, and tie them tight down, upon little cylindrical instruments, either of wood or earthen ware, a quarter of an inch thick, and hollowed a little in the middle called pipes; in which state they are put in a pot over the fire, there to boil for about two hours.—When taken out, they let them dry; and when dried, they spread them on a sheet of brown paper, cover them with another, and thus send them to the pastry-cook; who making a crust or coffin around them of common paste, sets them in the oven, till the crust is about three fourths baked.

The end by which an *hair* grew to the head, is called the *head* of the *hair*; and the ether with which they begin to give the buckle, the *point*.—Formerly the peruke-makers made no difference between the two ends, but curled and wove them by either indifferently; but this made them unable to give a fine buckle: *hair* wove by the point never turning that it curl.—Foreigners own themselves obliged to the English for this discovery; which was first carried abroad by a peruke-maker of our country. Savar. *D. d. d. Comm.*

HAIR is also used in divers arts and manufactures.

The *hair* of beavers, hares, conies, &c. is the principal matter whereof hats are made.

Spread on the ground, and left to putrify on corn lands, *hair*, as all other animal substances, hares, hocks, blood, garbage, &c. proves a good manure.

Hair also makes an ingredient in the composition of plaister. See PLAISTER.

HAIR, in the manage and among farriers, is popularly called the *coat*, and makes a point of principal consideration in respect of horses, &c.

If the *hair* of a horse, especially that about the neck, and parts uncovered, be sleek and smooth, and close; it is an indication of his being in health and good case: if rough and staring, or any way discoloured, it denotes a coldness, poverty, or some inward defect.—To make the *hair* smooth, sleek, and soft, he must be kept warm, sweated often, and when sweated, the coat must be well scraped and rubbed down.

The *hair* growing on the fetlock, serves as a defence to the prominent part thereof, in travelling on stony ways, or in frosty weather.

If a place be bare, or thin of *hair*, or the *hair* be too short; the ancient farriers used to wash it with the urine of a young boy; and after that with a lye of unlaked lime, ceruse, and litharge.—The moderns have various other ways: some wash the parts with a decoction of the roots of althaea; others with goats milk, wherein agrimony has been pounded; others rub the part with nettle seed, bruised with honey water, and salt: others anoint it with the juice of an onion, or radish: others with a mixture of alum, honey, goats dung, and swines blood; others with the root of the white lilly, boiled in oil: others with tar, oil of olives, and honey: and others with green walnut shells powdered, and mixed with honey, oil, and wine.—To take off *hair* in any part, they apply a plaister made of unlaked lime, boiled in water, with orpiment added.

HAIRS breadth, this is accounted the forty-eighth part of an inch.

HALBARD*, or **HALBERT**, an offensive weapon, consisting of a shaft, or staff, five foot long; with a steel head, partly in form of a crescent.

* The word is formed of the German *hal*, hall, and *bard*, an hatchet. Vossius derives it from the German *heilbaert*, of *bel*, clarus, splendens, and *baert*, ax.

The *halbard* was anciently a common weapon in the army; where, there were companies of *halbardeers*: It is still carried by the serjeants of foot, and dragoons.

It was called the *Danish ax*, because first bore by the Danes; they carried it on the left shoulder. From the Danes it was derived to the Scots; and from the Scots to the English, and from them to the French.

THAERL, among farriers, &c. is a piece of iron an inch broad, and three or four inches long, soldered to the toe of an horse's shoe, that jets out before; to hinder a lame horse from resting or treading upon his toe.

Halbert-Shoes of necessity constrain a lame horse to tread or rest on his heel, when he goes a moderate pace; which lengthens and draws out the back sinews, that was somewhat shrunk before.

HALCYON-Days*, *Dies Alcyoni*, a phrase that frequently occurs among writers, to denote a time of peace, and tranquillity.

* The expression takes its rise from a sea fowl, called among naturalists *halcyon*, or *alcyon*, which is said to build its nest about the winter solstice, when the weather is usually observed to be still and calm.

Halcyon-days, according to the ancient tradition, are the seven days before, and as many after the brumal solstice: called also *S. Martin's summer*: these are famous for the calmness of the weather, which emboldens the *halcyon* to build, and brood its eggs on the rocks, on the very brink of the sea.

Columella also gives the denomination, *halcyon dies*, to a number of days commencing on the eighth of the calends of March; on account of the great stillness of the Atlantic ocean, then usually observed.

HALE, in the sea language, signifies *pull*; hence, to *bale* a ship, denotes to pull her on shore.

HALF-Bloom, a round mass of metal, which comes out of the finery of an iron-work. See **BLOOMERY**, and **IRON-work**.

HALF-Mark*, *Dimidia Merca*, is a noble.

* Fitzherbert says, that in case a writ be brought, and the feign of the demandant, or his ancestor, alleged; the feign is not traversable by the defendant, but he must tender the *half mark* for the enquiry of the feign: which is, in plainer terms, that the defendant shall not be admitted to deny, that the possessor, or his ancestor, was seized of the land in question, and to prove his denial; but that he shall be admitted to tender *half a mark* in money, to have an enquiry made, whether the demandant, &c. were seized or not?

HALF-MOON, *Demi-lune*, in fortification, an outwork, consisting of two faces, forming together a salient angle, whose gorge is turned like a *half-moon*.

Half-moons are sometimes raised before the curtain, when the ditch is wider than it ought to be; in which case it is much the same with a ravelin; only that the gorge of an *half-moon* is made bending in like a bow, or crescent, and is chiefly used to cover the point of the bastion; whereas ravelins are always strait before the curtain. But they are both defective, as being ill flanked. See **RAVELIN**.

HALF-PENNY, a copper coin, whose value is expressed by its name.

HALF-Seal, is that used in Chancery, for the sealing of commissions to delegates appointed upon any appeal in ecclesiastical or marine causes.

HALF-Tongue, *Medietas Lingua*. See **MEDIETAS Lingua**.

HALIËUTICS, *HALIËUTICA*, 'ΑΛΙËΤΙΚΑ, books treating of fishes, or the art of fishing.

We have still extant the *Haliëutics* of Oppian.

HALIGEMOTE. See the article **HALYMOTE**.

HALL, a word antiently used for a mansion-house, or habitation of a fine house, palace, or the like.

Vitruvius mentions three sorts of *halls*: The *tetraystyle*, which has four columns supporting the plafond, or ceiling: The *Corinthian*, which has columns all around, let into the wall, and is vaulted over: and the *Egyptian*, which had a peristyle of insulated Corinthian columns, bearing a second order with a ceiling. These were called *oeci*.

The *hall* is properly the first, and finest partition, or member of an apartment; and, in the houses of ministers of state, public magistrates, &c. is that wherein they dispatch business, and give audience.

In very magnificent buildings, where the *hall* is larger and loftier than ordinary, and placed in the middle of the house, it is called a *saloon*.

A royal apartment is said to consist of an *hall*, or chamber of guards, *aula prætoriana*; an anti-chamber, *procamera*; a chamber, *camera*; a cabinet, *conclave*; and a gallery, *porticus*.

HALL is also a public building erected for the administration of the policy and justice of a city, or corporation.

In this sense we say, the *town-hall*, a *company's hall*, &c. *Guild-hall*, is a stately building in the city of London, and the great court of judicature for that city. See **GUILD-hall**.

Here meetings of the citizens are held for the election of officers, solemn entertainments are given, &c.

HALL is also particularly used for a court of justice; or an edifice wherein there is one, or more tribunals.

In Westminster-hall, are held the great courts of this kingdom, viz. the King's-Bench, Chancery, Common-Pleas, and Exchequer.

Above stairs is likewise held the high court of Parliament. Westminster-hall, was the royal palace or place of residence of our ancient kings; who ordinarily held their parliaments, and courts of judicature, in their dwelling-houses, (as is still

done by the kings of Spain) and frequently sat in person in the courts of judicature, as they still do in parliament.

A great part of this palace was burnt under Henry VIII. what remains is still reserved for the said judicatories.—The great *hall*, wherein the courts of King's-Bench, &c. are kept, is said to have been built by William Rufus; others say by Richard I. or II. It is reckoned superior, in point of dimensions, to any *hall* in Europe, being 300 foot long, and 100 broad.

HALLAGE, a fee due for cloth brought for sale to Blackwell-hall, in London.

The word is also used for toll, paid to the lord of a fair, or market, for commodities sold in the common hall of the place.

HALLELUJAH*, a term of rejoicing, sometimes sung, or rehearsed, at the end of verses on such occasions.

* The word is Hebrew; or rather, it is two Hebrew words joined together: one of them הללו *hallichu*, and the other יהוה *Yehova*, an abridgment of the name of God, יהוה *Yehova*. The first signifies *laudate*, praise ye, and the other *Dominum*, the Lord.

St. Jerom first introduced the word *hallelujah* into the church service; for a considerable time it was only used once a year in the Latin church, viz. at Easter; but in the Greek church it was much more frequent. St. Jerom mentions its being sung at the interments of the dead, which it still continues to be in that church, as also on some occasions in the time of Lent.

In the time of Gregory the great, it was appointed to be sung all the year round in the Latin church, which raised some complaints against that pope, as giving too much into the Greek way, and introducing the ceremonies of the church of Constantinople into that of Rome.—But he excused himself, by alleging that this had been the ancient usage at Rome; and that it had been brought from Constantinople at the time when the word *hallelujah* was first introduced under pope Damasus.

HALLIARDS, or **HALYARDS**, in a ship, are ropes which serve for hoisting up the yards, all but the cross jack, and the sprit-fail yards, which are slung. See *Tab. Ship. fig. 1. n. 18, 24, 64*.

HALMÖTE*, or **HALIMÖTE** (from the Saxon *heale*, *hall*, and *zemo*, *meeting*), is the same with what we now call a *court baron*; the word implying a meeting of the tenants of the same *hall*, or manor.

* *Omnis causa terminatur, vel hundredo, vel comitatu, vel halimote, sœcum balietium, vel dominorum curia*. LL. Hen. I. c. 10.—*Halmote* and *halimote* are often confounded with *folk-mote* though originally they were distinct courts.—The *halmote* being properly the lord's court, or a court-baron held in the manor, in which differences between the tenants were determined. See **MANOR**, and **COURT**. The name is still retained at Luson, and other places in Herefordshire. See **MOTU**.

HALMÖTE, is sometimes also taken for a convention of citizens in their public hall, more properly called *folk-mote*. See **FOLK-MÖTE**.

HALO*, in phyfology, a meteor; in form of a luminous ring, or circle, of various colours, appearing round the bodies of the sun, moon, or stars.

* The word is formed of the Greek ἅλως, or ἄλως, *area*.

That around the moon is the most usual, and is also called *corona*, crown.

Naturalists conceive the *halo* to arise from a refraction of the rays of light in their passing through the fine, rare vesiculæ of a thin nubecula, or vapour, toward the top of our atmosphere; which account they confirm hence, that a quantity of water being thrown up against the sun, as it breaks and disperses into drops, it forms a kind of *halo*, or iris, exhibiting the colours of the natural Rainbow.

M. Huygens supposes *halo's*, or circles round the sun to be formed by small round grains of a kind of hail, made up of two different parts, one of which is opaque, and inclosed in the other, which is transparent: which is the general structure actually observed in hail.

After the same manner he accounts for the *parhelia*; only that there he imagines the icy grains of an oblong figure, and rounding at the ends, like cylinders with round convex tops.—Where some of these cylinders are in an erect position, the circle they form will be white, by reason of the reflection of the rays of the sun on the surface of these cylinders. He proceeds to account for the coloured *halo's*, and *parhelia*, from the same hypothesis; and produces an experiment of a glass cylinder, a foot long, having within it an opaque kernel, (which was a cylinder of wood) and the ambient space filled with water: this cylinder being exposed to the sun, and the eye disposed in a proper place, the several successive reflections and refractions necessary to produce such an effect did plainly appear.

The light which comes through drops of rain by two refractions, without any reflection, Sir Isaac Newton observes, ought to appear strongest at the distance of about 26 degrees from

from the sun, and to decay gradually both ways, as the distance from him increases and decreases: and the same is to be understood of light, transmitted through spherical hailstones.—Add, that if the hail be a little flattened, as is often the case, the light transmitted may grow so strong at a little less distance than that of 26 degrees, as to form a *halo* about the sun or moon; which *halo*, as often as the hailstones are duly figured, may be coloured; and then it must be made red within by the least refrangible rays, and blue without by the most refrangible ones; especially if the hailstones have opaque globules of snow in their centre, to intercept the light within the *halo*, as Huygens has observed, and make the inside thereof more distinctly defined than it would otherwise be.

Such hailstones, though spherical, by terminating the light by the snow, may make a *halo* red within, and colourless without, and darker in the red than without, as *halo's* use to be: For of those rays which pass close by the snow, the rubiform will be least refracted, and so will come to the eye in the directest lines. *Optics*.

HALSFANG. See the articles **HEALFANG**, and **PILLORY**.
HALT*, in war a pause, or stop, in the march of a military body.

* Some derive the word from the Latin *haultus*, breath; it being a frequent occasion of *halting*, to take breath: others from *alte*, by reason in *halt* they raise their pikes, &c. on end.

In places full of defiles, frequent *halts* must be made:—The army made a *halt* to rest themselves.

HALTERISTÆ, in antiquity, a sort of players at discus; so denominated from a peculiar kind of discus by the Greeks called *άλτρη*, and by the Latins *halter*.

Budeus, and others, take the *halter* to have been a leaden weight, or ball, which the vaulters bore in their hands, to secure and keep themselves the more steady in their leaping.—Nor will these Authors allow of any sort of *halter* besides this weight; nor other *halteristæ* but these vaulters.

Others, as Cornarius, Constantine, and Portus, will have the *halter* to be a lump, or mass of lead, or stone, with an hold, or handle, fixed to it, by which it might be carried; and that the *halteristæ* were those who exercised themselves in removing these weights from place to place.—These authors add, that the weight, or ball mentioned by Budeus, was not called *άλτρη*, *halter*, but *άλτρη*, *άλτρη*, which signifies helper, defender.

Hier. Mercurialis, in his treatise *De arte gymnastica*, L. II. c. 12. distinguishes two kinds of *halteristæ*; for though there was but one *halter*, there were two ways of applying it.—The one was to throw, or pitch it in a certain manner: the other only to hold it out at arm's end; and in this posture to give themselves divers motions, swinging the hands backwards and forwards, &c. according to the engraven figures thereof given us by Mercurialis.

The *halter* was of a cylindrical figure, smaller in the middle, (where it was held) by one diameter, than at the two ends. It was above a foot long; and there was one for each hand: it was made either of iron, stone, or lead.

Galen, *De tuend. valetud.* Lib. I. Lib. V. and Lib. VI. speaks of this exercise, and shews of what use it is in purging the body of peccant humours; making it equivalent both to purgation, and phlebotomy.

HALTING, among farriers, &c. an irregularity in the motion of an horse, arising from a lameness, or other injury in the shoulder, leg, or foot; which leads him to spare the part, or use it too timorously.

An acquaintance with this disorder, in its several circumstances, is a thing of great extent in the affairs of the manage; for which reason we shall add the principal points relating thereto.—If an horse *halts*, it is either *before*, in which case his complaint lies either in the shoulder, the legs, or feet; or *behind*, where it must lie in the hip, ham, or the like.

1°. The signs which indicate it in the *shoulder*, are his not lifting up his leg, but trailing it on the ground, or his casting one leg more than the other, and with his knee, in a manner, unbent.—Add, that in turning short he will visibly favour the leg on the lame side. Again, if the ailment be found in the shoulder, it must either be in the top of the shoulder-blade, called the *withers*, which is known by his *balting* most when a person is on his back, his shrinking much, and offering to bite when gripped, and handled about the top of the shoulder-blade, or in the bottom of the shoulder-blade, joining to the marrow-bone, which is the fore-pitch of the breast; which is known by his treading his steps thick, and shrinking, ready to fall down, when pressed in that part: or in the elbow, which joins the marrow-bone to the leg; which is known by wincing, and taking up his foot when pinched there. 2°. If the grievance be in the *legs*, it either lies in the knee, or pattern joint, which he discovers by refusing to bow the one or the other, and going stiffly on it: or in the *shank*, which is discovered by some piling, screw, wind-gall, or other visible malady thereon.

3°. If it be in the *foot*, it is either in the coronet, and owing to some strain, to be distinguished by some tumor, or

breaking thereon; or its appearing hot and burning to the touch: or in the *heel*, owing to an over-reach or the like, and visible to the eye, as also by his treading altogether on his toe: or in the *quarters*, between the middle of the hoof and the heel, which is known by his *balting* more when on the edge of a bank than when on plain ground.—This is sometimes occasioned by being pricked with a nail in the shoeing; and the faulty nail is distinguished by pinching the head of each nail, and the hoof together, with a pair of pinchers.

If an horse *halt behind*, from a disorder in the hip, or hucklebone, he will go side-long, and not follow to well with that leg as the others; nor will he turn on that side without favouring the leg; add, that he shows it still most in walking on the side of a bank with the worst leg highest.

If an horse has any hidden infirmity, that will bring him to *halt* when he comes to travel, it may be discovered by running him in the hand on smooth way, at the length of the halter, and observing how he sets down his legs; if he favour none of them, he is to be further proved, by riding him roundly till well heated; then letting him stand still an hour, and after that running him in the hand at halter's length, as before.

HALYMOTE, properly signifies an holy, or ecclesiastical court. See **HALMOTE**.

There is a court held in London by this name, before the lord mayor and sheriffs, for regulating the bakers.—It was antiently held on the Sunday next before St. Thomas's day, and for this reason called the *halmote*, or holy court.—The title thereof runs thus; *Curia sancti-matus tenens in Guilbalda civitatis London. coram major & minor. &c.*

HALYWERC FOLK, antiently signified such persons of the province of Durham, as held lands, on condition of defending the corps of St. Cuthbert; and who hereupon claimed the privilege, not to be forced to go out of the bishoprick either by king or bishop. *Hist. Dunelm.*

HAM, a Saxon word, properly signifying an house, or dwelling-place.

HAM is also used to denote a street or village.

Hence it is that the names of many of our towns end with it; as Nottingham, Buckingham, Walsingham, &c.

HAM is also a part of the leg of an animal; being the inner, or hind part of the knee; or the ply, or angle, in which the leg and thigh, when bent, incline to each other.

HAM, in commerce, &c. is used for a leg and thigh of pork, dried, seasoned, and prepared to make it keep, and to give it a brisk agreeable flavour.

Westphalia *hams*, so much in vogue, are prepared by salting them with salt-petre, pressing them in a press eight or ten days, then sleeping them in juniper water, and drying them by the smoke of juniper woods.

HAMADRYADES*, in antiquity, certain fabulous deities, revered among the antient heathens, and believed to preside over woods and forests, and to be inclosed under the bark of oaks.

* The word is compounded of *άμα*, *simul*, together; and *άδρυας*, *άδρυας*, of *δρυς*, oak.

The *hamadryades*, *άμαδρυαδες*, were supposed to live and die with the trees they were attached to; as is observed by Servius on Virgil, *Eclóg.* x. v. 62. after Menecmachus, the scholiast of Apollonius, &c. who mentions other traditions relating thereto.

The poets, however, frequently confound the *hamadryades* with the naiads and napeæ; witness Catullus, *Carm.* lxxiii. v. 23. Ovid, *Fest.* iv. 229. Propertius, *Eleg.* xx. 32. See **NAIADS**.

Festus calls them *querquetulane*, as being issued, or sprung from oaks.

An antient poet, one Pheenicus, in *Athenæus*, Lib. iii. calls the vine, fig-tree, and other fruit-trees, *hamadryades*; from the name of their mother the oak.

HAMAXOBII*. **HAMAXOBIANS**, in the antient geography, a people who had no houses, but lived in carriages.

* The word is formed from *άμαξα*, a carriage, or chariot, and *βίος*, life.

The *Hamaxobii*, called also *Hamaxobite*, were an antient people of Sarmatia Europæa, inhabiting the southern part of Muscovy: who instead of houses had a sort of tents made of leather, and fixed on carriages, to be ready for shifting and travel.

HAMBOROUGH Company. See the article **COMPANY**.

HAMELING, or *HAM-fringing*, the act of cutting the great tendon, vulgarly called the *ham-string*.

Hameling, or *hambling* of dogs, amounts to the same with expeditating, or lawing. See **EXPEDITATING**.

HAMLET*, a diminutive of *ham*, signifies a little village, or rather, a part of a village.

* Spelman, upon these words, shewing the difference between *villa integra*, and *villa dimissa* &c. Lamlet, says, *Hamleta vero, quæ medietatem habet, ut Hamletum, hoc est ubi quinque capitales plagi non deperitur.*—The statute of Exon, 14 Edw. I. mentions this word thus, *L. omnes de toutes les villes & hamlets qui sont en le royaume.*

In an antient MS. *Hamlet* is expounded, the seat of a freeholder.

HAMMER,

HAN

HAMMER, an instrument of iron, with a handle of wood; used in most mechanic arts, to beat, stretch, drive &c. Bodies capable of being stretched, or extended, under the hammer, are said to be malleable.

The Latins call it *malleus*, antiently *martulus*, or *marculus*; by which name Pliny calls it, when he says, that Cynira, son of Agriopa, invented the hammer and pinchers. *Hist. Nat. L. VII. c. 56. Vid. Hardouin, not. ad loc.*

The hammers of our great forges, are moved or worked by a water-mill. See **FORGE**.

HAMMER hardening. See the article **HARDENING**.

HAMMER of a clock. See **CLOCK**.

HAMMER, in anatomy. See the article **MALLEUS**.

HAMMERING, the act of beating, or extending, and fashioning a body under the hammer.

When it is performed on iron heated for the purpose, the smiths usually call it *forging*.

HAMMERING, in coining.—A piece of money, or a medal, is said to be *hammered*, when struck, and the impression given with a hammer, and not with a mill.

For the method of coining with the HAMMER. See **COINING**.

HAMMOCK, or **HAMAC**, a kind of hanging-bed; suspended between two trees, posts, hooks, or the like; much used throughout the West-Indies, as also on board of ships.

The Indians hang their hammocks to trees, and thus secure themselves from wild beasts and insects, which render lying on the ground there very dangerous.

The people of the Caribbee islands are wonderfully superstitious in the point of their hammocks; and do not make them without a deal of ceremonies.—At each end of the room they put bags of ashes, without which, it is their opinion, that the hammock will not last. If they were to eat figs on a hammock, they believe it would rot: nor dare they eat any fish that has good teeth, as believing that would make their hammock soon wear through.

According to F. Plumier, who has often made use of the hammock in the Indies, it consists of a large, strong coverlet, or sheet of coarse cotton, about six foot square: on two opposite sides are loops of the same stuff, through which a string is run, and thereof other loops are formed, all which are tied together with a cord; and thus is the whole fastened to two neighbouring trees, in the field; or two hooks, in houses. This kind of couch serves, at the same time, for bed, quilts, sheets, pillow, &c.

HAMPER. See the article **HANAPER**.

HAMUS, or **HAMULUS**, an hook. See the article **HOOK**. Surgeons also make use of an instrument thus called, to extract the child in difficult labours.

HANAPER, or **HAMPER**, an office in Chancery; answering in some measure to the *fiscus* among the Romans. See **CHANCERY**, and **FISCUS**.

Clerk of the HANAPER, sometimes styled *Warden of the Hanaper*, an officer who receives all money due to the king for seals of charters, patents, commissions, and writs; and attends the keeper of the seal daily in term time, and at all times of sealing; and takes into his custody all sealed charters, patents, and the like, which he receives into bags; but antiently, it is supposed, into *hampers*, which gave denomination to the office.

There is also an officer, who is comptroller of the hanaper. See **COMPTROLLER**.

HANCES, in a ship, are falls, or descents of the five rails, which are placed as banisters in the poop, &c. and down to the gang-way.

HANCES, or **HANSES**, in architecture, are the ends of elliptical arches, which are arcs of smaller circles than the scheme, or middle part of the arch.

HAND, *Manus*, a part, or member of the body of man; making the extremity of the arm.

The mechanism of the hand is very curious; excellently contrived to fit it for the various uses and occasions we have for it, and the great number of arts and manufactures it is to be employed in. It consists of a compages of nerves, and little bones, joined into each other, which give it a great degree of strength, and at the same time an unusual flexibility, to enable it to handle adjacent bodies, lay hold of them, and grasp them. In order either to draw them towards us, or thrust them off. Anaxagoras is represented by antient authors, as maintaining, that man owes all his wisdom, knowledge, and superiority over other animals, to the use of his hands.—Galen puts the thing another way: man, according to him, is not the wisest creature, because he has hands, but he had hands given him because he was the wisest creature. For it was not our hands that taught us arts, but our reason. The hands are the organs of reason, &c. *De usu part. Lib. I. c. 3.*

HAND, in medicine.—The hand, among anatomists, extends from the shoulder to the fingers ends; this is called also the greater hand.

It is divided into three parts:—The first reaching from the shoulder to the elbow; properly called the arm, *brachium*.

HAN

The second reaches from the elbow to the wrist:—The third is the hand, *manus*, properly so called; called also the lesser hand, or *extrema manus*.—This is subdivided into three other parts; the carpus, which is the wrist:—The metacarpus, which the body of the hand, including the dorsum, and vola: and the fingers, *digiti*. See each described under its proper article, **CARPUS**, **METACARPUS**, and **FINGERS**.

The muscles whereby the hand is moved and directed, are the *palmares*; the flexor and extensor, *carpi, ulnaris*, and *radialis*; *perforatus*; *perforans*; *lumbricales*; *interossei*; *extensori*, *abductor*, and *flexor* of the fingers. See each in its place, **PALMARIS**, **FLEXOR**, **EXTENSOR**, &c.

The hand makes the subject of the art of palmistry, which is employed in considering the several lines and eminencies of the palm of the hand, their significations, &c.

Among the Egyptians, the hand was used as a symbol of strength:—Among the Romans, it was held a symbol of fidelity; and accordingly was consecrated to that goddess, by Numa, with great solemnity.

They sometimes use an artificial hand, which is a kind of subsidiary hand, to be applied, and fitted on the stump of an arm, after the hand has been cut off.

This has most of the motions of the natural hand; which are effected by means of springs, pulleys, pinions, buttons, &c. Amb. Paré gives us its structure at large.

HAND, in falconry, is used for the foot of the hawk:—To have a clean, strong, slender, glutinous hand, well clawed, are some of the good qualities of a hawk, or falcon.

HAND, in the manege, is a term variously used.—Sometimes it stands for the fore feet of an horse.

Hand is also used, for a division of the horse into two parts, with respect to the rider's hand.—The fore-hand includes the head, neck, and fore-quarters.—The hind-hand is all the rest of the horse.

Spear-hand, or *sword-hand*, is used for an horseman's right hand.

Bridle-hand, is the horseman's left hand.

Your regular cavalier holds his bridle-hand two or three inches above the pommel of the saddle.

A horseman is said to have no hand, when he only makes use of the bridle unseasonably; not knowing how to give the aids or helps of the hand with discretion.

To keep a horse upon the hand, signifies to feel him in the stay upon the hand, and to be always prepared to avoid any surprize from him.—When the horse obeys and answers the effects of the hand, he is said to *rest well upon the hand*.

A horseman ought to have a light hand, i. e. he ought only to feel the horse upon his hand, so as to refist him whenever he attempts to slip from it: and as soon as he has made his resistance, he ought to lower the bridle, instead of cleaving to it.

If a horse, by a too great eagerness to go forward, presses too much upon the hand; it ought to be slackened at certain times, and at other times to be kept hard, in order to disengage him from continually pressing upon the bit. This facility, or liberty of the horseman, of slackening or stiffening the hand, makes what they call a good hand.

A horse is said to force the hand, when he does not fear the bridle, but runs away in spite of the rider.

To work a horse upon the hand, is to manage him by the effects of the bridle, without any other helps, except the calves of the legs.

To be heavy upon the hand, is understood of a horse, which by reason of the softness of his neck, the weakness of his back, the largeness of his head, and the weight of his fore quarters, or his weariness; throws himself upon the bridle, without making any resistance, or effort, to force the horseman's hand.

Harmonical HANDS, in music, is used by some writers for the antient diagrams, or scale of music, upon which they learned to sing.

The reason of the appellation was, that Guido Aretin, upon inventing the notes, *ut, re, mi, fa, sol, la*, divided them on the fingers of the figure of a hand stretched out. He placed the letters of the alphabet, used till that time to express the notes, for these fix syllables, which he took out of the first strophe of the hymn of S. John Baptist, composed by Paulus Diaconus.

*Ut queant laxis re-sonare fibris
Mi-ra gestorum fa-muli tuorum.
Sol-ve polluti la-bii reatum.*

Sancte Joannes.

HAND of Justice, is a scepter, or baton, a cubit long, having an ivory hand at the extremity thereof; used as an attribute of certain kings, wherewith they are painted in their royal robes; as on the coronation-day.

Authors usually call it *virga*.—Louis X. of France, first took the hand of justice for his device.

Imposition of HANDS, or *laying on of HANDS*, signifies the conferring

ferring of holy orders; a ceremony wherein the *bands* are laid on the head of another, as a sign of a mission, or of a power given him to exercise the functions of the ministry belonging to the order.

The apostles began to appoint missionaries by the imposition of *bands*.

Washing one's HANDS of a thing, signifies the witnessing that a person has no part or concern in an affair; and that he will not be answerable for it: This Pilate did in respect of our Saviour's death.—In this sense, a man is said to have *clean hands*; and particularly a judge does this, to denote that he has not been corrupted by bribes or presents.

Left HAND.—To marry with the *left hand*, is to espouse a woman of inferior degree, whose children, in virtue of such marriage, are not to succeed to the father, nor share with the other children; but are to be contented with what fortune the husband shall appoint them the next day after marriage.

This method of taking *left-handed wives* obtains at this time in Germany.

HAND, is also used for the index of a clock, watch, or the like, serving to point the hour, &c. See INDEX.

Long HAND, *Longimanus*, a kind of title, or surname, assumed by certain princes. Artaxerxes, the son of Xerxes, and his successor in the Persian empire, was thus denominated; as having *hands* so long, that he could touch his knees with them when he stood upright.

Short HAND. See the article TACHYGRAPHY.

Bloody HAND. See the article BLOODY HAND.

HAND is also figuratively used in painting, sculpture, &c. for the manner, or style, of this or that master.

HANDS, are born in coat armour, *dexter* and *sinister*; that is, right and left; expanded or open, and after other manners. Azure, a *dexter hand* couped at the wrist, and extended in pale argent; is born by the name of Brome.—Argent, three *sinister hands*, couped at the wrist, gules, by the name of Maynard.

Knights baronets, are to bear in a canton, or in an escutcheon, which they please, the arms of Ulster, viz. in a field argent, a *sinister hand* couped at the wrist, gules. See BARONET.

*HAND-borow**, a pledge, or surety of the lower rank.

* *Est quasi vas, aut fiduciaris manus, hoc est, minor, seu inferior; nam bead-borow, vas est capitalis, vel superior.* Spelman. See HEADBOROUGH.

HAND-breadth, is sometimes used for a measure of three inches.

HAND, or *HANDEFUL*, is also a measure of four inches, by the standard; according to the statute, 33 H. VIII. cap. 5.

The *hand*, among jockeys, is four fingers breadth, and is the measure of a fist clenched; by this the height of horses is measured.

A horse for war, should be sixteen, or eighteen *hands* high.

HAND-HABEND, in our ancient customs, denotes a thief taken in the very fact.

Hand, or *Hand-habend*, from the Saxon, *hand*, and *habend*, having; is a circumstance of manifest theft, when the party is taken with the mainor, or mainower, i. e. the thing stolen in his *hand*.

Bracton also uses *hand-berend* in the same sense. See *Latro manifestus*.

So in Fleta, *Furtum manifestum est ubi aliquis latro deprehensus seiscus de aliquo latrocinio hand-habund*, &c. back-berinde, &c. *infectus fuerit per aliquem cuius res illa fuerit, que dicitur Sachorh, & tunc licet infectori rem suam petere criminaliter ut furatam.* L. I. c. 38. § 1.

HAND-HABEND also signifies the right which the lord has to judge and determine of this offence in his court.

HANDLING, a term used in respect of fighting cocks; signifying the measuring the girth of them, by gripping one's hands and fingers round the cock's body.

HANGINGS, linings for rooms, made of arras, tapestry, or the like.

*HANGWITE**, *HANGWITA*, a mulct imposed for the hanging a thief, or felon, without course of law; or even for suffering him to escape out of legal custody.

* The word is also written corruptly, *hangwith*, or *hankwite*, it is formed from the Saxon *haegan*, to hang, and *we*, mulct, compensation.

To be quit of *HANGWITE*, *Quietus esse de hangwita*, in royal charters, denotes an immunity, or freedom from the mulct or penalty above-mentioned. *Quit de Larron pendu sans serjeants le roy.*

*HANSE**, or *HANS*, an ancient name, for a society or company of merchants: particularly that of certain cities in Germany, &c. hence called *hanse towns*.

* The word *hanse*, is obsolete High Dutch, or Teutonic, and signifies alliance, confederacy, association, &c. Some derive it from the two German words, *am-see*, that is, on the sea;

by reason the first *hanse towns* were all situate on the sea coast; whence, the society is said to have been first called, *am-see-steden*, that is, cities on the sea; and afterwards by abbreviation, *hanse*, and *hans*.

The *HANSE Towns* are certain free towns of Germany, and the North, united in strict league, under laws and magistrates of their own appointing, for the better carrying on of commerce, and for their mutual safety and assistance.

This celebrated association, which makes so great a figure in the history of commerce, is commonly supposed to have commenced at Bremen on the Weser, in the year 1164; others say in 1260, immediately after the incursions and pyracies of the Danes, Normans, &c. others say in 1206; and others in 920: but be its origin when it will, it was confirmed and re-established in 1270.

At first it only consisted of towns situate on the coasts of the Baltic sea, or not far from it.—But its strength and reputation increasing, scarce any trading city in Europe but desired to be admitted into it.

Under our king Henry III. the *hanse* consisted of no less than sixty two cities; to which were afterwards added four more.

France furnished to the confederacy, Rouen, S. Malo, Bourdeaux, Bayonne, and Marseilles: Spain, Barcelona, Sevil, and Cadiz: England, London: Portugal, Lisbon:—The Low Countries, Antwerp, Dort, Amsterdam, Bruges, Rotterdam, Ostend, and Dunkirk: and Italy, and Sicily, Messina, Leghorn, and Naples.

The *hanse* was divided into four classes, or members, which were those of Lubec, Cologne, Brunswick, and Prussia, or Dantzick.—Those four cities were the heads of the four members; and Lubec was the head of the whole *hanse*.

Besides this, the *hanse* had four principal factories, or staples, these were at London, Bruges, Novogrod, and Berg; that of Bruges was afterwards removed to Antwerp. But the first and principal was that of Lubec, which still remains the head of the association. That of London was called *Guild-halla Teutonicorum*, or the *Styliard*.

The government of the *hanse* was at first aristocratical: then it came under the sole direction of the grand master of the Teutonic order; and, at length, divers princes and lords made interest for it.

The end of the fourteenth century, and the beginning of the fifteenth, were the most flourishing times of this alliance.—

These towns were then in a condition to proclaim war against kings: History is not silent, as to that they waged against Waldemar king of Denmark, about the year 1348; and against Eric, in 1428; particularly this last, when the *hanseatic* fleet consisted of forty ships, containing about 12,000 regular troops, beside the seamen.

But the several princes, whose principal cities were entered into the association, began to think it policy to put some bounds to a power, which, in time, might have proved formidable to themselves.—The means were easy, and short: each withdrew the merchants of his country from the association; by which, in a little time, from the great number of cities it had comprehended, the association found itself sunk to those few which had begun the confederacy; which henceforth was called the *Teutonic hanse*. Though these are still so considerable in point of commerce, that they are admitted to make treaties with the greatest kings.

The divisions that were got among them, contributed greatly to their fall: nor must it be forgot, that the establishment of the republic and commerce of Holland has its share therein.

The four cities which formed the league, were Lubec, Cologne, Brunswick, and Dantzick, which were called *mother-towns*; as those afterwards added thereto, were called *daughters* thereof.

A great number of towns in Germany, still retain the title of *hanse towns*; but this is rather an empty title which they affect, than any argument of their continuing to trade under the laws and protection of the antient alliance; there being scarce any but Lubec, Hamburg, Bremen, Rostock, Brunswick, and Cologne, that are truly *hanseatic*, and that have deputies at the assemblies held on the common occasions thereof.

The great trade the Dutch maintain with the *hanse towns*, contributes not a little towards maintaining some part of them in their antient reputation; and it is principally to their alliance with that flourishing republic, that they owe the preservation of their liberties: the succours some of them have received from the Dutch, having saved them more than once from the enterprizes of the neighbouring princes.

HANSEATIC, something belonging to the alliance, or company of the *hanse*.

Thus we say, the *hanseatic* body; the *hanseatic* towns, &c. See *HANSE*.

*HANS GRAVE**, the title of an officer in Germany.—The *hansegrave* is the chief of a company, or society.

* The word is a compound of the German *hanse*, and *gras*, count. See *GRAVE*.

HAP, or **HAPP**, in law, signifies, to catch, or snatch a thing. Thus we meet with, to *hap* the possession of a deed poll, *Littleton*, fol. 8. also, to *hap* the rent. If partition be made between two parcellers, and more land be allowed the one than the other; the that hath most of the land, charges it to the other, and *happeth* the rent whereon assize is brought.

HAQUENY, **HACKNEY**, an old French word for an ambulating horse.

HAQUEBUT, a kind of fire-arm, otherwise called an *hagbut*, or *barquebut*. See **HARQUEBUSS**.

HARANGUE *, a modern French name for a speech, or oration, i. e. a discourse made by an orator in public.

* *Menage* derives the word from the Italian *aranga*, which signifies the fame; formed, according to Ferrari, from *arangi*: a just, or place of justing. Others derive it from the Latin *ara*, altar; by reason the first *harangues* were made before altars: whence the verse of Juvenal, *Aut Lugdunensis rhetor didurus ad aram*.

The word is also frequently used in an ill sense, viz. for a too pompous, prolix, or unbecomable speech or declamation.—In Homer the heroes generally *harangue* e're they come to fight; as, in England, criminals *harangue* on the scaffold before they die. *S. Evrem.*

HARBINGER, an officer of the king's household, having four yeomen under him, who ride a day's journey before the court when it travels, to provide lodgings, &c.

HARBOUR, a sea-port; or a station where ships may ride safe at anchor.

The word is chiefly applied to those closed, or secured with a boom, or chain; and that are furnished with a mole, &c.

To **HARBOUR**, popularly signifies to lodge, receive, or entertain; or to find a retiring place.

Among hunters, a hart is said to *harbour*, when he goes to rest; whence, to *unharbour* a deer, is to dislodge him.

HARDENING, the act of communicating a greater degree of hardness to a body than it had before.

The hardening and tempering of iron and steel, makes a considerable article in the mechanical arts.

There are divers ways of effecting it: as by the hammer; quenching it, when hot, in cold water; case hardening, &c. To *harden* and temper English, Flemish, and Swedish steel, they give it a pretty high heat, then suddenly quench it in water, to make it very *hard*: Spanish and Venice steel only need a blood-red heat, and then to be quenched.

The workmen sometimes also grind indigo, and fallad oil together, and rub the mixture upon it with a woollen rag, while it is heating, and let it cool of itself.

If the steel be too *hard* or brittle for an edge, spring, or pointed instrument, it may be let down, or made softer, thus: Take a piece of grindstone, or whetstone, and rub hard on the work, to take the black scurf off it, and brighten it; then let it heat in the fire, and, as it grows hotter, the colour will change by degrees, coming first to a light goldish colour, then to a darker goldish colour, and at last to a blue colour: chuse it at which of these colours the work requires, and quench it suddenly in the water.

Hammer HARDENING, is mostly used on iron and steel plates, for saws, springs, rules, &c.

Case HARDENING is thus performed:—Take cow-horn, or hoof, dry it well in an oven, and beat it to powder; put as much bay-salt as of this powder into stale urine, or white-wine vinegar, and mix them well together; cover the iron, or steel, all over with this mixture, and wrap it up in loam, or plate iron, so as the mixture touch every part of the work; then put it in the fire, and blow the coals to it, till the whole lump have a blood-red heat, but no higher; lastly, take it out and quench it.

HARDNESS, *Durities*, in philosophy, that quality in bodies, whereby their parts cohere firmly together, so as to resist the touch.

In this sense, *hardness* coincides with what on other occasions we call *firminess*, and sometimes *solidity*: in opposition to *fluidity*.

More strictly speaking, a body is said to be *hard*, when its parts mutually cohere, so as not to yield inwards, or give way to an external impulse; and therefore are not subject to any motion in respect of each other, without breaking the body.—In which sense *hardness* stands opposed to *softness*, where the parts do readily give way.

The Peripatetics make *hardness* a secondary quality; as supposing it to arise from *dryness*, which is a primary one, and to be in proportion thereto.

Its remote causes, according to them, are either heat or cold, according to the diversity of the subject: heat producing *dryness*, and by that means *hardness* in clay; and cold doing the like in wax.

The epicurean and corpuscular philosophers, account for *hardness*, from the figure of the component parts, and their union together.—Accordingly, some ascribe it to the atoms, or particles of the body being hooked, and thus mutually catching and hanging upon one another: but this is directly bring-

ing that for an answer, which was the question. For how do those hooked parts cohere?

Again: the Cartesians will have the cohesion of hard bodies effected by rest; that is, by nothing at all.

Sir Isaac Newton shews, that the primary particles of all bodies, whether solid or fluid, are *hard*, perfectly *hard*; and not capable of being broke or divided by any power in nature.

These particles he maintains to be connected together by an attractive power; and according to the circumstances of this attraction, is the body either *hard*, or soft, or even fluid.

If the particles be so disposed or fitted for each other, as to touch in large surfaces, such body will be *hard*; and the more so, as those surfaces are the larger. If, on the contrary, they only touch in small surfaces, the body, by the weakness of the attraction, will remain soft.

HARDS, or **HURDS**, of flax, or hemp, denote the coarser parts, separated in the dressing of it, from the *tear*, or fine stuff. See **HEMP**.

HARE-HUNTING. See the article *Hare-Hunting*.

HARIOT *, or **HEROIT**, a due, or service, belonging to the lord at the death of his tenant; consisting of the best beast the tenant had at the time of his decease.

* Coke on Little on observes, that *harist* in Saxon is called *bepegear*, q. d. the lord's left; hence, signifying *lord*, and *gear*, *craft*; which others reject, using that *hepe*, in Saxon signifies an *army*, and *gear*, a *march*, or *expedition*: and that the Saxon *bepegear*, whence we derive our *harist*, signified *provision* for war, or a tribute, or relief, given to the lord of a manor, for his better preparation towards war.

—*Erat enim heriotum militaris suppellectilis profectus, quem obrute missallo, domnus reportavit in finitibus suarum terrarum*, says Spelman. By the laws of Canutus, Tit. de *Heriotis*, it appears, that at the death of the great men of this nation, so many horses and arms were to be paid, as they were in their respective life obliged to keep for the king's service.

But *harist* is now wholly taken for a beast, which the lord by custom chuses out of all the store of his deceased tenant, be it horse, ox, &c. and in some manors, the best piece of plate, jewel, or even the best moveable.

Harist is of two sorts; viz.—**HARIOT Custom**, where *harists* have been paid time out of mind by custom, after the death of a tenant for life.

HARIOT Service, when a tenant holds by such service to pay *harist* at the time of his death; which service is expressed in the deed of feoffment.

For this latter the lord shall distrain; and for the other he shall seize, and not distrain.

If the lord purchase part of the tenancy, *harist service* is extinguished; but it is not so of *harist custom*.

HARLEQUIN, in the Italian comedy, a buffoon, quaintly dressed; answering much the same purpose as a merry-andrew, or jack pudding in our drolls, on mountebanks stages, &c. We have also introduced the *harlequin* upon our theatres; and this is one of the standing characters in the modern grotesque entertainments.

The term took its rise from a famous Italian comedian, who came to Paris under Henry III. and who frequenting the house of M. de Harlay, his companions used to call him *Harlequina*, q. d. little *Harley*; a name which has descended to all those of the same rank, and profession.

HARLOT *, a woman given to incontinency; or that makes a habit or a trade of prostituting her body. See **COURTEZAN**.

* The word is supposed to be used for the diminutive *harlot*, a little whore.—Others derive it from *Arlet*, a name given to Robert duke of Normandy, and mother to William the conqueror: Camden derives it from one *Arlet*, a comrade to William the conqueror.—Others from the Italian *Arletta*, a proud whore.

HARMONIA, in music, &c. See the article **HARMONY**.

HARMONIA, *APOMONIA*, in anatomy, a sort of juncture, or articulation of the bones.

Harmonia is a species of the symphyisis, or juncture intended for absolute rest.

Two bones are said to be joined *per harmoniam*, by *harmonia*, when the juncture is in one uniform, right, or circular line; or when the bones meet with even margins: in contradistinction from *sutura*, where they are indented.

The bones of the upper jaw, and most of the epiphyyses, are joined *per harmoniam*.

HARMONICA, **HARMONICS**, a branch, or division of the antient music.

The *harmonica* is that part which considers the differences, and proportions of sounds, with respect to acute and grave: in contradistinction from *rhythmica*, and *metrica*. See **RHYTHMICA**, and **METRICA**.

The only part of their music the antients have left us any tolerable account of, is the *harmonica*; which itself is but very general and theoretical.

Mr. Malcolm has made a very indutrious and learned inquiry into the *harmonica*, or harmonic principles of the antients. — They reduced their doctrine into seven parts, *viz.* of *sounds*; of *intervals*; of *systems*; of the *genera*; of the *tones*, or *modes*; of *mutations*; and of the *melopœia*. See each considered under its proper article.

HARMONICAL Arithmetic, is so much of the theory and doctrine of numbers, as relates to making the comparisons, reductions, &c. of musical intervals, which are expressed by numbers, in order to our finding their mutual relations, compositions and resolutions.

HARMONICAL Composition, in its general sense, includes the composition both of harmony and melody, *i. e.* of music, or songs, both in a single part, and in several parts.

In its more proper and limited sense, *harmonic composition* is restrained to that of harmony. — In which sense it may be defined the art of disposing and concerting several single parts together, in such manner as to make one agreeable whole.

The art of harmony has been long known under the name of *counterpoint*. See **COUNTERPOINT**.

At the time when parts were first introduced, music being then very simple, there were no different notes of time; and the parts were in every note made concord.

This they afterwards called *simple*, or *plain counterpoint*, to distinguish it from another kind, then introduced, wherein notes of different value were introduced, and discords brought in between the parts.

This they called *figurative counterpoint*. See **FIGURATIVE Counterpoint**.

HARMONICAL Interval, is an interval, or difference of two sounds which are agreeable to the ear, whether in consonance or succession. See **INTERVAL**.

Harmonic Intervals, therefore, are the same with *concord*.

They are thus called, as being the only essential ingredients of harmony.

HARMONICAL Proportion, is a sort of proportion between three quantities, wherein the difference of the first and second, is to the difference of the second and third, as the first is to the third.

Thus, 2 : 3 : 6 are *harmonic*; because 2 : 6 :: 3 : 6 are geometrical.

So four numbers are *harmonic*, when the first is to the fourth, as the difference of the first and second, to the difference of the third and fourth.

Thus, 24 : 16 : 12 : 9 are *harmonic*; because 24 : 2 :: 8 : 3 are geometrical.

For the laws and rules of *harmonic proportion*, see *Harmonic Proportion*.

HARMONICAL Series, is a series of many numbers in continual *harmonic* proportion.

If there be four or more numbers, whereof every three immediate terms are *harmonic*; the whole makes an *harmonic series*, of continual *harmonic* proportionals; as, 30 : 20 : 15 : 12 : 10.

Or if every four immediately next each other are *harmonic*, it is also a continual *harmonic series*; but of another species; as, 3, 4, 6, 9, 18, 36, &c.

HARMONICAL Sound, is an appellation given by M. Sauveur to such sounds as always make a certain determinate number of vibrations, in the time that some other fundamental sound, to which they are referred, makes one vibration.

Harmonic sounds are produced by the parts of chords, &c. which vibrate a certain number of times while the whole chord vibrates once.

By this they are distinguished from the third, fifth, &c. where the relations of the vibrations are four to five, or five to six, or two to three.

The relations of sounds, had only been considered in the series of numbers, 1 : 2, 2 : 3, 3 : 4, 4 : 5, &c. which produced the intervals called *octave*, *fifth*, *fourth*, *third*, &c. M. Sauveur first considered them in the natural series, 1, 2, 3, 4, &c. and examined the relations of the sounds arising therefrom. — The result is, that the first interval, 1 : 2, is an octave; the second, 1 : 3, a twelfth; the third, 1 : 4, a fifteenth, or double octave; the fourth, 1 : 5, a seventeenth; the fifth, 1 : 6, a nineteenth, &c.

This new consideration of the relations of sounds, is more natural than the old one; it does express and represent the whole of music, and is in effect all the music that nature gives without the assistance of art. — The string of an harpichord, or a bell, besides their general sound, which is proportionate to their length, tension, &c. do also at the same time yield other subordinate and acuter sounds, which a nice ear, with a good attention, clearly distinguishes.

These subordinate sounds arise from the particular vibrations of some of the parts of the string, or bell, which are, as it were, detached from the rest, and make separate vibrations: in effect, every half, every third, every fourth, &c. of the chord, performs its vibrations apart, while a general vibration

is made of the whole chord. — Now all these subordinate sounds are *harmonic* with regard to the whole sound: the least acute which we hear is octave with the whole sound: the least acute that follows, makes a twelfth with the whole sound; the next a seventeenth, &c. till they grow too acute for the ear to perceive them. Now throughout the whole, we hear no such thing as a sound that makes a fifth, or a third, &c. with regard to the whole sound; none, in short, but what are comprized in the series of *harmonic* sounds.

Add, that if the breath, or bellows that blow a wind instrument, be played stronger and stronger, the tone will be continually raised, but this only in the ratio of the *harmonic sounds*. — So that it appears that nature; when she makes as it were a system of music herself, uses no other but this kind of sounds; and yet they had till of late remained unknown to the musicians: not but that they frequently fell into them, but it was only inadvertently, and without knowing what they did. — M. Sauveur shews, that the structure of the organ depends entirely on this so long unknown principle.

HARMONY*, *APOMONIA*, in music, the agreeable result of an union of several musical sounds, heard at one and the same time; or, the mixture of divers sounds, which together have an effect agreeable to the ear.

* The word is Greek *ἀμονία*, formed of the verb *ἀμωζω*, *convenire*, *congruere*, to agree, quadrate, march, &c.

As a continued Succession of musical sounds produces melody, so does a continued combination of them produce *harmony*.

Among the antients, however, as sometimes also among the moderns, *harmony* is used in the strict sense, of *consonance*; and so is equivalent to the *symphony*.

The words *concord*, and *harmony*, do really signify the same thing; though custom has made a little difference between them. Concord is the agreeable effect of two sounds in consonance; and *harmony* the effect of any greater number of agreeable sounds in consonance.

Again, *harmony* always implies consonance; but concord is also applied to sounds in succession; though never but where the terms can stand agreeably in consonance. — The effect of an agreeable succession of several sounds, is called *melody*; as that of an agreeable consonance, is called *harmony*.

The antients seem to have been entirely unacquainted with *harmony*; the soul of the modern music. — In all their explanations of the *melopœia*, they say not one word of the concert, or *harmony* of parts. We have instances, indeed, of their joining several voices, or instruments, in consonance; but then those voices, &c. were not so joined, as that each had a distinct and proper melody, so making a succession of various concords; but they were either unisons, or octaves, in every note; and so all performed the same individual melody, and constituted one song.

When the parts differ, not in the tension of the whole, but in the different relations of the successive notes; it is this that constitutes the modern art of *harmony*.

Harmony is well defined the sum or result of the combination of two or more concords, *i. e.* of three or more simple sounds striking the ear all together; and different compositions of concords make different *harmony*.

To understand the nature, and determine the number, and preference of *harmonies*; it is to be considered, that in every compound sound, where there are no more than three simple ones, there are three kinds of relations, *viz.* the primary relation of every simple sound to the fundamental, or gravest, whereby they make different degrees of concord with it: the mutual relations of the acute sounds each with other, whereby they mix either concord or discord into the compound: and the secondary relation of the whole, whereby all the terms unite their vibrations, or coincide more or less frequently.

Suppose, *e. g.* four sounds, A, B, C and D; whereof A is the gravest; B next; then C; and D the acutest. — Here, A is the fundamental; and the relations of B, C, and D, to A, are primary relations: So, if B be a third *g* above A, that primary relation is 4 to 5; and if C be fifth to A, that primary relation is 2 to 3; and if D be octave to A, that is 1 to 2. For the mutual relations of the acute terms B, C, D, they are had by taking their primary relations to the fundamental, and subtracting each lesser from each greater: thus, B to C is 5 to 6, a third *l*; B to D is 5 to 8, a sixth *l*, &c. — Lastly, to find the secondary relation of the whole, seek the least common dividend to all the lesser terms or numbers of the primary relations, *i. e.* the least number that will be divided by each of them exactly: this is the thing sought; and shews that all the simple sounds coincide, after so many vibrations of the fundamental as the number expresses.

So in the preceding example, the lesser terms of the three primary relations are 4, 2, 1, whose least common dividend is 4. Consequently, at every fourth vibration of the fundamental, the whole will coincide.

H A R

Now *harmony*, we have observed, is a compound sound, consisting of three or more simple sounds.— Its proper ingredients are concords; and all discords, at least in the primary and mutual relations, are absolutely forbidden.—It is true, discords are used in music; but not for themselves simply, but to set off the concords by their contrast and opposition. Hence any number of concords being proposed to stand in primary relation with a common fundamental; we discover whether or no they constitute a perfect *harmony*, by finding their mutual relations.—Thus, suppose the following concords, or primary relations, *viz.* the greater third, fifth, and octave given; their mutual relations are all concord, and therefore may stand in *harmony*. For the greater third and fifth are to one another, as 5 : 6, a lesser third. The greater third and octave, are as 5 : 8, a lesser sixth. And the fifth, and octave, are as 3 : 4, a lesser fourth. But if fourth, fifth and octave be proposed, it is evident they cannot stand in *harmony*; by reason, betwixt the fourth and fifth there is a discord, *viz.* the ratio 8 : 9. Again, supposing any number of sounds which are concord each to the next, from the lowest to the highest; to know if they can stand in *harmony*, we must find the primary, and all the mutual relations, which must be all concord. So let any number of sounds be as 4 : 5 : 6 : 8; they may stand in *harmony*, by reason each to each is concord; but the following ones cannot, *viz.* 4, 6, 9, because 4 : 9 is discord.

The necessary conditions of all *harmony*, then, are concords in the primary and mutual relations ; on which footing, a table is easily formed of all the possible varieties. But to determine the preference of *harmonies*, the secondary relations are likewise to be considered. — The perfection of *harmonies* depends on all the three relations : it is not the best primary relations that make best *harmony* ; for then a fourth and fifth must be better than a fourth and sixth : whereas the first two cannot stand together, because of the discord in the mutual relation. Nor does the best secondary relation carry it ; for then would a fourth and fifth, whose secondary relation with a common fundamental is 6, be better than a lesser third and fifth, whose secondary relation is 10 : but here also the preference is due to the better mutual relation. — Indeed, the mutual relations depend on the primary ; though not so as that the best primary shall always produce the best mutual relation ; however, the primary relations are of the most importance ; and together with the secondary, they afford us the following rule for determining the preference of *harmonies*.

life. Comparing two harmonies, which have an equal number of terms; that which has the best primary and secondary relations, is sure to be most perfect.—But in cases where the advantage is in the primary relation of the one, and the secondary of the other, we have no certain rule: The primary are certainly the most considerable; but how the advantage in this ought to be proportioned to the disadvantage in the other, or *vice versa*, we know not. So that a well turned ear must be the last resort in these cases.

Harmony is divided into *simple* and *compound*.

Simple HARMONY, is that where there is no concord to the fundamental above an octave.

The ingredients of *simple harmony*, are the seven simple original concords, of which there can be but eighteen different combinations, that are *harmony*; which we give in the following table from Mr. Malcolm.

Table of simple HARMONIES.

2dary rel.		2dary rel.	
fifth octave	2 third <i>g</i> fifth	4 third <i>g</i> fifth octave	
fourth octave	3 third <i>l</i> fifth	10 third <i>l</i> fifth octave	
sixth <i>g</i> octave	3 fourth, sixth <i>g</i>	3 fourth, sixth <i>g</i> octave	
third <i>g</i> octave	4 third <i>g</i> sixth <i>g</i>	12 third <i>g</i> sixth <i>g</i> octave	
third <i>l</i> octave	5 third <i>l</i> sixth <i>l</i>	5 third <i>l</i> sixth <i>l</i> octave	
sixth <i>l</i> octave	5 fourth, sixth <i>l</i>	15 fourth, sixth <i>l</i> octave	

These are all the possible combinations of the concords that make *harmony*: for the octave is compounded of a fifth and fourth, or a fifth and third, which have a variety of greater and lesser; out of these are the first six *harmonies* composed: then, the fifth being composed of the greater third and lesser third, and the sixth of fourth and third; from these proceed the next six of the table: then an octave joined to each of these six, make the last six.

The perfection of the first twelve is according to the order of the table: of the first six each has an octave; and their preference is according to the perfection of the other lesser concord joined to the octave.—For the next six, the preference is given to the two combinations with the fifth, whereof that which has third g is best; then to these two combinations with the sixth g , of which that which has the fourth is best. —For the last six, they are not placed last as being the least perfect, but because they are the most complex, and are the mixtures of the other twelve with each other. In point of perfection they are plainly preferable to the preceding six, as

H A R

having the very same ingredients, and an octave more.

Compound HARMONY, is that which to the simple *harmony* of one octave, adds that of another octave.

For the *compound harmonies*, their variety is easily found out of the combinations of the simple *harmonies* of several octaves.

HARMONY, again, may be divided into that of *concord*s, and that of *discord*s.

The *first* is that we have hitherto considered, and wherein nothing but concords are admitted.

The *second* is that wherein discords are used, intermixed with the concords.

Composition of HARMONY. See HARMONICAL *Composition*.

HARMONY is sometimes also used in a laxer sense, to denote an agreement, suitableness, union, conformity, &c.

In music, we sometimes apply it to a single voice when sonorous, clear, and soft; or to a single instrument, when it yields a very agreeable sound.—Thus, we say, the *harmony* of her voice, of his lute, &c.

In matters of learning, we use *harmony* for a certain agreement between the several parts of the discourse, which renders the reading thereof agreeable.—In this sense we say, *harmonious periods*, &c.

In architecture, *harmony* denotes an agreeable relation between the parts of a building. See SYMMETRY.

In painting, they speak of an *harmony*, both in the ordonnance and composition, and in the colours of a picture.—In the ordonnance, it signifies the union or connection between the figures, with respect to the subject of the piece.

In the colouring, it denotes the union, or agreeable mixture of different colours. See COLOURING.

M. de la Chambre derives the *harmony* of colours from the same proportions as the *harmony* of sounds.—Thus he infits on at large, in his treatise *Of the colours of the Rainbow*. On this principle, he lays down green as the most agreeable of colours, corresponding to the octave in music; red, to a fifth; yellow, to a fourth, &c.

HARMONY, or *Evangelical HARMONY*, is also a title of divers books, composed to shew the uniformity and agreement of the accounts given by the four evangelists.

The first attempt of this kind is attributed to Tatian, or Theophilus of Antioch, in the second century.—After his example, divers other *harmonies* have been composed, by Ammonius of Alexandria, Eusebius of Cæsarea, Janfenius bishop of Ghant, Mr. Toynard, Mr. Whitton, &c.

HARMONY of the Spheres or Celestial HARMONY, is a sort of music much spoke of by many of the philosophers and fathers; supposed to be produced by the regular, sweetly tuned motions of the stars and planets.

Plato, Philo Judeus, S. Augustine, S. Ambrose, S. Isidore, Boethius, and many others, are strongly posited with the opinion of this *harmony*, which they attribute to the various proportionate impressions of the heavenly globes upon one another; which acting under proper intervals, form an *harmony*.—It is impossible, according to them, that such spacious bodies, moving with so much rapidity, should be silent; on the contrary, the atmosphere, continually impelled by them, must yield a set of sounds, proportionate to the impulsions it receives: consequently, as they do not all run the same circuit, nor with one and the same velocity, the different tones arising from the diversity of motions, directed by the hand of the Almighty, must form an admirable symphony, or concert. S. Irenæus, S. Basil and St. Epiphanius, &c. have appeared against the notion.

Pre-established HARMONY, a celebrated system of M. Leibnitz, by means whereof he accounts for the union, or communication between the soul and body.

The Philosophers had universally held, that the soul and body act really and physically on each other.—Des Cartes first appeared and shewed that the heterogeneity of their nature did not allow of such real union; and that they could only have an apparent one, whereof God is the mediator.

M. Leibnitz, unsatisfied with either of these hypotheses, establishes a third.—A soul or spirit he observes, is to have a certain series of thoughts, desires, and wills: A body, which is only a machine, is to have a certain series of motions, to be determined by the combination of its mechanical disposition, with the impressions of external objects.

If, now, there be found a soul and a body so framed, that the whole series of wills of the soul, and the whole series of motions of the body, exactly correspond; and at the same time, for instance, when the soul desires to go to any place, the two feet move mechanically that way: this soul and body will have a relation to one another, not by any actual union between them, but by the constant and perpetual correspondence of the several actions of both.—Now, God puts together this soul and body, which had such a correspondence antecedent to their union; such a *pre-established harmony*.—And the same is to be understood of all the other souls and bodies, that have been or ever will be joined.

In effect, the laws of motion in the body, succeeding in the order of efficient causes, do also agree and correspond with the ideas

ideas of the foul; so that the body is determined to act at the time when the soul wills.

The same principle he extends further, and makes a *pre-established harmony* between the kingdoms of nature and grace; to account for the apparent communication between them, and make physical and moral evil correspond.

Such is the system of *pre-established harmony, harmony pre-establie*.—The author's way of stating and enforcing it, may be seen in his *Essais de Theodicee*.

HARMONY, in anatomy. See the article HARMONIA.

HARMOSTES*, or **HARMOSTA**, in antiquity, a fort of magistrate among the Spartans, whereof there were several; whose business was to look to the building of citadels, and repairing the forts, and the fortifications of the cities.

* The word is Greek, ἁρμόστης; formed of ἁρμονία, *armonia*, concert, *armonia*, I adapt, concert, &c.

HARNES*, a complete armour; or the whole equipage and accoutrements of a cavalier, heavily armed; as casq, cuirass, &c.

* The word is formed of the French, *harnois*; which some derive from the Greek ἁρμός, a lamb's skin; by reason they anciently covered themselves therewith. Du Cange observes, that the word *harnesum* is used in the corrupt Latin in the same sense; and that it comes from the High Dutch, *harnas*, or *harnisch*. Others derive it from the Italian, *arnese*; others from the Celtic, *harnes*, a cuirass.

Under king Richard II. it was expressly forbid all men to ride in *harnes*, with lanceys, &c. *Stat. 7 R. II. c. 13*. In the statute 2 H. VI. c. 14. *harnes* seems to include all kind of furniture for offence, as well as defence, both of man and horse: as swords, buckles for belts, girdles, &c.

HARNES is also used for the furniture put on a horse, to draw in a coach, waggon, or other carriage; such as collars, leathers, traces, &c.

HARO*, **HAROU**, or **HAROL**, in the Norman customs.---*Glamur de HARO*, is a cry, or formula of invoking the assistance of justice, against the violence of some offender, who upon hearing the word *hara*, is obliged to desist, on pain of being severely punished for his outrage, and to go with the party injured before the judge.

* The word is commonly derived of *ha* and *roul*, as being supposed an invocation of the sovereign power, to assist the weak against the strong; on occasion of Raoul first duke of Normandy, about the year 912: who rendered himself venerable to his subjects by the severity of his justice; so that they called on him even after his death, when they suffered any oppression.—Guill. Guizart speaks of the *ha rouls*, or *ha rouls*, as a military cry, first brought into Normandy by the Normans, under the conduct of Raoul. Others say, that during his lifetime they used to cry a *Raoul*, I cite you to appear before Raoul; by reason he administered justice to his subjects in person. But others, as M. Cafeneuve, take all these etymologies to be false; and suppose the word *hara*, to have been a cry long before duke Raoul. Some derive it from Harold king of Denmark, who in the year 826, was made grand conservator of justice at Mentz: others, from the Danish *aa rou*, q. d. help me; a cry raised by the Normans in flying from a king of Denmark, named Roux, who made himself duke of Normandy.

The letters of the French chancery have usually this clause, *Non obstant clamor de haro*, &c.

The *hara* had antiently such vast power, that a poor man of the city of Caen, named Affelin, in virtue hereof, arrested the corps of William the conqueror, in the middle of the funeral procession, till such time as his son Henry had paid the value of the land in question; which was that whereon the chapel was built, where he was interred.

HARP*, a musical instrument, of the string kind; being of a triangular figure, and placed on end between the legs to be play'd on.

* Papias, and Du Cange after him, will have the *harp* to have took its name from the *Arpi*, a people of Italy, who were supposed the first that invented it; and from whom they say it was borrowed by other nations.—Menage, &c. derive the word from the Latin *harpa*; and that from the German *herp* or *harp*. Others bring it from the Latin *carpa*, because touched or thrummed with the fingers. Dr. Hickes derives it from *harpa*, or *bearpa*, which signify the same thing; the first in the language of the Cimbri, the second in that of the Anglo-Saxons.—The English priest who wrote the life of St. Dunstan, and who lived with him in the tenth century, says, C. 2. n. 12. *Sampsi fecum ex more Cytharum suam, quam paternam lingua hearpan vocamus*; which intimates the word to be Anglo-Saxon.

There is some diversity in the structure of *harps*.---That called the *triple harp* has 78 strings or chords, in three rows, 49 in each, which make four octaves: the first row is for the semi-tones; and the third is in unison with the first. There are two rows of pins, or screws, on the right side, serving to keep the strings tight in their holes, which are fastned at the other end to three rows of pins on the upper side.

This instrument is struck with the finger and thumb of both hands. Its music is much like that of the spinett; all its strings going from semi-tone to semi-tone: whence some call it an *inverted spinett*.

It is capable of a much greater degree of perfection than the lute.

Vol. I.

King David is usually painted with a *harp* in his hands; but we have no testimony in all antiquity, that the Hebrew *harp*, which they call *chinnor*, was any thing like ours. On a Hebrew medal of Simon Maccabæus we see two sorts of musical instruments; but they are both of them very different from our *harp*, and only consist of three or four strings.—All authors agree, that our *Harp* is very different from the lyra, cithara, or barbiton, used among the Romans.

Fortunatus, Lib. VII. *Carm. 8*. witnesses, that it was an instrument of the barbarians.

Romanusque lyra, plaudet tibi barbarus harpa

Græcus acbilliacæ, crotta Britannia canat.

HARPIES, ἁρπυιῶν, **HARPYIÆ**, in antiquity, a rapacious impure sort of monsters, of the bird kind, mentioned among the poets.

They are represented with wings, ears like bears, bodies like vultures, faces like women, and feet and hands hooked like the talons of birds of prey. See Virgil *Æneid*. Lib. III. who gives a description of them.

The ancients looked on the *harpies* as a sort of genii, or dæmons.---Some make them the daughters of Tellus and Oceanus, the earth and ocean; whence, says Servius, it is, that they inhabit an island, half on land, and half in water. Valerius Flaccus makes them the daughters of Typhon.

There were three *harpies*, Aello, Ocypete, and Celceno; which last Homer calls *Podarge*.---Hesiod, in his *Theogony*, V. 267. only reckons two, Aello and Ocypete; and makes them the daughters of Thaumias and Electra; &rhyming, that they had wings, and went with the rapidity of the wind. Zephyrus begat of them Balios and Xanthus, Achilles's horses. Pherecydes relates, that the Boreades expelled them from the Ægean and Sicilian seas, and pursued them as far as the islands, which he calls *Plate*, and Homer *Calyx*; and which have since been called the *Strophades*.

Vossius, *De idola*. L. III. c. 99. p. 63. thinks, that what the ancients have related of the *harpies*, agrees to no other birds so well as the bats found in the territories of Darien in South America.---These animals kill not only birds, but dogs and cats; and prove very troublesome to men by their peckings. But the ancients, as the same Vossius observes, knew nothing of these birds. By the *harpies*, therefore, he thinks they could mean nothing else but the winds; and that it was on this account they were made daughters of Electra, the daughter of Oceanus. Such is the opinion of the scholiasts of Apollonius, Hesiod, and Eustathius.---Their names, Aello, Ocypete, Celceno, are supposed to be a further argument of this.

HARPINEER, or **HARPONEER**, an engineer, or fisherman, who manages, and throws the harping-iron, in the whale-fishing.

The *harpineers*, are the most robust and dextrous persons in the crew of the ships sent on whale-fishing.---Their place is at the end of the pinnace, and they direct the steersman as well as the rowers. When they come within reach of the whale, they dart their iron with great vehemence into his head, so as to penetrate the skin and fat, and enter deep into the flesh. Immediately upon this, the whale dives to the bottom, and when he returns to the air again to fetch breath, the *harpineer* takes occasion to strike him afresh; though he would have died of the former wound: it being a circumstance generally asserted, that blood never stanches, nor wounds ever heal in the water. This done, the other fishers approach aside of him, and run a long spear shod with iron under the fins, through the integuments, into his breast. The blood now spouts out, and the carcass welters in its own fat. It remains then only to tow him to shore, there to cut off the blubber, &c. See *Whale-Fishery*.

In the Sturgeon-Fishery, as soon as the *harpineer* perceives the sturgeon's belly, which is frequently turning, now on this side, and then on that, he darts his iron into the same, as being destitute of scales. Denis *Hist. de l'Amérique*. See *Sturgeon-Fishery*.

HARPING-IRON, **HARPAGO**, **HARPOON**, a sort of dart, or spear, fastned to a line, wherewith they catch whales and other large fish, as sturgeons, &c.

This *harping-iron* is a large javelin of forged iron, five or six feet long, with a sharp, cutting, triangular point, barbed like that of an arrow. At the upper end is engraven the *harpineer's* name, near a ring, to which the line is fastned, which they let down as soon as the fish is struck, to give him room to dive, &c. See *Whale-Fishery*.

HARPINGS, in a ship, properly denotes her breadth at the bow. Some also call the ends of the bends, which are fastned into the stem, the *harpings*.

HARPOCRATIANS, a sect of heretics mentioned by Celsus; the same with *Carpocratians*. See *CARPOCRATIANS*.

HARPSICHOORD, or **HARPSICHOIR**, a musical instrument of the string kind; play'd after the manner of an organ.

The Italians call it *clave cimbal*, and the French *clavicin*. In Latin it is usually called *grave cymbalum*, q. d. a large or deep cymbal.

The *harpischord* is furnished with a set of keys; sometimes

H A T

two sets:---The touching or striking of these keys, moves a kind of little jacks, which move a double row of chords, or strings of brads and iron, stretched on the table of the instrument over four bridges.

HARQUEBUSS*, in our ancient statutes, called also **ARQUEBUSE**, **HAQUEBUT**, or **HAGBUT**; is a handgun; or a fire-arm of a proper length, &c. to be bore in the arm.

* The word is formed of the French *arquebuse*: and that from the Italian, *arcobuso*, or *arco abuso*, of *arco*, a bow, and *busio*, a hole; on account of the touch-hole, at which the powder is put to prime it; and that it succeeded to the bows of the ancients.

The *harquebuse* is properly a fire-arm, of the ordinary length of a musket, or fowling-piece; cocked usually, with a wheel.---Hanzelet prescribes its legitimate length to be forty calibers; and the weight of its ball one ounce, seven eighths; its charge of powder as much.

There is also a larger kind, called *harquebuse a croc*, much of the nature of our blunderbusses, used in war, for the defence of places; being usually rested on something when discharged.

---The first time these instruments were seen, was in the imperial army of Bourbon, who drove Bonnavet out of the state of Milan.---They were so big and heavy, that there were two men to carry them. They are now little used except in some old castles, and by the French in some of their garisons.

HARRIER, a kind of hound, called in Latin *sagax*, from his tracing, or chasing by foot.---Being endowed with an admirable gift of smelling, and also very bold in the pursuit of his game.

There are several kinds, all differing in their services; being for the hare, fox, wolf, hart, buck, badger, otter, polecat, weasel, or coney; some, in fine, for one game, some for another, &c. See **HUNTING**.

HARROW, in husbandry, a drag made in a square form, to break the clods of earth after ploughing.

It consists of three parts: 1^o. The *harrow-bulls*; which are the holes where the nails go in; 2^o. The slots, which are the cross pins; 3^o. The *harrow-tines*, pins, or tushes, which are great iron nails; beside these there are 4^o. The hook, being that which fastens the horse to them; 5^o. The couples, when two *harrows* are tied together.

HART, in the forest law, a stag, or male deer of five years old complete.

If the king or queen hunt him, and he escape, he is called a *hart royal*.

And if by such hunting he be chased out of the forest, proclamation is commonly made in the places adjacent, that in regard of the pastime the beast has afforded the king or queen, none shall hurt, or hinder him from returning to the forest; upon which he is called an *hart royal proclaimed*.

HARTS-HORN, *Cornu Cervi*. See the article **HARTS-HORN**.

HART-HUNTING. See the article **HART-HUNTING**.

HARTH-PENY, or **HARTH-SILVER**. See **CHIMNEY-MONEY**.

HARUSPEX, or **ARUSPEX**, in antiquity, a sort of priest, or diviner, who inspected and consider'd the entrails of beasts, particularly those of victims; to find signs or indications of something he wanted to know.

Cicero, *de Divinatione*. L. II. explains the difference between *aruspex* an *haruspex*.

HASSOCK, denotes a bair, or cushion made of rushes, to kneel or rest the feet on in churches.

HASTA, or **HASTA PURA**, among medalists, signifies a kind of spear, or javelin, not thod, or headed with iron; or rather, an ancient scepter, somewhat longer than ordinary, occasionally given to all the gods.

The *hasta* is supposed a symbol of the goodness of the gods, and of the conduct of providence, which is equally mild and forcible.

HASTA, in some countries, is a measure, or quantity of ground amounting to thirty paces; thus called, according to M. du Cange, from the *hasta*, or rod, wherewith it was measured.

HASTIVE, a French term, sometimes used in English for *early*, *forward*, or something that comes before the ordinary time, or season.

The *hastive* fruits are strawberries and cherries.---We have also *hastive* peas, &c.

HAT, a covering for the head, wore by the men throughout the western part of Europe.

Hats are chiefly made of hair, wool, &c. worked, fulled, and fashioned to the figure of the head.

Hats are said to have been first seen about the year 1400; at which time they became of use for country wear, riding, &c.

---F. Daniel relates, that when Charles II. made his public entry into Rouen in 1449, he had on a *hat* lined with red velvet, and surmounted with a plume, or tuft of feathers.

---He adds, that it is from this entry, or at least under this reign, that the use of *hats* and caps is to be dated, which

H A T

henceforward began to take place of the chaperons and hoods, that had been wore before.

In progress of time, from the laity, the clergy likewise took this part of the habit; but it was looked on as a crying abuse, and several regulations were published, forbidding any priest, or religious person, to appear abroad in a *hat* without cornets; and enjoining them to keep to the use of chaperons, made of black cloth, with decent cornets: if they were poor, they were at least to have cornets fastened to their *hats*, and this upon penalty of suspension and excommunication.---Indeed the use of *hats* is said to have been of a longer standing among the ecclesiastics of Brittany, by two hundred years; and especially among the canons: but these were no other than a kind of caps; and it was from hence arose the square caps wore in colleges, &c.

Lobineau observes, that a bishop of Dol, in the twelfth century, zealous for good order, allowed the canons alone to wear such *hats*; enjoining, that if any other person should come with them to church, divine service should immediately stand still. T. I. p. 845.

Hats make a very considerable article in commerce.---The finest, and those most valued, are made of the pure hair of an amphibious animal, called the *castor*, or *beaver*, frequent in Canada, and other provinces of north America. See **CAS-TOR**.

Method of making HATS.---*Hats*, we have observed, are made either of wool, or hair of divers animals, particularly of the castor, hare, Rabbit, camel, &c. The process is much the same in all; for which reason we shall content ourselves to instance in that of castors.

The skin of this animal is covered with two kinds of hair; the one long, stiff, glossy, and pretty thin set; this is what renders the skin, or fur, of so much value. The other is short, thick, and soft; which alone is used in *hats*.

To tear off one of these kinds of hair, and cut the other, the *hatters*, or rather the women employed for that purpose, make use of two knives, a large one like a shoe-maker's knife, for the long hair; and a smaller, not unlike a vine-knife, wherewith they shave, or scrape off the shorter hair.

When the hair is off, they mix the stuff; to one third of dry castor, putting two thirds of *old coat*, i. e. of hair which has been wore some time by the favages; and card the whole with cards, like those used in the woollen manufactory, only finer. This done, they weigh it, and take more or less, according to the size or thickness of the *hat* intended.---The stuff is now laid on the *burdle*, which is a square table, parallel to the horizon, having longitudinal chinks cut through it. On this hurdle, with an instrument called a *baw*, much resembling that of a violin, but larger; whose string is worked with a little bow-stick, and thus made to play on the furs; they *fly* and mix them together, the dust and filth at the same time passing through the chinks. This they reckon one of the most difficult operations in the whole; by reason of the justness required in the hand to make the stuff fall precisely together, and that it may be every where of the same thickness. In lieu of a bow, some *hatters* make use of a sieve, or searce of hair, through which they pass the stuff.

After this manner, they form gores, or two capades, of an oval form, ending in an acute angle atop.---And with what stuff remains, they supply and strengthen them in places where they happen to be slenderer than ordinary.---Though it is to be remembered, that they designedly make them thicker in the brim, near the crown, than towards the circumference, or in the crown itself.

The capades thus finished, they go on to harden them into closter, and more consistent flakes, by pressing down a *hardening skin*, or leather thereon.---This done, they are carried to the *bafon*, which is a sort of bench with an iron plate fitted therein, and a little fire underneath it; upon which laying one of the hardened capades, sprinkled over with water and a sort of mould being applied thereon; the heat of the fire, with the water and pressing, embody the matter into a slight hairy sort of stuff, or felt: after which, turning up the edges all around over the mould, they lay it by; and thus proceed to the other.---This finished, the two are next joined together, so as to meet in an angle atop, and only form one conical cap, after the manner of a manica Hippocrates or flannel Bag.

The *hat* thus bafoned, they remove it to a large kind of receiver or trough, resembling a mill-hopper, going sloping or narrowing down from the edge, or rim, to the bottom, which is a copper kettle, filled with water and grounds, kept hot for the purpose.---On the descent or sloping side, called the *plank*, the bafoned *hat*, being first dipt in the kettle, is laid.---And here they proceed to work it, by rolling and unrolling it again and again, one part after another, first with the hand, and then with a little wooden roller; taking care to dip it from time to time: till at length by thus fulling and thickening it, four or five hours, it is reduced to the extent, or dimensions of the *hat* intended.---To secure the hands

from being injured by this frequent rolling, &c. they usually guard them with a sort of thick gloves.

The *hat* thus wrought, they proceed to give it the proper form; which is done by laying the conical cap on a wooden block, of the intended size of the crown of the *hat*; and thus tying it round with a packthread, called a *commander*: after which, with a piece of iron, or copper, bent for the purpose, and called a *stanper*, they gradually beat or drive down the commander all around, till it has reached the bottom of the block: and thus is the crown formed; what remains at bottom below the string, being the brim.

The *hat* being now set to dry; they proceed to *finge* it, by holding it over a flair of straw, or the like; then it is *pounded*, or rubbed with pumice, to take off the coarser nap; then rubbed over afresh with seal-skin, to lay the nap still finer; and lastly, carded with a fine card, to raise the fine cotton, with which the *hat* is afterwards to appear.

Things thus far advanced, the *hat* is sent, upon its block, and tied about with packthread as before, to be dyed. — The dyer's copper is usually very large, holding ten or twelve dozen *bais*. The dye, or tincture, is made of logwood, verdigrease, coppers, and alder-bark; to which some add galls and sumac.

Here the *hat* is kept boiling for about three quarters of an hour; then taken out and set to cool, and then returned to the dye; and this for ten or twelve times successively. The dye being compleat, the *hat* is returned to the *batter*, who proceeds to dry it, by hanging it in the top, or roof, of a stove or oven; at the bottom of which is a charcoal fire. —

When dry, it is to be stiffed, which is done with melted glue, or gum seneca, applied thereon by first smearing it, and beating it over with a brush, and then rubbing it with the hand. — The next thing is to *steam* it, on the *steaming-basin*, which is a little hearth, or fire place, raised three foot high, with an iron plate laid over it, exactly covering the hearth. On this plate they first spread clothes, which being sprinkled over with water to secure the *hat* from burnings, the *hat* is placed, brim downwards, thereon. When moderately hot, the workman strikes gently on the brim, with the flat of his hand, to make the jointings incorporate and bind, so as not to appear; turning it from time to time, this way and that way, and at last overturning and setting it on the crown.

When steamed sufficiently, and dried, they put it again on the block, and brush and *iron* it on a table or bench for the purpose, called the *stall-board*. This they perform with a sort of irons like those commonly used in ironing linen, and heated like them; which being rubbed over and over each part of the *hat*, with the assistance of the brush, smoothes and gives it a gloss, which is the last operation; nothing now remaining but to clip the edges even with scissors, and sew a lining into the crown.

Hats for women have been made, in various forms, of silk, straw, shavings of wood, ivory, feathers, gold, and silver.

HAT, is also figuratively used for the dignity of a cardinal, or a promotion to that dignity.

In this sense they say, to expect the *hat*; to claim, or have pretensions to the *hat*, &c.

Pope innocent IV. first made the *hat* the symbol, or cognizance of the cardinals; enjoining them to wear a red *hat*, at all ceremonies and processions, as a token of their being ready to spill their blood for Jesus Christ.

HAT, in heraldry. See the article **CHAPEAU**.

HATCHES, in a ship, a sort of trap-doors in the mid-ship, or between the main-mast and fore mast; through which goods of bulk are let down into the hold. — Hence, the

HATCH-way, is that place where the *hatches* are. — See *Tab. Ship*, fig. 2. n. 40.

To lay a thing into the *hatch-way*, is to put it so that the *hatches* cannot be come at, or opened.

HATCHES are also flood-gates, set in a river, &c. to stop the current of the water.

The word is particularly used for certain dams, or mounds, made of rubbish, clay, or earth, to prevent the water that issues from the stream-works, and tin-washes in Cornwall, from running into the fresh rivers.

The tenants of Bulstoke, and other manors, are bound to do certain days work to the *hatches*.

HATCHET, a joiner's instrument wherewith to hew wood. The *hatchet* is a smaller, lighter sort of ax, with a basile edge on its left side; having a short handle, as being to be used with one hand.

HATCHING, the act whereby fecundated eggs, after seasonable incubation, exclude their young.

Hatching, with respect to the oviparous tribe, amounts to the same as parturition, or delivery, in the viviparous.

The office is said to lay her eggs in the sand; and that the heat of the sun does the office of a parent animal, and *hatches* them. In Egypt, they *hatch* their chickens by the heat of an oven: the method whereof is given us by Mr. Greaves, in the *Philosophical Transactions*, N^o. 117.

They have houses, it seems; built for the purpose; having a long entrance, on each side whereof are twelve or fourteen ovens, whose bottoms and sides are formed of sun-dried bricks, lined with mats, for the eggs to lie on; and the tops covered with sticks, except two spaces, which are brick, and serve as hearths to build the fires on wherewith the eggs are to be heated. — Over these is another story of ovens; having holes, which are either stopped with tow, or left open at pleasure, to govern the heat of the ovens below.

They begin to heat the ovens in the middle of January; spending on them every morning about an hundred pound weight of camels or buffalo's dung, and the like quantity at night; till the middle of February; by which time the ovens are too hot for the hand to be held upon the walls. — After this they put in the eggs to *hatch*; which they continue successively till the end of May.

The eggs are first put upon the mats in the lower ovens, upon the ground, 7 or 8000 eggs in number, and laid only double, one upon another; in the ovens over these, the fire is made in the little channels, from whence the heat is conveyed into the lower: the eggs directly under these hearths lie threefold.

At night, when they new-make their fires in the hearths they remove the eggs that were directly undermost, laying three one upon another, in the place of those which lay on the sides only double; and these being now removed, they lie treble under the hearth, because the heat is greater there, than on the sides.

These eggs continue in the lower ovens fourteen days and nights; after which they remove them into the upper. And in these, there being now no more fire used, they turn the eggs four times every twenty-four hours.

The 21st, or 22^d day, the chickens are *hatched*; which the first day eat not: the second day they are fetched away by women, who give them corn, &c. The master of the ovens hath a third part of the eggs for his cost and pains, out of which he is to make good to the owners, (who have two thirds in chickens for their eggs,) if any happen to be spoiled, or miscarry.

The fire in the upper ovens, when the eggs are placed in the lower, is thus proportioned. — The first day there is the greatest fire, the second less than the first; the fourth more than the third, the fifth less, the sixth more than the fifth, the seventh less, the eighth more, the ninth without fire, the tenth a little fire in the morning, the eleventh they shut all the holes with flax, &c. making no more fire; for if they should, the eggs would break. They take care that the eggs be no hotter than the eye of a man, when they are laid upon it, can well endure. When the chickens are *hatched*, they put them into the lower ovens.

HATCHING, or **HACHING**, in designing and engraving, signifies the making of lines with a pen, pencil, graver, or the like; and intersecting, or going across those lines, with others drawn over them another way.

The depths and shadows of draughts are usually formed by *hatching*, or *hatch-work*.

What is surprising in the gravings of Mellan and Sadeler, is, that they express the shadows exceeding well, without any *hatches*, or *hatchings*.

HATCHINGS are of great use in heraldry, to distinguish the several colours of an escutcheon, without its being illuminated. See **COLOUR**.

The first kind of *hatching* in pale, or from top to bottom, signifies *gules*, or *red*. — The second in fess, across the coat, *azure*, or *blue*.

Hatching in pale, counter-*hatched* in fess, signifies *sable*, or *black*. — *Hatching* in bend, proceeding from right to left, signifies *green*: and that in bars, from left to right, *purple*.

When the coat is only dotted, it is supposed to be *or*, or *gold*. And when quite bare, or void, *argent*, or *white*.

This invention is, commonly, ascribed to F. Pietra Sancta. — Though the Sieur de la Columbiere has disputed his title to it.

HATCHMENT, in heraldry, the marshalling of several coats of arms in an escutcheon.

HATCHMENT, is also a popular name for an achievement. See **ATCHEVEMENT**.

HATTOCK, a shock of corn, containing twelve sheaves. — Others make it only three sheaves laid together.

HAVEN*, a sea port, or harbour for ships. See **PORT**, and **HARBOUR**.

* The word is derived from the Saxon *hafene*, or the German *hafen*, or the French *havre*; which all signify the same thing.

HAUNCH, or **HANCH**, the hip; or that part of the body between the last ribs, and the thigh.

The *haunches* consist of three bones, joined together by cartilages; which, in course of time, grow dry, hard, and bony; so that in adults, the three only seem to constitute one continued bone.

HAW

HAUNCHES, or hips of a horse, are those parts of the hind quarters which extend from the reins or back, to the hough or ham.

One of the most necessary lessons in managing the great horse, is that of *putting him upon his haunches*; which, in other terms, is called to *couple him well*, or to put him well together, or make him compact.

A horse that does not *bend*, or lower his *haunches*, throws himself too much upon his shoulders, and is heavy upon the bridle.—To *drag the haunches*, is to change the leading foot in galloping.

HAUNT, among hunters, the walk of a deer, or the place of his ordinary passage. See **HUNTING**.

HAVRE, in geography, &c. a French term, signifying the fame with *haven*, or harbour.

HAUTBOY*, or **HOBBOY**, a sort of musical instrument, of the wind kind, with a reed to blow or play it withal.

* The word is French, *haut-bois*, q. d. high-wood; and is given to this instrument, by reason its tone is higher than that of the violin.

The *hautboy* is shaped much like the flute, only that it spreads, or widens more toward the bottom. The treble is two foot long: the tenor goes a fifth lower, when blown, or sounded open: it has only seven holes. The bass is five foot long, and has eleven wholes.

HAW, among farriers, &c. a gristle growing between the nether eye-lid and the eye of a horse, or other beast, and which will put the Eye quite out, if not timely taken away.

It comes by gross, tough, and stigmatic humours, falling from the head, and knitting together, which in the end grow to this infirmity; the signs whereof are the watering of the eye, and involuntary opening of the nether side.

Every common farrier can cut it out:—The affected beast is to be held fast by the head, and, with a strong double thread, a needle is to be put in the midst of the upper eyelid, and tied, if it be a bullock, to his horn: then taking the needle again, with a long thread, and putting it through the gristle of the *haw*, with a sharp knife cut the skin finely round, and so pluck out the *haw*.—That done, they dress the eye, take out the blood, wash it with beer, or ale, and cast in a good deal of salt; then wash it again afterwards, stroking it down with their hands, and so let him go.—To cure a sheep of this malady, they drop into the eye the juice of camomile, or crows-foot.

HAWK, *Accipiter*, a bird of prey, of a bold and generous nature; whereof there are several species.

The *hawk* makes the subject of a particular art, called *hawking*, or *falconry*.

Naturalists disagree about the number and division of the *hawk* kind.—The most commodious distribution is that into long-winged and short-winged *hawks*.

To the long-winged, which may be also called the *falcon* tribe, belong the falcon, haggard falcon, ger-falcon, lanner, hobby, faker, merlin, and bawler: all which are reclaimed, manned, fed, and mued, much after the same manner.—Of the short-winged species, or *hawks* properly so called, are the *gos-hawk* and *sparrow-hawk*.

The former are generally brought to the lure; and seize their prey with the foot; breaking the neck-bone with their beak, ere they proceed to plume or tire it: the latter are brought to the fist, and kill their game by strength and force of wing, at random; and proceed immediately to plume them.

It is to be noted, that the female of all birds of prey is much larger, stronger, and more courageous than the male; which is distinguished therefrom by some diminutive name.—Those of the *falcon* and *gos-hawk*, are called *tiercel*, or *tiercelet*; that of the ger-falcon, *jerkin*; that of the merlin, *jack*; that of the hobby, *robbin*; that of the sparrow-hawk, *musket*; and that of the lanner, *lanneret*.

The *Hawk* also has different names, according to their different ages.—The first year she is called a *soarage*.—The second, an *entrevue*.—The third, a *white hawk*.—The fourth, a *hawk of the first coat*.

Add, that they have different denominations according to the different seasons when they are taken.—Those taken in the ayrie, are called *eyesset*, or *mysses*.—Those which had forsaken it, and were fed in some place not far off, by the old ones, *branchers*.—Those which had begun to prey for themselves, *sar-hawks*.—Those which have changed their feathers once or more *musued-hawks*.—And those which lived at large, and preyed for themselves about the woods, *haggards*.

We shall here, according to our method in other cases, give the reader what relates to the several species of *hawks*; referring for what is common to them all, to the article **HAWKING**.

1°. Of the *falcon*, or *falcon-gentle*, her nature and qualities; with the manner of luring and reclaiming, and bringing her up to the sport, we have elsewhere spoke under the article **FALCON**.

2°. The *haggard falcon*, called also *peregrine falcon*, *passenger*, and *traveller*, because no native of our island; or rather, by reason of its roving, and wandering more than any other

HAW

fort; is not inferior to the best of the tribe, for strength, courage, hardiness, and perseverance. She is distinguished from the common falcon, as being larger, longer, armed with a longer beak and talons, a higher neck, &c. She will lie longer on the wing; and is more deliberate and advised in her stooping, than the others.

The haggard falcon, when wild and unreclaimed, takes the greatest liberty of all birds; living either by land or sea: and is of such absolute power, that wherever she comes, all flying fowl stoop under her subjection; even the tiercelet, though her natural companion, dares not sit by her, or approach her reliance, except in cawking time; when, for procreation sake, she admits him in a submissive manner to come near and woo her.

When very young, she is apt to attack birds too strong for her; which she persists in, till a found beating has brought her to a better understanding.—She is an incessant pains-taker; no weather discouraging her from her game.—When, unreclaimed, as soon as she has seized her prey, and broke the ink or neck, she falls on the crop, and feeds first on what is contained there; then on the other parts. When she has filled her gorge, she flies to some solitary place, near the water, where she sits all day, and at night takes wing to some convenient place, where she had before purposed, to perch till morning.

For the method of reclaiming, manning, entering, &c. a haggard falcon, or other sort of hawk, with the terms of art used in respect thereof; see the article **HAWKING**.

3°. The *ger-falcon*, or *gyr-falcon*, is the largest bird of the falcon kind; coming next to the size of a vulture; and is of the greatest strength next an eagle: she is stoutly armed, and in all respects a lovely bird to the eye.

Her head and eyes are like those of the haggard; her beak great and bending, her nares large:—her sails long and sharp pointed, and her train and mail much like the lanners, having a large marble feared foot; and plumed black, brown, and russet.—She may also be called a *passenger*, her ayrie or breeding place being in Prussia, Muscovy, and the mountains of Norway.

The *ger-falcon* is of a fierce and fiery nature, and is very hardly managed and reclaimed; but being once overcome, she proves an excellent *hawk*, scarce refusing to strike at any thing. She does not naturally fly the river; but always pursues the herons, shovellers, &c. In going up to their gate, they do not hold the course, or way, which others use to do; but climb up upon the train, when they find any fowl, and as soon as they have reached her, pluck her down, if not at the first, yet at the second or third encounter.

4°. The *faker*, or *sacre*, is the third in esteem, next the falcon and *ger-falcon*, but difficult to be managed, being a *passenger*, or *peregrine hawk*, whose ayrie has not yet been discovered, but the young are chiefly found in the islands of the Levant.

She is somewhat longer than the haggard falcon; her plume ruffy and ragged; the fear of her foot and beak like the lanner; her pounces short, and her train the longest of all birds of prey.

She is very strong and hardy against all kind of fowl, being a great deal more disposed to the field than the brook; and delighting to prey on great fowl, as the heron, goose, &c. but for the crane she is not so free as the haggard falcon.—She also excels for the lesser fowl, as pheasants, partridges, &c. and is much less dainty in her diet, as long-winged *hawks* usually are.

The *faker* makes excellent sport with a kite; who, as soon as he sees the *faker* cast off, immediately betakes himself to, and trusts in the goodness of his wings, and gets to his pitch, as high as possibly he can, by making many towers and wrenches in the air; which, together with the variety of contests and bickerings between them, affords a curious spectacle.

5°. The *lanner*, or *lanner*, is a *hawk* common in most countries, especially in France; making her ayrie on lofty trees in forests, or on high cliffs near the sea-side.

She is less than the falcon-gentle, fair plumed and of shorter talons than any other falcon.—Such as have the largest and best fashioned heads, are esteemed the best.

Mewed lanners are not easily known from *gos-hawks*, or *fakers*; the chief marks and characteristics are, that they are blacker, have less beaks, and are less armed and pounced than any other *hawks*.

Of the whole *hawk* tribe, there is none so fit for a young falconer as this, because she is not inclined to surfeits, and seldom melts greasy by being overkown.

There is another sort of *lanner*, whose ayrie is in the Alps, having their heads white, and flat aloft, large and black eyes, slender nares, short and thick beaks; being less than the haggard, and falcon-gentle, though there are different sizes of them: their tail is marble, or russet; their breast-feathers white and full of russet spots, and the points and extremities of their feathers full of white drops; their sails and trains long; they are short legged, with a foot less than that of a falcon, and marble feared.—This *hawk* never lies upon the wing, after she has flown to a mark; but after once stooping, makes a point; and like the *gos-hawk*, waits the fowl.—She is more valued abroad than

in England; we looking on her as slothful, and hard mettled. The truth is, a very strict hand must be kept over her; as being of an ungrateful disposition.—She is flown at field or brook, and will maintain long flights; by which means much fowl is killed. To fly them, they must be kept very sharp; and because they keep their castings long, they must have hard castings, made of tow, and knots of hemp.

6°. The *merlin* is the smallest of all birds of prey; and bears a resemblance to a haggard falcon in plumage, as also in the fear of the foot, beak, and talons, and is not unlike her in conditions.

—When well manned, lured, and carefully looked after, she proves an excellent *hawk*; especially at partridge, thrush, and lark.—But she is very busy, and unruly, and special care must be had lest the unnaturally eat off her own feet and talons, as she has often been known to do.

She is very bold; and will fly at birds bigger than herself, with such eagerness, as to pursue them even into a town or village.

Though the merlin be accounted a *hawk* of the fist, she may be brought to take delight in the lure; when you have made her come to the lure, so as she will patiently endure the hood, you should make her a train with a partridge; if the foot and kill it, reward her well: then fly her at the wild partridge, and if she take or make it at first or second flight, being retrieved by the spaniels, feed her upon it with a reasonable gorge; cheering her in such manner with the voice, that she may know it another time: If she do not prove hardy at the first or second time, she will always be good for nothing.

7°. The *hobby*, is a sort of *hawk* that naturally preys on doves, larks, and other small game.

She has a blue beak, but the feet thereof and legs are yellow; the crinels, or little feathers under the eye, very black; the top of the head between black and yellow.

She has also two white seams on her neck: the plumes under the gorge, and about the brows, are reddish, without spot or drop; the breast feathers for the most part are brown, yet interperfed with white spots; her back, train, and wings, are black aloft, having no great scales upon the legs, unless a few behind: the three stretchers and pounces are very large, with respect to her short legs; her ball feathers are tinged between red and black; the pendant ones, or those behind the thigh, of a rusty, smoky hue.

She is a *hawk* of the lure, and not of the fist; and is an high flyer, being in every respect like the falk, but that she is of a much less size; for she is not only nimble and light of wing, but dares encounter kites, buzzards, or crows, and will give soule for soule, and blow for blow, till sometimes they siege, and come tumbling down to the ground both together.—But she is chiefly for the lark, which poor little creature does so dread the sight of her, soaring in the air over her, that she will rather chuse to commit herself to the mercy of men or dogs, or to be trampled on by horses, than venture into the element, when she sees her mortal enemy there.

The hobby also makes excellent sport with nets and spaniels; for when the dogs range the field, to spring the fowl, and the hobby soars aloft over them, the poor birds, apprehensive of a conspiracy between the *hawks* and dogs to their utter ruin, dare not commit themselves to their wings, but think it safer to lie close on the ground, and so are taken in the nets.—This sport is called *dagging*.

8°. The *gos-hawk*, or *gosi-hawk*, q. d. *grofs hawk*, is a large short-winged *hawk*, of which there are several sorts, differing in goodness, force, and hardiness, according to the diversity of their choice in cawking; at which time the several sorts of birds of prey assemble themselves with the *gos-hawk*, and gallant it together.

There are *gos-hawks* from most countries, but none better than those bred in the north of Ireland.—This Hawk ought to have a small head, a long and straight face, a large throat, great eyes deep set; the apple of the eye black; nares, ears, back, and feet large and black; a black long beak, long neck, big breast, hard flesh, long fleshy thighs, the bone of the leg and knee short, long large pounces and talons; and to grow round from the fern, or train, to the breast forward.—The feathers of the thighs, towards the train, should be large, and the train feathers short and soft, somewhat tending to an iron mail.

The ball feathers ought to be like those of the breast; and the covert feathers of the train, spotted and full of black rundles, but the extremity of every train feather, black streaked.

To distinguish the strength of the bird, tie divers of them in several places of one chamber, or mew; and that *hawk* that slices and mutes highest and farthest off, may be concluded to be strongest.

The *gos-hawk* flies at the pheasant, mallard, wild goose, hare and coney; nay, she will venture to seize a kid, or goat.—She is to be kept with care, as being very choice and dainty in eating, &c.

Vol. I.

9°. *Sparrow-hawk*, is also a kind of short-winged *hawk*; whereof there are several sorts, different in plumes: some small plumed and black; others of a larger feather; some plumed like the quail; some brown or of a canvas-mail, &c.

The *sparrow-hawk*, so far as her strength will give her leave, is a good *hawk*; and he that knows how to man, reclaim, and fly with a *sparrow-hawk*, may easily attain to the keeping and managing of all others.—In this respect she really excels, that she serves both for winter and summer, with great pleasure, and will fly at all kind of game, more than the falcon.

HAWKERS*, antiently, were fraudulent persons, who went from place to place, buying and selling brags, pewter, and other merchandize, which ought to be uttered in open market.—In this sense the word is mentioned, anno 25 Hen. VIII. c. 6. and 33 ejusdem, c. 4.

* The appellation *hawkers*, seems to have grown from their uncertain wandering, like those who, with *hawks*, seek their game where they can find it.

HAWKERS, is also now applied to those who go up and down London streets, crying news-books, and selling them by retail.

The women who furnish the *hawkers*, i. e. sell the papers by wholesale from the press, are called *mercuries*.

HAWKING, the art, or exercise of chasing and taking wild fowl, by means of *hawks*, or birds of prey.

Hawking is the same thing with what we otherwise call *falconry*.

The word *hawking*, in its latitude, does also include the taming and disciplining of hawks, and fitting them for the sport.

Hawking, though an exercise now much disused among us, in comparison of what it antiently was, does yet furnish a great variety of significant terms, which still obtain in our language.

Thus, the parts of a hawk have their proper names.—The legs, from the thigh to the foot, are called *arms*; the toes, the *petty-fingers*; the claws, the *pounces*.—The wings are called the *ails*; the long feathers thereof, the *beams*; the two longest, the *principal feathers*; those next theeto, the *flags*.—The tail is called the *train*; the breast feathers the *mail*; those behind the thigh, the *pendant feathers*.—When the feathers are not yet full grown, she is said to be *unsummed*; when they are complete, she is *summed*.—The craw, or crop, is called the *gorge*.—The pipe next the funnament, where the faces are drawn down, is called the *panel*.—The slimy substance lying in the panel, is called the *glut*.—The upper and crooked part of the bill, is called the *beak*; the nether part, the *clap*; the yellow part between the beak and the eyes, the *sear* or *sear*; the two small holes therein, the *nares*.

As to her furniture:—The leathers, with bells buttoned on her legs, are called *hewits*.—The leathern thong, whereby the falconer holds the hawk, is called the *leafe*, or *leaso*; the little straps, by which the leafe is fastened to the legs, *jesters*; and a line or packthread fastened to the leafe, in disciplining her, a *creance*.—A cover for her head, to keep her in the dark, is called a *hood*; a large wide hood, open behind, to be wore at first, is called a *ruffier hood*: To draw the strings, that the hood may be in readiness to be pulled off, is called *unstriking the hood*.—The blinding a hawk just taken, by running a thread through her eyelids, and thus drawing them over the eyes, to prepare her for being hooded, is called *feeling*.—A figure, or resemblance of a fowl, made of leather and feathers, is called a *lure*.—Her resting place, when off the falconer's fist, is called the *perch*.—The place where her meat is laid, is called the *back*.—And that wherein she is set, while her feathers fall and come again, the *mew*.

Something given a hawk, to cleanse and purge her gorge, is called *casting*.—Small feathers given to make her cast, are called *plumage*.—Gravel given her to help bring down her stomach, is called a *rangle*.—Her throwing up fish from the gorge after casting, is called *gleaming*.—The purging of her greafe, &c. *enfeaming*.—A being stuffed is called *gurgiting*.—The inserting a feather in her wing, in lieu of a broken one, is called *imping*.—The giving her a leg, wing, or pinion of a fowl to pull at, is called *tiring*.—The neck of a bird the hawk preys on, is called the *ink*.—What the hawk leaves of her prey, is called the *pill*, or *pelf*.

There are also proper terms for her several actions:—When she flutters with her wings, as if striving to get away, either from perch or fist, she is said to *bate*.—When standing too near, they fight with each other, it is called *crabbing*.—When the young ones quiver, and shake their wings in obedience to the elder, it is called *covering*.—When she wipes her beak after feeding, she is said to *seak*.—When she sleeps, she is said to *jouk*.—From the time of exchanging her coat, till the turn white again, is called her *intermewing*.—Treading is called *cawking*.—When she stretches one of her wings after her legs, and then the other, it is called *manling*.—Her dung is called *muting*; when she mutes a good way from her, she is said to *stice*; when she does it directly down, instead of yerking backwards, she is said to *stume*; and if it be in drops, it is called *dropping*.—When she as it were sneezes, it is called

HAW

led *smiting*.—When she raises and shakes herself, she is said to *rouse*.—When after mantling, she crosses her wings together over her back, she is said to *warble*.

When a hawk seizes, she is said to *bind*.—When after seizing, she pulls off the feathers, she is said to *plume*.—When she raises a fowl aloft, and at length descends with it to the ground, it is called *truffing*.—When being aloft, she descends to strike her prey, it is called *stooping*.—When she flies out too far from the game, she is said to *rake*.—When forsaking her proper game, she flies at pyes, crows, &c. that chance to cross her, it is called a *check*.—When misting the fowl, she betakes herself to the next check, she is said to *fly on head*.—The fowl or game she flies at is called the *quarry*.—The dead body of a fowl killed by the hawk, is called a *pelt*.—When she flies away with the quarry, she is said to *carry*.—When in stooping, she turns two or three times on the wing, to recover herself ere she seizes, it is called *canceliering*.—When she hits the prey, yet does not trust it, it is called *ruff*.—The making a hawk tame and gentle, is called *reclaiming*.—The bringing her to endure company, *manning* her.—An old fawn hawk, used to fly and set example to a young one, is called a *make-hawk*.

The reclaiming, manning, and bringing up a hawk to the sport, is not easy to be brought to any precise set of rules.—It consists in a number of little practices, and observances, calculated to familiarize the falconer to his bird, to procure the love thereof, &c.—The principal hold and foundation which the falconer has to work upon, is the bird's stomach.—This great principle of appetite he is to make use of a hundred ways, to lead the bird obliquely to what he would have from her: all he can do is to divert nature, and make her subservient to his purposes, to make it the interest of the bird, either real or apparent, to do what the falconer requires of her.

The course, it is evident, will be different, according to the state and condition of the bird to be managed.—An *eyef*, e. g. needs no reclaiming; she is to be carefully nursed, and brought up in her natural tameness.

A *brancher*, *foar-hawk*, or *ramage-hawk*, needs no nursing; she is to be brought down from her wildness, and habituated to another course of life; and in pursuance of her own views and interests, she is to be made subject to those of her master.

To reclaim, e. g. a *baggard falcon*; they begin with shutting her up from the light, by pulling a hood over her eyes; and fixing her by a *creance*, which makes her more accessible.—The next thing is to handle her frequently, taking her up, often stroking her, setting her on the hand, and carrying her about; unhooding, and presently hooding her again; and this for eight or nine days, without ever suffering her to sleep.—All the while she is to be kept sharp set, but to be frequently fed, with a little at a time; unhooding her for the purpose, and when unhooded, the voice is to be continually used to her, that she may learn it; and that the hearing of the voice may naturally put her in hopes of being fed.—This done, she is to be invited to come from the perch to the fist, by unfriking her hood, shewing her some meat, using the voice, and calling her till she come to it, and feed thereon.—If she still refuse, keep her sharp set till she will do it.—Proceed then to bring her to the lure, by giving her to some person to hold, and calling her with a lure, well garnished with meat on both sides, and give her a bit: use her to this for six or seven days; after which tempt her to come gradually further and further off to the lure, waving it, and casting it round your head, &c. and if she come to it roundly, reward her. In three or four days more call her to your lure, well garnished as above, as far as it is possible for her to see or hear you; and set her loose from all her furniture.

The hawk thus manned, reclaimed, and lured, you may go with her into the fields; and whistle her off your fist, to see whether she will rake out or no. If she mount and fly round you in circles, as a good hawk ought to do; after two or three turns call to her with your voice, and fling out the lure about your head, and upon her stooping or coming to it, give her a chicken, or pigeon, and let her kill and feed thereon.—Being thus far initiated, give her first stones, every evening, to prepare her body for castings; and then castings, to cleanse and scour her body, and make her eager.—This course continue, till she have endewed and muted enough to enter upon business.

If the hawk be intended for some particular sort of game, let her lure be a resemblance of that sort of game; and make a practice of frequently feeding and rewarding her thereon, or on a train of the same kind: calling her, when feeding, as if she were called to the lure: Add, that it may be proper to feed her in such sort of places as those her game is chiefly to be found in.

To enter a hawk, it may be convenient to take a well quarried hawk, and let her stoop a fowl, on brook or plash; this done, reward, hood, and set her; and taking the young hawk, go half a bow-shot up the wind, loose her hood, and softly whistle her off the fist, till she have rouzed or muted; then let her fly with her head into the wind; and when she is at

HEA

a proper height, let go a fowl for her to stoop and trust. See further under the article FALCON.

HAWSER, or **HALSER**, belonging to a ship, is a rope consisting of three strands; being a kind of little cable, serving for many uses on board, as to fasten the main and fore shrouds, to warp a ship over a bar, &c.

HAWSEES, in a ship, are two round holes under her head, through which the cables pass when she lies at anchor.—See *Tab. Ship*, fig. 2. n. 10. See also the articles CABLE, and ANCHOR.

Burning in the HAWSE, is when the cable endures an extraordinary stress.

Clearing the Hawse, is the untwisting of two cables, which being let out at different *hawses*, are entangled or twisted about one another.

Bold Hawse, is when the holes are high above the water.

Fresh the Hawse. When there is reason to suspect the cable may be fretted in those holes, they veer out a little, to let another part endure the stress.—This they call to *fresh the hawse*.

Freshing the Hawse, is also used when new pieces are laid upon the cable in the *hawse*.

Riding upon the Hawse, is when any weighty substance lies across, or falls directly before the *hawse*.

HAY, HAYA, or HAYE, a fence or inclosure, formed of rails; wherewith some forests, parks, &c. were antiently surrounded.

HAY is sometimes also used for the park itself.—And, sometimes for an hedge, or a place hedged round.

HAYS also denote a particular kind of nets, for the taking of rabbits, hares, &c.

HAYBOTE *, **HEDGEBOTE**, in our antient customs, a mulct, or recompence for hedge-breaking; or rather, a right to take wood necessary for making hedges, either by a tenant for life, or for years, though not expressed in the grant or lease.

* It is mentioned in the *Manass.* 2 Tom. pag. 134, & *concedo ei ut de bosco meo haybot*, &c.—In the same place, *haybote* signifies a right to take timber to repair the house.

HAYWARD, or **HAWARD**, a keeper of the common herd of cattle of a town; who is to look that they neither break nor crop the hedges of inclosed grounds; and is sworn in the lord's court, for the due performance of his office.

HAZARD. See the articles CHANCE, and GAMING.

HEAD, Caput, the uppermost, or foremost part of the body of an animal.

Pliny, and other of the antient naturalists, speak of a nation of people without heads, called *Blemmyes*. See *BLEMMYES*.

We have accounts in modern geographers and travellers, of people whose heads are as flat as the hand; it being the custom among them to flatten their childrens heads, when newborn, by passing them through a press, or laying them between two planks with a considerable weight thereon.—These are said to be the inhabitants of the province *Colaquas*, on the river *Amazons*, in South America.

Anatomists account the head of man the first, or uppermost venter; being that which comes last in order of dissection, by reason its contents are not so subject to corruption as those of the others.

The head is divided into two parts: the first, the *calvaria*, or scalp, being that part covered with hair.

The second smooth, or without hair, called the *face* or *vifage*; by the Latins *vultus*; and by the Greeks, *prosopon*, q. d. looking forward.

The former is subdivided into four; viz. the *front*, or forehead, which is reputed the moist humid, called by physicians the *sinapit*, q. d. *sumum caput*.

The hind, or back part, called *occiput*; by the Greeks, *inion*; by reason all the nerves, which among them are called *ines*, arise herefrom.

The middle, or top part, called the *crown* of the head, and by anatomists *vertex*, à *vertende*, by reason the hair turns round there.

Lastly, the sides are called the *temples*, *tempora*, as being the places where the hair first begins to turn gray, and discover the age.

The bone, or basis of the head, is called by one general name, *skull*, or *cranium*; consisting of several parts, or lesser bones.

The bone of the forehead is called *os frontis*, or *puppis*, or *coronale*, or *verecundum*; whence impudent persons are said to be *frontless*.

The bone of the scalp is called *os sinapitis*, or *bregma*.

The bone of the back of the head, *os occipitis*, or *prææ*.

And those of the temples, *temporalia*, or *ossa temporis*.

These bones are connected or joined together by sutures.

In the head are seated the principal organs of sense, viz. the eyes, ear, &c. and in it is likewise the *brain*, invested with its *meninges*, the supposed seat of the soul.

The *head* is moved by ten pair of muscles, viz. the *par splenium*, *complexum*, *rectum majus externum*, *rectum minus externum*, *obliquum superius*, *obliquum inferius*, *massoideum*, *rectum internum majus*, *rectum internum minus*, and *rectum laterale*. See each described under its respective article.

The Orientals cover the *head* with a turban, or a cap.—The Occidentals with a hat, &c.

Kings, on solemn occasions, wear the crown on their *head*; bishops the mitre, &c.

The antient cavaliers wore helmets.—The soldiers, casks.

HEAD, is also used for the top of a tree, or other plant.

HEAD, is also applied to the extremity of a bone.

When a bone has a round tip, or end, which advances, or projects forward, whether in the way of an apophysis or epiphysis; it is called the *head* of the bone.

If its rise, or origin, be slender, and it enlarge by degrees, it is called the *neck*.

If it terminate in a point, it is called *corona*, *corvus*, or *coracoides*, as resembling a crow's bill.

When the *head* is flat, they call it *condylus*, or *double head*; as in the extremities of the bones of the fingers.

HEAD, is also used for the extreme of a muscle, which is fastened or inserted into the stable-bone, or the part not intended for motion.

The *head* of a muscle is always a tendon.

HEAD, again, is applied in the mechanic arts, to the parts of inanimate and artificial bodies.

In this sense we say, that some nails have *heads*; others hooks; others, as brads, neither. See **NAIL**.

So also we say, the *head* of a pin, &c.

HEAD, is also used in painting, sculpture, &c. for a picture, or representation of that part of the human body; whether in colours, draught, relieve, or creux.

Those in painting, taken from the life, or supposed to bear a just resemblance to the person; are more properly called *portraits*.

HEAD, in architecture, &c. an ornament of sculpture, or carved work, frequently serving as the key of an arch, or plataband, and on other occasions.

These *heads* usually represent some of the Heathen divinities, virtues, seasons, ages, &c. with their attributes.—As a trident for Neptune, a helmet for Mars, a crown of ears of corn for Ceres, a caduceus for Mercury, a diadem for Juno.

The *heads* of beasts are also used in places suitable thereto: as a bullock's, or sheep's *head*, for a shambles or a market-house; a dog's, for a kennel; a deer's, or boar's, for a park or forest; or a horse's, for a stable, &c.

In the metopes of the freezes, and other parts of certain antique Doric temples, we meet with representations of bullocks, or ram's *heads* fixed; as a symbol of the sacrifices offered there.

In heraldry, the *heads* of men, beasts, birds, &c. are bore in armoury, either full-faced and in front, or side-faced and in profile; which must be distinguished in blazoning—*Vert a chevron gules, between three Turks heads, couped, side-faced, proper*: by the name of Smith.

Among medals, the different *heads* on antient coins; are distinguished by the different dresses thereof. See **MEDAL**. In the Imperial medals, where the *head* is quite bare, it is usually a sign the person was not an emperor, but one of the children of one, or the presumptive heir of the empire.

Though we have instances of those who were only Cæsars, and never reigned, being crowned with lawrel, or adorned with a diadem: as on the contrary, we have some emperors *heads* entirely bare.

The *heads* which are covered, are either covered with a diadem, or a crown, or a simple cask, or a veil, or with some other foreign covering; whereof the diadem is the most antient.—The senate first granted it to Julius Cæsar, to wear the lawrel crown, which his successors took after him.

The *heads* of deities are frequently distinguished by some special symbol thereof.

HEAD, is also applied to monsters; supposed most of them fabulously to have many *heads*. See **MONSTER**, &c.

The serpent Amphispæna, is said by naturalists to have two *heads*.—The poets attribute three *heads* to Hecate, Geryon, and Cerberus: and Typhon and Hydra are said to have an hundred *heads*.

The *head* of the gorgon Medusa, is said to have struck people dead with the very sight.—It has been since they tell us, translated into heaven, and made a constellation; where it still shines as a part or appendage of the constellation Perseus; continuing still to dispense its malific influences, as the astrologers suppose, upon our earth.

The stars, &c. in Medusa's *head*, which is also called from the Arabs, *ras algal*; see among the rest of **PERSEUS**.

HEAD, is also used for the horns of a deer; as a hart, buck, &c.

Harts *meti*, or cast their *heads* every year; and get new ones.

The old hart, or buck, casts his *head* sooner than the young; and the time is about the months of February and March.—Having cast their *heads*, they instantly withdraw into the thickets; hiding themselves in convenient places near good water, &c. and far from the annoyance of flies.

After they have mewed, they begin to *button* again in March, or April, i. e. to shoot out new horns; which at first appear like little branches.

Note, If a hart be gelt before he have a *head*, he will never bear any; and if he be gelt when he has a *head*, he will never after mew or cast it.—If only one of his testicles be taken out, it is said he will want the horn of that side; and that if one of the testicles be only tied up, he will want the horn of the opposite side.

The age of a hart, or deer, is usually reckoned by the number of *heads*.—A deer of the first *head*, the second *head*, &c.

At one year they have nothing but bunches, called *figs*, *figators* of horns to come. The second year they appear more perfectly, but straight and simple: this makes the first *head*, properly called *broches*, and in a fallow deer, *pricks*. The third year they grow into two *spears*, or four, six, or eight small branches. At the fourth, they bear eight or ten: at the fifth, ten or twelve: at the sixth, fourteen or sixteen: at the seventh year they bear their *heads* beamed, branched and summed as much as they will bear; never multiplying further, but only growing in magnitude.

The names and diversities of *heads* in the hunting language, are as follow:

The part that bears the antlers, royals, and tops, is called the *beam*; and the little streaks therein are *glitters*.—That which is about the crust of the beam, is termed *pearls*; and that which is about the bur itself, formed like little pearls, is called *pearls bigger than the rest*.—The *bur* is next the *head*, and that which is about the bur, is called *pearls*.—The first branch is called *antler*, the second *fur-antler*; all the rest which grow afterwards, till you come to the crown, palm, or croche, are called *royals* or *fur-royals*; the little buds or *broches* about the tops, are called *o'c' bes*.

—The *heads* also go by several names: the first *head* is called a *crown-top*, because the croches are ranged in form of a crown.

—The second is called a *pained top*, because the croches are formed like a man's hand.—In all *heads*, which bear not above three or four, the croches being placed aloft all of one height in form of a cluster of nuts, are called *heads of so many croches*: all *heads* which bear two on the top, or have their croches doubling, are called *forked heads*.—All *heads* which have double burs, or the antlers, royals, and croches turned downwards, contrary to other *heads*, are called *simple heads*. See **HUNTING**.

HEAD, is sometimes also used for the whole man.

In this sense we say, to offer a reward for a man's *head*.—

In proscriptions a price is set on a man's *head*.

Capitation is a tax laid upon each *head*; called also *poll* and *head money*.

HEAD, again, is used figuratively in speaking of communities and bodies politic, for the principal or leading member thereof.

Thus, we say, a president, or master, is at the *head* of his company.—A dean is the *head* of his chapter.—The ministers are at the *head* of affairs.

The king of Great Britain, is at the *head* of the protestant world, &c.

HEAD, is also used to denote the relation of priority; or that which comes first in any thing. See **PRIORITY**.

In this sense, we say, the names of authors should always appear at the *head* of their books.—Prefaces, and epistles dedicatory, come at the *head*.—The governor marches out at the *head* of the garrison.

HEAD, in the military art.—**HEAD of the camp**, is the front, or foremost part of the ground an army is incamped on; or that which advances most towards the field, or enemy.—The *head* of the camp is always to be the best fortified.

In the like sense we say, the *head of the trenches*.—The *head of the sap*.—*Of the works*, &c. meaning the front, or those parts next the enemy, and furthest from the body of the place.

Such a night the *head* of the trenches was carried further by an hundred paces.—There are two *heads* of a trench; that is, two attacks. See **TRENCH**, and **ATTACK**.

The *head* of a horn-work, is that part contained between the flanked angles of the two demi-bastions.

HEAD of a ship, or other vessel, is the *prow*, or part that goes foremost. See *Tab. Ship, fig. 2. lit. A. fig. 1. lit. L.*

HEAD, in the manage. The perfections requir'd to the *head of a horse*, are that it be small, narrow, lean and dry.—

Horses with a big, gross *head*, are apt, by their weight, to rest and loll upon the bridle; and so to incommode the rider's hand.—A horse with a large *head* can never look stately, unless

HEA

unless he have a long and very well turned neck, and place his head well.—Horses with gross fat heads, much charged with flesh, are too often subject to infirmities of the eyes.

But the chief thing in a horse's head is a good *onset*, so as he may be able to bring his head into its natural situation; which is, that all the forepart, from the brow to the nose, be perpendicular to the ground; so that if a plummet were applied thereto, it would but just raze or shave it. See HORSE.

The head of a horse is also used to import the action of his neck, and the effect of the bridle and wrift.

Moors HEAD, is understood of a horse with a black head and feet; the body being usually of a roan colour.

Moors HEAD, is also used by engineers, for a kind of bomb or granado, shot out of a cannon.

Moors HEAD, is also used in heraldry, for a representation, usually in profile, of a black-moors head, swathed or rolled about with a bandage; frequently born as a crest.

Moors HEAD, in chemistry, is a cover, or capital, of an alembic, having a long neck, to convey the vapours raised by the fire, into a vessel, which serves as a refrigerator.

In music, the HEAD of a lute, theorbo, or the like, is the place where the pins or pegs are screwed, to stretch or slacken the strings.

Dragons HEAD, in astronomy, &c. is the ascending node of the moon, or other planet. See NODE.

HEAD-ACH, a painful sensation in the muscles, membranes, nerves, or other parts of the head. See CEPHALALGIA. It is supposed to arise from an extraordinary distention of those parts, either by the fluids therein being rarified, or their quantity and motion increased.

When attended with a vomiting, deafness and watching, it portends madness; with a noise in the ears, dulness of feeling in the hands, &c. an apoplexy or epilepsy.

The cure is by bleeding in the jugulars; cupping or applying leeches to the temples, and behind the ears and neck.—Issues, emetics, and diaphoretics are also occasionally to be used; with anti-epileptics and apopleptics.—A vesicatory applied to the whole scalp is the last remedy.

M. Homberg gives us an extraordinary instance of the cure of a most vehement and inveterate head-ach, by an accidental burn of the head.

HEAD-BOROW, signifies the person who is the chief of the frank-pledge; and had antiently the principal direction of those within his own pledge. See FRANK-Pledge.

He was also called *barrow-head*, *burholder*, now *boholder*, *third-borow*, *tything-man*, *chief-pledge*, and *borow-elder*, according to the diversity of speech in divers places.

This officer is now usually called a *high-constable*.

The headborow was the chief of ten pledges; the other nine were called *hand-borows*, or *plegii manuales*, &c.

HEAD-FARCIN. See the article FARCIN.

HEAD-LAND, in husbandry, is the upper part of a ground left for turning the plow; or that part which is ploughed across, at the ends of other lands.

HEAD-MOULD-SHOT, a disease in children, wherein the sutures of the skull, generally the coronal, *ride*; that is, have their edges shot over one another; and are so close locked together, as to compress the internal parts, the meninges, or even the brain itself.

The disease usually occasions convulsions; and is supposed to admit of no cure from medicines; unless room could be given by manual operation, or a division of the sutures.

The head-mould-shot, is the disorder opposite to the horse-shoe head. See HORSE-SHOE-HEAD.

HEAD-SEA, is when a great wave or billow of the sea, comes right ahead of the ship, as she is in her course.

HEAD-STALL, in the manage. See the article CAYESON.

HEALFANG*, **HEALSFANG**, or **HALSFANG**, in our antient customs, signifies *collustrigium*, or the punishment of the pillory. See PILLORY.

* The word is compounded of two Saxon words, *halp*, neck, and *fangen*, to contain, *parna scilicet qua alicui collum stringatur*. See COLLISTRIGIUM. The *healfang* however cannot signify a pillory in the charter of Canutus, *de Forestis*, cap. 14. *Et pro culpa solvat regi duo solidos quos Dani vocant healfang*.

HEALFANG*, is also taken for a pecuniary punishment, or mulct, to commute for standing in the pillory; and is to be paid either to the king, or to the chief lord.

* *Qui solum testimonium dedit, reddat regi vel terræ domino healfang*. Leg. H. I.

HEALING in its general sense, includes the whole process of curing or removing a disorder, and restoring health. In this sense, medicine is defined the art of healing.

HEA

In its more restrained sense, as used in chirurgery, &c. *healing* denotes the uniting or consolidating the lips of a wound or ulcer.

The medicines proper for this intention, are called *incarnatives*, *agglutinatives*, *vulneraries*, &c.

Dr. Beal has a discourse of fanative, or healing springs and waters, in the *Philosophical Transactions*, N^o 20.

HEALING, in architecture, denotes the covering the roof of a building.

The *healing* is various; as of lead, tiles, slate, Horsham stone, shingles, or reed, and straw.

HEALTH, a due temperament, or constitution, of the several parts whereof an animal is composed, both in respect of quantity and quality.—Or it is that state of the body wherein it is fitted to discharge the natural functions perfectly, easily, and durably.

Health, is the state of condition, opposite to *disease*.

The preservation and restoration of *health*, makes the objects of the art of medicine.

The continuance of *health* depends principally on the six non-naturals, viz. air, food, exercise, the passions, evacuation and retention, and sleep and waking. See each in its place.

The antients personified and even deified *Health*; or rather, they erected a goddess to whom they supposed the care of *health* to belong.—The Greeks worshipped her under the name *Hygiea*, and the Latins under that of *Salus*—The place of her worship at Rome was on the *mons Quirinalis*, where she had a temple; and a statue crowned with medicinal herbs.

We frequently find the goddess *Health* on the reverse of medals.—She is represented with a serpent stretched on her left arm, and holding a patera to it with the right. Sometimes she has an altar before her, with a serpent twisted round the same, and raising its head to take something off from it.

The inscription is *SAL. AUG.*

House of HEALTH, a kind of hospital, or public building, for the reception and entertainment of persons infected with the plague, or coming from places infected therewith. See *Pest-house*, *QUARANTINE*, &c.

In the like sense we say, officers of *health*, certificate of *health*, &c.

HEAM, in beasts, denotes the same with *after-birth* in women.

Thyme, penny-royal, winter savory, or common horehound, boiled in white-wine, and given a mare, are esteemed good to expel the *heam*.—Dittany apply'd in a pessary, expels the *heam*, as well as the dead foal: so also do fennel, hops, favin, angelica, &c.

HEARING, *Auditus*, the act, or faculty of perceiving sounds.

Hearing, is reckoned among our external senses.—Its organ is the ear, and particularly the auditory nerve diffused through the same: and its object, certain motions, or vibrations of the air.

Hence, *hearing* may be more scientifically defined a sensation, whereby from a due motion impressed on the fibrille of the auditory nerve, and communicated thence to the sensory; the mind perceives, or gets the idea of sounds.

Philosophers have differed as to the immediate organ of *hearing*.—Aristotle will have it to be the cochlea and tympanum; and takes the sense of *hearing* to be seated therein. *Hist. Animal*. cap. 10. in which he is followed by Galen, Lib. 8. *de usu part.* See TYMPANUM.

The moderns speak of the point on much better ground.—The ear, and the several parts thereof, membranes, canals, labyrinths, nerves, &c. they say are only means, and vehicles, for the reception, modification and transmission of the sonorous matter to the brain; which is the seat of the sense.

A sound, in effect, is nothing but a certain refraction, or modulation of the external air, which being gathered by the external ear, passes through the meatus auditorius, and beats upon the membrana tympani, which moves the four little bones in the tympanum.

In like manner, as this is beat by the external air, these little bones move the internal air, which is in the tympanum and vestibulum; which internal air makes an impression upon the auditory nerve in the labyrinth, and cochlea, according as it is moved by the little bones in the tympanum; so that according to the various refractions of the external air, the internal air makes various impressions upon the auditory nerve, the immediate organ of *hearing*; which different impressions represent different sounds.

Sir Isaac Newton carries the thing somewhat farther, and supposes *hearing*, like seeing, to be performed, not immediately by the vibrations of the air, but by those of some other more subtil medium, excited in the auditory nerves by the tremors of the air, and propagated through the solid capillaments of the nerve to the place of sensation.

The curious structure of the labyrinth, and cochlea, tend to make

make the weakest sounds audible; for the whole organ of hearing being included in a small space, had the auditory nerve run in a straight line, the impression would only have been made on a very small part of it; and the strength of the impression being, *ceteris paribus*, always as the number of parts upon which the impression is made, sounds which are now low, could not have been heard at all.—If the auditory nerve had, like the retina, been expanded into a large web, which had covered or lined some wide cavity, the impression of sounds, even in this case, had been much weaker than they are now: For this large cavity had given room for the sounds to dilate; and all sounds grow weaker, as they dilate.

Both of these inconveniences are prevented by the present structure of the labyrinth and cochlea, whose canals, by their winding, contain large portions of the auditory nerve, upon every point of which the smallest sound being at once impressed becomes audible; and by their narrowness, the sounds are hindered from dilating: and the impressions made upon the nerves by the first dilatations are always the strongest.

The strength of the impression in narrow channels, is likewise increased on account of the elasticity of the sides of the bony canal; which receiving the first and strongest impulses of the air, do reverberate them more strongly upon the auditory nerve.

It may be observed, that though the air be the usual matter of sounds; so that a bell rung in vacuo is not heard at all: yet will most other bodies, properly disposed, do the like office; only some more faintly than others.

Thus may a sound be heard through water, or even through earth; of which we have various instances.

Add, that though the ear be the ordinary organ of hearing, yet Hagerup, a Danish physician, maintains, that one may hear with the teeth.—Thus, if one end of a knife, or the like, be applied on a harpsicord, and the other held between the teeth; the music thereof will be plainly heard, though the ears be ever so closely stopped.—But this, perhaps, may more properly be referred to the sense of feeling.

Such as want the sense of hearing are said to be *muti* or *deaf*. See DEAFNESS.

'The sense of hearing, says Cicero, is always open; for this we have need of even when asleep. The passage to it is full of turns, and meanders; that nothing hurtful may enter or find its way in. And if any little vermin does endeavor to pass; it must flick and be benimed in the *cerumen*, or ear-wax, laid for that purpose near the entrance.' *De Nat. Deor. Lib. II. cap. 57.*

HEARING, is particularly used in civil and judicial concerns, for a cause being brought before the judge and jury, and the parties being heard as to the merits thereof.

Such a cause was kept off eight months, before it was brought to a hearing.—We are to have our hearing the last day of the term.

The hearing of ambassadors at the courts of princes is usually called *audience*.

HEARSE, among hunters, an hind in the second year of her age. See HUNTING.

HEART, *Cor*, in anatomy, a musculous part of the animal body, situate in the thorax; wherein the veins all terminate, and from which all the arteries arise; and which, by its alternate contraction and dilatation, is the chief instrument of the circulation of the blood, and the principle of life.—See *Tab. Anat. (Splanchn) fig. 12. lit. cc.*

This noble part is included in a capsula, or pouch, called the *pericardium*; whose structure and office will be explained under the article PERICARDIUM.

The figure of the heart is a cone, or pyramid reverfed; the upper, and broader point whereof, is called the *basis*; and the lower the *apex*, or point; this is turned a little towards the left side.

The magnitude of the Heart is indeterminate, and different in several subjects, according to their respective dimensions.—Its ordinary length is about six inches, its breadth at the basis four or five; and the whole circumference, fourteen. Its place is in the middle of the thorax, between the two lobes of the lungs; and it is fastned to the mediastinum and pericardium, and supported by the great blood-vessels, to which alone it is immediately connected; being, for the convenience of its motion, disengaged from any other impediments.—It is covered with a thin membrane, which, about the basis, is guarded with fat; and which is no other than the common membrane of the muscles.

It has two great cavities called *ventricles*, somewhat unequal; the right being larger, capable of containing between two and three ounces of blood.—They are divided by a fleshy partition, consisting of the same muscular fibres with the parietes themselves, and called the *septum*; the figure whereof is concave towards the left ventricle, and convex towards the right.—There is no immediate communication between the

ventricles; but for the blood to pass out of one into the other, it must fetch a round through the lungs.

The parietes, or sides of these ventricles, are of a thickness and strength very unequal; the left much exceeding the right, because of its office, which is to force the blood through all the parts of the body; whereas the right drives it through the lungs only, and is therein greatly assisted by other parts.—The right ventricle, in effect, seems only intended with a view to the lungs; whence, in such animals as have no lungs, we only find one ventricle, which is the left.

In the ventricles are little muscles, called *columnæ carneæ*, or *lacertuli*, these are derived from the parietes, and connected, by tendinous extremities, to the valves of the heart hereafter mentioned.

The ventricles are capped each with an auricle, or little muscle, consisting, like the ventricles themselves, of a double order of fleshy fibres.

The vessels, either arising from, or terminating in the heart, and its auricles, are two arteries, *viz.* the aorta, and the pulmonary artery, which have their origin from the two ventricles, *viz.* the aorta from the left, and the pulmonary from the right: and two veins, which terminate in the auricles, *viz.* the cava vein in the right, and the pulmonary vein in the left.

At the respective orifices of these vessels are placed valves. Particularly, at the orifice of the arteries, within each of them, are three semi-lunar valves, or membranes of a semi-lunar figure, which close the orifice of the artery, and hinder the relapse of the blood into the heart at the time of its dilatation.—At the mouth of the right ventricle, just at its juncture with the auricle, are three others called *tricuspidates*, from their three points being fastned by tendinous fibres to the *columnæ carneæ*; so that upon the contraction, or systole of the heart, they close the orifice, and hinder the blood from recurring into the great vein.—The same office do the two mitral valves, at the exit of the left ventricle, stopping the return of the blood into the pulmonary vein.

The substance of the heart is entirely fleshy, or muscular.—

The ancients, indeed, generally took it for what they call a parenchyma; but Hippocrates had a juster sentiment; and after him Steno and the moderns, have evidently found it to consist of a continued series of proper muscular fibres, variously contorted, or wound up, and ending at the orifices of the respective ventricles, where they form their tendons.

In dissecting the heart, after taking off the proper membrane, there appear, on the outer surface of the right ventricle, some slender straight fibres tending to and ending in the basis.—Immediately under these there is a double order of spiral fibres, the exterior whereof ascend obliquely from the septum to the basis, and form a sort of helix, or cochlea: The interior take a contrary course; winding obliquely from the right side towards the left, so as to encompass both ventricles, and ending in the basis on the left side, form likewise an helix of an inverse order.—Under these appear the fibres of the left ventricle; and first, a spiral series running to the left, under which, as in the other ventricle, lie another order running the contrary way, which not only extend to the outward paries, but encompassing the whole ventricle, make the septum more immediately appertain to, and be a part of, the left ventricle. Some of them, instead of terminating, as the rest do, in the tendons of the heart, run inwards, and form the *columnæ carneæ*; while others reaching down to the cone, are wound about it, and form the circle called the *centre of the heart*.

The fibres of the heart appear to be the same with those of the other muscles; whence the part now generally passes for a real muscle; though some think that inference not over just, inasmuch as the aorta has the same claim to be reputed a muscle.

Some late authors, upon considering the structure and disposition of the spiral fibres, chuse rather to make the heart a double muscle, or two muscles tied together.—In effect, the two ventricles, with their respective auricles, are found two distinct bodies, two vessels or cavities, which may be separated, and yet remain vessels; the septum, which was supposed to belong only to the left, being now found to consist of fibres derived from them both.—To say no more, the two ventricles, according to M. Winslow, are two several muscles united together, not only by the septum, but by several plans of fibres arising from the exterior base of the heart, and meeting at the apex, which entering the left ventricle, lines the parietes, &c.

The heart has also its proper blood-vessels, *viz.* two arteries springing from the entrance of the aorta; and one larger vein, with one or two lesser; all which, from their encompassing the heart, are called *coronariæ*.

The nerves of the heart and its auricles, come from a plexus of the par vagum, called by Willis, *plexus cardiacus*. It has also lymphæducts, which carry the lymph from the heart to the thoracic duct.

The use of the *heart* and its appendant auricles, is to circulate the blood through the whole body: in order to which, they have an alternate motion of contraction and dilatation.—By the dilatation, called the *diastole*, their cavity is opened, and their internal dimensions enlarged to receive the reflux blood from the veins; and by their contraction, called the *systole*, their cavity is shrunk, and their dimensions lessened, to expel the blood again into the arteries.

It must be added, that these alternate motions of the *heart* and auricles, are opposite in time to each other; the auricles being dilated whilst the *heart* is contracted again; and contracted whilst it is dilated, to drive the blood into it.

By means of the right ventricle, the blood is driven through the pulmonary vein, from which being received into the pulmonary artery, it is returned to the left ventricle; from which by the aorta, it is distributed all over the rest of the body, and thence returned to the right ventricle by the vena cava; so making an entire circulation through the whole body.

Schenchius gives an account of a man who had no *heart*; but Molinetti denies it: as also that there ever were two *hearts* found in any man, though the case be common in divers insects, which have often naturally several *hearts*; witness silk-worms, which have a chain of *hearts* running the whole length of their bodies. But we have in other authors instances of two *hearts*, even in the same man.—There have been *hearts* found all gnawed and devoured with worms: Muretus opened the *hearts* of some banditti, which were all hairy, or at least invetted with a tomentum, or down.—And what is still more extraordinary, we have accounts of persons in whom the *heart* has been found inverted, or turned upside down; particularly in a woman hanged some time ago in Saxony, and a man hanged at Paris. *Journ. des Scav.*

Timorous animals have always larger *hearts* than courageous ones; as we see in deer, hares, asses, &c.—There is a bone sometimes found in the basis of the *hearts* of certain animals, particularly deer, which seems to be no other than the tendons of the fibres of the *heart* indurated and ossified.

Historians relate, that Pope Urban VIII. being opened after his death, was found to have such a bone in his *heart*. The case is very useful in the trunk of the aorta, which springs from the *heart*.

Many amphibious creatures, as the frogs, &c. have but one ventricle in the *heart*.—The tortoise is said by the French academists to have three ventricles: M. Buffiere charges this on them as a mistake; and maintains it has but one. The point is scarce yet ascertained. *Mem. de l'Acad. an. 1703. and Philoceph. Transact. N° 328.*

Theory of the motion of the HEART.—The principle of motion in the *heart*, or the power from which its alternate contraction and dilatation arises, has been greatly controverted among the late physicians and anatomists.

The expulsion of the blood out of the ventricles, argues a very considerable motion in the part.—The motive power, it is certain, must surmount the resistance made to it; and according to Borelli's computation, the resistance made to the motion of the blood through the arteries, is equal to 180000 pounds, which therefore are to be removed by the *heart*; or else the circulation must cease. Now, whence comes the machine of the *heart* to have such a power? And after the expulsion, what other power is it that surmounts the former, and restores its part to the dilatation, that is to produce a reciprocal action? This whole affair remained in the utmost darkness and uncertainty, till Dr. Lower's excellent treatise *De Cordis*, where the mechanism, whereby the contraction, or systole, is effected, was admirably explained.—The cause of the dilatation, or diastole, which Dr. Lower had in great measure over-looked, has since also been happily supplied by Dr. Drake.

That the *heart* is a muscle, furnished and instructed for motion like other muscles, is abundantly demonstrated by Dr. Lower and others; and as it is a solitary muscle, without any proper antagonist, and not directly under the power of the will, nor exercising voluntary motion, it approaches nearest to the sphincter kind, all which have these conditions in common with it.

But in constant, and regular alternations of contraction and dilatation, the *heart* differs exceedingly from all the other muscles of the body.

This alternation has given the learned abundance of trouble, who finding nothing peculiar in the structure, which should necessarily occasion it; nor any antagonist, whose re-action should produce it; have been extremely perplexed to find out the cause.

That contraction is the proper action and state of all muscles, is evident both from reason and experience. For if any muscle be freed from the power of its antagonist, it immediately contracts: and is not by any action of the will or spirits to be reduced to a state of dilatation.—Thus, if the flexors of any joint be divided; the extensors of that joint being by that means freed from the contrary action of their

antagonists, the joint is immediately extended, without any consent of the will, and in that state it remains; and so *vice versa*, if the extensors be divided.

Hence it appears, that the ordinary muscles have no restitutive motion, but what they derive from the action of their antagonists, by which they are balanced.—Thus the sphincters of the anus, vesica, &c. having no proper antagonists, are always in a state of contraction, and suffer nothing to pass them, but what is forced through them by the contrary action of some stronger muscles, which, though not properly called antagonists, yet on all necessary occasions, perform the office of such.

We have here, then, an adequate cause of the contraction of the *heart*, viz. the natural vis motrix of muscular fibres, whose proper natus, or tendency, is to contract themselves.

It may be added, however, that though the muscular fibres of the *heart*, acted by the nerves, be the immediate instrument of its contraction, or systole, as is shewn by Dr. Lower, yet is there another cause which contributes not a little thereto, and which Dr. Lower overlooked, viz. the intercostal muscles and diaphragm, which aid and facilitate this contraction, by opening a passage for the blood through the lungs, which denied, would be an invincible obstacle.—Add, that the pulmonary artery and vein, spreading themselves throughout all the divisions and subdivisions of the bronchia of the lungs, and being as it were co-extended therewith, must suffer the like alteration of superficial dimensions, as the bronchia do in the elevation and depression of the costae. So that while the ribs are in a state of depression, whether before commerce with the external air, or after, the annular cartilages of the bronchia shrink one into another, and by that means their dimensions are exceedingly contracted: in conformity to which condition of the bronchia, the pulmonary artery and vein must likewise, either by means of their muscular coats, contract themselves to the same dimensions, or lie in folds or corrugations; which is less probable.—On the other hand, when the ribs are elevated, and the diaphragm bears downwards, the air rushing into the lungs, shoots out the cartilaginous rings, and divaricates the branches of the trachea, and by them extends the several divisions of the pulmonary artery and vein, and thereby lengthens and enlarges their cavities: and thus their alternate action will be continued, and imparted to the *heart*; from which they arise.

Thus is a passage opened to the blood from the right ventricle of the *heart*, to the left, through the lungs, to which it could not otherwise pass; and the opposition which the blood, contained in that ventricle, must otherwise necessarily have to its contraction, is taken off; and the systole thereby facilitated.

For the diastole, or dilatation of the *heart*, Dr. Lower contents himself to ascribe it to a motion of restitution of the over-strained fibres.—His words are, 'Since all its motion consists in its contraction; and the fibres of the *heart* are made for contraction only; it is evident, all the motion of the *heart* is in its systole: but, as the fibres are stretched beyond their tone in every contraction; for this reason, after that natus is over, the *heart* relaxes again by a natural motion of restitution, and is distended by the influx of new blood from the veins. The diastole, then, is not effected by any further action of the *heart*, before a remission of its former tension, and the influx of the blood.'

Now, if contraction be the sole action of those fibres, as it certainly is, and as the author here confesses; how can their distention, vulgarly, though improperly, called their relaxation, be a motion of restitution? for, from the nature of those fibres, and their disposition; the structure of the *heart* manifestly appears conical, and its dilatation a state of violence. So that the contraction is the true motion of restitution, and the only state to which it will spontaneously return when the force is taken off; and thus we are left still to seek for the true cause of the diastole, which appears the most difficult phenomenon relating to the *heart*.

Mr. Cowper, in his introduction to his anatomy, improves on the share Dr. Lower hints the blood to have in that action, and makes it the main instrument of the dilatation of the *heart*; in which he is followed by Dr. Drake; who, however, differs from him as to the manner, and reasons of its being so. 'The *heart* of an animal, says Mr. Cowper, bears a great analogy to the pendulums of those artificial automata, clocks and watches; while its motion is performed like that of other muscles, the blood doing the office of a pendulum.'—If he means that the blood, in its reflux, by gravitating on the auricles and ventricles, dilates and expands them; acting therein as a counterpoize to its contraction as a muscle; it is pity he had not given an explication at large of so abstruse and important a phenomenon: the specific gravity of the blood not seeming a cause adequate to the effect it is here supposed to produce.—For if the blood act only as a weight, by meer gravitation; so much of it only as descends from above the *heart*, can be employed in that action; which,

which, at the largest computation, does not amount to above five pound weight, and yet it must be able, according to the computation of Borelli, to overcome a resistance of 135,000 pound. Whatever, therefore, the force that dilates the heart, and is the cause of the diastole, be, it must be equal to that of the heart, the intercostal muscles and diaphragm; to all which it acts as an antagonist.

Such a power is hard, perhaps impossible to be found in the machine of an animal body; and yet without some such antagonist, it is as impossible the circulation of the blood should be maintained.---All the engines yet discovered within the body, conspire towards the constriction of the heart, which is the state of quiescence, to which it naturally tends; yet we find it alternately in a state of violence, or dilatation: and on this alternation does all animal life immediately depend.

Some external cause, therefore, must be found to produce this phenomenon; which cause must be either in some quality of the air, or the pressure of the atmosphere, because we have no constant and immediate commerce with any other media.

Some physicians observing this, and that, deprived by whatever means of communication with the external air, we became instantly extinct; have imagined, that in the act of inspiration, certain purer parts of the air were mixed with the blood in the lungs, and conveyed along with it to the heart, where they nourished a sort of vital flame, which was the cause of this reciprocal æstus of the heart.

Others, rejecting an actual flame, have fancied that these fine parts of air, mixing with the blood in the ventricles of the heart, produced an effervescence which dilated it.

But these notions have been long exploded, upon ample conviction; and it is a point yet undetermined, whether any air does mix with the blood at all in the lungs, or not.

But supposing that some air do insinuate itself into the pulmonary vein, it can no other way dilate the heart, than by an effervescence in the left ventricle, which would not dilate the right.---But even this opinion is contradicted by autopsy, and abundantly confuted by divers authors.

Upon the whole, the gross body of the atmosphere appears to be the true antagonist to all the muscles serving for ordinary inspiration, and the constriction of the heart; which is confirmed not only from its sufficient power, but from the necessity of its action upon animal bodies.

The heart, we have observed, is a solitary muscle, of very great strength; and the intercostal muscles and diaphragm, which likewise have no antagonists, are a vast additional force, which must be balanced by the contrary action of some equivalent power, or other. For though the action of the intercostal muscles be voluntary, it does not exempt them from the condition of all other muscles serving for voluntary motion, which would be in a state of perpetual contraction, notwithstanding any influence of the will, were it not for the liberation of antagonist muscles. This liberation, between other muscles, is answered by the weight of the incumbent atmosphere, which presses upon the thorax, and other parts of the body. And as in all other voluntary motions, the influence of the will only gives a prevalence to one, of two powers before equilibrated; so here it serves to enable those muscles to lift a weight too ponderous for their strength not so assisted: so that as soon as that assistance is withdrawn, the ribs are again depressed by the mere gravitation of the atmosphere, which would otherwise remain elevated, through the natural tendency of those muscles to contraction.---This is evidently proved from the Toricellian experiment, and those made upon animals in vacuo; where, as soon as the air is withdrawn, and the pressure thereby taken off, the intercostal muscles and diaphragm are contracted, and the ribs elevated in an instant, and cannot by any power of the will be made to subside, till the air is again let in to bear them forcibly down.

As in the elevation of the ribs, the blood, by the passage opened for it, is in a manner solicited into the lungs; so in their depression, by the subsidence of the lungs, and contraction of the blood-vessels consequent thereto, the blood is forcibly driven through the pulmonary vein into the left ventricle of the heart. And this, together with the general compression of the body by the weight of the atmosphere which surrounds and presses on its whole surface, is that power which causes the blood to mount in the veins, after the force impressed upon it by the heart is broken and spent, and which suffices to force the heart from its natural state to dilatation.

Upon computing the weight of a column of air equal to the surface of the body, it appears a power sufficient for the effects here ascribed to it: and considering that the bodies of animals are compressible machines, it appears that it must of necessity affect them in the manner here laid down.---And yet, though our bodies be entirely composed of tubuli, or vessels filled with fluids, this pressure, how great soever, being equal, every way, could not affect them, were it not that the superficial dimensions are equally variable: because, being compressed on all parts with the same degree of force, the contained fluids could not any where begin to recede, and make

way for the rest to follow, but would remain as fixed and immoveable, as if they were actually solid.

But, by the dilatation of the thorax, room is made for the fluids to move; and by the coarctation of it, fresh motion is impressed; which is the great spring whereby the circulation is set and kept going.

This reciprocal dilatation and contraction of the superficial dimensions of the body, seems so necessary to animal life, that there is not any animal so imperfect as to want it, at least none to which our anatomical enquiries have yet reached.---For though most kinds of fish, and insects, want both moveable ribs and lungs, and consequently have no dilatatable thorax; yet that defect is supplied by an analogous mechanism, answering sufficiently the necessities of their life.---Thus, fishes, which have no lungs, have gills to do the office of lungs, receiving and expelling alternately the water, whereby the blood-vessels suffer the same alteration of dimensions, as in the lungs of more perfect animals.

Add, that the lungs, or air-vessels, of insects, are much more different from those of perfect animals, than those of fishes are; and yet in their action and use, they agree perfectly with both; that is, removing and expelling the air, and varying the dimensions and capacities of the blood-vessels. Having no thorax, or separate cavity for the heart and air-vessels, the latter are distributed through the whole trunk; by which they communicate with the external air through several spiracles or vent-holes, to which are fitted so many little tracheæ or wind-pipes, which thence send their branches to all the muscles and viscera, and seem to accompany the blood-vessels all over the body, as they do in the lungs of perfect animals. By this disposition, in every inspiration, the whole body is inflated, and in every expiration compressed; and consequently the blood-vessels must suffer a vicissitude of extension and contraction, and a greater motion be thereby impressed on the contained fluids, than the heart, which in these creatures does not appear to be muscular, would be capable of giving.---The only animal, exempted from this necessary condition of receiving and expelling alternately some fluid in and out of the body, is a fetus: but this, while included in the womb, seems to have little more than a vegetative life; and ought scarce to be reckoned among the number of animals: and were it not for that small share of muscular motion which it exercises in the womb, it might, without absurdity, be accounted a graft upon, or branch of the mother.

One difficulty we must not here conceal, which will lie against the whole doctrine, viz. that the hearts of several animals have been found to beat regularly, and strongly, even in vacuo; not less so than in the air. Witness the hearts of frogs, tried by Mr. Boyle. *Philosoph. Transact.* No 62.

Estimate of the force of the HEART.---The quantity of the force of the heart has been variously estimated, and on various principles; by various authors, particularly Borelli, Morland, Keill, Jurin, &c.

The force of the heart may be defined by the motion whereby the heart contracts; or by the motion of a weight which being opposed to the blood at its exit out of the heart, will just balance and stop the same.---This we have no way of coming at *a priori*; the internal structure of the part, and the nature and power of the contracting cause, being but imperfectly known: so that the only means remaining, is to estimate it by the effects.

All the action of the heart consists in the contraction of its ventricles: the ventricles contracting, strike or press upon the blood, and communicating part of their motion thereto, drive it out with vehemence where the passage is open.---The blood thus protruded into the aorta, and pulmonary artery, presses every way; partly against the coats of the arteries, which by the last diastole had been left in a collapsed, flaccid state; and partly against the anterior blood moving on too slowly before it. By such means the coats of the arteries are gradually distended, and the antecedent blood has its motions accelerated.---By the way it may be observed, that the more flaccid the arteries are, the less resistance will they make to a dilatation; and the more they are dilated, the more strongly will they resist a further distraction; so that the force of the blood, at its egress out of the heart, is at first spent in distending the arteries, more than in protruding the antecedent blood; but afterwards more in protruding the blood, than in distending the arteries.

Borelli, we have already observed, in his *Oecon. Animal.* makes the obstacles to the motion of the blood through the arteries, equivalent to 180,000 pound; and the force of the heart itself, only equal to 3,000 pound, which is only $\frac{1}{60}$ of the opposition it has to overcome. Then, deducting 45,000 pound for the adventitious help of the muscular elastic coat of the arteries; he leaves the heart with a force of 3,000 pound to overcome a resistance of 135,000 pound; that is, with 1 to remove 45; which he supposes it enabled to do by virtue of percussion.

But had he proceeded in his calculation to the veins, which he allows

allows to contain quadruple the quantity of blood found in the arteries, and to which this energy of percussio*n* either does not reach at all, or but very languidly; he would readily have seen the system of percussio*n* to be insufficient.

But the *lyrion* or *perichloron* to be intended. Then his calculus itself is also found to be faulty; the force ascribed by him to the *heart* being immensely too great---D. Jurin shews, that had he not made a mistake in the computation, the resistance which the *heart* has to overcome, must have come out, on his own principles, much greater; and instead of 135,000 pound, would have been 1,976,000 pound, which transcends all probability.

The great faults in his solution consist, according to Dr. Jurin, in his estimating the motive force of the *heart* by a pondus at rest; in supposing the whole weight sustained by a muscle, in one of his experiments, to be sustained wholly by the contracting force thereof; in assuming muscles, equally heavy, to be of equal force: and in supposing the utmost force of the *heart* exerted at every systole.

Dr. Keill, in his *Essays of the Anim. Oecon.* first ventured to set aside Borelli's calculus; and substituted another, almost infinitely smaller, in its stead. His method of estimating the force of the *heart* is as follows:—Having the velocity wherewith a fluid flows out at an orifice, without meeting any re-

A distance from an anterior fluid; the force which produces that motion is thus determined. Let the line AB be the height from which a falling body will acquire a velocity equal to that wherewith the fluid flows out at the orifice; then is the force which produces the motion of this fluid, equal to the weight of a cylinder of the same fluid, whose base is equal to the orifice, and weight equal to 2 AB. Coroll. 2. Prop. 36. Lib. II. Newton. *Princip.*

Now, the blood flowing out of the *heart*, is refitted in its motion by the anterior blood in the arteries and veins, and therefore cannot flow with all the velocity the force of the *heart* will give it; part of that force being spent in overcoming the resistance of the mass of blood. If therefore we knew how much the velocity of the blood is diminished by this resistance, or what proportion the velocity of the blood refitted, has to the blood driven out, and not refitted; having already determined the velocity of the blood as it is refitted, we might easily recollect the velocity by which the blood would flow were it not refitted; and from thence find the absolute force of the *heart*. To find this, the author made the following experiment.—Having uncovered the iliac artery and vein in the thigh of a dog, near his body; and passed convenient ligatures under them; he opened the whole diameter of the vein, and received the blood which run from it in the space of ten seconds: The fame was afterwards done by the artery, for the same space of time; and both the quantities of the blood were exactly weighed. The experiment was repeated for the greater security: till, the quantity of blood from the artery, was found at a medium, to that from the vein in the same space of time, nearly as $7\frac{1}{2}$ to 3.

Now, the velocity of the blood in the iliac artery, so near the aorta, must be nearly the same with that in the aorta itself; and consequently the velocity with which it flows out of the iliac artery cut afunder, is the same with which it would flow out of the *heart* unrefisted: or, the blood runs through a wound in the iliac artery, with all the velocity it received from the *heart*. Now all the blood which runs along the iliac artery, returns again by the iliac vein; and consequently, the quantities of blood which pass through both in the same space of time, are equal. The quantity of blood, therefore, which runs out of the iliac vein cut afunder, is the same which ran through the iliac artery, before it was cut, in that space of time. Having, therefore, the quantity which runs through the iliac artery when it is cut, and when it is not cut, we have their velocities; for the velocity of a fluid, running through the same canal, in equal spaces of time, is directly as their quantities: but the velocity of the blood, when the artery is cut, is equal to that it receives by the full force of the *heart*; and the velocity when it is not cut, is that velocity with which the blood moves through the aorta, refisted by the anterior blood: and therefore these two velocities are to one another, as $7\frac{1}{2}$ to 3.

If now the heart throw out two ounces of blood every systole, which is a probable assumption, then the blood moves through the aorta at the rate of 156 feet in a minute; and therefore the absolute velocity wherewith the blood would be forced into the aorta, did it find no resistance, is such as would make it move 390 feet in a minute, or $6\frac{1}{2}$ feet in a second.

We now proceed to enquire, what is the height from which a falling body will acquire this given velocity? for this height doubled, gives the length of the cylinder whose base is equal to the orifice of the aorta, and weight equal to the absolute force of the heart.

It is known by experiment, that the force of gravity will make a body move 30 feet in a second, which is the velocity it acquires in falling through 15 feet; and therefore this velocity is to the velocity of the blood flowing without resistance into the aorta, as 30 to 6.5: But because the heights from which bodies acquire given velocities, are as the squares of

the velocities, that is, as 900 to 42.25; therefore, as 900 to 42.25, so is 15 to 0.74. This height doubled, gives 1.48, or in inches 17.76; which is the height of a cylinder of blood, whose base is equal to the aorta, which we have supposed to be equal to 0.4187; and therefore the solid content is 7.436112, the weight of which is equal to the absolute force of the heart.

This weight is five ounces, whence the force of the *heart* is found equal only to the weight of five ounces.

The same author, by another method of calculating from the laws of projectiles, finds the force of the *heart* almost equal to eight ounces, which though somewhat more than was before determined, yet the difference is of small moment in respect of *Borelli's* account; the great failing in whose calculation *Dr. Keill* takes to arise from his not distinguishing between the blood at rest, and the blood already in motion.— The force of the *heart*, it is certain, is not employed in giving motion to any quantity of blood at rest, but only to continue it in motion; how that motion first arose, seems out of the human capacity to determine. It is demonstrable, that if the resistance of the blood always bore the fame proportion to the force of the *heart* it does now, the blood never could at first be put in motion by the *heart*. If the blood constantly moved forwards, with the motion first communicated to it, and did the coats of the vessels make no resistance; the posterior blood would not be retarded by the anterior, and the force of the blood would equal the entire force of the mover. But because of the resistance made by the coats of the blood-vessels, and the force which is spent in diffusing them, the blood is continually retarded in its motion as it circulates and would in a short time stop, were not the motion lost made up again by a fresh impulse from the *heart*; and therefore the force of the *heart* must be equal to the resistances the blood meets with in its motion: If it were more, the velocity of the blood would be continually increasing; if less, it would continually decrease; and at last stop: And hence it is evident, that if the circulation of the blood was once stopped, all the force of the *heart* could never set it moving again.

Thus much for Dr. Keill's system :—Dr. Jurin charges even this with its defects; and particularly in that it supposes the weight, whereby the motion of water running out at a vessel may be generated, to be what generates that motion: which this last author takes for a misapprehension of Sir Isaac Newton's corollary; urging, that the water falling by the power of gravity, acquires its motion of itself; and that the weight falling the same time, only receives a motion equal to that of the water out of the vessel.—There are some other points which he objects against, and of which the learned author has an express vindication in the *Philosophical Transactions*; to which his antagonist has since replied; but the author dying in the mean time, the dispute ceas'd.

Dr. Jurin, however, proceeds to give another computation, on more unexceptionable principles; though his adversary has found occasion therein for recrimination.

He considers one of the ventricles of the *heart* impelling the blood, as a given body impelling another at rest, with a given velocity; and after communicating part of its motion thereto, proceeding with the same common velocity. On which principle, the force of the *heart* will either be equal to the factum of the weight of the ventricle, and its initial velocity ere it impels the blood; or to the sum of the motions of the ventricle and the blood flowing out of the fame, and the motion communicated to the coats of the arteries and the antecedent blood.

Now it is demonstrable, 1^o. That the motion whereby a hollow machine, unequally contractile does act in contraction, is equal to the sum of the factums of the several particles of the machine multiplied into their respective velocities. Whence it follows, that the motion of the machine is equal to the factum of its weight into some mean velocity between the particles moved swiftest, and those moved slowest.—2^o. That if the water be expreffed out of the orifice of such a machine, the motion of the water bursting out of the fame, will be equal to the sum of the facta of any transverse sections of all the threads of water, severally multiplied into their respective lengths and velocities: Whence it follows, that the motion of the water is equal to the factum of the water issuing out at the orifice into some mean length between that of the longest thread and the shortest. Hence, also, if there be several such machines full of water, and contracted alike, whether equally or unequally, the motion of the water, bursting out at the orifice of one of them, will be in a ratio compounded of the quadruple ratio of any homologous diameter of the machine, and the reciprocal ratio of the time wherein the contraction is effected.

From these data is drawn a solution of the problem, *To find the force of the heart.*—For, calling the weight of the left ventricle, or the quantity of blood equal to the same, p ; the inner surface of the ventricle, S ; the mean length of the filaments, or threads of blood expelled from the same, l ; a section of the aorta, s ; the quantity of blood contained in

the left ventricle, q ; the time wherein the blood would be thrown out of the heart, were the resistance of the arteries and antecedent blood removed, t ; the variable velocity, where-with the blood would flow through the aorta, if the resistance were taken away, v ; the variable length of the aorta, passed over by the blood, x ; and the time wherein the length x is run, z .—The mean variable velocity of the blood contiguous to the ventricle, or the mean velocity of the ventricle itself,

will be $= \frac{sv}{z}$; the motion of the ventricle, $= p \times \frac{sv}{z}$; the

motion of the blood issuing out, $= sv \times l + x$; and their

sum, or the force of the ventricle, $= v \times \frac{p}{s} + l + x$. But,

$v = \frac{x}{z}$; whence, by the inverse method of fluxions, the

force of the ventricle is found $= \frac{px}{z} \times \frac{p}{s} + \frac{x}{z} + l$. But since

$z = t$; $sv = q$. And hence, the force of the ventricle $=$

$\frac{q}{t} \times \frac{p}{s} + l$. After the like manner, the force of the right

ventricle (noting the same things by Greek letters, which in

the left are denoted by Italic ones, is found, $= \frac{q}{t} + \frac{p}{s} + \frac{q}{2s} + \lambda$.

So that the whole force of the heart, is $= \frac{q}{t} \times \frac{p}{s} + \frac{p}{s} + \frac{q}{2s}$

$+ \frac{q}{2s} + l + \lambda$. Q. E. J.

If now we suppose $p = 8$ ounces, and $s = 4$ ounces avoird. $S = 10$ square inches, and $z = 10$ as much; $l = 2$, and $\lambda = 1$; inches; $q = 2$ ounces avoird. $s = 0, 4185$ square inches, $\sigma = 0, 583$; and $t = 0, 4$. The forces of the ventricles will be equal to the weights under-written, viz. lib. oz.

Of the left ventricle " " " 9 1

Of the right ventricle " " " 6 3

Force of the whole heart " " " 15 4

Which weights have a velocity, wherewith they would move an inch each second of a minute.

Coroll. Hence it is inferred, that when the pulse is quicker than ordinary, either the resistance is less than ordinary, or the force of the heart is increased, or a less quantity of blood than usual is expelled at each contraction of the heart; and vice versa.—As also, that if the resistance be either increased or diminished, either the pulse, or the quantity of blood expelled at each contraction, will be either increased or diminished respectively.—And that if the force of the heart be increased or diminished, either the pulse must be accelerated, or the resistance diminished.

On these principles Dr. Jurin proceeds to demonstrate the three following theorems.

1^o. That the whole motion of resistance made to the blood issuing out of the heart in the systole, or the whole motion communicated to the antecedent blood and the coats of the arteries, is equal to the whole force of the heart; quam proximè.

2^o. That the motion communicated to the antecedent blood in a systole, is to the motion communicated to the coats of the arteries, as the time of the systole is to the time of the diastole. Whence if, with Dr. Keil, we suppose the systole performed in one third of the interval between two pulses, the motion communicated to the antecedent blood will be one third of the whole motion of the heart; and that communicated to the arteries, two thirds.

3^o. In different animals, the force of the heart is in a ratio compounded of the quadruple ratio of the diameter of any homologous vessel, and the inverse ratio of the time wherein the heart is contracted; or a ratio compounded of the ratio of the weight either of the heart, or the whole animal, the subtriplicate ratio of the same weight, and the reciprocal ratio of the time.

HEART-BURN, a disease, among physicians usually called *cardialgia*.

The testaceous powders, as oyster-shells, crabs eyes, chalk, &c. are the usual remedies for the heart-burn.

HEART of a tree, the middle part thereof, taken longitudinally, is called so.

HEART, in the manage.—A horse that works in the manage with constraint and irresolution, and cannot be brought to consent to it, is said to be a horse of two hearts.

HEARTH-MONEY. See the article CHIMNEY-MONEY.

HEARTH-STONES. See the article FIRE-STONE.

HEAT, Calor, one of the primary qualities of bodies; opposed to cold.

Heat may be defined a physical being, whose presence is known, and its degree measured by the expansion of the air, or spirit, in the thermometer.

Heat in us is properly a sensation, excited by the action of fire: or it is the effect of fire on our organs of feeling.

VOL. I.

Hence it follows, that what we call heat, is a particular idea; or modification of our own mind; and not any thing existing in that form in the body that occasions it.—Heat is no more in the fire that burns the finger, than pain in the needle that pricks it.—In effect, heat, in the body that gives it, is only motion; and in the mind, only a particular idea or disposition of the soul.

Heat, with respect to our sensation, of the effect produced on us by a hot body, is estimated by its relation to the organ of feeling; no object appearing to be hot, unless its heat exceed that of our body: whence, the same thing to different persons, or at different times to the same person, shall appear both hot and cold.

Heat, as it exists in the hot body, or that which constitutes and denominates a body hot, and enables it to produce such effects on our organ; is variously considered by the philosophers.—Some will have it a quality, others a substance, and others only a mechanical affection, viz. motion.

Aristotle, and the Peripatetics define heat a quality, or accident, whereby homogeneous things, i. e. things of the same nature and kind, are collected or gathered together; and heterogeneous ones, or things of different natures, are severed or disunited.—Thus, says he, the same heat which associates and brings into a mass several particles of gold before separate, separates the particles of two metals before mixed together.

But, not only the doctrine, but the very instance he produces, is faulty: For heat, though continued to eternity, will never separate a mass, e. g. of gold, silver, and copper: and, on the contrary, if bodies of different qualities, as gold, silver, and copper, be put separately in a vessel over a fire; notwithstanding all their heterogeneity, they will be mixed and congregated into a mass thereby.

In effect, heat cannot be said to do either this thing or that universally; but all its effects depend on the circumstances of its application.—Thus, to do the same thing in different bodies, different degrees of heat are required; as, to mix gold and silver, the heat must be in one degree, and to mix mercury and sulphur, in another.

Add, that the same degree of heat shall have opposite effects:—Thus a vehement fire shall render water, oils, salts, &c. volatile; and yet the same fire shall imbue sand and fixed alkaline salt into glass.

The Epicureans, and other corpuscularians, define heat not as an accident of fire, but as an essential power or property thereof, the same, in reality with it, and only distinguished therefrom in the manner of our conception.

Heat, then, on their principles, is no other than the volatile substance of fire itself, reduced into atoms, and emitted in a continual stream from ignited bodies; so as not only to warm the objects within its reach, but also, if they be inflammable, to kindle them, turn them into fire, and conspire with them to make flame.

In effect, these corpuscles, say they, flying off from the ignited body, while yet contained within the sphere of its flame, by their motion constitute fire; but when fled, or got beyond the flame, and dispersed every way, so as to escape the apprehension of the eye, and only to be perceivable by the feeling, they take the denomination of heat; inasmuch as they still excite in us that sensation.

The Cartesians, improving on this doctrine, assert heat to consist in a certain motion of the insensible particles of a body, resembling the motion whereby the several parts of our body are agitated by the motion of the heart and blood.

Our latest, and best writers of mechanical, experimental, and chemical philosophy, differ very considerably about heat.—The fundamental difference is, whether it be a peculiar property of one certain immutable body called fire; or whether it may be produced mechanically in other bodies, by inducing an alteration in the particles thereof.

The former tenet, which is as ancient as Democritus, and the system of atoms, had given way to that of the Cartesians and other mechanists; but is now with great address retrieved and improved on by some of the latest writers, particularly Homberg, the younger Lemery, Gravefande, and above all, by the learned and industrious Boerhaave, in a course of lectures expressly on fire; the result whereof we have already laid down under the article FIRE.

The thing we call fire, according to this author, is a body, sui generis, created such ab origine, unalterable in its nature and properties, and not either producible de novo, from any other body, nor capable of being reduced into any other body, or of ceasing to be fire.

This fire, he contends, is diffused equably every where, and exists alike, or in equal quantity, in all the parts of space, whether void, or possessed by bodies; but that naturally, and in itself, it is perfectly latent and imperceptible; and is only discovered by certain effects which it produces, and which are cognizable by our senses.

These effects are heat, light, colour, rarefaction and burning; which are all indications of fire, as being none of them pro-

ducible by any other cause: So that wherever we observe any of these, we may safely infer the action and presence of fire.—But, though the effect cannot be without the cause, yet the fire may remain without any of these effects; any, we mean, gross enough to affect our senses, or become objects thereof: and this, he adds, is the ordinary case; there being a concurrence of other circumstances, which are often wanting, necessary to the production of such sensible effects. Hence, particularly, it is, that we sometimes find several, and sometimes all of these effects of fire together, and sometimes one unaccompanied with any others; according as the circumstances favour or dispoise things for the same.—Thus we find light without heat; as in rotten wood, putrid fishes, or the mercurial phosphorus: nay, and one of them may be in the highest degree, and the other not sensible; as in the focus of a large burning-glass exposed to the moon; where, though the light, as Dr. Hooke found, was sufficient to have instantly blinded the best eye, yet no heat was perceivable, nor was there the least rarefaction occasioned in an exquisite thermometer.

On the other hand, there may be heat without light, as we find in the solid phosphorus; in fluids, which emit no light even when they boil, and not only heat and rarely, but also burn or consume the parts; and in metals, stones, &c. which conceive a vehement heat before they shine, or become ignited.—Nay, and there may be the most intense heat in nature without any light: Thus in the focus of a large burning concave, where metals melt, and the hardest gems vitrify, the eye perceives no light; so that should the hand happen to be put there, it would be instantly turned into a coal, or even a cask. So also rarefactions are frequently observed by the thermometer, in the night time, without either heat or light, &c.

Thus it appears, that the effects of fire have a dependance on other concurring circumstances; some more, and others less.—One thing seems to be required in common to them all, viz. that the fire be collected or brought into less compass: without this, as fire is every where equally diffused, it could have no more effect in one place than another, but must either be disposed to warm, burn, and shine every where, or no where. Indeed, such every where does amount to no where; for to have the same heat, &c. in every place, would be to have no heat at all: It is only the changes that we perceive; those alone make the mind distinguish in its state, and become conscious of the things that diversify it. So our bodies being equally pressed on all sides by the ambient air, we feel no pressure at all; but if the pressure be only taken off in any one part, as by laying the hand over an exhausted receiver, we soon grow sensible of the loss.

This collection is performed two ways: the first, by directing and determining the fluctuating corpuscles of fire into lines, or trains, called rays; and thus driving infinite successions of the fiery atoms upon the same place or body, each to produce its several effect, and second that of the preceding ones, till by a series of augmentations, the effect is sensible.—This is the office of those bodies which we call luminaries; such as the sun, and other heavenly bodies; and also of our culinary fires, lamps, &c. on earth, which do not emit the fire from their own substance, as is commonly conceived, but only by their rotatory mutation direct the undetermined corpuscles into parallel rays. And the effect may be still further intended by a second collection of these parallel, into converging rays, by means of a concave speculum, or a convex glass, which at length brings them all into a point; whence those astonishing effects of our large burning-glasses.

The second way wherein the collection is made, is not by determining the vague fire, or giving it any new direction; but merely by assembling it; which is done by the attrition, or rubbing of two bodies swiftly against each other; so swiftly, in effect, as that nothing in the air, except the floating fire, has activity enough to move an equal pace, or succeed fast enough into the places continually relinquished by it: by which means fire, the most agile body in nature, slipping in, becomes collected in the path of the moving body; so that the moveable has, as it were, a fiery atmosphere around it.—Thus it is the axes of chariot-wheels, mill-stones, the ropes of ships, cannon-balls, &c. conceive heat, and some of them kindle into flame.

Thus much for the circumstance in heat, common to all the effects of fire, viz. collection.—The particular circumstances are various: Thus, for it to warm, or to heat, i. e. to give the sensation of it, it is necessary that there be more fire in the hot body, or thing, than in the organ whereby it is to be felt; otherwise the mind will not be put into any new state upon its approach, nor have any new idea.—Whence, also, if the contrary to this obtains, v. g. if there be less fire in the external object than in the organ, it will raise an idea of cold, or chilliness.

Thus it is, that a man coming out of a hot bath, into a moderately warm air, seems as if he were got into an excess-

five cold place; and another entering a room scarcely warm, in a very pinching day, will at first fancy himself in a stove.—Whence it appears, that the sense of heat does by no means determine the degree of fire; the heat being only the ratio, or difference between the internal and external fire.—As to the circumstances necessary to the fire's producing light, burning, rarefaction, &c. See LIGHT and BURNING.

The mechanical philosophers, particularly my lord Bacon, Mr. Boyle, and Sir Isaac Newton, look on heat in another light.—They do not conceive it as an original inherent property of any particular sort of body; but as mechanically producible in any body.

My lord Bacon, in an express treatise *De forma Calidi*, deduces, from a particular enumeration of the several phenomena and effects of heat:

1^o. That heat is motion: not, that motion generates heat, or heat motion; though in many cases, this be true: But, that the very thing heat is very motion, and nothing else.—But this motion, he shews, has several peculiar circumstances, which constitute it heat.

As, 2^o. That it is an expansive motion, whereby a body endeavours to dilate or stretch into a larger dimension than it had before.

3^o. That this expansive motion is directed towards the circumference, and at the same time upwards; which appears hence, that an iron rod being erected in the fire, will burn the hand that holds it, much sooner than if put in laterally.

4^o. That this expansive motion is not equable, and of the whole, but only of the smaller particles of the body; as appears from the alternate trepidation of the particles of hot liquors, ignited iron, &c. And lastly, that this motion is very rapid.

Hence, he defines heat an expansive, undulatory motion in the minute particles of the body; whereby they tend, with some rapidity, towards the circumference, and at the same time incline a little upwards.

Hence, again, he adds, that if in any natural body, you can excite a motion whereby it shall expand or dilate itself; and can so repress and direct this motion upon itself, as that the dilation shall not proceed uniformly, but obtain in some parts, and be checked in others, you will generate heat. This doctrine, Des Cartes and his sect adhere to with some little variation.—According to them, heat consists in a certain motion, or agitation of the parts of a body, like to that wherewith the several parts of our body are agitated by the motion of the heart and blood.

Mr. Boyle, in a treatise of the *Mechanical Origin of Heat and Cold*, strenuously supports the doctrine of the producibility of heat, with new observations and experiments: as a specimen, we shall here give one or two.

In the production, says he, of heat, there appears nothing, on the part either of the agent or patient, but motion and its natural effects.—When a smith briskly hammers a small piece of iron, the metal thereby becomes exceedingly hot; yet there is nothing to make it so, except the forcible motion of the hammer impressing a vehement and variously determined agitation on the small parts of the iron, which being a cold body before, grows, by that super-induced commotion of its small parts, hot: First, in a more loose acceptation of the word, with regard to some other bodies, compared with which it was cold before: and then sensibly hot, because this agitation surpasses that of the parts of our fingers; and in this instance oftentimes, the hammer and the anvil continue cold after the operation; which shews, that the heat acquired by the iron, was not communicated by either of those implements as heat, but produced in it by motion great enough strongly to agitate the parts of so small a body as the piece of iron, without being able to have the like effect upon so much greater masses of metal, as the hammer and the anvil. Though, if the percussions were often, and briskly renewed, and the hammer were small; this also might be heated.—Whence it is not necessary that a body itself should be hot to give heat.

If a large nail be driven by a hammer into a plank of wood, it will receive several strokes on its head, ere it grow hot; but when it is once driven to the head, a few strokes suffice to give it a considerable heat: for while, at every blow of the hammer, the nail enters farther into the wood, the motion produced is chiefly progressive, and is of the whole nail tending one way; but when the motion ceases, the impulse given by the stroke, being unable to drive the nail farther on, or to break it, must be spent in making a various, vehement, and intestine commotion of the parts among themselves, wherein the nature of heat consists. *Mech. Product. of Heat and Cold.*

That heat, says the same author, is mechanically producible, appears probable from a consideration of its nature, which seems principally to consist in that mechanical property of matter called motion; but which is here subject to three conditions, or modifications.

First, the agitation of the parts of the body must be vehement.—For this distinguishes the bodies said to be hot, from those

those which are barely fluid.—Thus, the particles of water, in its natural state, move so calmly, that we do not feel it at all warm, though it could not be a liquor, unless they were in a restless motion; but when water becomes actually *hot*, the motion manifestly and proportionally appears vehement, since it does not only strike out organs of feeling briskly, but ordinarily produces numerous very small bubbles, melts coagulated oil cast upon it, and affords vapours, which by their agitation ascend into the air.—And if the Degree of *heat* be such as to make the water boil, the agitation becomes more manifest by the confused motions, waves, noise, bubbles, and other obvious effects, excited therein. Thus, in a *heated* iron, the vehement agitation of its parts, may be easily inferred from the motion, and the hissing noise it makes with the drops of water that fall from it.—But though the agitation be various, as well as vehement, yet there is a third condition required to make a body *hot*; which is, that the agitated particles, or at least the greatest number of them, be so minute, as to be finely insensible.—Were an heap of sand to be vehemently agitated by a whirlwind, the bulk of the corpuscles would keep their agitation from being properly *heat*, though by their numerous strokes upon a man's face, and the brisk commotion of the spirits, which would thence ensue, they might perhaps produce that quality.

The second condition is, that the determination be very various, and tend all manner of ways.—This variety of determinations appears to be in *hot* bodies, both by some of the instances already mentioned, and especially that of flame, which is a body; by the dilatation of metals when melted; and by the operations of *heat*, exercised by *hot* bodies upon others, in what posture or situation soever the body to be *heated* thereby, be applied to them: thus a coal, thoroughly kindled, will appear on all sides red, and melt wax, and kindle brimstone, whether the body be applied to the upper, the lower, or any other part of it.—Hence, if we duly attend to this notion of the nature of *heat*, it is easy to discern how it may be mechanically produced several ways; for, except in some few anomalous cases, by whatever means the insensible parts of a body can be put into a very confused and vehement agitation, *heat* will be introduced into that body: and as there are several agents and operations, by which the *heating* motion may be excited; so there must be several mechanical ways of producing *heat*: various experiments may be reduced to almost each of these heads; chance itself having, in the laboratories of chemists, afforded several phenomena referable thereto.

This system is further supported also by Sir Isaac Newton, who does not conceive *fire*, as any particular species of body, originally endued with such and such properties.—*Fire*, according to him, is only a body much ignited, *i. e.* *heated* hot, so as to emit light copiously: What else, says he, is red hot iron than fire? And what else is a burning coal than red hot wood? or flame itself than red hot smoke? It is certain, that flame is only the volatile part of the fuel *heated* red hot, *i. e.* so hot as to shine; and hence only such bodies as are volatile, *i. e.* such as emit a copious fume, will flame; nor will they flame longer than they have fume to burn.—In distilling hot spirits, if the head of the still be taken off, the ascending vapours will catch fire from a candle, and turn into flame. And in the same manner several bodies, much *heated* by motion, attrition, fermentation, or the like, will emit lucid fumes; which, if they be copious enough, and the *heat* sufficiently great, will be flame: and the reason why fused metals do not flame, is the smallness of their fume; this is evident, for, that spelter, which fumes most copiously, does likewise flame.—Add, that all flaming bodies, as oil, tallow, wax, wood, pitch, sulphur, &c. by flaming waste, and vanish into burning smoke.

And do not all fixed bodies, when *heated* beyond a certain degree, emit light and shine? and is not this emission performed by the vibrating motion of their parts? and do not all bodies, which abound with terrestrial and sulphureous parts, emit light as often as those parts are sufficiently agitated; whether that agitation be made by external fire, or by friction, or percussion, or putrefaction, or by any other cause?—Thus, sea-water, in a storm; quicksilver agitated in vacuo; the back of a cat, or the neck of a horse, obliquely rubbed in a dark place; wood, flesh and fish, while they putrify; vapours from putrifying waters, usually called *ignes fatui*; stacks of moist hay or corn; glow-worms, amber and diamonds by rubbing; fragments of steel struck off with a flint, &c. all emit light. *Id. ibid.*

Are not gross bodies and light convertible into one another? and may not bodies receive much of their activity from the particles of light, which enter their composition? I know no body less apt to shine than water; and yet water, by frequent distillations, changes into fixed earth; which, by a sufficient *heat*, may be brought to shine like other bodies. *Id. ibid.*

Add, that the sun and stars, according to Sir Isaac Newton's conjecture, are no other than great earths vehemently *heated*: for large bodies, he observes, preserve their *heat* the longest,

their parts *heating* one another; and why may not great, dense and fixed bodies, when *heated* beyond a certain degree, emit light so copiously, as by the emission and reflection thereof, and the reflections and refractions of the rays within the pores, to grow still hotter, till they arrive at such a period of *heat* as is that of the sun? Their parts also may be further preserved from fuming away, not only by their fixity, but by the vast weight and density of their atmospheres incumbent on them, and strongly compressing them, and condensing the vapours and exhalations arising from them. Thus, we see, warm water, in an exhausted receiver, shall boil as vehemently as the hottest water open to the air; the weight of the incumbent atmosphere, in this latter case, keeping down the vapours, and hindering the ebullition, till it has conceived its utmost degree of *heat*. So, also, a mixture of tin and lead, put on a red hot iron in vacuo, emits a fume and flame: but the same mixture, in the open air, by reason of the incumbent atmosphere, does not emit the least sensible flame.—Thus much for the *System of the Productibility of heat*.

On the other hand, M. Homberg, in his *Essai du Souffire Principe*, holds, that the chemical principle, or element, sulphur, which is supposed one of the simple, primary, pre-existent ingredients of all natural bodies, is real fire; and consequently that fire is co-eval with body. *Mém. de l'Acad. an. 1705.* See SULPHUR.

Dr. Gravefande goes on much the same principle: fire, according to him, enters the composition of all bodies, is contained in all bodies, and may be separated or procured from all bodies, by rubbing them against each other, and thus putting their fire in motion. But fire, he adds, is by no means generated by such motion. *Elem. Phys. T. II. c. 1.*

A body is then only sensibly *hot*, when the degree of its *heat* exceeds that of our organs of sense; so that there may be a lucid body, without any sensible *heat*; and consequently, as *heat* is only a sensible quantity, without any *heat* at all.

Heat, in the *hot* body, says the same author, is an agitation of the parts of the body, made by means of the fire contained in it; by such agitation a motion is produced in our bodies, which excites the idea of *heat* in our minds: so that *heat*, in respect of us, is nothing but that idea, and in the *hot* body nothing but motion.—If such motion expel the fire in right lines, it may give us the idea of light; if in a various and irregular motion, only of *heat*.

M. Lemery the younger, agrees with these two authors in asserting this absolute, and ingenerable nature of fire; but he extends it further.—Not contented to confine it as an element to bodies, he endeavours to shew that it is equally diffused through all space, that it is present in all places, even in the void spaces between bodies, as well as in the insensible interstices between their parts. *M. de l'Acad. an. 1713.* See ETHER.

This last sentiment falls in with that of Boerhaave above delivered: It seems extravagant to talk of *heating* cold liquors with ice; yet Mr. Boyle assures us, he has easily done it, by taking out of a basin of cold water, wherein several fragments of ice were swimming, one piece or two which he perceived very well drenched with the liquor, and suddenly immersing them into a wide-mouthed glass of strong oil of vitriol: for the menstruum presently mixing with the water, which adhered to the ice, produced in it a brisk *heat*, sometimes with a manifest smoke, and that suddenly dissolving the contiguous parts of the ice, and those the next, the whole ice was soon reduced to water; and the corrosive menstruum being, by two or three shakes, well dispersed through it, the whole mixture would immediately grow so *hot*, that sometimes the containing vessel could not be endured in ones hand. Boyle, *ubi supra*.

There is a great variety in the *heat* of different places, and seasons.—Naturalists commonly lay it down, that the nearer any Place is to the center of the earth, the hotter it is found; but this does not hold strictly true.—In digging mines, wells, &c. they find that at a little depth below the surface, it feels cool; a little lower, and it is yet colder, as being now beyond any reach, or influence, of the sun's rays, inasmuch that water will freeze almost instantaneously; and hence the use of ice-houses, &c. but when a little lower, viz. about 40 or 50 foot deep, it begins to grow warmer, so that no ice can bear it; and then the deeper they go, still the greater is the *heat*: till, at length, respiration grows difficult, and the candles go out.—Hence some have resorted to the notion of a fund of fire lodged in the centre of the earth; which they consider as a central sun, and the great principle of the generation, vegetation, nutrition, &c. of fossil and vegetable bodies.

But Mr. Boyle, who had been at the bottom of some mines himself, suspects that this degree of *heat*, at least in some of them, may arise from the peculiar nature of the minerals generated therein. To confirm this, he instances a mineral of a vitriolic kind, dug up in large quantities, in several

H E A

parts of England, which by the bare effusion of common water will grow so *hot*, as almost to take fire.

On the other hand, as you ascend high mountains, the air grows more and more piercing and cold: thus the tops of the Pico de Theide in Bohemia, the pike of Tenariff, and several others, even in the most sultry countries, are found eternally invested with snow and ice; the *heat* never being sufficient to thaw the same.

In some of the mountains of Peru there is no such thing as running water, but all ice: plants make a shift to grow about the feet of the mountains, but near the top no vegetable can live, and this is not for want of food, but through the intenseness of the cold.—This effect is attributed to the thinness of the air, and the little surface of earth there is to reflect the rays. The rays are here only determined into a parallelism; but the effect of direct parallel rays is found, by computation, to be very inconsiderable; this effect being really greater in winter than summer.

HEAT, in geography.—The diversity of the *heat* of climates and seasons, arises from the different angles under which the sun's rays strike upon the earth's surface.

It is shewn in mechanics, that a moving body, striking perpendicularly on another, acts on it with all its force, and that a body striking obliquely, acts with the less force, the more it deviates from the perpendicular.—Now fire, moving in right lines, must observe the same mechanical law as other bodies; and consequently its action must be measured by the sine of the angle of incidence: And hence fire, striking on any obstacle in a direction parallel thereto, has no sensible effect, by reason the ratio is almost infinite, *i. e.* it is nothing. Accordingly, the sun, radiating on the earth in the morning, scarce produces any warmth at all.

Hence, Dr. Halley gives a mathematical computation of the effect of the sun, under different seasons and climates; going on this principle, that the simple action of the sun, as all other impulses or strokes, is more or less forcible, according to the sines of the angles of incidence, or to the perpendicular let fall on the plane: whence, the vertical ray (which is of the greatest *heat*) being put for radius, the force of the sun on the horizontal surface of the earth will be to that, as the sine of the sun's altitude at any other time.

Hence it follows, that the time of the continuance of the sun's shining, being taken for a basis, and the sines of the sun's altitudes erected thereon as perpendiculars; and a curve drawn through the extremities of those perpendiculars: the area comprehended will be proportionate to the collection of the *heat* of all the sun's beams in that space of time.

Hence it will follow likewise, that under the pole the collection of all the *heat* of a tropical day, is proportionate to a rectangle of the sine of 23 degrees and an half, into 24 hours, or the circumference of a circle; that is, the sine of 23 degrees and an half, being nearly $\frac{1}{2}$ of radius, as $\frac{1}{2}$ into 12 hours. Or, the polar *heat* is equal to that of the sun continuing twelve hours above the horizon at 53 degrees height; than which the sun is not five hours more elevated under the equinoctial.

But whereas the nature of *heat* is to remain in the subject, after the luminary that occasioned its being *heated* is removed, and particularly in the air; under the equinoctial, the 12 hours absence of the sun does but little diminish the motion impressed by the past action of his rays, wherein *heat* confists, before he rises again; but under the pole, the long absence of the sun for six months, wherein the extremity of cold does obtain, hath so chilled the air, that it is, as it were, frozen, and cannot, before the sun has got far towards it, be any ways sensible of his presence, his beams being obstructed by thick clouds, and perpetual fogs and mists.

Add, that the different degrees of *heat* and cold in different places, depend in a very great measure, upon the accidents of situation, with regard to mountains or valleys, and the soil.—The first greatly help to chill the air by the winds, which come over them, and which blow in eddies through the levels beyond.

Mountains, sometimes, turning a concave side towards the sun, have the effect of a burning mirror on the subject plain; and the like effect is sometimes had from the concave or convex parts of clouds, either by refraction or reflection. And some even take these to be sufficient to kindle the exhalations lodged in the air, and to produce thunder, lightning, &c.

As to soils: a stony, sandy, or chalky earth, it is known, reflects most of the rays into the air again, and retains but few; by which means a considerable accession of *heat* is derived to the air; as, on the contrary, black loose soils absorb most of the rays, and return few into the air, so that the ground is much the *hotter*.

This the peasants, who inhabit the morafs de Veenen, where turf is dug, are very sensible of; walking there but a little while, the feet grow extremely *hot*, but the face not at all: on the contrary, in a sandy place, the feet are scarce warm, when the face is scorched by the great reflection.

The following table gives the *heat* to every tenth degree of

H E A

latitude to the equinoctial and tropical sun, by which an estimate may be made of the intermediate degrees.

Lat.	Sun in ☿ ♊	Sun in ♋	Sun in ♈
0	20000	18341	18341
11	19696	20290	15834
20	18797	21737	13166
30	17321	22651	10124
40	15321	23048	6944
50	12855	22991	3798
60	10000	22773	1075
70	6840	23543	000
80	3473	24673	000
90	0000	25055	000

Whence are deducible the following corollaries:

1^o. That the equinoctial *heat*, when the sun becomes vertical, is as twice the square of the radius: which may be proposed as a standard to be compared with in all other cases.

2^o. That under the equinoctial, the *heat* is as the sine of the sun's declination.

3^o. That in the frigid zones, when the sun sets not, the *heat* is as the circumference of a circle into the sine of the altitude at 6. And, consequently, that in the same latitude, these aggregates of warmth, are as the sine of the sun's declination; and at the same declination of the sun, they are as the sines of the latitudes into the sines of the declination.

4^o. That the equinoctial day's *heat*, is every where as the cosine of the latitude.

5^o. In all places where the sun sets, the difference between the summer and winter *heats*, when the declinations are contrary, is equal to a circle into the sine of the altitude at 6, in the summer parallel; and consequently, those differences are as the sine of the latitude into, or multiplied by, the sines of declination.

6^o. From the foregoing table it appears, that the tropical sun, under the equinoctial, has of all others the least force; under the pole it is greater than any other day's *heat* whatever, being to that of the equinoctial as 5 to 4.

From the table, and these corollaries, a general idea may be conceived of the sum of all the actions of the sun in the whole year, and thus that part of *heat*, which ariseth simply from the presence of the sun, may be brought to a geometrical certainty.—The *heat* of the sun, for any small portion of time, is always as a rectangle, contained under the sine of the angle of incidence of the ray producing *heat* at that time.

HEAT, is usually divided, by the school philosophers, into *actual* and *potential*.

Actual HEAT, is that which we have been hitherto speaking of, and which is an effect of real, elementary fire.

Potential HEAT, is that which we find in pepper, wine and certain chemical preparations, as oil of turpentine, brandy, quick-lime, &c.

The Peripatetics account for the *heat* of quick-lime from an antiperistasis.

The Epicureans, and other corpuscularians, attribute even *potential heat*, to atoms or particles of fire detained and locked up in the pores of those bodies, and remaining at rest therein; which being excited to action again by the *heat* and moisture of the mouth, or by the effusion of cold water, or the like cause, then break their inclosures, and discover what they are.

This doctrine is well illustrated by M. Lemery the younger, in the instances of quick lime, regulus of antimony, tin, &c. in the calcination whereof he observes, 1^o. That the fire, which they imbine in the operation, makes a sensible addition to the weight of the body, amounting sometimes to one tenth of the whole; and, that during this imprisonment, it still retains all the particular properties or characters of fire, as appears hence, that when once set at liberty again, it has all the effects of other fire.

Thus a stony, or saline body being calcined, and water poured thereon, that fluid is found sufficient, by its external impression, to break up the cells, and let the fire out; and upon this the water is rendered more or less warm, according to the quantity of fire lodged therein.—Hence, also, it is, that some of these bodies visibly contain a great deal of actual fire; and the slightest occasion is capable of disengaging it: and upon applying them to the skin, they burn and raise an eschar, not unlike the top of a live coal.

To this it is objected, that the particles of fire are only such in virtue of the rapid motion wherewith they are agitated; so that to suppose them fixed in the pores of a body, is to divert them at once of that which constituted them fire, and, consequently, to disqualify them from producing the effects ascribed to them.—To which M. Lemery answers, that though the rapid motion of fire do contribute very greatly to its effects, yet the particular figure of its particles is to

to be considered withal. And though fire should be detained, and fixed in the substance of bodies, yet why should it fare worse than other fluids under the same circumstances? Water, for instance, is a fluid, whose fluidity depends, as already observed, on fire, and consequently it is less fluid than fire; and yet every day water is inclosed in bodies of all sorts without losing its fluidity, or any of the properties that characterize it as water.

Add, that when water is froze, the motion of its parts is, doubtless, discontinued; and yet the figure of the particles remaining the same, it is ready to commence a fluid, as before, upon the least warmth.

Lastly, though salt be allowed to be the matter of tastes, and that it has certain properties, arising chiefly from the figure of its parts, yet it only acts when dissolved; or, which amounts to the same, when it swims in a fluid proper to keep its parts in motion: yet it is not less salt, or less the matter of taste, when not in a state of dissolution: to despoil it of that quality, the figure of its parts must be altered.

As to what may be further objected of the impossibility of fixing so fine, subtle, penetrative, and active a matter as fire, within the spongy substance of a gross, porous body; it will be of no great weight, unless it can be proved, that the pores of the cells are bigger than the same.—If it be insisted, again, that a body which could find its way into a solid body, might get out again the same way; and that as it only penetrated the body, by reason its own corpuscles were smaller than the pores, the same consideration must let it out again: It is answered, that the pores are not now in the same condition as before; the fire in calcining, opened and dilated the pores; which, upon the fire's ceasing, must naturally close and contract again. *Mém. de l'Acad. an. 1713.*

Mr. Boyle endeavours to set aside this account, and substitute a mechanical property, viz. a peculiar texture of parts, in these cases, in lieu of fire.—Though a great likeness might be expected between the particles of fire adhering to the quick-lime, and those of highly rectified spirit of wine; yet he has not found that the effusion of the spirit upon quick-lime produced any sensible heat, or visible dissolution of the lime, though it seemed to be as greedily sucked in, as common water would have been. And further, he found, that if cold water were poured on the same lime so drenched, there would ensue no manifest heat; nor did the lump appear swelled or broken, till some hours after; which seems to argue, that the texture of the lime admitted some particles of the spirit of wine into some of its pores, which were either larger, or more fit for it, without admitting it into the most numerous, whereinto the liquor must be received, to be able suddenly to dissipate the corpuscles of lime into their minuter particles.

These phenomena, according to Mr. Boyle, seem to shew, that the disposition which lime has to grow hot with water, greatly depends on some peculiar texture; since the aqueous parts, which one would think capable of quenching most of the fiery atoms supposed to adhere to quick-lime, did not near so much weaken the disposition of it to heat, as that excess of the spirituous corpuscles, and their contexture with those of the lime, increased it.

Yet, in other places, this author appears rather to give into the corpuscular scheme: urging, that if instead of cold water, you quench the lime with hot water, the ebullition will be, oftentimes, far greater than if the liquor were cold; which indeed might well be expected, hot water being much fitter than cold, suddenly to pervade the body of the lime, and hastily to dissolve, and set at liberty, the fiery and saline parts wherewith it abounds. And what a greater interest salts may have in producing such heats than cold water, he has also tried, by pouring acid spirits, and particularly spirit of salt, upon good quick-lime: for by this means there was always a far greater degree of heat excited, than if he had used common water; and this, whether he employed the spirit cold or hot.

It is not easy, says the same author, to apprehend how such light and minute bodies should be so long detained, as must by this hypothesis be allowed, in quick-lime especially; since no great heat ensues the pouring of water upon minium, or crocus martis per se, though they have been calcined by a violent fire, the effluvia whereof seem to adhere to them, by the increase of the weight the lead and iron manifestly receive from the operation of it. *Mech. Orig. of Heat.*

HEAT, in the animal oeconomy, *Natural HEAT*, *Vital HEAT*. See *Innate HEAT*.

Innate HEAT, *calidum innatum*, is a term the ancients had many vague notions about: but geometrical reasoning has taught us to affix a more distinct idea hereto: for it is hence, says Dr. Quincy, we know, that this *innate heat* is no more than the attrition of the parts of the blood, occasioned by its circulatory motion, especially in the arteries; wherein, being propelled from a circular base, towards the apex of an hollow cone, with a force begun in the heart, it meets with a double resistance; viz. against the sides of the arteries, and against the preceding blood.

VOL. I.

For whereas the blood contains in it parts that are fitted to excite heat whenever they can get at liberty; that is, if the parts inclosing them can be got asunder: and whereas the parts inclosing such corpuscles cannot be got asunder, unless by some nifus of the parts of the blood among one another, whereby the attrition and abrasion of the cohering particles is produced; it follows, that the heat will be so much the greater, by how much such a nifus, and attrition of the parts among one another is increased.

And with the same resistances, (that is, the sections of the arteries, and the quantity of blood remaining the same) and an increased force of the heart, and circular motion of the blood, the nifus and attrition of the parts of the blood amongst one another, must necessarily be increased; both by the preceding blood being struck harder upon by the protrusion of a succeeding blood coming on with an increased velocity; and the occasioning thereby also more frequent strokes against the sides of the arteries; by which means, an increased velocity of blood increases the heat: and thus consequently does its heat depend upon its circulation.

From hence it appears, that at the same distances from the heart, the heat of equal quantities of blood will be as their velocities: and, that in the same velocities of blood, the heat will be reciprocally as the distances from the heart.—For since, in homogeneous and simple bodies, nothing else is required to disengage the particles exciting heat, but a nifus and attrition of parts, produced by the force of the heart; to which is always proportional the velocity of the blood; and the re-action, or resistance of the arteries and the antecedent blood; it follows, that if the resistance or re-action is not altered, which it will not be at the same distance from the heart; then the heat of the blood will not be altered, unless by an alteration of the impetus, or velocity impressed upon the blood from the heart: that is, as effects are proportional to their causes, the heat of the blood, at the same distances from the heart, will be proportional to its velocity.

In the same manner it appears, that if the velocities impressed by the heart be equal, there can be no change in the heat of the blood, but from a diversified resistance, or re-action of the arteries and antecedent blood. But the resistance of the preceding blood is proportional to its quantity; and its quantity is reciprocally proportional to the distance from the heart; (for the nearer the blood is to the heart, so much the greater will be its quantity between any given place and the extremity of the artery.) And therefore the resistance of the arteries will also be so much the greater, by how much nearer they are to the heart: for in this case, the resistance is proportional to the velocity; and the velocity of the blood is always greatest at the least distances from the heart.

Hence the heat of the blood may be considered as a rectangle, under the velocity and the distance: that is, if in two persons the velocity be as three, and the distances wherein we would determine the heat, be as much more in one as in another; that is, as two to one; the heat of one will be six, and the other three; that is, the heat of the first will be double that of the second. And if the distance of the first be as two, and the velocity as four; but the distance of the second as three, and the velocity as one; the heat of the first will be as eight, and of the second as three: and so the heat of the first, will be more than double the heat of the second.

HEAT, in chemistry. See the article FIRE.

HEAT, in smithery, &c. See the article IRON.

HEAT is also used in respect of race-horses, for the exercises to be given them by way of preparation, &c.

Two heats in a week are reckoned a just measure for any horse of what state or constitution soever.—The jockeys lay it down as a rule, that one of the heats be given on the same day of the week, whereon the horse is to run his match; and this to be the sharpest heat.

HEATHEN. See the article PAGAN.

HEAVE, at sea, signifies to throw away, or sling any thing over-board.

When a ship, being at anchor, rises and falls by the force of the waves, she is also said to heave and set.

To HEAVE at the capstan, signifies to turn it about. See CAPSTAN.

To HEAVE a flag aboard, is to hang it out. See FLAG, and SIGNAL.

To HEAVE out the top-sail, is to put them abroad.

HEAVE-OFFERINGS, under the Jewish law, were things offered up to God by lifting them up on high.

HEAVEN, *Caelum*, an azure, transparent orb, investing our earth; wherein the celestial bodies perform their motions.

This is the popular notion of heaven; for the word, it must be observed, has various other ideas, in the language of philosophers, divines, and astronomers: agreeable to which, we may lay down divers heavens, as the highest, or *empyrean heaven*; the *aetherial*, or *starry heaven*; the *planetary heaven*, &c.

HEAVEN, among divines, called also the *empyrean heaven*, is the abode of God, and blessed spirits: as angels, and the souls of the righteous deceased.

In this sense, *heaven* stands opposed to *hell*.

This is also frequently called in scripture the *kingdom of heaven*, the *heaven of heavens*; and by St. Paul the *third heaven*; sometimes *paradise*; the *new Jerusalem*, &c.

This *heaven* is conceived as a place in some remote part of infinite space, wherein the Deity is pleased to afford a nearer, and more immediate view of himself; and a more sensible manifestation of his glory; and a more adequate perception of his attributes, than in the other parts of the universe, where he is likewise present.

This makes what the divines also call the *beatific vision*.
---Authors are much divided as to the reality of such local *Heaven*.

The inspired writers give us very magnificent descriptions of *heaven*, the structure, apparatus, and attendance thereof; particularly Isaiah, and St. John the divine.---The philosopher Plato, in his *Dial. de Anim.* speaks of *heaven* in terms that bear so near a resemblance to those of scripture; that Eusebius charges him with borrowing his account thence. *De Præpar. Evangel.* L. XI. c. 37.

The ancient Romans had a kind of *heaven* in their system of theology, which they called *elysium*, or the *elysian fields*.

The Mahometan *heaven*, or *paradise*, is very gross, agreeable to the genius of their religion.

HEAVEN, among astronomers, called also the *ætherial* and *starry heaven*, is that immense region wherein the stars, planets and comets are disposed.

This is what Moses calls the *firmament*, speaking of it as the work of the second day's creation; at least it is thus the word רָקִיעַ is usually rendered by his interpreters; though this somewhat abulively, to countenance their own notion of the *heavens* being firm, or solid.---The word, it is certain, properly signifies no more than *expanse*, or *extension*; a term very well adapted by the prophet to the impression which the *heavens* make on our senses: whence in other parts of scripture, the *heaven* is compared to a curtain, or a tent stretched out to dwell in.---The LXX first added to this idea of expansion, that of *firm* or *solid*; rendering it by στερεώμα, according to the philosophy of those times; in which they have been followed by the modern translators.

The later philosophers, as des Cartes, Kircher, &c. have easily demonstrated this *heaven* not to be solid, but fluid; but they still suppose it full, or perfectly dense, without any vacuity, and cantoned out into many vortices.

But others carry the thing much further, and overturn not only the solidity, but the supposed plenitude of the *heavens*.

---Sir Isaac Newton has abundantly shewn the *heavens* void of almost all resistance, and consequently of almost all matter; this he proves from the phenomena of the celestial bodies; from the planets persisting in their motions without any sensible diminution of their velocity; and the comets freely passing in all directions towards all parts of the *heavens*.

Heaven, taken in this general sense, for the whole expanse between our earth and the remotest regions of the fixed stars, may be divided into two very unequal parts, according to the matter found therein, viz. the atmosphere, or *aerial heaven*, possessed by air; and the *ætherial heaven*, possessed by a thin, unresisting medium, called *æther*.

HEAVEN, is more particularly used in astronomy, for an orb, or circular region of the *ætherial heaven*.

The ancient astronomers assumed as many different *heavens*, as they observed different motions therein.---These they supposed all to be solid, as thinking they could not otherwise sustain the bodies fixed in them; and spherical, that being the most proper form for motion.

Thus we had seven *heavens* for the seven planets, viz. The *heavens* of the Moon, Mercury, Venus, the Sun, Mars, Jupiter and Saturn.

The eighth was for the fixed stars, which they particularly called the *firmament*.

Ptolemy added a ninth *heaven*, which he called the *primum mobile*.

After him two *crystalline heavens* were added, by king Alphonsus, &c. to account for some irregularities in the motions of the other *heavens*: And lastly, an *empyrean heaven* was drawn over the whole, for the residence of the Deity; which made the number twelve.

The *crystalline heavens* were not supposed to have any stars fixed in them: they encompassed the inferior, starry and planetary *heavens*; and communicated their motion to them.---The first served to account for that slow motion of the fixed stars, whereby they advance a degree eastward in 70 years; whence the precession of the equinox. The second was to solve the motions of libration, or trepidation.

But others admitted many more *heavens*, according as their different views, and hypotheses required.---Eudoxus supposed

23, Calippus 30, Regiomontanus 33, Aristotle 47, and Fracastor no less than 70.

We may add, that the astronomers did not much concern themselves whether the *heavens* they thus allowed of were real or not, provided they served a purpose in accounting for any of the celestial motions, and agreed with the phenomena.

Among the other reveries of the Rabbins, contained in the Talmud, we find it asserted, that there is a place where the *heavens* and earth join together; that Rabbi Barchana going thither, laid his hat on the window of *heaven*; and that going to take it again immediately after, it was gone, the *heavens* having carried it off; so that he must wait for a revolution of the orbs to bring it to its place again.

HEAVINESS. See GRAVITY.

For the laws of the descent of *heavy* bodies; see DESCENT.

Heavy bodies do not tend precisely to the very centre of the earth, except at the poles and the equator; by reason of the spheroidal figure of the earth.---Their direction is every where perpendicular to the surface of the spheroid.

HEAULME, or **HEAUME**, in heraldry, an helmet, or head-piece. See HELMET.

HEWING of timber. See the article TIMBER.

HEBBERMAN, in ancient law-books, a poacher, or a fisherman below London-bridge; thus called, because he commonly fishes at ebb water. See EBB.

HEBERTHIEF, in ancient customs, a privilege of having the goods of a thief, and the trial of him, within a particular district.

HEBDOMADARY*, **HEBDOMADARIUS**, or **HEBDOMADIUS**, a member of a chapter, or convent, whose week it is to officiate in the choir; to rehearse the anthems, and prayers, and to perform the usual functions which the superiors perform at solemn feasts, and on other extraordinary occasions.

* The word is formed of the Greek, ἑβδομα, which signifies the number seven, of *hepta*, seven.

The *hebdomadary* generally collates to the benefices which become vacant during his week: though this is usually looked on as an abuse.

In cathedrals, the *hebdomadary* was a canon, or prebendary who had the peculiar care of the choir, and the inspection of the officers for his week.

In monasteries, the *hebdomadary* is he who waits at table for a week, or other stated period; directs and assists the cook, &c.

In church antiquity, we meet with accounts of nine different sorts of *hebdomadaries*, viz.---The *hebdomadarius cantor*, or *hebdomadary chanter*; *hebdomadarius chori*, *hebdomadary* of the choir; which two were really the same, viz. he who led or conducted the public service: *hebdomadary* of the kitchen, *hebdomadarius equine*; *hebdomadary* of the defunct or the dead, *hebdomadarius defunctorum*, he who took care of the office and service of the dead: *hebdomadarius invitatorii*, he who sang the invitatory: *hebdomadarius lector ad mensam*, he who read at meal time; *hebdomadarius majoris missæ*, he who read mats: *hebdomadarius psalterii*, who probably was the same with the *hebdomadarius chori*: And *hebdomadarius sacri altaris*, who might be the same with *hebdomadary* of the high mats.

HEBRAISM, an idiosyncrasy or manner of speaking peculiar to the Hebrew tongue.

There is no understanding, even the versions of the Old Testament, without some acquaintance with the Hebrew; they are so full of *Hebraisms*.

We have abundance of *Hebraisms* borrowed from scripture, and naturalized in our own language; as, *Son of perdition*: *To sleep in the Lord*, &c.

HEBREW, something relating to the people of the Jews, i. e. the twelve tribes, descended from the twelve patriarchs, sons of Jacob. See JEWS.---Thus we say,

Hebrew Bible. See the article BIBLE.

HEBREW Character.

There are two kinds of *Hebrew* characters; the *ancient*, called also the *square*; and the *modern*, or *rabbinnical* characters.---The *square Hebrew*, takes its denomination from the figure of its characters, which stand more square, and have their angles more exact and precise than the other.

This character is used in the text of holy scripture, and their other principal and most important writings.---When both this, and the *rabbinnical* character, are used in the same work, the former is for the text, or the fundamental part; and the latter, for the accessory part, as the glosses, notes, commentaries, &c.

The best and beautifullest characters of this kind, are those copied from the characters in the Spanish manuscripts; next, those from the Italian manuscripts; then those from the

the French; and lastly, those of the Germans, whose characters are much the same, with respect to the other genuine square Hebrew characters, that the Gothic or Dutch characters are with respect to the Roman.

Several authors contend, that the square character is not the real, ancient Hebrew character, wrote from the beginning of the language to the time of the Babylonish captivity; but that it is the Assyrian, or Chaldee character, which the Jews assumed, and accustomed themselves to, during the captivity, and retained afterwards. These authors add, that what we call the Samaritan character, is the genuine ancient Hebrew.

The learned Jesuit Souciet maintains, with great address, that the ancient Hebrew character, is that found on the medals of Simon, and others, commonly called Samaritan medals; but which, he asserts, were really Hebrew medals, struck by the Jews, and not by the Samaritans.

Modern, or Rabbinical Hebrew character, is a good neat character, formed of the square Hebrew by rounding it, and retrenching most of the angles, or corners of the letters, to make it the more easy and flowing. The Letters used by the Germans, are very different from the rabbinical character used every where else, though all formed alike from the square character, but the German in a more slovenly manner than the rest.

The Rabbins frequently make use either of their own, or the square Hebrew character, to write the modern languages in. There are even books in the vulgar tongues, printed in Hebrew characters: instances whereof are seen in the French king's library.

HEBREW Language, called also absolutely HEBREW, is the language spoke by the Hebrews, and wherein all the books of the Old Testament are wrote; whence it is also called the holy, or sacred language.

There is no piece, in all antiquity, wrote in pure Hebrew, beside the books of the Old Testament; and even some parts of those are in Chaldee.

The Hebrew then, appears to be the most ancient of all the languages in the world; at least, it is so with regard to us, who know of no older. Some learned men will have it the language spoke by Adam in paradise; and that the saints will speak it in heaven.

Alberti, in his Hebrew Dictionary, endeavours to find in each word, in its root, in its letters, and the manner of pronouncing it, some natural reason of the signification of that word. But he has carried matters too far; and it has been shewn, in the *Mémoires de Trévoux*, that on his principles, words which signify quite different things, should signify the same.

Neuman, and Loecher, have prosecuted Alberti's scheme further, and with more address than he has done: The first, in his *Genesis Lingua Sanctæ*, and *Exodus Lingua Sanctæ*; and the latter, in his treatise de *Causis Lingue Hebrææ*.

Be that as it will, the Hebrew, such as we have it in the holy scripture, is a very regular, analogical language, and is particularly so in its conjugations. Properly speaking, there is but one, simple conjugation; but this is varied in each verb seven or eight different ways, which has the effect of so many different conjugations, and affords a great number of expressions, whereby to represent, under one single word, all the different modifications of a verb; and several ideas at once; which in the modern, and most of the ancient and learned languages, are expressible only by phrases.

The original, or primitive words in this language, which they call *radices*, roots, rarely consist of more than three letters, or of two syllables, which are expressed by two sounds, or by the same sound redoubled, which is indicated by a point.

There are twenty two letters in the Hebrew language, which grammarians divide into guttural, palatal, dental, labial, and lingual. This division is taken from the several organs of speech; some whereof contribute more than others to the pronunciation of certain letters.

Usually, they only reckon five vowels in the Hebrew, which are the same with ours, *viz.* a, e, i, o, u; but then each vowel is divided into two, a long, and a breve, or short: the sound of the former is somewhat graver, and longer; and that of the latter shorter, and more acute. It must be added, that the two last vowels have quite different sounds; different, we mean, in other respects besides quantity and degree of elevation.

To these ten or twelve vowels must be added some others called *semi-vowels*, which are only slight motions serving to connect the consonants, and make the easier transitions from one to another.

The number of accents is prodigious in the Hebrew. There are near forty different ones; and of these there are several whose use is not well ascertained, notwithstanding all the enquiries of the learned into that matter.

In the general, we know these three things: 1^o. That they serve to distinguish the sentences, and the members thereof, like the points and comma's, &c. in English. 2^o. To de-

termine the quantity of the syllables; And 3^o. To mark the tone wherewith they are to be spoke or sung.

It is no wonder, then, that there should be more accents in the Hebrew than in other languages; as they do the office of three different things, which in other languages are called by different names.

As we have no Hebrew, but what is contained in the scriptures, that language to us wants a great many words; not only by reason, in those primitive times, the languages were not so copious as at present, but also on this account; that the inspired writers had no occasion to mention many of the terms that might be in the language.

The Chaldee, Syriac, Ethiopic, &c. languages, are by some held to be only dialects of the Hebrew; as the French, Italian, Spanish, &c. are dialects of the Latin.

Rabbinical HEBREW, or Modern HEBREW, is the language used by the Rabbins, in the writings they have composed.

The basis, or body hereof, is the Hebrew and Chaldee, with divers alterations in the words of those two languages, the meanings whereof they have considerably enlarged and extended. Abundance of things they have borrowed from the Arabic. The rest is chiefly composed of words, and expressions chiefly from the Greek; some from the Latin; and others, from the other modern tongues; particularly that spoken in the place where each Rabbins lived or wrote.

The rabbinical Hebrew must be allowed a very copious language. M. Simon, in his *Hist. Crit. du Vieux Testam.* L. III. c. 27. observes, that there is scarce any art, or science, but the Rabbins have treated thereof in it. They have translated most of the ancient philosophers, mathematicians, astronomers, and physicians; and have wrote themselves on most subjects: They do not want even orators and poets. Add, that this language, notwithstanding it is so crowded with foreign words, has its beauties visible enough in the works of those who have wrote well in it.

M. Simon says, it is impossible to reduce it into an art, or system of rules; but several learned men are of another sentiment; and it not only appears possible, but has actually been performed. Gesebrius first attempted it in his *Ijagoge Rabbinica*, which yet goes no further than to the learning to read it. Buxtorf seconded him, at the end of his *Hebrew Grammar*; where we have an additional piece, under the title *Lectionis Hebræo-Germanicæ usus & exercitatio*. Others have gone yet further: Maius has lately given us a Rabbinical grammar, at Gießen, under the title of *Yohannis Maii Grammatica Rabbinica*: And before him Sennet had done the same; *Rabbinismus, h. e. Præcepta Targumico-Talmudico Rabbinica*. Wirtemb. an. 1666.

HECATOMB*, HECATOMBE, in antiquity, a sacrifice of an hundred beasts of the same kind, at an hundred altars, and performed by an hundred priests, or sacrificers.

* The word is formed of the Greek *ἑκατόμβη* which properly signifies a sumptuous, or magnificent sacrifice. Others derive it from the Greek *ἑκατος*, centum, a hundred, and *βου*, bullock, &c. On which footing the *hecatomb* should be a sacrifice of an hundred bullocks. Others derive the word from *ἑκατος*, and *πῦρ*, fire; and on that principle hold, that the *hecatomb* might consist of only twenty five four-footed beasts. There add, that it did not matter what kind of beasts were chose for victims, provided the *quom* of feet were but had.

Pythagoras is said to have sacrificed a *hecatomb* to the muses, of an hundred oxen, in joy and gratitude, for his discovering the demonstration of the 47th proposition of the first book of Euclid, *viz.* that in a rectangled triangle, the square of the hypotenuse is equal to the squares of the two other sides.

For the origin of *hecatombs*. Strabo relates, that there were an hundred cities in Laconia; and that each city used to sacrifice a bullock every year, for the common safety of the country; whence the institution of the celebrated sacrifice of an hundred victims, called *hecatombs*. Others refer the origin of *hecatombs* to a plague; wherewith the hundred cities of Peloponnesus were afflicted; for the removal whereof, they jointly contributed to so splendid a sacrifice.

Julius Capitolinus relates, that for a *hecatomb* they erected a hundred altars of turf, and on these sacrificed a hundred sheep, and a hundred hogs. He adds, that when the emperors offered sacrifices of this kind, they sacrificed a hundred lions, a hundred eagles, and a hundred other beasts of the like kind.

HECATOMPHONIA*, ἑκατομόνια, an ancient sacrifice among the Messenians; offered by such as had slain an hundred enemies in battel.

* The word comes from *ἑκατος*, an hundred, and *φωνή*, to kill.

HECK, among husbandmen, a truck, at which horses are fed with hay.

It is also used as the name of an Engine, wherewithal to take fish in the river Ouse. A salmon *heck*, is a grate for the catching that sort of fish. See SALMON FISHING.

Hence also HECKACTUM, or HECACACTUM, which occurs in

HEE

in antient records, for a rent paid the lord for the liberty to use such engines.

HECKLING of *Hemp*. See the article **HEMP**.

HECTIC*, or **HECTIC FEVER**, in medicine, a sort of slow habitual fever, seated in the solids, and gradually preying on and consuming the substance thereof.

* The word is Greek, *ἡκτικός*, formed of *ἥκω*, *habitus*, a quality hard to separate from its subject.

A *hectic* is an usual attendant of a consumption; and is reputed one of the diagnostic signs thereof.

The *hectic*, according to Dr. Quincy, is the reverse of those fevers which arise from a plethora, or too great a fulness. This being attended with too lax a state of the excretory passages, and particularly of those of the skin, whereby so much runs off, as leaves not resistance enough in the contractile vessels, to keep them sufficiently distended; so that they vibrate oftner, agitate the fluids more, and keep them thin and hot.

The remedy consists in giving a firmer tone to the solids, and laying more load upon the fluids, and thus bringing them to a better confidence; which is effected by means of balsamics, agglutinants, and foods of the best nourishment.—All evacuation herein is bad.

A milk diet is much recommended in *hectics*, and particularly asses milk, as being the least viscid and heavy of any kind. Dr. Baynard proposes butter-milk as a succedaneum to asses milk. According to him, it answers most of the indications in this case, as it cools, moistens, nourishes, &c. He adds, that he has known many persons cured of obstinate *hectics*, only by a continued use thereof.

HEDAGIUM*, antiently signified a toll, or custom, paid at the hyth, or wharf, &c. for landing merchandise, goods, &c.

* The word is formed from *beda*, a hyth, port, or wharf.

From such toll, or customary duty, exemptions were sometimes granted by the Sovereign to particular persons, and societies.

HEDGE*, in agriculture, &c. a fence, inclosing a field, garden, or the like; made of branches of trees interwoven.

* The word is formed of the German *bag*, or *baeg*, or the Anglo-Saxon *legge*, or *bege*; which signifies simply *inclosure*, *circumference*.

Quick-set HEDGE, is that made of quick or live trees, which have a taken root; in contradistinction to that made of faggots, hurdles, or dry boughs, &c.

To plant a *quick hedge* of thorn, or the like, Mortimer directs, that the sets be about as big as the thumb, and cut within four or five inches of the ground; that if the *hedge* have a ditch, it be three foot wide atop, and one at bottom, and two deep: that if the *hedge* be without a bank, or ditch, the sets be in two rows, almost perpendicular, and at a foot distance; that the turf be laid with the grass side downwards: that at every thirty foot distance, a young oak, elm, crab, or the like, be placed: that stakes be driven into the loose earth, at about two foot and a half distance, so low as to reach the firm ground.

When the *hedge* is of eight or nine years growth, it may be splashed or laid down; by giving the shoots, or branches, a cut with a knife, or bill, half through; and then weaving them about the stakes, and trimming off the small superfluous branches.

Instead of building a garden-wall facing the north-east, Mr. Lawrence advises, that to save charge, &c. a crab-tree *hedge* of three rows be planted; which will be a good mound, and quickly grow up to be a better fence than a wall against the west and south-west winds, which make the greatest destruction in a garden, and which blow two parts in three of the whole year: beside the stock of fruit such a *hedge*, grafted with red-streak, or gennet moyl, will yield.

Espalier HEDGES. See the article **ESPALIER**.

Transplanting of HEDGE-ROWS. See **TRANSPLANTING**.

HEEL, in anatomy, the hind part of the foot. See **FOOT**. In winter, the *heels* are liable to a kind of chilblains, called *kibes*, which sometimes tend to mortification.

The bone of the *heel* is called *calcaneum*. See the article **CALCANEUM**.

HEEL of a horse, is the lowest hind part of the foot, comprehended between the quarters, and opposite to the toe.

The *heel* should be high and large, and one side not rise higher on the pattern than the other.—The distempers incident to this part, are scabbiness and scratches. See **SCRATCHES**.

Some narrow *heeled* horses have high *heels*, but so weak and tender, that by pressing the two sides of the *heel* one against another, they will sensibly yield. See **HOOF**.

To open the *HEELS*, is to pare the foot, and cut the *heel* low, almost close to the frush; taking it down within a finger's breadth of the coronet, or top of the hoof, so as to separate the quarters, and by that means weaken and take away the substance of the foot, and make it close, and become narrow at the *heels*.

HEI

The **HEEL of the horseman**, being the part which is armed with a spur, the word is used for the spur itself: as, this horse understands the *heels* well.

To ride a horse from one **HEEL** to another, is to make him go sideways, sometimes towards one *heel*, and sometimes another.

HEEL, in the sea language:—If a ship lean on one side, whether aground or afloat, they say the *heels* a-star-board, or a-port, or the *heels* off-ward, or to the shore; that is, she inclines more to one side than to the other.

HEEL of a mast, is that part of the foot thereof, which is pared away flanting, that the mast may be stayed astward on it. See **MAST**.

HEELER, or **Bloody-HEEL Cock**, is a fighting cock which strikes, or wounds much with his spurs.

The masters know such a cock, even while a chicken, by the striking of his two *heels* together in his going.

HEGIRA*, in chronology, a celebrated epocha, used by the Arabs and Mahometans, for the computation of time.

* The word is Arabic, formed of *هجرة* *hagira*, flight; or *هجر* to fly, quit one's country, family, friends, &c.

The event which gave occasion to this epocha, was Mahomet's flight from Mecca.—The magistrates of that city fearing his importunities might raise a sedition, resolved to expel him: this, accordingly, they effected in the year of our Lord 622, on the evening of the 12th or 16th of July.

To render this epocha more creditable, the Mahometans affect to use the word *hagira* in a peculiar sense, for an act of religion, whereby a man forsakes his country, and gives way to the violence of persecutors and enemies of the faith: They add, that the Corahtites being then the strongest party in the city, obliged their prophet to fly, as not being able to endure his abolishing of idolatry.

This flight was not the first of Mahomet's; but it was the most famous. It happened in the 12th year from his assuming the character of prophet and apostle, and promulgating his new religion.

The Orientals do not agree with us, as to the time of the *hagira*. Among the Mahometans, Amassi fixes it to the year of Christ 630; and from the death of Moses, 2347, and Ben Caffem, to the year of the world 5800, according to the Greek computation. Among the Christians, Said Ebn Batrick refers the *hagira* to the year of Christ 614, and of the creation 6114.

Khondemir relates, that it was Omar, the second caliph, that first established the *hagira* as an epocha, and appointed the years to be numbered from it: at the time he made this decree, there were already seven years elapsed. This establishment was made in imitation of the Christians; who, in those times, reckoned their years from the persecution of Dioclesian.

But there is another *hagira*, and the earlier too, though of less eminence:—Mahomet, in the 14th year of his mission, was obliged to relinquish Medina: the Corahtites had all along opposed him very vigorously, as an innovator, and disturber of the public peace; and many of his disciples, not enduring to be reputed followers of an impostor, desired leave of him to abandon the city, for fear of being obliged to renounce their religion. This retreat makes the first *hagira*.

—These two *hagira's* the Mahometans in their language call *hagiran*.

The years of the *hagira* consist only of 354 days. To reduce these years to the Julian calendar, *i. e.* to find what Julian year a given year of the *hagira* answers to, reduce the year of the *hagira* given, into days, by multiplying by 354; divide the product by 365, and from the quotient subtract the intercalations, *i. e.* as many days as there are four years in the quotient; and, lastly, to the remainder add 622. See **YEAR**.

HEIGHTH, the third dimension of a body, considered with regard to its elevation above the ground. See **DIMENSION**.

HEIGHTH, in astronomy, geography, &c. See **ALTITUDE**, and **ELEVATION**.

HEIGHTH, in the manage, &c. the stature of a horse, &c.

It is a reputed imperfection in a horse, when set too high on his legs, *i. e.* when the legs are too long in proportion to the body.

Some jockeys have determined a measure for them thus:—Take a string, and measure from the horse's withers to his elbow; and what length that is, the same should he have betwixt the elbow and the lower part of the heels.—Some measure their colts after this manner at a year old; being of opinion, that the legs of a colt at this age are as long as they ever will be.

The Duke of Newcastle, and Sir W. Hope, allow this to hold generally, but not universally.

HEIGHTS, in the military art, are the eminencies round a fortified place, whereon the armies usually post themselves.—The enemy had seized all the *heights*; appeared on the *heights*, &c.

HEIR.

HEIR *, *HÆRES*, in the civil law, he who succeeds to the whole estate and effects of another, whether by right of blood, or of testament.

* The word is formed of the Latin *heres*, of the verb *herere*, to stick, remain fast, be near, follow immediately, &c.

The institution of an *heir*, is a circumstance necessary to the validity of a testament.

There are two principal kinds of *heirs*, the *apparent* and *presumptive*.

HEIR Apparent, is he on whom the succession is so settled, that he cannot be set aside, without altering the laws of succession.

HEIR Presumptive. See the article *PRESUMPTIVE HEIR*.

HEIR, in common law, is he who succeeds, by right of blood, to any man's lands, or tenements in fee.

For, nothing passes in common law, *jure hereditatis*, by right of inheritance, but fee.

By common law, therefore, a man cannot be *heir* to goods or chattels; for, *heres dicitur ab hereditate*; it is the inheritance denominates the *heir*.

Every *heir*, having lands by descent, is bound by the acts of his ancestors, if he be named; it being a maxim, that *qui sentit commodum sentire debet et onus*.

Movables, or chattels immoveable, are given by testament, to whom the testator thinketh fit; otherwise they lie at the disposition of the ordinary, to be distributed as he in conscience likes best.

LAST HEIR. See the article *LAST HEIR*.

HEIR-LOOM *, in our law-books, signify such household furniture, as is not inventoried after the owner's decease; but necessarily comes to the heir along with the house. See *HEIR*.

* *Confectudo hundredi de Stretford, in com. Oxon. est quod hæredes tenementorum infra hundredum predict. existen. post mortem antecessorum suorum habebunt, &c. principalium, Anglice an heir-loome, viz. de quadam genere catallorum, utensilium, &c. Optimum plaurum, optimam carucam, optimum ciphum, &c. Coke on Littleton.*

Heir-loom comprehends divers implements; as tables, presses, cupboards, bedsteads, furnaces, waincot, and such like; which, in some countries, have belonged to a house for certain descents, and are never inventoried after the decease of the owner, as chattels are; but accrue by custom, not by common law, to the *heir*, with the house itself.

HELCESAITES, or ELCESAITES. See *ELCESAITES*.

HELEPOLIS *, in antiquity, a military machine for battering down the walls of a place besieged.

* The word is Greek, *ἡλεπολις*; compounded of the words *ἡλω*, to take, and *πολις*, city.

The *helepolis*, as described by Diodorus Siculus, &c. appears to have been no more than the *aries*, or battering ram, with a roof, or covering over it, to prevent its being set on fire, as also to screen the men who worked it. See *ARIES*.

Some will have it a combination of two or three battering rams, moving on large strong wheels, roofed over, and covered with raw or wet skins. It had several iron points, or heads, wherewith the execution was done; formed much like the thunderbolts which painters represent. Within was a great number of soldiers, who drove it with force of arm and by means of ropes, violently against the wall where the breach was intended.

Others will have *helepolis* a general name, comprehending all the machines used by the antients in besieging towns; as, among us, the name *artillery* includes all the forts of large fire-arms.—But this opinion is chiefly founded on the origin of the name, and does by no means suit with those minute descriptions given of the *helepolis* in the antient writers.

The invention of the *helepolis*, and divers other military machines, is ascribed to Demetrius; which, with the great number of cities he took thereby, gave him the denomination of *Polioretes*, or city taker.

HELIIACA *, in antiquity, sacrifices, and other solemnities, performed in honour of the sun.

* The word is formed from the Greek *ἡλιος*, sun.

HELIIACAL *, in astronomy:—**HELIIACAL Rising** of a star, planet, &c. is its issuing, or emerging out of the rays, and lustre of the sun, wherein it was before hid: whether this be owing to the recess of the sun from the star, or that of the star from the sun.

* The word is derived from the Greek, *ἡλιος*, *sol*, sun.

HELIIACAL Setting, is a star's entering or immersing into the sun's rays, and so becoming inconspicuous by the superior light of that luminary.

A star rises *heliacally*, when after it has been in conjunction with the sun, and on that account invisible, it gets at such a distance from him, as to be seen in the morning before the sun's rising.

The same is said to set *heliacally*, when it approaches so near the sun, as to be hid therein. So that, in strictness, the *heli-*

acal rising and setting, are only an apparition and occultation.

The *heliacal* rising of the moon, happens when she arrives at the distance of 17 degrees from the sun; for the other planets, 20 degrees distance is required: and for the stars more or less, as they are greater or smaller.

To find the *HELIIACAL rising and setting by the globe*; see *GLOBE*.

The antients computed that a star, between the tropics, would be forty days ere it got clear of the sun's rays, and become conspicuous again. Hesiod first made this computation; and the rest followed him. The period comes very near to the computation of the moderns: for the sun advancing nearly a degree every day, it will be 20 days approaching thereto; from the *heliacal* setting of the star; and thirty days more withdrawing, till the *heliacal* rising.

HELIIASTES * in antiquity, officers, or magistrates of Athens; who constituted a court of 500 persons, and were judges, for taking cognizance of civil matters.

* Ulpian gives us two etymologies of the word: some, says he, derive it from *ἡλιος*, *helios*, sun; and hold it thus called, by reason they sat in the open air, in sight of the sun. Ulpian himself chooses rather to derive *heliastes* from *ἡλιαία*, *Helicia*, the place where this court or council was held; and that from *ἀνέλεω*, I assemble, of *ἀνέλεω*, *fatui*, enough.

The court of *heliastes* was one of the six civil jurisdictions of Athens, and that before which matters of the greatest moment were usually brought: so that it was held the first and most considerable of all the civil tribunals. The delinquencies of the military men were also brought before the *heliastes*.

HELICE, *ΕΛΙΚΗ*, in astronomy, the same with *ursa major*. See *URSA*.

HELICOID Parabola, or the *parabolic spiral*, a curve arising upon a supposition of the axis of the common Apollonian parabola's being bent round into the periphery of a circle. See *PARABOLA*.

The *helicoid parabola*, then, is a line passing through the extremities of the ordinate, which now converge towards the centre of the said circle.

Suppose, e. g. the axis of the common parabola to be bent into the periphery of the circle BDM. (See *Tab. Conics*, fig. 11.) then, the curve BFGNA, which passes through the extremities of the ordinates CF, and DG, which converge toward the centre of the circle A; constitutes what we call the *helicoid*, or *spiral parabola*.

If the arch BC, as an abscissa, be called *x*; and the part CF of the radius, as an ordinate to it, be called *y*; the nature of this curve will be expressed by the equation $ix = yy$. See *CURVE*, and *EQUATION*.

HELIOCENTRIC * Place, of a planet, is the place wherein the planet would appear to be, if viewed from the centre of the sun: Or the point of the ecliptic, wherein a planet viewed from the sun would appear to be.

* The word is compounded of *ἡλιος*, sun, and *κεντρος*, centre.

The *heliocentric place*, therefore, coincides with the longitude of a planet viewed from the sun.

HELIOCENTRIC Latitude of a Planet, is the inclination of the line drawn between the centre of the sun and the centre of a planet, to the plane of the ecliptic.

The *heliocentric latitude* of a planet is thus determined.—If the circle KLM, (See *Tab. Astron.* fig. 62.) represent the orbit of the earth round the sun, and the inner one ANBN, be placed so as to be inclined to the plane of the other (for which reason it appears in the form of an ellipse) when the planet is in N or n, (which points are called its *nodes*) it will appear in the ecliptic, and so have no latitude; if it move to P, then, being seen by the sun, it will appear to decline from the ecliptic, or to have latitude; and the inclination of the line RP, to the plane of the ecliptic, is called the planet's *heliocentric latitude*; and the measure of it is the angle P R Q, supposing the line Pq to be perpendicular to the plane of the ecliptic.

This *heliocentric latitude* will be continually increasing, till it come to the point A, which they call the *limit*, or utmost extent of it; and then it will decrease again, till it come to nothing in N; after which it will increase again till it come to B; and lastly, it will be decreasing again, till the planet come to be in n, &c.

HELIOCOMETES, *Comet of the Sun*; a phenomenon sometimes observed at the setting of the sun; thus denominated by Sturmius and Pylæus, who had seen it, in regard it seems to make a comet of the sun, being a large tail, or column of light, fixed or hung to that luminary, and dragging after it at his setting, much in the manner of a tail of a comet. In that observed by M. Pylæus at Grypswald, March 15. 1702. at five of the clock in the afternoon, the end which touched the sun was only half the sun's diameter broad; but the other end, opposite to the sun, was much broader. Its length was above ten diameters of the sun; and it moved in the same track as the sun. Its colour was yellow next the sun and darker further off. It was only seen painted on the thinner, higher clouds: a little telescope easily discovered that there was nothing of it on the thicker, and lower clouds; though

HEL

the naked eye could not discover so much. It lasted, in its full vigour, the space of an hour, and then gradually diminished.

HELIOSCOPE *, in optics, a sort of telescope, peculiarly fitted for viewing and observing the sun, without doing prejudice to the eye.

* The word is compounded of ἥλιος, the sun, and σκοπεῖν, to view, consider.

Helioscopes are necessary in viewing the phenomena of the sun, as his spots, eclipses, &c.

There are various apparatuses of this kind.—As coloured glasses are found to diminish the force of the sun's rays; to make a *helioscope*, it is enough that both the object-glass, and the eye-glass of the telescope, be of coloured glass; the first, e. g. of red, and the latter green.

But, as there is a necessity for the glasses to be very transparent, and equally coloured, which rarely happens; Hevelius chooses rather to use two plain coloured glasses, with a piece of paper between, either tied or cemented together, and applied before the eye-glass.

Dr. Hooke, in an express treatise on *helioscopes*, recommends four reflecting glasses placed in the tube; by these, he observes, the force of the rays will be so weakened, as only to strike the eye with a 256th part of their force: and this *helioscope* he prefers to all others.

M. Huygens's method is much easier:—He only blackens the inside of the eye-glass of the telescope, by holding it over the flame, or smoke of a lamp or candle: or, which is yet more commodious, blackens a piece of plain glass, and holds it between the eye and the object-glass: or, which is best of all, claps the smoked glass to another, with a rim of thick paper between, to keep the black from rubbing off; and fits the two into a cell, or frame, to be applied between the eye and the eye-glass.

HELIOTROPE *, ἡλιότροπον, in natural history, the plant sun-flower, or turnsole; so called, by reason its flowers always turn towards the sun. See **TURNSOLE**.

* The word is compounded of the Greek, ἥλιος, sun, and τροπεῖν, to turn. See supplement: article **HELIOTROPISM**.

HELIOTROPE is also a precious stone, of a green colour, streaked with red veins.

Pliny says, it is thus called by reason when cast into a vessel of water, the sun's rays falling thereon, seem to be of a blood colour, and that when out of the water, it gives a faint reflection of the figure of the sun; and is proper to observe eclipses of the sun withal, as a helioscope.

The *heliotrope* is also called *oriental jasper*, on account of its ruddy spots.

It is found in the East-Indies; as also in Ethiopia, Germany, Bohemia, &c. Some have ascribed to it the faculty of rendering people invisible, like Gyges's ring. See supplement: article **BLOODSTONE** and **HELIOTROPE**.

HELISPHERICAL LINE, in navigation, denotes the rhumb line. See **RHUMB LINE**.

It is thus called, because, on the globe, it winds round the pole helically, i. e. spirally, and still comes nearer and nearer to it.

HELIX *, in geometry, a spiral line. See **SPIRAL**.

* The word is Greek, ἑλῆξ, and literally signifies a wreath, or winding; of ἵκνω, involvo, I inviron.

In architecture, some authors make a difference between the *helix* and the spiral.

A stair-case, according to Daviler, is in a *helix*, or is *helical*, when the stairs or steps wind round a cylindrical newel; whereas the spiral winds round a cone, and is continually approaching nearer and nearer its axis.

HELIX is also applied in architecture to the caulicoles, or little volutes, under the flowers of the Corinthian capital; called also *urillee*.—See *Tab. Archit. fig. 26. lit. D*; see also **CAULICOLES**.

HELIX, in anatomy, is the whole circuit or extent of the auricle, outwards.

In opposition to which, the inner protuberance answering thereto is called *anhelix*. See **EAR**.

HELL, a place of punishment, wherein the wicked are to receive the reward of their evil deeds, after this life.

In this sense, *hell* stands opposed to *heaven*. See **HEAVEN**. Among the antients, *hell* was called Τάρταρος, Τάρταρος, Tartarus, Tartara; Ἅδης, Hades, Infernus, Inferna, Inferi, &c.—The Jews, wanting a proper name for it, called it *Gehenna*, or *Gehinnon*, from a valley near Jerusalem, wherein was a Tophet, or place where a fire was perpetually kept. Divines reduce the torments of *hell* to two kinds, *pœna damni*, the loss and privation of the beatific vision; and *pœna sensus*, the horrors of darkness, with the continual pains of fire inextinguishable.

Most nations and religions have their notions of a *hell*.—The *hell* of the poets is terrible enough: witness the punishment of Tityus, Prometheus, the Danaids, Lapithæ, Phlegyas, &c. described by Ovid in his *Metamorphosis*.—Virgil, after a survey of *hell*, *Æneid*. Lib. VI. declares, that had he a hundred mouths

HEL

and tongues, they would not suffice to recount all the plagues of the tortured.—The New Testament represents *hell* as a lake of fire and brimstone; and a worm which dies not, &c. Rev. xx. 10, 14, &c. Mark ix. 43, &c. Luke xvi. 23, &c.

The Caffres are said to admit thirteen *hells*, and twenty-seven paradises; where every person finds a place of recompense suited to the degree of good or evil he has done.

There are two great points of controversy among writers touching *hell*: the first, Whether there really be any local *hell*, any proper and specific place of torment by fire? the second, Whether the torments of *hell* are to be eternal?

I. The locality of *hell*, and the reality of the fire thereof, have been controverted from the time of Origen.—That father, in his treatise *Περὶ Ἀρχῶν*, interpreting the scripture account metaphorically, makes *hell* to consist not in external punishments, but in the conscience of sinners, the sense of their guilt, and the remembrance of their past pleasures.—S. Augustine mentions several of the same opinion in his time; and Calvin, and many of his followers, have embraced it in ours.

The retainers to the contrary opinion, who are much the greater part of mankind, are divided as to the situation, and other circumstances of this horrible scene.—The Greeks, after Homer, *Hæliod*, &c. conceived *hell*, Τῆνος τὰ κατὰ τοῦ γῆς μυχῶς, &c. a large and dark place under the earth. Lucian, *De luctu*; and Eustathius, on *Homer*.

Some of the Romans lodged it in the subterranean regions directly under the lake Avernus, in Campania; which they were led to from the consideration of the poisonous vapours emitted by that lake.—Through a dark cave near this lake, Virgil makes *Aeneas* descend to *hell*. See **AVERNUS**.

Others placed *hell* under Tænarus, a promontory of Laconia; as being a dark frightful place, beset with thick woods, out of which there was no finding a passage. This way, Ovid says, Orpheus descended to *hell*. Others fancied the river, or fountain of Styx, in Arcadia, the spring-head of *hell*, by reason the waters thereof were mortal.

But these are all to be considered as only fables of poets; who, according to the genius of their art, allegorizing and personifying every thing, from the certain death met withal in those places, took occasion to represent them as so many gates, or entering places into the other world.

The primitive Christians, conceiving the earth a large extended plain, and the heavens an arch drawn over the same; took *hell* to be a place in the earth, the furthest distant from the heavens; so that their *hell* was our antipodes.

Tertullian, *De anima*, represents the Christians of his time, as believing *hell* to be an abyss in the centre of the earth: which opinion was chiefly founded on the belief of Christ's descent into hades, *hell*, Matt. xii. 40. See the following article, **HELL**.

Mr. Whiston has lately advanced a new opinion.—According to him, the comets are to be conceived as so many *hells*, appointed, in the course of their trajectories, or orbits, alternately to carry the damned into the confines of the sun, there to be scorched by his flames; and then to return them to starve in the cold, dreary, dark regions, beyond the orb of Saturn.

The reverend and orthodox Mr. T. Swinden, in an express *Inquiry into the nature and place of Hell*, not contented with any of the places hitherto assigned; contends for a new one.—According to him, the sun itself is the *local hell*.

This does not seem to be his own discovery:—It is probable he was led into the opinion by that passage in *Rev.* xvi. 8, 9.—Though it must be added, that Pythagoras seems to have had the like view, in that he places *hell* in the sphere of fire; and that sphere in the middle of the universe.—Add, that Aristotle mentions some of the Italic, or Pythagoric school, who placed the sphere of fire in the sun, and even called it Jupiter's prison. *De Cælo*, L. II.

To make way for his own system, Mr. Swinden undertakes to remove *hell* out of the centre of the earth, from these two considerations:—1^o. That a fund of fuel, or sulphur, sufficient to maintain so furious and constant a fire, cannot be there supposed: And, 2^o. That it must want the nitrous particles in the air, to sustain and keep it alive.—And how, says he, can such fire be eternal, when by degrees the whole substance of the earth must be consumed thereby?

It must not be forgot, however, that Tertullian had long ago obviated the former of these difficulties, by making a difference between *arcæus*, and *publicus ignis*, secret and open fire: The nature of the first, according to him, is such, as that it not only consumes, but repairs what it preys upon.—The latter difficulty is solved by St. Augustine, who alleges, that God supplies the central fire with air, by a miracle.

Mr. Swinden, however, proceeds to shew, that the central parts of the earth are possessed by water rather than fire; which he confirms by what Moses says of water under the earth, *Exod.* xx. from *Psal.* xxiv. 2. &c.

As a further proof, he alleges, that there would want room in the centre of the earth, for such an infinite host of inhabitants, as the fallen angels, and wicked men.

Drexelius, we know, has fixed the dimensions of *hell* to a German

German cubic mile, and the number of the damned to an hundred thousand millions: *De Damnator. Carcer. & Rego.* But Mr. Swinden thinks he needed not have been so sparing in his number, for that there might be found an hundred times as many; and that they must necessarily be unnumberably crowded in any space we could allow them in our earth.—It is impossible, he concludes, to flow such a multitude of spirits in such a scanty apartment, without a penetration of dimensions, which, he doubts, is not good philosophy, even in respect of spirits: If it be, he adds, 'he does not see why God should prepare, i. e. make a prison for them, when they might have been all crowded together into a baker's oven, p. 206.

His arguments for the fun's being the *local hell* are,

1. Its capacity;—No body will deny the fun spacious enough to receive all the damned conveniently; so that there will be no want of room. Nor will fire be wanting, if we admit of Mr. Swinden's argument against Aristotle, whereby he demonstrates that the sun is hot, p. 208, and *seq.*—The good man is 'filled with amazement to think what Pyrenean mountains of sulphur, how many Atlantic oceans of scalding bitumen, must go to maintain such mighty flames as those of the sun: to which our *Ætna* and *Vesuvius* are mere glow-worms,' p. 137.

2. Its distance and opposition to the empyreum, which has usually been looked upon as the local heaven: such opposition is perfectly answerable to that opposition in the nature and office of a place of angels and devils, of elect and reprobate, of glory and horror, of hallelujahs and curfings: And the distance quadrates well with Dives seeing Abraham *afar off*, and the great gulph between them; which this author takes to be the solar vortex.

3. That the empyreum is the highest, and the sun the lowest place of the creation; considering it as the centre of our system: And that the sun was the first part of the visible world created; which agrees with the notion of its being primarily intended or prepared to receive the angels, whose fall he supposes to have immediately preceded the creation.

4. The early and almost universal idolatry paid the sun; which suits well with the great subtilty of that spirit to entice mankind to worship his throne.

II. As to the eternity of *hell torments*, we have Origen, again at the head of those who deny it; it being the doctrine of that writer, that not only men, but devils themselves, after a suitable course of punishment, answerable to their respective crimes, shall be pardoned and restored to heaven. *Aug. de Civit. Dei*, L. XXI. c. 17.—The chief principle Origen went upon was this, that all punishments are emendatory; applied only as painful medicines, for the recovery of the patient's health. And other objections insisted on by modern authors, are the disproportion between temporary crimes, and eternal punishments, &c.

The scripture phrases for eternity, as is observed by archbishop Tillotson, do not always import an infinite duration: Thus, in the Old Testament, *for ever*, often signifies only a long time; particularly till the end of the Jewish dispensation: Thus in the epistle of *Jude*, ver. 7. the cities of Sodom and Gomorrah are said to be set forth for an example, suffering the vengeance of eternal fire; that is, of a fire that was not extinguished till those cities were utterly consumed.—So one generation is said to come, &c. but the earth endureth *for ever*.

In effect, M. le Clerc notes, that there is no Hebrew word which properly expresses eternity: *לעלם* *lelam*, only imports a time whose beginning or end is not known; and is accordingly used in a more or less extensive sense, according to the thing treated of.

Thus, when God says concerning the Jewish laws, that they must be observed *לעלם* *lelam*, for ever; we are to understand as long a space as he should think fit; or a space whose end was unknown to the Jews before the coming of the Messiah.—All general laws, and such as do not regard particular occasions, are made *for ever*, whether it be expressed in those laws or not: which yet is not to be understood in such a manner, as if the sovereign power could no way change them.

Archbishop Tillotson, however, argues very strenuously, that where *hell torments* are spoke of, the words are to be understood in the strict sense of infinite duration; and what he esteems a peremptory decision of the point is, that the duration of the punishment of the wicked, is in the very same sentence expressed by the very same word which is used for the duration of the happiness of the righteous, which all agree to be eternal. 'These, speaking of the wicked, shall go away, *וְהַנְּקִיִּים יֵלְכֻן עֲלֵיהֶם*, into eternal punishments; but the righteous, *וְהַצְדִּיקִים יֵלְכֻן עֲלֵיהֶם*, into life eternal.

The same great author attempts to reconcile this eternity with the divine justice, which had not been satisfactorily done before.—Some had urged that all sin is infinite, in respect of the object it is committed against, *viz.* God; and therefore deserves infinite punishment: But,

that crimes should be heightened by the quality of the object, to such degree, is absurd: since the evil and demerit of all sin must then be equal; inasmuch as none can be more than infinite; and consequently there can be no foundation for degrees of punishment in the next life. Add, that for the same reason as the least sin against God is infinite, in respect of its object; the least punishment inflicted by God may be said to be infinite, because of its author; and thus all punishments from, as well as sins against God, would be equal.

Others have urged, that if the wicked were to live for ever, they would sin for ever: But this, says the author, is mere presumption. Who can say, that if a man lived ever so long, he would never repent? Besides, the justice of God only punishes sins which men have committed, not those they might possibly have committed.

Others therefore urge, that God gives men the choice of everlasting happiness and misery; and that the reward promised to obedience, is equal to the punishment threatened to disobedience.—To which it was answered, that though it be not contrary to justice to exceed in rewards, that being matter of mere favour; it may be so to exceed in punishments.

It may be added, that man in this case has nothing to complain of, since he has only his election.—But though this may suffice to silence the sinner, and make him acknowledge his destruction to be of himself, it does not satisfy the objection from the disproportion between the crime and the punishment.—All the considerations, therefore, hitherto alleged, proving ineffectual; our great author is left to solve the difficulty himself.

In order to this, he observes, that the measure of penalties, with respect to crimes, is not only, nor always taken from the quality and degree of the offence; much less from the duration and continuance of it; but from the reasons of government, which properly require such penalties as may secure the observation of the law, and deter men from the breach of it.—Among men it is not reckoned injustice to punish murder, and many other crimes, which perhaps are committed in a moment, with perpetual loss of estate, or liberty, or life. So that the objection of temporary crimes being punished with such long sufferings, is of no force.

In effect, what proportion crimes and penalties are to bear to each other, is not so properly a consideration of justice, as of wisdom and prudence in the law-giver, who may enforce his laws with what penalties he pleases, without any impeachment of his justice, which is out of the question.

The primary end of all threatening is not punishment, but the prevention of it: God does not threaten that men may sin and be punished; but that they may not sin, and so escape: And therefore the higher the threatening runs, the more goodness there is in it.

After all, it is to be considered, says the good archbishop, that he who threatens, has still the power of execution in his own hands.—There is this difference between promises and threatnings; that he who promises, passes over a right to another, and thereby stands obliged to him in justice and faithfulness, to make good his word: but it is otherwise in threatnings; he that threatens, keeps the right of punishing still with him, and is not obliged to execute what he has threatened, any further than the reasons and ends of government require.—Thus, God absolutely threatened the destruction of Nineveh; and his peevish prophet understood the threatening to be absolute, and was angry for being employed in a message that was not made good: But God understood his own right, and did what he pleased, notwithstanding the threatening he had denounced, and notwithstanding Jonah was so touched in point of honour, that he had rather have perished, than Nineveh should have escaped.

HELL, *Hades*, is sometimes also used, in the scripture-style, for death, or burial; by reason the Hebrew and Greek names signify sometimes the place of the damned, and sometimes simply the grave.

Divines are divided about the sense of that article in the apostles creed, where our Saviour is said to have been crucified, dead and buried, and that he descended into *hell*, *Adnc.*—Some understand this descent into *hell* as no other than a descent into the tomb, or sepulchre; which others object against, in that his burial is expressly mentioned before; and maintain, that our Saviour's soul actually descended into the subterraneous, or local *hell*; where he triumphed over the devils, &c.

The Romanists add, that he there comforted the souls in purgatory; and brought away the spirits of the patriarchs, and other just persons, departed till that time; carrying them with him into paradise.

In the Romish church, that part of *hell*, wherein those were retained who died in the mercy and favour of God before our Saviour's suffering, is called *limbus*. See LIMBUS.

HELLEBORE, *ΕΛΛΕΒΟΡΕ*, or ELLEBORUS, a medicinal plant, reputed, among the antients, a specific for the cure of melancholy and madness.

There are two sorts of *hellebore*, the *black* and *white*. *Black HELLEBORE*, *Helleborus niger*, called also *melampodium*, and in English, the *christmas rose*, has a dark-coloured root, furnished with abundance of little fibres; its stem is green, its leaves are digitated, and its flowers are of a whitish colour, but in shape not unlike the rose.

White HELLEBORE, *Helleborus albus*, called also *veratrum*, in English, *newswort*, has a whitish root, beset with fibres of the same colour, shooting out at a sort of bulb, not unlike the head of an onion. Its leaves are broad; at first green, afterwards of a yellowish red. From the middle of the leaves rises a stem, two or three feet high, which toward the upper part has several branches, each whereof bears a considerable number of little flowers like stars, disposed in manner of a spica, or ear.

It is only the roots that are used, in each kind; which are to be chosen large and fair, furnished with thick filaments: those of the *white* tan-coloured without, and *white* within; and those of the *black*, blackish without, and brownish within; dry, clean, and of a sharp, disagreeable taste.

The antients, as already observed, had a great opinion of their efficacy in diseases of the mind; whence various phrases and forms of speaking among writers: as *caput helleboro dignum*: Juvenal says, *Misers need a double dose of hellebore*: *Danda est hellebori multo pars maxima avaris*.—The island of Anticyra, situate against mount Oeta, was famous for the growth and use of this plant: it being here in its greatest perfection, and used with the best effect. Whence the proverb *Naviget Anticyras*, send him a voyage to Anticyra; spoken of a madman.

The *white* acts as a purgative, but so very violently, both upwards and downwards, as frequently to cause convulsions; whence the use of it internally is now out of doors: but it is still retained with success for the fury in horses, and the scab in sheep.

The chief use wherein the present practice acknowledges it, is in form of a stermutatory powder, to clear and open the head.

The *black hellebore* used among us, Dr. Quincy suggests to be much inferior in virtue to that of the antients; for that it will not operate much by stool; but is only a powerful alternative, getting far into the habit, and so promoting sweat.

He adds, that he has known it do wonders in the gout and rheumatism, and that it rarely fails in obstructions of the menses. See supplement: article HELLEBORUS.

HELLENISM, a sort of Grecism; or a phrase peculiarly accommodated to the genius, and construction of the Greek tongue.

Hellenism, is distinguished from *Grecism*, in that the former is not applied to authors who have wrote in Greek: their language, it is evident, should be a continual *Hellenism*: But it is applied to authors, who writing in some other language, use terms and expressions peculiar to the Greek.

There are abundance of *Hellenisms* in the vulgate version of the scriptures.

HELLENISTIC, or *HELLENISTIC Language*, that used among the *Hellenists*. See **HELLENISTS**.

The critics are divided as to this language. — Several of them, and among the rest Drusius and Scaliger, take it to be the language used among the Grecian Jews. They add, that it is in this language the Greek translation of the Septuagint was wrote; and even the books of the New Testament composed.—M. Simon calls it the *language of the synagogue*.

It must not be imagined, that this was any peculiar language distinct from all others; or even any peculiar dialect of the Greek: It was thus denominated, to shew that it was Greek, mixed with Hebraisms, and Syriacisms.

Salmatus rejects the common opinion of the learned touching the *Hellenistic* language; and has wrote two volumes on the subject, in which there is not a little logomachia.

HELLENISTS, *HELLENISTÆ*, a term occurring in the Greek text of the New Testament, and which in the English version is rendered *Grecians*.

The critics are divided as to the signification of the word.—Oecumenius, in his *Scholia* on *Acts* vi. 1. observes, that it is not to be understood as signifying those of the religion of the Greeks, but those who spoke Greek, *τῶν ἰδίων ὁμιλητῶν*. The authors of the vulgate version, indeed, render it, like ours, *Græci*; but Messieurs du Port Royal, more accurately, *Juifs Grecs*, Greek or Grecian Jews; it being the Jews who spoke Greek, that are here spoken of, and who are hereby distinguished from the Jews called *Hebrews*; that is, who spoke the Hebrew tongue of that time.

The *Hellenists*, or Grecian Jews, were those who lived in Egypt, and other parts, where the Greek tongue prevailed. It is to them we owe the Greek version of the Old Testament, commonly called the *Septuagint*, or that of the Seventy. See **SEPTUAGINT**.

Salmatus, and Vossius, are of a different sentiment with regard to the *Hellenists*. The latter will only have them to be those who adhered to the Grecian interits.

Scaliger is represented in the *Scaligerana*, as asserting the

Hellenists to be the Jews who lived in Greece, and who read the Greek Bible in their synagogue.

HELM, in navigation, a horizontal piece of timber, serving to move another fitted into it at right angles, called the *rudder*.

The *helm*, or tiller of a ship, is a beam, or piece of timber, fastened into the rudder, and so coming forward into the steerage; where he that stands at *helm* steers the ship.

A-lee the Helm, signifies to put the *helm* to the lee-side of the ship.

Bear up the Helm, is to let the ship go more large before the wind.

Port the Helm, is to put the *helm* on the left hand or side of the ship.

Right the helm, or *helm the midship*, is to keep it even with the middle of the ship.

Starboard the Helm, is to put it to the right side of the ship.

HELM, in chemistry, is the head of a still or alembic; thus called, because in figure it something resembles a *helm*, or helmet.

Hence, to bring a thing *over the helm*, is the same as to force it by fire up to the top of the vessel, that it may distil down into the receiver by the beak of the head.

And when they say, such a thing cannot be brought over the *helm*, they mean, that it is of too fixed a nature to be raised into vapour, by the force of fire.

HELMET, or **HELM**, an antient armour of defence, wore by the cavaliers, both in war and in tournaments, as a cover and defence of the head; and still used by way of crest or ornament, over the shield or coat of arms.

The *helmet* is known by divers other names, as the *casque*, *head-piece*, *steel cap*, &c.

The *helmet* covered the head and face, only leaving an aperture about the eyes, secured by bars, which served as a visor.

The *helmet* is bore in armoury as a mark of nobility; and by the different circumstances of the bearing of the *helmet*, are the different degrees of nobility indicated. In France, whence all our heraldry originally came, the following rules obtain.

A person newly ennobled, or made a gentleman, bears over his escutcheon a *helmet* of bright iron or steel, in profile, or standing sideways; the visor quite close.

A gentleman of three descents bears it a little open, but still in profile, shewing three bars of the visor.

Antient knights, &c. have it in profile, but shewing five bars; the edges of silver.

A baron's *helmet* is of silver, the edges gold; with seven bars neither quite in profile, nor yet in front; with a coronet over it adorned with pearls.

Viscounts and earls formerly bore a silver *helmet*, with gold edges; its position like the former: but now they bear it quite fronting, with a coronet over it.

Marquises bear a silver *helmet*, damasked, fronting; with eleven bars, and their coronet.

Dukes and princes have their *helmet*, damasked, fronting, the visor almost open, and without bars; with their coronets over them.

Lastly, the *helmets* of kings and princes are all of gold, damasked, full fronting, and the visor quite open, and without bars.

The *helmets* of bastards are to be turned to the left, to denote their bastardy.

Among the English heralds, these laws are of late somewhat varied.—Leigh will have the *helmet* in profile, and close, to belong to knights: but all other authors give it to esquires and gentlemen.

To a knight they assign the *helmet* standing right forward, and the bearer a little open.

The *helmet* in profile or posited side-ways, and open, with bars, belongs to a nobleman under the condition of a duke.

The *helmet* right forward, and open, with many bars, is assigned to dukes, princes and kings.

Those turned side-ways are supposed to be giving ear to the command of their superiors; and those right forwards to be giving orders with absolute authority.

Commonly there is but one *helmet* in a shield; but, sometimes, there are two or three; if there be two, they must be placed facing each other: if three, the two extremes must be looking towards that in the middle.

HELMONTIAN Laudanum. See **LAUDANUM**.

HELPS, in the manage.—To teach a horse his lessons, there are seven *helps*, or aids, to be known.—These are the *voice*, *red, bit*, or *snaffle*; the *calves* of the legs, the *stirrups*, the *spur*, and the *ground*.

The *helps* are occasionally turned into corrections. See **CORRECTION**.

HELVETIC, something that has a relation to the Switzers, or inhabitants of the Swiss cantons, who were antiently called *Helvetii*.

The *Helvetic* body comprehends the republick of Switzerland, consisting of thirteen cantons, which make so many particular commonwealths.

By the laws, and customs of the *Helvetic* body, all differences between the several states and republics are to be decided within themselves, without the intervention of any foreign power.

HELVIDIANS, a sect of antient heretics, denominated from their leader *Helvidius*, a disciple of Auxentius the Arian, whose distinguishing principle was, that Mary the mother of Jesus did not continue a virgin; but had other children by Joseph.

The *Helvidians* are called by the Greeks, *Antidicomarianites*. **HEMEROBAPTISTS**, a sect among the antient Jews, thus called from their washing and bathing every day, in all seasons.

Epiphanius, who mentions this as the fourth hereby among the Jews, observes, that in other points these heretics had much the same opinions as the Scribes and Pharisees; only that they denied the resurrection of the dead, in common with the Sadducees, and retained a few other of the impieties of these last.

D^r Herbelot speaks of them as a sect still subsisting:—The disciples of St. John Baptist, says he, who in the first ages of the church were called *Hemerobaptists*, have constituted a sect, or rather a religion apart, under the name of *Mendai Tabia*. These people, whom our travellers call Christians of St. John Baptist, by reason their baptism is very different from ours, have been confounded with the Sabæans, from whom, however, they are very different.

HEMERODROMI *, among the antients, were centinels, or guards, appointed for the security, and preservation of cities, and other places.

* The word is Greek, *ἡμεροδρόμος*, compounded of *ἡμέρα*, day, and *δρόμος*, course, running about, &c.

They went out of the city every morning, as soon as the gates were opened, and kept all day patrolling round the place; sometimes also making excursions further into the country, to see that there were no enemies lying in wait to surprize them.

HEMERODROMI, were also a sort of couriers among the antients, who only travelled one day, and then delivered their packets, or dispatches to a fresh man, who run his day; and so on, to the end of the journey.

The Greeks had of these sort of couriers, which they learnt from the Persians, who were the inventors thereof, as appears from Herodotus.—Augustus had the same: at least, he established couriers, who, if they did not relieve each other from day to day, yet did it from space to space, and that space was not very great.

HEMI, a word used in the composition of divers terms.—It signifies the same with *femi* or *demi*, viz. half; being an abbreviation of *ἡμιον*, hemion, which signifies the same.

The Greeks retrenched the last syllable of the word *ἡμιον*, in the composition of words; and after their example we have done so too, in most of the compounds borrowed from them.

HEMICRANIA, *ἡμικρανία*, in medicine, a species of cephalalgia, or head-ach; wherein only one hemisphere, or half, or one side of the head is affected.

HEMICYCLE *. **HEMICYCLUM**, a femicircle. See **SEMICIRCLE**.

* The word is compounded of *ἡμις* dimidiis, half, and *κύκλος*, circle.

HEMICYCLE, is particularly applied in architecture, to vaults in the cradle form; and arches, or sweeps of vaults, constituting a perfect femicircle.

To construct an arch of hewn stone, they divide the *hemicycle* into so many vouffours; taking care to make them an uneven number, that there be no joint in the middle, where the key-stone should be. See **KEY**.

HEMICYCLUM was also a part of the orchestra in the antient theatre.—Scaliger, however, observes, it was no standing part of the orchestra; being only used in dramatic pieces, where some person was supposed to be arrived from sea, as in Plautus's *Rudens*.

The antients had also a sort of sun-dial, called *hemicyclum*.—It was a concave femicircle, the upper end or cusp whereof looked to the north.

There was a style or gnomon, issuing from the middle of the *hemicycle*, whereof that point corresponding to the centre of the *hemicycle*, represented the centre of the earth: and its shadow projected on the concavity of the *hemicycle*, which represented the space between one tropic and another, the sun's declination, the day of the month, hour of the day, &c.

HEMINA *, a vessel used as a measure among the antient Romans, containing half the sextary.

* The word is formed of the Greek, *ἡμιον*, half.

The *hemina*, called also *cotyla* and *acetabulum*; contained eight ounces of liquor; and was the 12th part of the congius.

Several authors have wrote expresse treatises on the Roman *hemina*; particularly Mess. Arnaud, and Pelletier.

S. Benedic^t prescribes the *hemina*, as the portion or quantity of wine, to be allowed the religious of his order at each meal. F. Mabillon, who has wrote on the subject, shews, that this *hemina* was a measure peculiar to the Benedictines; as well as the pound of bread allowed the same religious, which only consisted of fifteen ounces. F. Lancelot has a dissertation to prove that the *hemina* of wine, prescribed by S. Benedic^t, only amounts to a demi-septier of Paris measure: But others make it two septiers; and others three.

HEMIOLIUS *, or **HEMIOLIA**, an antient mathematical term, occurring chiefly in musical writers.—It signifies the ratio of two things, whereof the one contains the other once and an half; as 3 : 2, or 15 : 10, otherwise called *sesquialterate*. See **RATIO**, and **SESQUIALTE-RATE**.

* The word is compounded of *ἡμιον*, half, and *ὅλος*, whole.

Macrobius, on the *Somnium Scipionis*, L. II. c. 1. observes, that the concord, called in the antient music *diapente*, and in the modern, a *fifth*, arises from this proportion.

HEMIOPE * or **HEMIOPUS**, a musical instrument in use among the antients.

* The word is compounded of *ἡμιον*, half and *ὀπη*, hole.

The *hemiopeus* was a flute with only three small holes. See **FLUTE**.

HEMIPLEGIA * or **HEMIPLEXIA**, in medicine, a palsy of one whole side of the body. See **PALSY**.

* The word is Greek, *ἡμιπληγία*, compounded of *ἡμιον*, half, and *πλησσω*, I strike, or seize.

HEMISPHERE *. **HEMISPHERIUM**, in geometry, is one half of a globe, or sphere, when divided into two by a plane, passing through its centre.

* The word is compounded of *ἡμιον*, half, *σφαίρα*, sphere globe.

If the diameter of a sphere be equal to the distance of the two eyes; and a right line drawn from the centre of the sphere to the middle of that distance, be perpendicular to the line which joins the eyes: the eyes making a rotation on the axis, or middle point between them, will see the whole *hemisphere*.—If the distance of the eyes be either greater or lesser than the diameter of the sphere; in making such rotation they will view respectively more or less than a *hemisphere*. See **VISION**.

The writers in optics demonstrate, that a glass *hemisphere* unites parallel rays at the distance of a diameter, and one third of a diameter from the pole of the glass.

The centre of gravity of a *hemisphere* is five eighths of the radius distant from the vertex.

HEMISPHERE, in astronomy, is particularly used for one half of the mundane sphere. See **WORLD**.

The equator divides the sphere into two equal parts, called the northern and southern *hemispheres*.

The northern *hemisphere*, is that half in whose vertex is the north pole.—Such is that represented by DPA, (*Tab. Astronomy*, fig. 52.) terminated by the equator DA, and having the pole P in its zenith.

The southern *hemisphere*, is that other half DQA, terminated by the equator DA, and having the south pole Q in its zenith.

The horizon also divides the sphere into two *hemispheres*, the upper and the lower.

The upper *hemisphere* is that also of the mundane sphere HZR, terminated by the horizon HR, and having the zenith Z in its vertex.

The lower *hemisphere*, is that other half HNR, terminated by the horizon HR, and having the nadir N in its vertex.

HEMISPHERE is also used for a map, or projection, of half the terrestrial globe, or half the celestial sphere, on a plane.

Hemispheres are frequently called *planispheres*.

HEMISPHEROIDAL, in geometry, something that approaches to the figure of a *hemisphere*, but is not justly so.

The cacao opens when yellow and ripe, into two large *hemispheroids*, three foot in diameter.

HEMISTICH *, in poetry, a half verse. See **VERSE**.

* The word is compounded of *ἡμιον*, half, and *τιχον*, verse.

Such, e. g. are, *Cernit Deus omnia vindex*—
or *Medio tutissimus ibis*, &c.

It is disputed, whether or no the *hemistichs* in the *Æneid* were left with design; or whether they are owing to the work's being unfinished?

HEM

In English, &c. the common and Alexandrine verses, require a rest at the end of each *hemistich*: Common verses require it at the end of four syllables; and Alexandrine at the end of six.

Leonine verses rhyme both at the end and at the *hemistich*. See LEONINE.

HEMITONE, in the ancient music, was, what we now call an half note or tone.

HEMITRITÆUS *, HMITPITAIOS, in medicine, an irregular, intermitting fever, which returns twice every day; by which it is distinguished from the quotidian, which only returns once in the day.

* The word is compounded of ἡμις, half, and τριταῖος, third: Modern Latin authors express it by *semiteriana*.

HEMLOCK, *Cicuta*, a narcotic plant of some use in physic, in that intention.

There is a plaster denominated from it in the college dispensatory; consisting of the juice of the plant boiled up with gums, &c.

The common *hemlock* is however a poison; though not of the most violent sort.—We have instances of considerable quantities being taken without the least disorder. *Philosoph. Transact.* N^o. 231.

The *cicuta* so much celebrated among the antients, was the juice of a species of this plant, called *oenanthe aquatica Cicuta facie*. See supplement: article *CICUTA*.

HEMP, a plant of great use in the arts and manufactures; furnishing thread, cloth, cordage, &c.

Hemp, by naturalists called *canabis*, bears a near analogy to flax, *linum*; both in respect of form, culture and use.

The plant is annual; that is, it must be sown afresh every year.—It rises quick, into a tall, slender sort of shrub, whose stem however is hollow, and big enough to be char'd, and is often thus used in the composition of gunpowder.—Its leaves arise by fives or sixes from the same pedicle, and are a little jagged; yielding a strong smell which affects the head.—Its flowers grow in clusters, opposite to each other, in manner of a St. Andrew's cross; each consisting of five yellowish stamina, inclosed with a like number of petals, purple without, and white within.—Its fruit, or seed, is small and round, filled with a white solid pulp; and grows on the top of the stem; having its stalks distinct from those of the flowers.—Lastly, its bark is a tissue of fibres, joined together by a soft matter, which easily rots away.

Hemp is of two kinds; male, popularly called *kari*; and female, or *fenble*.—It is the female alone that produces seed, to perpetuate the kind: from the seed of this arises both male and female.

It does not appear, that the antients were acquainted with the use of *hemp*, in respect of the thread it affords. Pliny, who speaks of the plant in his *Natural History*, Lib. XX. c. 23. says not a word of this; contenting himself with extolling the virtues of its stem, leaves and root. In effect, what some writers of the Roman antiquities remark, viz. that the *hemp* necessary for the use of war, was all stored up in two cities of the western empire, viz. at Ravenna and Vienne, under the direction of two procurators, called *procuratores liniarii*; must be understood of *linum*, or flax.

The seed of *hemp* is said to have the faculty of abating venereal desires; and its decoction in milk, is recommended against the jaundice.—The leaves are held good against burns, and the juice thereof against deafness.—The powder, or flower, mixed with any ordinary liquor, is said to turn those who drink thereof stupid.

The culture and management of *hemp*, makes a considerable article in agriculture; there being divers operations required therein, as *pulling*, *watering*, *beating*, *swingling*, &c.

The plant is to be sown in May, in a warm, sandy, rich soil; and is itself sufficient to destroy weeds on any ground.—About Lammas they begin to gather it; the light, or female, being first ripe. The marks of its maturity, are its leaves turning yellow, and the stalks white.

The way of gathering, is to *pull* it up by the roots; after which they bind it up in handfuls or bundles: the female they let stand eight or ten days in the air, that the seed may dry and ripen; after which they cut off the heads, and beat or thrash them to get out the seed.—They also beat the male, to get out a hurtful thick fetid sort of dust, contained therein.

This done, they proceed to *water* or *rate* it, by laying it five or six days in a pool, or other stagnant water, to rot the bark. A stream, or running water, would do the business much better, but that it infects the water, and gives it a quality very pernicious to the health; for which reason it is forbid to rate it in any waters used for domestic purposes.

When rotted, and taken out again, they dry it; then *brake* or beat out the dry bun, or hex, which is the woody part of the stem, from the rind or bark which covers it, by crushing it in a toothed or nicked instrument called a *brake*, beginning with the root end.

When the bun is sufficiently broke, and hangs by small shivers, they *swingle* or beat it out with a piece of wood

HEP

edged for the purpose.—Note, the *kari hemp* they sometimes break with the fingers, and strip off the rind, without the help of the brake or swingle.

The next thing is to *beat* the *hemp*; which is done either on a block, or in a trough, with a hammer, or with beetles; till it feel sufficiently soft and pliable.—It remains now to be *beckled*, or passed through divers toothed instruments, not unlike the wool-dressers combs, of different fineness: This, separating the shorter tow from it, the rest is fit to be spun, wove, &c. for thread, cloth, cordage, or the like.

HENBANE, a poisonous plant. See supplement: article HY-OSCIAMUS.

HENDECAGON, in geometry, a figure which has eleven sides, and as many angles.

* The word is Greek, ἑνδεκάγωνος, compounded of ἑνδεκα, eleven, and γωνία, angle.

HENDECAGON, in fortification is used for a place defended by eleven bastions.

HENDECASYLLABUM *, ἑνδεκάσλλαβον, in Greek and Latin poetry, a verse of eleven syllables. See VERSE.

* The word is Greek, compounded of ἑνδεκα, eleven, and σλλαβή, syllable, of σνδλαβωμαι, I comprehend.

Sapphic, and Phaleucic verses, are *hendecasyllabs*, or *hendecasyllabie*, c. g.

Sap. Jam satis terris nivis atque diræ.

Phal. Passer mortuus est meæ puella.

HENOTICUM *, in church history, a famous edict of the emperor Zeno, in the fifth century, intended to reconcile and reunite the Eutychnians with the Catholics.

* The word is Greek, ἡνωτικος, q. d. irenic, reconciliative; of ἡνω, I unite.

It was procured of the emperor, by means of Acacius, patriarch of Constantinople, with the assistance of the friends of Peter Mogges.

The sting of this edict lies here, that it does not admit the council of Chalcedon, like the other three, but rather seems to charge it with errors.—It is in form of a letter, addressed by Zeno to the bishops, priests, monks, and people of Egypt and Lybia. It was opposed by the Catholics, and condemned in form by pope Felix III.

HEPAR, in anatomy, the liver. See the article LIVER.

HEPAR Uterinum, the same with *placenta*. See PLACENTA.

HEPATIC, in medicine and anatomy, something that relates to the liver; by the Greeks called ἡπατις, hepar.

HEPATIC Aloes. See the article ALOES.

HEPATIC Duct, is a vessel more usually called *perus biliaris*. See PORUS BILIARIS.

HEPATIC Flux. See the article FLUX.

HEPATIC Plexus. See the article PLEXUS HEPATICUS.

HEPATIC Vein, is that otherwise called *basilica*. See BASILICA.

HEPATI-CYSTIC Ducts. See CYST-HEPATIC Duct.

HEPATITES, liver stone, in natural history, a sort of stone, thus denominated from its liver-colour, or because it is generated in the liver.

HEPATITIS, ἡπατιτις, in medicine, an inflammation of the liver, with an abscess or imposthume thereof.

The *hepatitis* bears a near resemblance to the pleurisy; only that its symptoms are less intense.

It usually either kills the patient, or else discharges, or suppurates gradually, or finally degenerates into a scirrhus.

HEPATOSCOPIA *, the art of divining, or discovering future, or hidden things, by inspecting the entrails of beasts.

* The word is compounded of the Greek, ἡπατος, the genitive of ἡπαρ, liver, and σκοπος, I consider; the liver being a part principally regarded.

The Romans called it *extispicina*. See EXTISPEX.

HEPTACHORD *, in the ancient poetry.—*Heptachord* verses, were those sung or played on seven chords; that is, in seven different notes, or tones; and probably on an instrument with seven strings.

* The word is compounded of ἑπτα, septem, and χορδή, chord, string.

HEPTAGON *, in geometry, a figure consisting of seven sides, and seven angles.

* The word is compounded of ἑπτα, septem, seven, and γωνία, angle.

If the sides be all equal, it is called a *regular heptagon*.

HEPTAGON, in fortification, a place strengthened with seven bastions for its defence. See BASTION.

HEPTAGONAL Numbers, are a sort of polygonal numbers, wherein the difference of the terms of the corresponding arithmetical progression is five.

One property, among others, of these numbers is, that if they be multiplied by 40, and 9 be added to the product, the sum is always a square number. See NUMBER.

HEPTAMERIS literally signifies a *seventh part*; being formed of the Greek ἑπτα, seven, and μέρος, part, or portion.

The word is used by M. Sauveur, in his *Principles of Acoustics*, for the seventh part of a *meris*; and in his *system*, for the forty third part of the octave.

HEPTAMERON, a term literally implying *seven days*: being compounded of *hepta*, seven, and *hēmera* day. It is chiefly used as a title of certain books, containing the transactions of seven days.

The *Heptameron* of Margaret de Valois, sister to Francis I. of France, and queen of Navarre, is a very ingenious piece, in the manner of Boccaccio's *Decameron*.

HEPTARCHY*, a government composed of seven persons: or a country governed by seven persons, or divided into seven kingdoms.

* The word is compounded of the Greek *hepta*, seven, and *archē*, imperium, command, rule.

The Saxon *Heptarchy* included all the southern as well as northern parts of England, which were cantoned out into seven petty kingdoms, viz. those of Kent, the South-Saxons, West-Saxons, East-Saxons, Northumberland, the East-Angles, and Mercia.—The *heptarchy* was formed by degrees, from the year 457, when the first kingdom of Kent was erected; and it terminated in 805, when king Egbert re-united them into one; and made the *heptarchy* into a monarchy. See *MONARCHY*.

HEPTATEUCH*, in matters of literature, a volume, or work confining of seven books.

* The word is composed of *hepta*, seven, and *teuchos*, I do, I work; whence *teuchos* a work, book; and *hepta* *teuchos* *Heptateuch*, a work of seven parts; or seven different works joined in one volume.

Heptateuch is chiefly applied to the first seven books of the Old Testament, viz. Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, and Judges; that is, the five books of Moses called the *pentateuch*, and the two following ones, which are usually joined therewith.

HEPHTHEMIMERIS*, in the Greek and Latin poetry, a sort of verse confining of three feet and a syllable; that is, of seven half feet.

* The word is Greek *hephtthemimeris*: composed of *hepta*, seven, *hēmera*, half, and *meros*, part.

Such are most of the verses in Anacreon.

Θάω	:	λίσσω	:	Ατρί	:	δάς
Θάω	:	δι καδ	:	μος α	:	διν, &c.

And that of Aristophanes in his *Plutus*:

Επὶ τρεῖς μετρί χιλιεῖ.

They are also called *trimetri cataleptici*.

HEPHTHEMIMERIS, or *HEPHTHEMIMERES*, is also a *cæfura* after the third foot, that is, on the seventh half foot. It is a rule, that this syllable, though it be short in itself, must be made long, on account of the *cæfura*, or to make it an *hephtthemimeris*: as in that verse of Virgil;

Et furis agitated amor, & conscia virtus.

It may be added, that the *cæfura* is not to be on the fifth foot, as it is in the verse which Dr. Harris gives us for an example,

Ille latus niveum molli fultus Hyacintho.

This is not a *hephtthemimeris* *cæfura*, but a *hennemimeris*, i. e. of nine half feet.

HERACLEONITES, ancient heretics of the sect of the Gnostics; thus called from their leader, Heracleon. S. Epiphanius, *Her.* 36. is very ample on this heresy. He represents Heracleon as one who had reformed the theology of the Gnostics in many points; though, at bottom, he had retained the principal articles thereof. He refined on the ordinary interpretations of abundance of texts of scripture; and even altered the words of some, to make them consist with his own notions.

For example, he maintained that by those words of S. John, *all things were made by him*, is not to be understood the universe, and all that is good therein: But that the universe, which he calls *æon*, was not made by the Word, but was made before him. And to support this construction, he added to those words of St. John, *without him nothing was made*, those other words, *of things in the world*.

He distinguished two kinds of worlds; the one divine, the other corruptible; and refrained the word *æon*, all things to this last. He held, that the Word did not create the world immediately, and of himself, but only that he gave occasion to the demiurgos to do it.

The *Heracleonites*, after the example of their master, annulled all the ancient prophecies; holding, that St. John was really the voice that proclaimed and pointed out the Messiah, but that the prophecies were only empty sounds, and signified nothing.—They held themselves superior in point of knowledge to the apostles; and on that footing dared to advance the most extravagant paradoxes, on pretence of explaining scripture in a sublime, elevated manner. They were so fond of these mystic interpretations, that Origen, though a stickler that way him-

self, was obliged to reproach Heracleon with his abusing scripture by that means.

HERACLIDÆ, in antiquity, the descendants of Hercules, whom the Greeks called, *Ἡρακλίδες*, *Heracles*.

The *Heracidae* were expelled from Peloponnesus, by Euristheus king of Mycenæ, after the death of Hercules.

Return of the HERACLIDÆ into Peloponnesus, is a celebrated epocha in the ancient chronology.

The time of this return is differently assigned; by reason that authors mistake the divers attempts which they made to return, for the return itself. The first attempt was twenty years before the taking of Troy: the second was 100 years later, or 80 years after the taking of Troy. This last is supposed to have succeeded; at least, according to Petavius, who mentions only these two. *Rat. Temp.* P. I. L. I. c. 12. and *Deâri Temp.* L. IX. and c. 30.

Scaliger distinguishes three attempts; and fixes the first 50 years later than Petavius, viz. 30 years after the taking of Troy. He says nothing of the second, which was unfortunate like the first; but he places the third in the same year with Petavius.

As it occasioned a world of changes and revolutions in the affairs of Greece, inasmuch that scarce a state or people but were turned upside-down thereby; the return of the *Heracidae* is the epocha of the beginning of profane history: all the time that preceded it is reputed fabulous. Accordingly, Ephorus, Cumanus, Callisthenes, and Theopompus, only begin their histories from hence.

HERALD*, an officer of arms, antiently in great repute, and possessed of several considerable functions, rights, and privileges.

* The word *Herald*, according to Du Cange, comes from the Saxon *hepe*; or German *heer*, army, and *aid* servant; because chiefly serving in the army. Others will have the two words signify *champion of the army*; in allusion to their office of denouncing war, proclaiming peace, &c.—Du Cange adds, that they were called *clarigarii*, as well as *heraldi*. Borel derives the word from the Latin *herus*, master; *q. d.* one coming from his master. Others from *herhaut*, *q. d.* high loud: others from *herold*, which is the same with *dominus veteranus*; and others, lastly, from *heer*, master, or army, and *held*, *q. d.* bound to his lord, or the army.

The origin of *heralds* is very antient.—Stentor is represented by Homer as *herald* of the Greeks, who had a voice louder than fifty men together. The Greeks called them *μερμυκας*, and *εμμεροφολακας*; and the Romans, *feciales*.

The Romans had a college of *heraldi*, appointed to decide whether a war were just or unjust; and to prevent its coming to open hostilities, till all means had been attempted for deciding the difference in a pacific way.

Heralds, or *heralds at arms*, have formerly been denominated *dukes at arms*, because properly belonging to dukes; as kings at arms, to kings.

In England we have six *heraldi*, viz. 1^o. *Richmond*, 2^o. *Langcaster*, 3^o. *Chester*, 4^o. *Windsor*, 5^o. *Somerset*, 6^o. *York*.—To which may be added a seventh, or *Braunfeich herald*, erected by king George I.—Their office is to wait at court, to attend public solemnities, to proclaim war and peace, and to look to the regulation of the bearings of arms; and to search pedigrees, &c.

They were formerly created and christened by the king; who slowly pouring a gold cup of wine on their head, gave them their *herald's* name. Now it is done by the earl-marshal.—They could not arrive at the dignity of *herald*, without having been seven years pourfuiwant: nor could they quit the function of *herald*, but to be made king at arms. See *POUR-SUIVANT*, &c.

Their principal employment was to compose or make out coats of arms, genealogies, and titles of the nobility. They were the superintendants of military exploits, and the conservators of the honours of war. They had a right to take away the arms of such as for cowardice, treason, &c. deserved to be degraded. They had a commission to examine, and correct the vices and disorders of the nobles, and on such occasions to exclude them from jousts, tournaments, &c. To them belonged also the correcting of all usurpations, and abuses relating to crowns, coronets, casks, crests, supporters, &c. They took cognizance of all differences among the nobles, with respect to their bearings, the antiquity of their families, precedencies, &c. They went into the several countries to search into the grounds and pretensions of nobility; and had a right to open all libraries, and to command all the ancient charters and instruments in the archives to be shewn them. They had admission into all foreign courts, where they were commissioned to proclaim war and peace; and their persons were held sacred, as those of ambassadors. To them it belonged to make publication of jousts, and tournaments; to call the people to them; to signify the cartels; to mark the ground, list, or place of duel; to see fair play observed; and to divide the fun between the two parties. In the army, they advertised the cavaliers and captains of the day

of battle, and assisted therein before the standard; retiring, after the first onset, to some place of eminence, there to observe who behaved best, and to give a faithful report thereof to the king. They also numbered the dead, relieved the engines, re-demanded prisoners, summoned places to surrender, and in capitulations walked before the governor of the place, to secure and warrant his person. They were the principal arbiters of the distribution of the spoils of the vanquished, and of military rewards. They published victories, and gave notifications thereof to foreign courts. They convened the estates of the kingdom, assisted at royal marriages, and frequently made the first demand; they also officiated at solemn feasts, &c.

The modern *heralds*, i. e. those we properly call *heralds*, have lost a good deal of the distinction and office of the ancient ones. What relates to the making out arms, the rectifying of abuses therein, &c. is chiefly committed to the kings at arms.

And in the army, drums and trumpets have succeeded to the function of *heralds*, being sent by the generals on the same errands; and on that account enjoying the same rights and privileges. Their persons are under the protection of the law of nations, when they bear the marks of their offices publicly, i. e. the trumpeter his trumpet, and the drummer his drum; in the same manner as the *herald* his coat.

The *heralds*, with the kings at arms, and the four pursuivants, are a college, or corporation; erected into such by charter of Richard III. who granted them divers privileges, as to be free from subsidies, tolls, and all trouble some offices. Clarenceux and Norroy king at arms, are also called *provincial heralds*.

HERALDRY, the art of armoury, and blazoning; or the knowledge of what relates to the bearing of arms, and the laws and regulations thereof.

Heraldry likewise comprehends what relates to the marshalling of solemn cavalcades, processions, and other ceremonies at coronations, instalments, creations of peers, funerals, nuptials, &c.

HERB*, a name common to all plants whose stalks, or stems, die away every year, after their seed is become ripe.

* The word is formed of the Latin *herba*; which some derive from *arvum*, field: others from the Greek *phéron*, *passere*, to feed; of *phéron*, *pabulum*. Of the Greek *phéron*, the Latins formed *phéba*; and of *féba*, *herba*; after the manner of the Spaniards, who always change the *f* at the beginning of a word into *b*.

There are some *herbs* whose root perishes with the stem: and others, where the root survives the stem by several years.

Of the former, those which come to maturity the first year, and after they have cast their seed, die away, are called *annuals*: such are wheat, rye, &c.

Those which only bear flowers and fruit the second year, or even the third year, and then perish, are called *biennials* and *triennials*: such are the garden angelica, and some others.

Herbs whose root does not perish after they have shed their seed, are called *perennials*: such are mint, &c.

Of these, some keep their leaves all the year round, and are called *ever-greens*; as the asarabacca, &c. See **EVER-GREENS**.

The rest lose their leaves, and continue bare part of the year; as colts-foot, &c.

Herbs are also distinguished into *kitchen*, or *sallet* *herbs*, and *medicinal* *herbs*.

Sallet-HERBS, } See the articles { **SALLET**.

Medicinal-HERBS, } **SIMPLE**.

HERBAGE, a collective name, comprehending all kinds of herbs.

The ancient hermits lived altogether on *herbage*.

What makes the principal difference in the goodness of butters and cheeses, is the difference of *herbage*.

HERBAGE, in law, signifies the green pasture, or fruits of the earth, provided by nature for the bite or food of cattle.

HERBAGE is also used for a liberty which a man hath to feed his cattle in another man's ground; as, in the forest.

HERBAL, a book which treats of plants; or describes the figure, genus, species, properties, virtues, &c. of herbs, trees, feeds, plants, &c.

Such are Gerard's *Herbal*, Parkinson's *Herbal*, &c.

HERBAL, is also used for a set or collection of specimens of the several kinds of plants, dried and preserved in the leaves of a book, called also a **HORTUS SICCUS**.

In the *Philosophical Transactions*, we have a method described for preserving specimens for such an *herbal*.—The flowers, leaves, &c. gathered perfectly ripe, and in their true colours, are to be spread on whitey-brown paper, with the parts all displayed as distinctly as may be. If the stem, or body of the flower, &c. be thick, one half is to be pared away to make it lie flat. Over these is to be spread another paper; and the whole is to be put between two iron plates, screwed tight together, and thus baked in an oven for two hours. When taken out, wash the plants over with a mixture of brandy and aqua fortis, and lay them on fresh paper to dry. Lastly, lick over the back sides with a brush dipped in a dissolution

of gum Tragacanth, to make them stick; and lay them in the paper book, where they will lie fast, and always look fresh.

HERBALIST, or **HERBORIST**, a person skillful in plants; the same with *botanist*.

HERBE, in the academies, a reward or some good stuff given to a horse that has worked well in the manege.

HERBINGER, or **HARBINGER**. See **HARBINGER**.

HERCULES, EN **TONAÏN**, in astronomy, one of the constellations of the northern hemisphere. See **CONSTELLATION**.

The stars in the constellation *hercules*, in Ptolemy's catalogue, are 29; in Tycho's, 28; in the Britannic catalogue, 95. The longitudes, latitudes, magnitudes, &c. whereof are as follows.

HERCULEUS Morbus, in medicine, the epilepsy; thus called from the terror of its attacks, and the difficulty of cure. See **EPILEPSY**.

HERD, among hunters, a company, or assemblage, of black or fallow beasts; in contradistinction to *stock*.

A herd of deer from such a forest.—The deer begin to herd in the month of December.

In the hunting language, there are various terms used for companies of the divers kinds of game.—We say a herd of hearts or bucks; a *bevy* of roes; a *route* of wolves; a *riches* of martens, &c. See **HUNTING**.

HERDEWICH*, **HERDEWIC**, or **HERDEWYCH**, in our ancient law-books, a grange, or place for cattle and husbandry.

* Et unam herdewycham apud herbecotum in peco, &c. Mon. Angl.

HEREDADE *, the king's edict, anciently issued to command his subjects into the field.

* The word is formed of the Saxon hepe, army, and booe, messenger.

HEREDITAMENTS, in law, are such things immoveable, as a man may have to himself and his heirs, by way of inheritance; or which, not being otherwise bequeathed, do naturally and of course descend to him who is next heir of blood; and fall not to the executor or administrator, as chattels do.

Hereditaments is a word of a large extent, and is much used in conveyances: for by the grant of *hereditaments*, i. e. feignories, manors, houses, and lands of all sorts, charters, rents, services, advowsons, conveyances, and whatever may be inherited, will pass.

HEREDITARY, something appropriated to a family, or belonging thereto by right of succession, from heir to heir. Of monarchies, some are *hereditary*, others elective: of *hereditary* monarchies some descend only to the heirs male, as in France; others to the next of blood, whether male or female, as in England, Spain, &c.

The dominions of the emperor are distinguished into *hereditary*, which are those he derives from his ancestors by right of blood and inheritance; and those he enjoys in quality of emperor, by virtue of his election.

HEREDITARY is also applied to offices, and honours annexed to certain families.—Thus the offices of lord great chamberlain and earl marshal, are *hereditary*, in the families of the Howards, and Lindseys.

It is of no very long date, that the dignities of duke, count, &c. are *hereditary*.

The canon law has taken all possible precautions to prevent benefices from becoming *hereditary*.

HEREDITARY is also applied figuratively to good or evil qualities, habits, &c. capable of being transmitted, by blood, from father to son.

The gout, kings-evil, madness, &c. are *hereditary* diseases, i. e. they are sometimes transmitted from the parents in the stomach, or first rudiments of the fœtus. And such, probably, is the origin of numerous other chronic diseases.

HEREDITARY Right denotes a right, or privilege, in virtue whereof a person succeeds to the effects of his ancestors.

The Nonjurors, &c. hold *hereditary right* to be a *divine* Vol. I.

right, i. e. of God's own appointment, and consequently indispenfible, or, as they call it, *indisfible*. On this account they stickle for the obligation of *hereditary right*, in favour of the descendants of king James II.

HERESIARCH*, *Arch-Heretic*, the founder or inventor of a heresy; or the chief and rind-leader of a sect of heretics.

* The word is Greek, ἀρεισιάρχης, compounded of ἀρεισι, *heresi*, heresy, and ἀρχή, *princeps*, prince, chief.

Thus Arius, and Socinus, are called *heresiarchs*; as being the founders and patriarchs of the Arians and Socinians.

Simon Magus is recorded as the first *heresiarch* under the new law.

HERESY, an error in some essential point of Christian faith, maintained with obstinacy, and dissimulity.

It is properly the obstinacy that constitutes the character of *heresy*, not the error.—When a man is humble, and ingenuous, ready and desirous to receive further light and instruction, and when he gives every thing urged against him its due weight; he is not guilty of *heresy*—*Errare possim*; *hæreticus esse nolo*, is a celebrated maxim of St. Augustine.

Tertullian, in his treatise *Of Prescriptions*, defines *heresy* by choice; agreeably to the etymology of the word.—A heretic, in this sense, is one who of his own choice, on his own bottom, invents, proposes, or even embraces, any new dogma, or article of faith.

The word is formed of the Greek ἀιρεσις, which, among the ancients, had nothing of that odious signification attached to it by ecclesiastical writers of later times. It only signified a *peculiar opinion*, *dogma*, or *sect*.

In this sense, they said, the *heresy* of the Stoics, of the Peripatetics, &c. meaning their sect, their system, &c.

HERESY is sometimes also used, by extension, for a proposition that is notoriously false, in some other science.

Thus, it is a *heresy* in morals, to say that a man must be ungrateful. It is a *heresy* in geometry, to say that two triangles, whose angles are similar, are not proportional.

HERETIC, a person who maintains, or adheres to a heresy, especially if convicted thereof.

A real *heretic*, is properly he who maintains a false opinion, out of a spirit of obstinacy, faction, or hypocrisy.—A *heretic* makes profession of Christianity; by which he is distinguished from an *infidel*, *Jew*, and *idolater*.

A man does not become an *heretic* by doing a thing condemned, or forbidden by the gospel, and, of consequence, repugnant to the Christian faith; but by a stiff dissingenuous adherence to an opinion opposite to some article of the Christian faith, whether it regard speculation or practice.

The sects of *heretics* who have at different Times disturbed the church, are innumerable.

The emperor Maximus, who usurped the throne from Gratian, was the first that decreed the pains of death to *heretics*.

By our own law, *heretics* were anciently to be burnt. And there was a writ, *De hæretico comburendo*, which lay for that purpose; but it was taken away by Stat. Car. II.

HERIOT. See the article **HARIOT**.

HERISSON, in fortification, a beam armed with iron spikes, the points whereof are turned outward; supported in the middle by a stake, wherein is a pivot on which it turns; it serves as a barrier to block up a passage.

Herissons are frequently placed before gates; especially the posterns of a town or fortress, to secure those passages, which must of necessity be frequently opened and shut.

HERITAGE. See the article **INHERITANCE**.

HERMAPHRODITE*, ἑρμαφροδιτης, a person who has both the sexes, or the genital parts both of male and female.

* The word is formed of the Greek ἑρμαφροδιτης, a compound of ἑρμας, Mercury, and ἀφροδιτης, Venus; q. d. a mixture of Mercury and Venus, i. e. of male and female. For, it is to be observed, *Hermaphroditus* was originally a proper name, applied by the heathen mythologists to a fabulous deity, whom some represent as a son of *Hermes*, Mercury, and *Aphrodite*, Venus; and who being desperately in love with the nymph *Salmacis*, obtained of the gods to have his body and hers united into one. Others say, that the god *Hermaphroditus* was conceived as a composition of Mercury and Venus, to cement the union between eloquence, or rather commerce, where Mercury was god; with pleasure, where Venus was goddess, or deity. Lastly, others think this junction intended to show that Venus, pleasure, was of both sexes; as, in effect, the poet Calvus calls Venus a god.

Pollentemque Deum Venerem.
As also Virgil, *Æneid*. Lib. II.
Dilecto ac ducente Deo flumina inter.

Expeller.—
M. Spon observes, *Hefychius* calls Venus *Aphrodite*; and *Theophrastus* affirms, that *Aphrodite*, or Venus, is *Hermaphroditus*; and that in the island of Cyprus she had a statue, which represented her with a beard like a man.—The Greeks also call *Hermaphroditus*, ἀνδρογυνή, androgynē, q. d. man woman.

Naturalists distinguish four kinds of *hermaphrodites*: whereof one kind only are the perfect *hermaphrodites*, or those who have the pudenda of both kinds; but these are rarely if ever found. It is affirmed, however, that there were once two such *hermaphrodites* married to each other; and that each begot children upon the other. See various instances of *hermaphrodites* in a dissertation of M. Loffhagen, in the *Nov. Lit. Mar. Balt.* 1704. p. 105. Baubine, *De Hermaphrod.* Ludov. Bonacioli. *Traité de Part. Form.* cap. 9. Aldrovand. *de Monstr.* cap. 1. Paul. Zacch. *Quæst. Med. Legal.* T. I. L. vii. § 8.

Others dispute all that has been said on the subject; maintaining, that the ill conformation of the parts of generation, the testicles being detained or concealed in men, and the clitoris longer than ordinary in women, have been the sole occasion of so erroneous a notion. To which may be added, scrotomatous tumors of the labia pudendi, which have sometimes passed for testicles.

Dr. Quincy thinks, that the frequent use of lascivious frictions, and titillations, may contribute greatly to the extension of the clitoris; and make it pass with the ignorant for a penis. This, he adds, was the case in the celebrated instance of the two nuns at Rome, who, after they had lived women for many years, were said to have become men.—But on what grounds he asserts this we do not know.

The extraordinary size of the clitoris, says Dr. Drake, and its propendence, sometimes, out of the body in infants, makes the women mistake such children for that sort of monsters called *hermaphrodites*. Of this kind, I had one brought to me, the clitoris whereof hung out of the body so far, at about three years old, that it resembled very much a penis; but it wanted a perforation: and instead of that, just behind it, the urine issued at a hole, which was nothing else but the corner of the rima; the clitoris filling all the rest of the orifice: so that the parents mistook it for a boy, and as such christened it.—But the neighbours called it an *hermaphrodite*. *Anthropol.* p. 148.

But we have an authentick account, in the history of the *Royal Academy of Sciences*, of a real *hermaphrodite*; which may put the point out of question.—This person had all the external characters of a woman in the face, neck, breasts, hips, and pudendum; and accordingly had been baptized in that quality, and named *Margaret*; but had withal the real character of a man, and a very able one.—The pudendum masculine appeared very well, but was not above two fingers breadth deep; out of the middle of the rima, or aperture thereof, hung a pretty bulky penis, which in an erection came out eight inches. The penis was well formed, except that it had no prepuce, nor was accompanied with any apparent testicles. The urine and feed came out at it as in men; and, what was very extraordinary, the menfes flowed through the same, and this very regularly once a month.

The person was brought sick to the hospital of St. James at Tholouse; and the account was given by M. Veay, surgeon of the same hospital; who adds, that having shewn the whole to several physicians, and the vicars general, they ordered the party to take the name and habit of a man; it being apparent that he could do the office of a man; but not that of a woman.

The interpreters, and commentators on the civil law, hold, that an *hermaphrodite* who has chose the male sex, as that which prevails most in him, may no longer do the office of a woman. And the French lawyers produce an arret of the parliament of Paris, whereby a young *hermaphrodite* was condemned to be burnt on that very account.

At Athens, and Rome, they looked on *hermaphrodites* as ominous monsters, and precipitated them into the sea; as we are informed by Alexander ab Alexandro.

S. de Rennefort relates, that at Surat there are abundance of *hermaphrodites*; who, with womens clothes, wear mens turbans, to distinguish them, and let all the world know they have two sexes.

In 1376. Albert, bishop of Bremen, and brother of the duke of Brunswick, was accused by John de Cesterval, dean of his chapter, with being an *hermaphrodite*; but he cleared himself.

J. Frederic Mayer, a Lutheran divine, has an express dissertation, to prove that an *hermaphrodite* cannot be a priest: it was printed at Grypswald in 1705. And Willenberg, another Lutheran of Dantzick, has wrote to prove them excluded from all civil employments, like women.

HERMAPHRODITE is also applied, metaphorically, to divers other things besides the human species.

The latest botanists make a division of plants, which they call *hermaphrodites*; as having both the male and female parts of generation, viz. the stamina and pistil in the same flower.

Divers of the insect and reptile kind are also *hermaphrodites*; particularly worms, snails, &c.

In the *Memoirs of the French Academy*, we have an account of this very extraordinary kind of *hermaphrodites*, which not only have both sexes, but do the office of both at the same

time.—Such are earth-worms; the round tailed worms found in the intestines of men and horses; land-snails, and those of fresh waters; and all the sorts of leaches. And as all these are reptiles, and without bones, M. Poupert concludes it probable, that all other insects, which have those two characters, are also *hermaphrodites*.

The method of coupling, practised in this class of *hermaphrodites*, may be illustrated in the instance of earth-worms. Vid. Ray's *Hist. Insect.* p. 2. These little creatures creep, two by two, out of holes proper to receive them; where they dispose their bodies in such manner, as that the head of the one is turned to the tail of the other. Being thus stretched lengthwise, a little conical button, or papilla, is thrust forth by each, and received into an aperture of the other.

These animals, being male in one part of the body, and female in another; and the body flexible withal; M. Homberg does not think it impossible but that an earth-worm may couple with itself; and be both the father and mother of its young: an observation, which to some appears highly extravagant!

*HERMATHENA**, *Ἑρμαθηνή*, in antiquity, a statue representing Mercury and Minerva both in one.

* The word is a compound of *Hermes*, Mercury; and *Athena*, a Greek name of Minerva.

M. Spon gives divers figures of *hermathena*, in his *Rech. Cur. de l'Antiquité*, p. 98. They are a sort of statues raised on square pedestals, after the manner of *Hermes*; only that the attributes of Minerva are added thereto.

HERMERACLES, in antiquity, a statue compounded of the figures of Mercury and Hercules.

M. Spon gives us a type of an *hermeracles*, *Rech. Cur. de l'Antiq.* p. 96. fig. 13. The name, he observes, was given to a divinity, represented after the manner of *Hermes*, with the additional attributes of *Hercules*, viz. a lion's skin, and a club.—This he ascribes to the custom among the Greeks, of placing the statues of Mercury and Hercules in the academy, and gymnasia, as both the one and the other presided over the exercises of the youth.

HERMES, or *HERMA*, among antiquaries, a sort of square, or cubical figure of the god Mercury; usually made of marble, though sometimes of brass or other materials; without arms or legs; and planted by the Greeks and Romans in their cross-ways.

Servius gives us the origin hereof, in his comment on the eighth book of the *Æneid*. Some shepherds, says he, having one day caught Mercury, called by the Greeks *Hermes*, asleep, on a mountain; they cut off his hands: from which he, as well as the mountain where the action was done, became denominated *Cyllenius*, from *κύνειος*, maimed: and thence, adds Servius, it is, that certain statues without arms are denominated *hermes's*, or *herma*.—But this etymology of the epithet *Cyllenius* contradicts most of the other ancient authors, who derive it hence, that Mercury was born at Cyllene, a city of Elis, or even on the mountain Cyllene itself, which had been thus called before him.

Suidas gives a moral explication of this custom of making statues of Mercury without arms. The *hermes's*, says he, were statues of stone placed at the vestibles, or porches of the doors, and temples at Athens; for this reason, that as Mercury was held the god of speech and of truth, square and cubical statues were peculiarly proper; having this in common with truth, that on what side soever they are viewed, they always appear the same.

It must be observed, that Athens abounded more than any other place in *hermes's*: There were abundance of very signal ones in divers parts of the city; and they were indeed one of the principal ornaments of the place. They were also placed in the high roads, and cross-ways; by reason Mercury, who was the courier of the gods, presided over the highways: whence he had his surname of *Trivius*, from *trivium*, and that of *Viacus*, from *via*.

From Suidas's account above cited, it appears, that the terms, *termini*, used among us in the door-ways, balconies, &c. of our buildings, take their origin from these Athenian *hermes's*; and that it were more proper to call them *hermetes* than *termini*; for that though the Roman *termini* were square stones, whereon a head was frequently placed, yet they were rather used as land-marks, and mere-stones, than as ornaments of building.

HERMETIC, or *HERMETICAL Art*, a name given to chemistry, on a supposition that Hermes Trismegistus was the inventor thereof, or that he excelled therein. See *CHEMISTRY*. We know but little of this Hermes, only that he was an ancient king of Egypt, a thousand years prior to Æsculapius.—Zosimus Panoplitia mentions him as having wrote of natural things; and there are several pieces still extant under his name, but they are all supposititious.

HERMETICAL Philosophy, is that which undertakes to solve and explain all the phenomena of nature, from the three chemical principles, salt, sulphur, and mercury.

A considerable augmentation was made to the ancient *hermetical philosophy*, by the modern doctrine of alkali and acid.

HERMETICAL *Physic*, or *Medicine*, is that system, or hypothesis, in the art of healing, which explains the causes of diseases, and the operations of medicines, on the principles of the *hermetical* philosophy; and particularly on the system of alcahi and acid.

HERMETICAL Seal, a manner of stopping or closing glass vessels, for chemical operations, so very accurately, that nothing can exhale, or escape; not even the most subtle spirits.

It is performed by heating the neck of the vessel, in the flame of a lamp, till it be ready to melt; and then with a pair of pinchers twisting it close together.—This they call putting on *Hermes's seal*.

Though there are other ways of sealing vessels *hermetically*, viz. by stopping them with a plug, or stopple of glass, well luted into the neck of the vessel.—Or, by turning another ovum philosophicum upon that wherein the matter is contained.

HERMHPROCRATES, or **HERMARPOCRATES**, in antiquity, a deity, or figure of a deity, composed of Mercury, and Harpocrates, the god of silence.

M. Spon gives us an *hermarprocrates* in his *Rech. Cur. de l'Antiquité*, p. 98. fig. 15. having wings on his feet, like Mercury; and laying his finger on his mouth, like Harpocrates. It is probable, they might mean by this combination, that silence is sometimes eloquent.

HERMIANI, or **HERMIATÆ**, a sect of heretics, in the second century; thus called from their leader Hermias.—They were also denominated *Seleuciani*.

One of their distinguishing tenets was, that God is corporeal.—Another, that Jesus Christ did not ascend into heaven with his body, but left it in the sun.

HERMIT*, or **EREMIT**, **EREMITA**, a devout person, retired into a solitude, to be more at leisure for prayer and contemplation, and to disencumber himself of the affairs of the world.

* The word is formed from the Greek, *ἐρημος*, *eremos*, wilderness; and, according to the etymology, should rather be wrote *eremit*, the spirit being lost.

A *hermit* is not reputed a religious, unless he have made the vows.

Paul, surnamed the *hermit*, *Paulus Eremitanus*, is usually reckoned the first *hermit*; though S. Jerom, at the beginning of the life of that saint, says, it is not known who was the first.—Some go back to S. John the Baptist, and others to Elias.

Others make S. Anthony the founder of the *hermetical* life: but others take him to have only rekindled and heightened the fervour thereof; and hold, that the disciples of that saint owned S. Paul of Thebes for the first person that practised it.—The persecutions of Decius and Valerian are supposed to have been the occasion.

Several of the antient *hermits*, as S. Anthony, &c. though they lived in deserts; had yet numbers of religious accompanying them.

There are also divers orders and congregations of religious, distinguished by the title of *hermits*; as, *hermits* of S. Augustin, of S. John Baptist, of S. Jerom, of S. Paul, &c.

HERMITS of S. Augustin, is a religious order, more frequently called *Augustins*, or *Austin* friars.

It is commonly pretended to have been instituted by that father; but without much ground. This is pretty certain, he laid the foundations of a monastic order about the year 388, and retired to his father's estate near Tagasta, to lead a religious life, with some companions: but it does not at all appear, that this order has subsisted ever since; nor that the *hermits* of S. Augustin are descended, without interruption, from them.

This order, in reality, only commenced under pope Alexander IV, in the middle of the thirteenth century; and was formed gradually by the union of divers congregations, which had no rule, or at least had not that of S. Augustin.—These congregations were that of John Bonites, the most antient of all; that of the *hermits* of Tuscany; that of the Sack, or Bag; those of Vallerfuta; of S. Blaise; of S. Benedict de Monte Fabalo; of the Tower of Palmes; Sancta Maria de Murcetta; of S. James de Molino, and de Loupavo near Lucca.

This coalition was not made by Innocent IV. as most historians of the order contend: all that pontiff did, was to unite some *hermits* in Tuscany, to whom he gave the rule of S. Augustin: but these were a distinct body from those just mentioned.—It was Alexander IV. that made the grand union; as appears from his bull, published in the *Mare magnum* of the Augustins.

That pontiff undertook this union from the first year of his pontificate, viz. the year 1254. It was the year 1256, before the superiors of all the congregations could be got together. In the general chapter the union was effected; Lanfranc Sepala, a Milanese, was chosen general: and the order divided into four provinces, viz. those of France, Germany, Spain and Italy.

Since that, other orders have been united to the *hermits* of S. Augustin; as, the Poor Catholics, &c. and the order now consists of 42 provinces.

After so many unions, the order began to divide again into separate congregations, according to the relaxations, and reformations that afterwards got footing.—Such, are the *Barefooted hermits* of S. Augustin; the congregation of *Centorbi*, or the *Sicilian Reform*; the congregation of the *Coloriter* in Calabria, &c.

There are also several congregations of nuns, under the appellation of *hermits* of S. Augustin.

There is also a Third order of *hermits* of S. Augustin. See **THIRD Order**.

HERMITS of Brittni, was a congregation formed under pope Gregory IX, who gave them the rule of S. Augustin.

Their first *hermitage*, or *abbacy*, was in a solitary place called *Brittni*, in the marquise of Ancona; whence the name. They led a very austere life; they never eat any meat, and fasted much.

HERMITS of Camalduli. See the article **CAMALDULIAN**.

HERMITS of S. Jerom. See the article **JEROMYNITES**.

HERMITS of S. John Baptist, was a religious order in Navarre; whose principal convent, or *hermitage*, was seven leagues from Pampelona.

Till the time of Gregory XIII. they lived under the obedience of the bishop of that city; but the pope confirmed them a religious order, approved their constitutions, and admitted them to make the vows.—Their way of living was exceedingly austere, they went bare-footed, wore no hosen, lay on boards, with a large stone for a pillow, and bore a large wooden cross on their breasts.

Their house was a kind of laura, rather than a convent; partitioned out into cells, in which they lived solitary, in the middle of a wood.

HERMITS of S. Paul the first *hermit*, is an order formed in the thirteenth century, by the union of two bodies of *hermits* in Hungary; viz. those of S. James de Patash, and those of Pissila near Zant.

Upon their being incorporated, they chose S. Paul the first *hermit*, for the common patron; and protector of their order; and assumed his name.—They multiplied very considerably in Hungary, Germany, Poland, and other provinces; and at length came to have seventy monasteries in Hungary alone: but the revolutions and wars in that kingdom reduced them again.

HERMITAGE, properly signifies a little hut, or habitation, in some desert place, where a hermit dwells.

HERMITAGE is also popularly attributed to any religious cell, built and endowed in a private and reclusive place; and thus annexed to some large abbey, of which the superior was called *hermita*.

HERMODACTYLS, in medicine, a drug used as a gentle purgative, &c.

Naturalists for a long time were not agreed as to the origin of this drug.—Some would have it the root, and others the fruit of a plant.—To reconcile them, some allowed two kinds of *hermodactyls*: the one a root, the other a fruit.

The *hermodactyl* is a root about the size of a little chestnut, in figure resembling a heart; ruddy without, very white within; of a light, fungous substance; without fibres; easily broke, and reducible into a powder like flour, of a sweetish taste, but somewhat viscid. It is brought to us dried, from Egypt and Syria.

Authors differ as to the plant which produces it. The most judicious allow it to be the root of a sort of colchicum: tho' others take it for a tuberous iris.

Hermodactyls are chiefly used to purge pituitous humours of the brain and joints.—They are so efficacious in scouring the mucilaginous glands, and preserving them from the lodgments of gritty matters, which occasion the gout and arthritic complaints; that they are denominated, by some writers, *animal articulorum*.—They also promote sweat. See **Supplement: article HERMODACTYLS**.

HERMOGENIANS, a sect of antient heretics, denominated from their leader *Hermogenes*; who lived towards the close of the second century.

Hermogenes established matter as his first principle; and made idea the mother of all the elements.

The *Hermogenians* were divided into several branches, under their respective chieftains, viz. *Hermiani*, *Seleucians*, *Materiarii*, &c.

Some will have the Manichees also to have sprung from the *Hermogenians*.

HERNIA*, in medicine, a descent of the intestines, or omentum, out of their natural place; or, rather, the tumor formed by that descent; popularly called a *rupture*.

* The word is Latin, *hernia*, and originally signifies the same with *tumor scroti*; e. lledolio, *hernia*. It is then observed, that the ancient Marj gave the appellation *hernia* to rocks, whence, some will have *hernia*, thus called *propter duritiam*, on account of their hardness.—Scaliger chuses rather to derive the word from the Greek, *ἑρνη*, *ernia*, branch.

When the peritoneum happens to be broken, or extraordinarily dilated; the viscera, and particularly the caul and small guts,

are apt to fall out of their place, and to form these sorts of tumors, called *hernia's*.

They happen most usually in the inguen or groin, or in the scrotum, and navel; though, sometimes, in other places; as above or below the navel; in the side, far above the inguen, in the upper part of the thigh, near the spine, &c.

Hernia's are often occasioned by blows, violent concussions, over-stretching in vomiting, and hard labour, or wind; from whatever cause it is, that they are so frequent in children, and so easily helped by timely care: in adults they are generally incurable. From *hernia's* frequently arise the iliac passion, and sometimes inflammations, and even gangreens of the intestines.

Hernia's are variously denominated, both according to the parts displaced, and to those wherein they fall.

A descent of the intestines into the scrotum, which is the most usual kind of rupture, is called *enterocoele*.

If, instead of the intestines, the omentum be fallen; it is called *epiplocele*.

A descent of both, is called *entero-epiplocele*.

If the intestines fall on the navel, it is called *omphalocoele*.

If they fall through the perforation of the oblique descender into the groin; it is called *bubonocoele*, or *inguinalis*.

There are also a spurious sort of *hernia's* or tumors of the testis, &c. occasioned, not by the descent of any of the solid parts, but by a coagulation of some of the fluids.

When the testicles are swelled, and distended with a watry humour, it is called an *hydrocele*, or *hernia aquosa*. See *HYDROCELE*.

When with winds *pneumatocoele*, or *hernia ventosa*. See *PNEUMATOCELE*.

When the tumor is owing to a mole, or excrescence of flesh, it is called *fungocoele*, or *hernia carnea*. See *SARCOCELE*.

When the dilatation of the vessels, in manner of a varix, circled, is called *varicocoele*.

A kind of prominent tumor in the throat, is frequently also called *hernia*, or *hernia trachealis*.

Some late authors also speak of *hernia's*, or descents of the bladder into the scrotum; but these are very rare.—M. Mery concludes, that they never arise from mere accident; but when they do happen, it must be the effect of an original ill conformation.—His reason is, that the bladder of urine is too big to pass through the annul or rings which the intestines pass through; besides that it is fastened too strongly on all sides to admit of a descent.

M. Petit, however, is of a different opinion; and maintains, that *hernia's* of the bladder may be produced after the ordinary manner of others. See the *Mémoires de l'Acad. an. 1717*.

HERO*, in the antient theology and mythology, a great and illustrious person, of mortal nature; though, by the populace, supposed to partake of immortality: and, after his death, placed by them in the number of the gods.

* The word is formed of the Latin, *heros*, and that of the Greek, *ἥρως*, *semi-deus*, demi-god. S. Augustin, *De Civit. Dei*, Lib. X. observes, that it is highly probable, that some one of Juno's sons was originally called by this name; that goddess being called in Greek *Ἥρα*. Or, it may be; that great men were distinguished by this appellation, in allusion to the opinion of the antients, that virtuous persons, after their deaths, inhabit the wide expanse of the air, which was Juno's province.—Isidore inclines to think, that *hero's* were thus called *quasi aëreos*, *aërei*, persons of superior merit, and worthy of heaven.—Plato derives the word from the Greek *ἔρως*, love, as intimating the *hero's* to have risen from the copulation of a god with a mortal woman; or of a goddess with a man.—Others derive the name from the Greek, *ἥρω, dicere*, to speak; the *heroes* being persons who by their eloquence led the people at their pleasure: Others, lastly, derive it from the Greek, *ἔρως, terra*, earth; the *heroes*, on their principle, being the *δῖοι terreſtreſtes*, or gods of the earth.

Hero's were, properly, persons partly of divine, and partly of human extraction; being begot between a deity and a mortal: as Achilles, who was the son of the goddess Thetis, by Peleus; and Hercules, who was the son of Jupiter by Alcmena.

A *hero*, then, coincides with what we otherwise call a *demi-god*: accordingly, Lucian defines a *hero* to be a medium between a god and a man; or, rather, a composition of both.

HERO, is also used in a more extensive sense, for a great, illustrious, and extraordinary personage; particularly, in respect of valour, courage, intrepidity, and other military virtues.

F. Bouhours makes this distinction between a great man and a *hero*, that the latter is more daring, fierce, and enterprising; and the former more prudent, thoughtful, and reserved:—in this sense we properly say, Alexander was a *hero*, Julius Cæsar a great man.

HERO of a *Poem*, or *Romance*, is the principal personage, or he who has the top part therein.

thus the *hero* of the *Iliad*, is Achilles; of the *Odyssey*, Ulysses; of the *Æneid*, Æneas; of *Tasso's Jerusalem*, Godfrey of Bulloign; of Milton's *Paradise Lost*, Adam; though Mr. Dryden will have the Devil to be Milton's *hero*; in regard he gets the better of Adam, and drives him out of paradise.

The character of Achilles, is the inexorable wrath of a haughty, valiant, unjust, and revengeful prince: that of Ulysses, is the wife and prudent diffimulation of a courageous king, whose constancy nothing could shake: that of Æneas, is piety, goodness, gentleness, good-nature and humanity; sustained, like the others, with an invincible courage.

Many of the critics find fault with the *hero* of the *Æneid*.—They say he is too sensible and delicate; and wants of the fire, firmness, and unconquerable spirit, remarkable in the *hero* of the *Iliad*.—Piety, tenderness, and submission to the gods, are the virtues of the middle class of mankind: they do not strike and command enough for a *hero*, who is to be the instrument of such notable exploits.—S. Evremont looks on Æneas as fitter to have been the founder of a religious order, than of an empire.

F. Boffu defends Virgil's *hero*, or at least Virgil, with admirable address.—Æneas's character, he observes, was not to be formed on the model, either of Achilles, or Ulysses; nor to be of the same kind with them; as the fable, and the design of the *Æneid*, was very different from those of the *Iliad* and *Odyssey*.

What Virgil had in view, was to make the Romans receive a new kind of government; and a new master: this master, then, must have all the qualities requisite for the founder of a state, and all the virtues which make a prince beloved.—The violence of Achilles was of consequence precluded; and so was the diffimulation Ulysses: that being a quality which renders a man suspected, not beloved.

Virgil was restrained in his choice; his *hero* was to be of the genius of Augustus: and the poet was in the condition of a painter, who is obliged to accommodate a piece of history to the model of a face that is given him.—The character of Homer's two *heroes*, as being directly opposite to his design, he has thrown upon Turnus and Mezentius, who are the counterparts to his *hero*.

It is disputed among the critics, whether it be necessarily required, that the *hero* of an epic poem be a good and virtuous man?—F. Boffu maintains the negative: between a *hero* in morality, and a *hero* in poetry, the same distinction is to be made, as between moral, and poetical goodness:—Hence, as the manners of Achilles, and Mezentius, are poetically as good as those of Ulysses, and Æneas; so those two cruel and unjust men are as regular poetical *heroes*, as these two just, wife, and good men.

Aristotle, indeed, represents the *heroic* virtue, as a virtue more than human; and, of consequence, *heroes*, as divine persons, whom the excellency of their nature raises above our class: but this, he says only in his books of Morality; in his Poetics he speaks another language.—The prime person of a poem, whom we call the *hero*, he there observes, must neither be good nor bad, but between both: He must not either be superior to the generality of mankind by his virtue and justice; nor inferior to them by his crimes and wickedness. The moral, and epic *heroes*, therefore, even on Aristotle's principles, have nothing in common with each other: the one must be raised above mankind; and the other must not be on a level with the most perfect of men.

In effect, reason, the nature of the poem, which is to be a fable, the practice of Homer, and the rules of Aristotle and Horace all agree, that so far is it from being necessary that the *hero* of an epopee be a perfect, faultless man; that it is not necessary he be an honest man: and that it is no ways irregular to make him as perfidious as Ixion; as unnatural as Medea; or as brutal as Achilles.

It is another subject of controversy among the critics, whether the catastrophe, or conclusion of the action, is necessarily to leave the *hero* happy, and at ease; or whether it be allowable to leave him unhappy?

The general practice of the *heroic* poets stands for the first. We have scarce one example of a *hero* who is overcome, and remains unhappy; excepting Adam in Milton.

In tragedy, the case is different: unhappy catastrophes, according to Aristotle, are preferable to happy ones; and were always much better received among the antients. Indeed, one reason may be, that in the popular states of Greece, monarchs being odious, nothing pleased them better than to see the misfortunes of kings: and even among us, where that consideration does not hold, yet the unhappy conclusion has its advantage.—The tragic scene is the throne of the passions; and terror and pity are there to rule in a peculiar manner: Now those passions arise the most naturally from unhappy events; and the audience, quitting the theatre full of the misfortunes wherewith the piece was closed, preferre their concern much longer, and feel more forcible effects from it, than if their tears had been wiped away, and their sighs smothered in the satisfaction of a more happy peripetia.

But these reasons have no place in the epopee; which is not intended

intended so much to affect the passions, as to remove ill habits.—But it is true withal, that the epopea does not exclude all unhappy conclusions: The nature of epic fable is such as admits equally of good and bad persons for the prime parts; the unhappy adventure of a lamb unjustly devoured by a wolf, is a subject every way as instructive, and as regular, as the generosity of a lion, who lets himself be disarmed of his rage by the innocence of the same lamb.

It is true, if the poet propoed his *hero* as a pattern of perfection for imitation, the misfortunes falling on him would suit very ill with the design: but this was doubtless the farthest thing from the intentions of the great masters of the epopea abovementioned.—The only reason, perhaps, that can be given for the uniform practice of the poets in this respect, is, that an epic poem, containing an action of much more extent than that of a tragic poem, the reader would not be so well satisfied, if, after so many labours and difficulties as the *hero* is brought to struggle withal, he should not, at last, be brought off; but perish miserably. There is something, no doubt, great and good in the *hero*, which, in the course of the poem, makes us concerned for him; so that, after so long an acquaintance, we cannot leave him miserable, without some anxiety; which it is not the final business of the poet to raise.

HEROIC, something belonging to a hero, or heroine.

Thus we say, *heroic actions*, *heroic virtues*, *heroic style*, *heroic verse*, *heroic poet*, *heroic age*, &c.

HEROIC AGE, is that age, or period of the world, wherein the heroes, or those called by the poets the *children of the gods*, are supposed to have lived.

The *heroic age* coincides with the *fabulous age*. See **FABULOUS**.

HEROIC POEM, is that which undertakes to describe some extraordinary action, or enterprise.

Homer, Virgil, Statius, Lucan, Tasso, and Milton have composed *heroic poems*.

In this sense, *heroic poem* coincides with *epic poem*. See **EPIC**.

HEROIC POETRY. See the article **EPIC POETRY**.

HEROIC VERSE, is that wherein *heroic poems* are usually composed; or, it is that proper for such poems.

In the Greek and Latin, hexameter verses are peculiarly denominated *heroic verses*, as being alone used by Homer, Virgil, &c.

Alexandrine verses of twelve syllables, were formerly called *heroic verses*, as being supposed the only verse proper for *heroic poetry*; but the later writers use verses of ten syllables.

HEROIN, **HEROINA**, or **HEROIS**, a woman, that has the qualities, and virtues of a *hero*; or, that has done some heroic action. See **HERO**.

HERODIANS, a sect among the Jews, at the time of Jesus Christ; mentioned by S. Matthew xxii. 16. and S. Mark iii. 6.

The critics, and commentators on the New Testament, are very much divided with regard to the *Herodians*.

S. Jerom, in his dialogue against the Luciferians, takes the name to have been given to such as owned *Herod* for the Messiah: And Tertullian and S. Epiphanius are of the same sentiment.—But the same St. Jerom, in his comment on S. Matthew, treats the false opinion as ridiculous; and maintains, that the Pharisees gave this appellation, by way of derision to Herod's soldiers, who paid tribute to the Romans: agreeably to which, the Syriac interpreters render the word by the *domestics of Herod*, i. e. his courtiers.

M. Simon, in his notes on the 22d chapter of Matthew, advances a more probable opinion.—The name *Herodian*, he imagines to have been given to such as adhered to Herod's party and interest, and were for preserving the government in his family; about which there were at that time great divisions among the Jews.

F. Hardouin will have the *Herodians* and Sadducees to have been the same.

HERPES, *, **ΕΡΠΙΣ**, in medicine, a cutaneous heat, or inflammation, attended with a roughness of the skin, and the eruption of a number of little pustules spreading every way.

* The word is formed of the Greek, *ἔρπω*, *paulatim gradior*, *reps*, by reason the eruptions creep from place to place.

There are divers kinds of this disease: as,

Miliary HERPES, this is an assemblage of innumerable little pustules, under the cuticle, of the size of millet seeds: popularly called the *shingles*.

The *herpes miliaris*, according to Wifeman, approaches very nearly to the nature of the *piora*; and therefore is to be cured with mercurial cathartics, &c.

Simple HERPES, is a single pustule or two, rising chiefly on the face, of a whitish or yellowish colour, pointed, and with an inflamed base.—These dry away of their own accord, upon letting out the little drop of pus contained in them.

A third species of *herpes*, is what we otherwise call *serpigo*.

VOL. I.

pigo; and, in English, a *tetter*, or *ring-worm*. See **SERPIGO**.

HERPES Exedens, is of a more corrosive kind; the pustules are ruddy, and attended with an itching; and ulcerate the parts they rise on.

HERRING. See the articles **FISH**, and **FISHERY**.

There are divers names given to preserved herrings, according to the different manners wherein they are ordered, as,

1°. *Sea-sticks*, these are such as are caught all the fishing season, and are but once packed.—A barrel of these holds six or eight hundred; eight barrels go to the tun, by law: A hundred of herrings, is to be a hundred and twenty; a last, is ten thousand; and they commonly reckon fourteen barrels to the last.

There are others repacked on shore, called *repacked herrings*: Seventeen barrels of sea-sticks, commonly make from twelve to fourteen of repacked herrings.

The manner of repacking them, is to take out the herrings, wash them out in their own pickle, and lay them orderly in a fresh barrel. These have no salt put to them, but are close packed, and headed up by a sworn cooper, with pickle, when the barrel is half full; the pickle is brine, so strong as that the herring will swim in it.

2°. *Summers*, these are such as the Dutch chafers, or dories, catch from June to the 15th of July.—These are sold away in sea-sticks, to be spent presently, in regard of their fatness; for that they will not endure repacking: they go one with another, full and flotten; but the repacked herrings are sorted, the full herrings by themselves.

3°. The *flotten* and *sick herrings* by themselves; the barrel whereof is to be marked distinctly.

4°. *Crux herrings*, which are such as are caught after the 14th of September.—These are cured with that kind of salt called salt upon salt, and are carefully sorted out, all full herrings, and used in the repacking.

5°. *Curved herrings*, these serve to make red herrings, being such as are taken in the Yarmouth seas, from the end of August to the middle of October; provided they can be caught ashore within a week, more or less, after their taking.—These are never gipped, but rowed in salt, for the better preserving of them, till they can be brought on shore; and such as are kept to make red herrings, are washed in great vats in fresh water before they are hanged up in the herring hangs, or red-herring houses.

As for the manner of *salting herrings*.—The nets being haled on board, the fishes are taken out, and put into the war-backs, which stand on one side of the vessels:—When all the nets are thus unloaded, one fills the gippers baskets.—The gippers cut their throats, take out their guts, and fling out the full herrings into one basket, and the flotten into another:—One man takes the full basket when they are gipt, and carries them to the rower-back, wherein there is salt.—One boy rows and flirs them about in the salt; and another takes them thus rowed, and carries them in baskets to the packers.—Four men pack the herrings into one barrel, and lay them, one by one, straight and even; and another man, when the barrel is full, takes it from the packer.—It is let stand a day or more open to settle, that the salt may melt and dissolve to pickle; after which it is filled up, and the barrel headed.—The pickle is to be strong enough to sustain a herring; otherwise the fish decay in it.

Pickled HERRING. { See the article *Herring FISHERY*.

Red HERRING.

Herrings are sometimes prescribed in medicine, by way of cataplasms, to the feet, in fevers; as being supposed to draw the febrile matter downwards. Though, it is more probable, this effect should be owing to the salt used in the pickle, than to the fish.

HERRING BUS, a vessel used in the herring fishery. See **FISHERY**.

HERRING COB, is a young herring. See *Herring FISHERY*.

HERRING FISHERY. See the article *Herring FISHERY*.

HERRING SILVER, a composition in money, formerly paid in lieu of a certain quantity of herrings for the provision of a religious house.

HERSE *, in fortification, a lattice, or port-cullice, in form of an harrow; beset with iron spikes.

* The word *herse* is French, and literally signifies *barrow*; being formed of the Latin *herpes* or *irpes*; which denote the same.

It is usually hung by a rope fastened to a moulinet; to be cut, in case of surprize, or when the first gate is broken with a petard; that the *herse* may fall, and stop up the passage of the gate, or other entrance of the fortrefs.

The *herse* is otherwise called a *saussure*, or *catarel*; and when it consists of straight stakes, without any cross-pieces, it is called *orgues*.

HERSE, is also a harrow, which the besieged, for want of chevaux de frise, lay either in the way, or in breaches, with the points up, to incommode the march as well of the horse, as the infantry.

HERSILLON*, in the military art, a sort of plank, or beam, ten or twelve foot long, whose two sides are drove full of spikes, or nails, to incommode the march of the infantry or cavalry.

* The word is a diminutive of *herse*, the *herfillon* doing the office of a little herse. See **HARSA**.

HESPER*, **HESPERUS**, in astronomy, the *evening-star*; an appellation given to Venus when she follows, or sets after the sun.

* The word is formed of the Greek, *ἠσπερος*, and is supposed to have been originally the proper name of a man, brother of Atlas, and father of the *Hesperides*. See **HESPERIDES**.—Diodorus, L. III. relates, that *Hesperus* having ascended to the top of mount Atlas, the better to observe and contemplate the stars, never returned more; and that hence he was fabled to have been changed into this star.

HESPERIDES, *ἠσπερίδες*, in the ancient mythology, were the daughters of Hesper, or Hesperus, the brother of Atlas. The *Hesperides* were three in number, *Egle*, *Arethusa*, and *Hesperhula*.—Hesiod, in his *Theogony*, makes them the daughters of *Nox*, night; and seats them in the same place with the Gorgons, viz. at the extremities of the west, near mount Atlas: It is on that account he makes them the daughters of Night, by reason the sun sets there.

The *Hesperides* are represented by the antients, as having the keeping of certain golden apples, on t'other side the ocean. And the poets give them a dragon to watch the garden where the fruit grows: this dragon they tell us Hercules slew, and carried off the apples.

Pliny and Solinus will have the dragon to be no other than an arm of the sea, wherewith the garden was encompassed; and which defended the entrance thereof. And Varro supposes that the golden apples were nothing but sheep. Others, with more probability, say they were oranges.

The gardens of the *HESPERIDES*, *Hesperidum horti*, or *horti Hesperidum*, are placed by some authors at Laracha, a city of Fez; by others, at Bernich, a city of Barca, which tallies better with the fable. Others, take the province of Sufa in Morocco, for the island wherein the garden was seated. And lastly, Rudbeck places the fortunate islands, and the gardens of the *Hesperides*, in Sweden.

HESYCHASTES*, **HESYCHASTA**, a person who keeps himself vacant and at leisure, to attend the better, and with the less interruption, to the contemplation of divine things.

* The word is Greek, *ἡσυχαστής*, formed of *ἡσυχία*, *quietas*, *quieti indulget*, a derivative of *ἡσυχέω*, *quietus*, *quiet*. So that *hesychastes* in Greek, answers to the literal sense of *Quietist* in English.

The name was chiefly used by the antients for such among the monks as did not employ themselves in any labour of the hands, but renounced all bodily action, to resign themselves wholly to prayer, and meditation.

HETERIARCH*, **HETARIARCHA**, in antiquity, an officer in the Greek empire; whereof there were two species: the one called simply *heteriarch*; and the other, *great heteriarch*, who had the direction of the former.

* The word is Greek, *ἡτεριαρχα*; formed of the Greek *ἡτερ*, *focius*, companion, ally, and *αρχή*, *imperium*, command.

Their principal function was to command the troops of the allies; besides which, they had some other duties in the emperor's court, described by Codin, *De Officiis*, c. 5. n. 30, 31, 32, 37.

HETEROCLITE*, **HETEROCLITON**, in grammar, an irregular, or anomalous word, which either in declension, conjugation, or regimen, deviates from the ordinary rules of grammar. See **ANOMALOUS**, **IRREGULAR**, &c.

* The word is Greek, *ἡτεροκλίτος*, formed of *ἡτερος*, *alter*, another, different, and *κλίω*, I decline.

Heteroclit is more peculiarly applied to nouns, which vary, or are irregular, in point of declension; having fewer cases, numbers, &c. than ordinary: or that are of one declension in one number, and another in another.

We have various sorts of *heteroclit*s, as defective, and redundant *heteroclit*s, &c.—Under the class of *heteroclit*s, come aptotes, diptotes, monaptotes, triptotes, tetrapotes, pentapotes, &c. See **APOTOTE**, **DIPTOTE**, &c.

HETERODOX*, in polemical theology, something that is contrary to the faith or doctrine established in the true church.

* The word is formed of the Greek, *ἡτεροδοξος*, a compound of *ἡτερος*, *alter*, and *δόξα*, opinion.

Thus, we say, a *heterodox* opinion, a *heterodox* divine, &c. The word stands in opposition to *orthodox*.

HETERODROMUS *Veltis*, in mechanics, a lever wherein the fulcrum, or point of suspension, is between the weight and the power.

This is what we otherwise call a *lever of the first kind*.—Such is that represented *Tab. Mechanics*, fig. 1.

If either the weight be in the middle between the power and the fulcrum; or the power between the weight and the fulcrum, the lever is denominated *homodromus*.—Such are those represented fig. 2. and 3.

HETEROGENEITY, in physics, the quality, or disposition which denominates a thing *heterogeneous*.

The word is also used for the *heterogeneous* parts themselves. —In which sense, the *heterogeneities* of a body are the same thing with the *impurities* thereof.

Heterogenity, is a term of a very lax signification, and is brought by the chemists to serve almost for any thing they do not understand; so that all disagreement, or inaptitude to mixture between any bodies, is imputed to the *heterogenity* of their parts.

But, so far as the term may be made use of, to convey any distinct signification, it must be by considering natural bodies under different fortments, according as they are diversified by figure, bulk, motion, and their more sensible properties: so that those of different fortments are *heterogeneous* to one another, and the parts of the same fortment, are homogeneous. Thus the division chemistry makes of bodies into oils, salts, spirits, &c. may be reckoned, with respect to one another, *heterogeneous*; though the parts of each division are among themselves homogeneous.

In effect, they are two terms, which serve frequently for a refuge to ignorance; otherwise the common terms of *like* and *unlike* might serve every way as well. *Quincy*.

HETEROGENEOUS*, or **HETEROGENEAL**, literally imports something of a different nature, or that consists of parts of different, or dissimilar kinds: in opposition to *homogeneous*. See **HOMOGENEOUS**.

* The word is Greek, formed of *ἕτερος*, *alter*, different, and *γενος*, *genus*, kind; *g. d.* composed of different kinds of parts.

Thus, we say, milk is a *heterogeneous* body; composed of, or containing butter, cheese, and whey.

The refining of a metal, is the purging it of all its *heterogeneous* parts.

HETEROGENEOUS, is particularly applied, in mechanics, to those bodies whose density is unequal in different parts of their bulk.

Or, *heterogeneous* bodies are such, whose gravities in different parts are not proportionable to the bulks thereof.

Bodies equally dense, or solid in every part, or whose gravity is proportionable to their bulk, are said to be homogeneous.

HETEROGENEOUS Light, is that which consists of parts or rays of different refrangibility, reflexivity, and colour.

HETEROGENEOUS Nouns, in grammar, are such as are of one gender in the singular number, and another in the plural. See **NOUN**, **GENDER**, &c.

HETEROGENEOUS Numbers, are those which are referred to different unities, or integers.

HETEROGENEOUS Quantities, are those which are of such different kind and consideration, as that one of them taken any number of times, never equals or exceeds the other.

HETEROGENEOUS Surds, are such as have different radical signs; as, $\sqrt[2]{a^2}$, and $\sqrt[3]{b^3}$; $\sqrt[5]{9}$, and $\sqrt[7]{19}$.

How to reduce the *heterogeneous surds* to homogeneous ones; see under the article **SURDS**.

HETERORHYTHMUS*, a term used by some fanciful writers, for a course of life unsuitable to the age of those who live in it.

* The word is compounded of the Greek, *ἡτερος*, and *ῥυθμος*, measure.

The same is also applied to pulses, when they beat variously or irregularly in diseases; or rather, when a pulse belonging to one age, is found in a patient of another.

HETEROSCI*, in geography, a term vulgarly applied to those inhabitants of the earth, whose shadow at noon-tide is always projected the same way, either northward, or southward.

* The word is Greek, formed of *ἕτερος*, other, different, and *σκια*, shadow.

In this sense, the inhabitants of the temperate zones, are denominated *heterosci*. See **ZONE**.

HETEROSCI, however, in strictness, and according to the origin and reason of the word, is a term of relation; and denotes those inhabitants, which, during the whole year, have their noon-tide shadows projected different ways from each other. Thus, we who inhabit the northern temperate zone, are *heterosci* with regard to those who inhabit the southern temperate zone: and they are *heterosci* with respect to us.

From this definition it follows, that only the inhabitants of the two temperate zones are *heterosci*; nor is the word ordinarily applied to any other. Though, in reality, there is always one part of the torrid zone, whose inhabitants are *heterosci* with regard to those of the rest, and with regard to those of one of the temperate zones, except at the time of the solstices. And even at that time, all of the torrid zone are *heterosci* with regard to those of one of the temperate zones.

But as this is variable, and the people of the torrid zone have their shadow now on this, and then on that side; the custom is to call them *ambischi*, and not *heterosci*.

HETEROUSII*, **HETEROUSIANS**, a sect, or branch of Ariens, the followers of Aetius, and from him also denominated *Aetians*.

* The word is Greek, compounded of *ἕτερος*, *alter*, and *ωσια*, substance. *They*

HEX

They were called *Heterousi*, by reason they held, not that the Son of God was of a substance like, similar to that of the Father; which was the doctrine of another branch of Arians, thence called *Homoousians*, *Homoousi*: but that he was of another substance different from that of the Father. See **ARIAN**, and **HOMOOUSIAN**.

HEXACHORD *, in the ancient music, a concord commonly called, by the moderns, a *sixth*.

* The word is Greek, compounded of ἕξ, *sex*, six; and χορδή, *chorda*, chord, or string.

The *hexachord* is two-fold, the *greater* and *lesser*.—The *greater hexachord*, is composed of two greater tones, two lesser tones, and one greater semitone; which make five intervals.

The *lesser hexachord* consists only of two greater tones, one lesser tone, and two greater semitones.

The proportion of the former, in numbers, is as 3 to 5; and that of the other, as 5 to 8.

HEXAEDRON *, or **HEXAEDRON**, in geometry, one of the five regular bodies, popularly called a *cube*. See **CUBE**.

* The word is Greek, formed of ἕξ, *sex*, six, and ἑδρα, *sedes*, seat.

The square of the side of a *hexaedron*, is in a sub-triple ratio to the square of the diameter of the circumscribed sphere.—Hence, the side of the *hexaedron* is to the side of the sphere it is inscribed in, as one to the $\sqrt{3}$; and consequently it is incommensurable thereto.

HEXAGON *, in geometry, a figure of six sides, and as many angles.

* The word is Greek, formed of ἕξ, *sex*, six, and γωνία, *angulus*, angle.

If these sides and angles be equal, it is called a *regular hexagon*.

The side of a *hexagon* is demonstrated to be equal to the radius of a circle circumscribed about the same.

Hence, a regular *hexagon* is inscribed in a circle, by setting the radius off six times upon the periphery.

To describe a *hexagon* on a given line A B, (*Tab. Geometry*, fig. 84.) draw an equilateral triangle A C B; the vertex C will be the centre of a circle, which will circumscribe the *hexagon* required.

HEXAGONS, in fortification, is a fortress with six bastions.

HEXAMERON *, or **HEXAMERON**, a name given to divers writings both of ancient and modern authors, containing commentaries, or discourses on the first chapter of Genesis; wherein is delivered the history of the creation, or the first six days of the world.

* The word is Greek, formed of ἑξαμερον, or ἑξαμερον, compounded of ἕξ, *sex*, six, and ἡμερα, which in the Doric dialect is wrote ἡμερα, *day*.

S. Basil, S. Ambrose, &c. have wrote *hexamerons*.

HEXAMETER *, in the ancient poetry, a verse used by Greek and Latin writers, consisting of six feet.

* The word is Greek, ἑξαμετρον, compounded of ἕξ, *sex*, six, and μετρον, *measure*, foot.

The first four feet of a *hexameter*, may be indifferently either dactyls, or spondees; but the last foot, in strictness, is always to be a spondee; and the last but one a dactyl.—Such is that of Homer,

Εἰς ἵδμεν μὲν ἱερῆας, ἔχονθ' ὅπως ἐκδιδόν ὀρμη.

And that of Virgil,

Discite justitiam moniti & non temere dvoos.

Hexameter verses are divided into *heroic*; which are to be grave and majestic, suitable to the dignity of heroic poetry; and *satyrical*, which may be more loose and negligent as those of the epistles of Horace.

Epic poems, as the *Iliad*, *Odyssey*, *Æneid*, &c. consist of *hexameter* verses alone: elegies and epistles ordinarily consist, alternately of *hexameters* and *pentameters*.

Some of the French and English poets have attempted to compose in *hexameter* verses, but without success. Jodelle made the first essay in 1553, with a distich in praise of Olivier de Magny, which Pasquier represents as a master-piece. It is this,

*Phœbus, amour, cypris, veut sauver, nourrir & orner
Ton vers, & ton chef, d'ombre, de flamme, de fleurs.*

But this kind of poetry pleases no body. The modern languages are not at all fit for a kind of verse whose cadence depends altogether on long and short syllables.

HEXAMILON *, **HEXAMILI**, or **HEXAMILUM**, in antiquity, a celebrated wall built by the emperor Emanuel, over the isthmus of Corinth.

* It took its name from ἕξ, *sex*, six, and μίλιον, which in the vulgar Greek signifies *mile*: as being six miles long.

The design of the *hexamilon*, was to defend Peloponnesus from the incursions of the barbarians.—Amurath II. having raised the siege of Constantinople, in the year 1424, demolished the *hexamilon*; though he had before concluded a peace with the Greek emperor.

The Venetians restored it in the year 1463, by thirty thousand

HIA

workmen, employed for fifteen days, and covered by an army commanded by Bertoldo d'Este, general of the land forces, and Louis Loredano, general of the sea.

The infidels made several attempts upon it, but were repulsed, and obliged to retire from the neighbourhood thereof. But Bertoldo being killed at the siege of Corinth, which was attempted soon after; Bertino Calcinato, who took on him the command of the army, abandoned, upon the approach of the beglerbeg, both the siege and the defence of the wall, which had cost them so dear: upon which it was finally demolished.

HEXAPLA *, in church history, a Bible disposed in six columns; containing the text, and divers versions thereof; compiled, and published by Origen.

* The word is formed of ἕξ, *sex*, six, and πᾶσι, *panda*, I open, I unfold.

Eusebius, *Hist. Eccl.* L. VI. c. 16. relates that Origen, after his return from Rome under Caracalla, applied himself to learn Hebrew; and began to collect the several versions that had been made of the sacred writings, and of these to compose his *Tetrapla*, and *Hexapla*: others, however, will not allow him to have begun 'till the time of Alexander, after he had retired into Palestine, about the year 231.

To conceive what this *Hexapla* was, it must be observed, that besides the translation of the sacred writings, called the *Septuagint*, made under Ptolemy Philadelphus, above 270 years before Christ; the scripture had been since translated into Greek by other interpreters. The first of those versions, (or, reckoning the *Septuagint*.) the second was that of Aquila, done about the year of Christ 140: the third was that of Symmachus, published, as is commonly supposed, under Marcus Aurelius: The fourth was that of Theodotio, under Commodus: the fifth was found at Jericho, in the reign of Caracalla, about the year 217; and the sixth was discovered at Nicopolis, about the year 228. Lastly, Origen himself recovered part of a seventh, containing only the Psalms.

Now Origen, who had held frequent disputations with the Jews in Egypt and Palestine; observing that they always objected against those passages of scripture quoted against them, and appealed to the Hebrew text; the better to vindicate those passages, and confound the Jews, by shewing that the Seventy had given the sense of the Hebrew; or rather to shew, by a number of different versions, what the real sense of the Hebrew was: undertook to reduce all these several versions into a body, along with the Hebrew text; so as they might be easily confronted, and afford a mutual light to each other.

In order to this, he made choice of eight columns: in the first he gave the Hebrew text in Hebrew characters: in the second, the same text in Greek characters. The rest were filled with the several versions abovementioned; all the columns answering verse for verse, and phrase for phrase. And in the Psalms there was a ninth column for the seventh version. This work Origen called ἑξαπλα, *hexapla*, q. d. *sextuple*, or a work of six columns; as only regarding the first six Greek versions.

Indeed, S. Epiphanius, taking in likewise the two columns of the text, calls the work *Octapla*, as consisting of eight columns.

This celebrated work perished long ago: though several of the ancient writers have preserved us pieces thereof; particularly S. Chrysostom on the *Psalms*, Hippolytus in his *Hexameron*, &c.—Some modern writers have earnestly endeavoured to collect fragments of the *Hexapla*, particularly Drusus, and F. Montfaucon.

HEXASTYLE *, **HEXASTYLOS**, in the ancient architecture, a building with six columns in front.

* The word is compounded of ἕξ, *sex*, six, and ὑλος, *column*.

The temple of Honour and Virtue at Rome, built by Mutius, was a *hexastyle*.

HEYRS, in husbandry, young timber trees, usually left for standards in felling of woods, or copes.

HIA TUS, a Latin term, properly signifying the aperture of the mouth; from the verb *hiare*, to gape.

It is variously used in works of literature, &c. to denote a *chasm* or *gap*; particularly in verses, where there is a clashing of vowels, by one word ending with a vowel, and the following one beginning with another.

As in — Tho' oft the ear the open vowels tire.

This clashing of vowels, so disagreeable to the ear, is called a *hiatus* in prose as well as verse.—The Romans were so very careful to avoid it, that they always suppressed the preceding vowel even in prose; as is observed by Cicero in his *Orator*.—In writing, to avoid it, they used to insert the letter *d*; as in *redo redema, nuderga*, &c. Hence on the base of the Duilian column, we meet with *prædæd, altod, marid*, &c. Voff.

HIATUS is also used for a defect in a manuscript copy; where something is lost, or effaced, by the injuries of time, or otherwise.

In a theatrical piece, there is said to be a **HIATUS**, when a scene

H I D

scene is not well connected to the next, but leaves the action interrupted, and the stage empty.

In matters of genealogy, **HIATUS** is an interruption in a line or series of defendants.—Those proofs of eight hundred years are impossible, by reason of the frequent *hiatus*: occasioned by civil wars, Gothic inundations, &c.

HICKUP*, **HICKOCK**, **HICCUGH**, or **HICKET**, *singultus*, in medicine, a sudden irregular inspiration; wherein the stomach, and the parts contained in the lower venter, are impelled downwards.

* The word seems formed of the Flemish, *bick*, which signifies the same thing: others derive it *ab hiscendo*; others, a *difficili anhelitu*: but others think the most natural derivation to be from the sound yielded in this action.

The *hickup* is not immediately a disorder of the stomach, as is usually imagined; but a convulsive motion of the diaphragm; whereby that muscle retiring impetuously downwards, impels the parts beneath it.

It is occasioned by sharp humours; a too great plentitude of the stomach; a bit of any thing stopped at its upper orifice: or, in the general, by any thing capable of irritating the nerves of the diaphragm.

The Remedy for the *hickup*, according to Hippocrates, is to fetch the breath very long, or even to stop the breath for some time. A sneezing happening upon a *hickup*, generally cures it; the diaphragm, shook by the violent expiration, being apt to throw off what before irritated it.

HIDAGE*, or **HYDGE**, an extraordinary tax; antiently payable to the king for every hide of land. See **HIDE**.

* *Sunt etiam quedam communes prestationes, quas servitia non dicuntur, nec de consuetudine veniunt, nisi cum necessitas intervenit, vel cum rex venerit; sicut sunt hidagia, coragia, & carwagia, & alia plura de necessitate & ex consensu communi totius regni introducta, & quæ ad dominum non pertinent, &c.* Bracton, Lib. II. cap. 6.

King Etheldred, in the year of Christ 994, upon the landing of the Danes at Sandwich, taxed all his lands by *bides*. Every three hundred and ten *bides* of land on this occasion found one ship furnished; and every eight hides found one jack, and one fiddle for the defence of the realm.—William the conqueror took six shillings for every *hide* of land in England. *Flor. Wigorn.* an. 1084.

HIDAGE, is also used for being quit of that tax; otherwise called *hide-gild*.

HIDE, the skin of a beast; particularly that of a bullock, or cow. See **SKIN**, and **TANNING**.

We have *bides* of divers denominations, according to their state, quality, &c.

Curried HIDE, is that which after tanning, has passed through the currier's hands, and has thus received its last preparation, and is fittet for use.

Raw HIDE, or **Green HIDE**, is that which has not undergone any preparation; being in the same condition as when taken off the carcase.

Salted HIDE, is a green *hide*, seasoned with sea-salt and alum, or salt-petre; to prevent its spoiling and corrupting, either by keeping it too long in cellars, or in transporting it too far in a hot season.

There are also *bides* dried in the hair, sent from America; particularly those of Buffalo's.

Tanned HIDE, is a *hide* either green, salted, or dried, further dressed and prepared by the tanner, by paring off the hair, and steeping it in pits of lime and tan. See **TANNING**.

HIDE, or **HYDE**, **HYDA**, in our antient customs, denoted a measure or quantity of land, containing so much as could be yearly tilled with a single plough.

Beda calls the *hide* of land, *familia*, and defines it to be so much as was sufficient for the ordinary maintenance of one family.—In other authors it is called *mansum*, *mansio*, *carucata*, &c.

Crompton, in his *Jurisdickt.* fol. 222. says, a *hide* of land contains one hundred acres: He adds, that eight *bides* make a knight's fee. In an antient manuscript the *hide* is fixed at one hundred and twenty acres.

But Sir Edward Coke notes, that a knight's fee, a *hide*, or plough-land, a yard-land, and an oxgang of land, do not contain any certain determinate number of acres.

The distribution of England into *bides* of land is very antient; there being mention made of it in the laws of king John, cap. 14. *Henricus I. Maritand, filius sue gratia imperatori, cepit ab unaquaque hida Angliæ tres fol.* SPELMAN.

HIDE-BOUND, a disorder of a horse, or other beast, wherein his skin sticks so tight to his ribs and back, as not to be loosened from it with the hand.

The disorder is sometimes owing to poverty, and bad keeping; at other times to over riding, or a surfeit, the horse being suffered, when he is hot, to stand long in the wet; or to a morbid drinck of the blood, which not having its natural course, causes the skin to shrink up, and cleave to the bones.—Among husbandmen, trees also are said to be *hide-bound*, when the bark sticks too close.

H I E

HIDEL, in our antient statutes, signifies a place of protection, or sanctuary.

HIDGILD*, or **HIDEGILD**, in the laws of king Canute, is explained by *pretium redemptionis servi*; the price by which a servant was to redeem his skin from being whipped.

* The word is formed from the Saxon, *huse*, skin, and *gild*, payment.—*Si liber fessis diabus operetur, perdat libertatem; si servus, corium perdat, vel hidgildum, i. e.* let him be whipped, (which was the punishment for servants) or let him pay for his skin; by which payment he is to be excused from whipping.

HIDROTICS*, or **HYDROTICS**, in medicine, the same with *sudorifics*.

* The word is composed of the Greek, *ιδρως*, sweat.

Contraeryva, zedoary, guaiacum, angelica, &c. are of the number of *hidrotics*, or *hidrotic* medicines.

HIERACITES, **HIERACITÆ**, a sect of antient heretics; denominated from their leader, Hierax.

This heresiarch was by nation an Egyptian; and, besides his mother-tongue, was a master of the Greek, and well skilled in all the polite parts of learning. Being born a Christian, he had been brought up to the study of the holy scriptures, with which he had a more than ordinary acquaintance; so that he wrote commentaries on some of them; but, by an ill use of his knowledge, he fell into divers errors, in which his interest and authority among the monks of Egypt, procured him abundance of followers.

He absolutely denied the resurrection of the body; maintaining, that the soul alone rose again; and that the resurrection was altogether spiritual.—Epiphanius furnishes that he might have imbibed this error from Origen.

The same Hierax, and his followers, likewise condemned marriage; being of opinion that it was only allowed under the Old Testament; and till the coming of Jesus Christ; but that under the new law, all marriage was prohibited, as incompatible with the kingdom of God.

S. Epiphanius produces the passages of scripture whereon he founded this doctrine. He adds, that Hierax did not give into Origen's error with regard to the Mystery of the Trinity, but allowed the Son to be really and truly begotten of the Father: He was also orthodox with respect to the Holy Ghost; excepting for some peculiarities received from the Melchisedecians, on which he had refined. He lived a very austere life, and promoted the same among his followers: but after his death they degenerated very fast.

HIERA PICRA*, in pharmacy, originally a kind of electuary, first described by Galen; composed of aloes, cinnamon, asarabacca, spica-nardi, saffron, and mastic, made up with honey, or syrup of violets and honey.

* It is denominated from the Greek *hieros*, *sacer*, holy, by reason of its rare virtues; and *πικρος*, *amarus*, bitter; aloes, which is the base thereof, rendering it extremely bitter.

It was used to purge, and cleanse the stomach; remove obstructions, promote the menfes and hæmorrhoids, and sweeten the blood: but its chief use among us, is in Powder for making the tinctura sacra.

Besides this *simple hiera picra*, there is a compound sort, called *diacolocynthidos pachii*, by reason colocynthis is the base thereof, and that it was first used, with good success, by Pachius of Antioch, in divers obfinate diseases.—It is composed of colocynth, opoponax, aristolochia rotunda, agaric, and other ingredients. It is used in epilepsies, apoplexies, palfies, and lethargies; and to excite the menfes, and promote the expulsion of the after-birth.

There is also a third sort of *hiera*, called *liberans*; but rarely used.—Dr. Quincy says, it is one of the most ridiculous medleys ever contrived. It passes for a cordial, &c.

HIERARCHY*, **HIERARCHIA**, in theology, the order, or subordination, among the several choirs, or ranks of angels.

* The word is Greek, *ἱεραρχία*; formed of *ἱερός*, *sacer*, holy, and *αρχή*, *principatus*, rule, *q. d.* *ἱεραρχία*, holy command, or rule in holy things.

S. Dionysius, and other of the antient writers, establish nine choirs, or orders of celestial spirits; viz. *seraphim*, *cherubim*, *thrones*, *dominions*, *principalities*, *powers*, *virtues*, *angels*, and *archangels*: and these they divide into three *hierarchies*.

HIERARCHY, is also used on earth, for the subordination between prelates, and other ecclesiastics. See **ECCLÉSIASTICAL ORDER**, **PRIEST**, &c.

Archbishops, bishops, priests, and deacons, compose the *hierarchy* of the church of England.—In that of Rome, the pope has likewise a place at the head of the *hierarchy*.

F. Cellæus, Jesuit of Paris, has published a volume expr^{ss}, (*De Hierarchia & Hierarhiis*) on the *hierarchy*, and those who compose it. He there distinguishes a created, and an uncreated *hierarchy*; a divine, and a human, or ecclesiastical *hierarchy*; and in this, a *hierarchy* of jurisdiction, and a *hierarchy* of authority.

archy of order, and a *hierarchy* of graces, the most sublime of all.

He defines *hierarchy* in the general, a command, or sovereignty, in holy things: *principatus, sive imperium in rebus sacris*; on which footing he holds, that *hierarchy* excludes all below bishops; and that neither priests nor deacons can be reckoned among the number of *hierarchists*. Bellarmine, Hallier, Aurelius, &c. he holds, were all mistaken, and did not distinguish between being of the *hierarchy*, and being under it.

According to him, to be of, or in the *hierarchy*, are the same thing; and are only applicable to those who govern the church, or have some part in the administration of the government thereof: On the contrary, to be under the *hierarchy*, is to be ruled or governed by the *hierarchy*.—Ceslot will not admit of any difference between these three expressions. To prove that they all denote the same thing, he instances in the case of monarchy, alledged for the same purpose by P. Aurelius: urging, that in a monarchy, all, even the subjects, are in the monarchy, of the monarchy, or under the monarchy; and that none are excluded but foreigners, and that the case is the same in the *hierarchy*.

HIERATIC Paper, among the ancients, was the finest sort of paper; which was set apart only for sacred or religious uses. See **PAPER**.

HIEROGLYPHIC*, *ἱερογλυφικά*, a symbol, or mystic figure, used among the ancient Egyptians, to cover, or conceal the secrets of their theology.

* The word is composed of the Greek *ἱερός*, *sacer*, holy, and *γλύφω*, *sculpere*, to engrave; it being the custom to have the walls, doors, &c. of their temples, obelisks, &c. engraven with such figures.

Hieroglyphics are properly emblems, or signs of divine, sacred, or supernatural things; by which they are distinguished from common symbols, which are signs of sensible and natural things.

Hermes Trismegistus, is commonly esteemed the inventor of *hieroglyphics*: He first introduced them into the Heathen theology; from whence they have been transplanted into the Jewish and Christian.

Sacred things, says Hippocrates, should only be communicated to sacred persons.—Hence it was, that the ancient Egyptians communicated to none but their kings and priests, and those who were to succeed to the priesthood and the crown, the secrets of nature, and the mysteries of their morality and history; and this they did by a kind of cabbala, which at the same time that it instructed them, only amused the rest of the people.—Hence the use of *hieroglyphics*, or mystic figures, to veil their morality, politics, &c. from profane eyes. *Span.*—This author, it may be observed, and many others, do not keep to the precise character of a *hieroglyphic*, but apply it to profane as well as divine things.

Hieroglyphics are a kind of real characters, which do not only denote, but in some measure express the things.—Thus, according to Clemens Alexandrinus, *Strom.* 5, a lion is the *hieroglyphic* of strength and fortitude; a bullock, of agriculture; a horse, of liberty; a sphinx of subtilty, &c.

HIEROGLYPHICAL, something containing a *hieroglyphic*. See **HIEROGLYPHIC**.

In Egypt are still found divers obelisks, figures, &c. full of *hieroglyphical* figures or characters.

* From the inmost recesses of the dome, says Apuleius, he brings forth certain books wrote in mystic, unintelligible characters; consisting partly of figures of animals, apparently suggesting some compendious sayings; and partly of knots, and flourishes, all abundantly scoured from the too curious eyes of profane readers. The religious traditions of the Egyptians, are mostly involved in such figures of animals, which are hence called *ἱερογλυφικά γράμματα*, *hieroglyphical letters*.

HIEROGRAMMATEI, *ἱερογρამματεῖς*, among the ancient Egyptians, were the priests appointed to explain the mysteries of religion, and to direct the performance of the ceremonies thereof.

The *hierogrammati* invented and wrote hieroglyphics and hieroglyphical books, and occasionally explained them, together with other matters relating to the doctrines of religion. If we may believe Suidas, they were also prophets; at least, he relates, that a *hierogrammatist* foretold to an ancient king of Egypt, that there would be an Israelite of great wisdom, virtue and renown, who should humble Egypt.

The *hierogrammati* were always near the kings, to assist him with their informations and counsels: the better to fit them for this, they made use of the skill and knowledge they had acquired in the stars, and the motions of the heavenly lights; and even of the writings of their predecessors, wherein their functions and duties were delivered. They were exempted from all civil employments; were reputed the first persons in dignity next the king; and bore a kind of scepter in form of a ploughshare.

Vol. I.

After Egypt became a province of the Roman empire, the *hierogrammati* sunk into neglect.

HIEROMNEMON*, an officer in the ancient Greek church; whose principal function was to stand behind the patriarch at the sacraments, ceremonies, &c. and then him the prayers, psalms, &c. which he was to rehearse.

* The word is composed of the Greek *ἱερός*, *sacer*, and *μνησκω*, one who advertises, or puts in mind of.

He also clothed the patriarch in his pontifical robes; and assigned the places of all those who had a right to be around him, when seated on his throne; as the master of the ceremonies now does to the pope.

The *hieromnemon* was commonly a deacon; when he was in priest's orders, as it sometimes happened, he was excused from dressing the patriarch in his pontifical habits. Whether he were deacon, or priest, he had always under him an officer named *calistrus*. He had also the keeping of the book entitled *Contacion*, or book of ordination; and that called the *Enthronisationis*, which was a sort of ritual.

HIERONYMITES*, or *Hermits of St. Jerom*. See **JERONYMITES**.

* The word is compounded of *ἱερός*, *holy*, and *οἶκος*, *name*.

HIEROPHANTES*, or **HIEROPHANTA**, in antiquity, a priest among the Athenians.

* The word comes from *ἱερός*, *holy*, and *φανος*, *I appear*.

The *hierophantes* was properly the chief person that officiated in the Eleusinia, that great solemnity, sacred to Ceres and Proserpine. See **ELEUSINIA**.

St. Jerom says, that the *hierophantes* extingished the fire of lust, by drinking cicuta, or the mandragora; or even by making themselves eunuch. — *Calistrus* observes, that it was the *hierophantes* who instructed persons initiated into their religion, in the mysteries and duties thereof; and that it was hence he derived his name.—For the same reason he was also called *prophetes*, the prophet.—He had officers under him to do the same thing, or to assist him therein, who were also called *prophetes*, and *exegetes*, i. e. explainers of divine things.

To the *hierophantes* it belonged to dress and adorn the statues of the gods, and to bear them in processions and solemn ceremonies.

HIEROPHYLAX*, an officer in the Greek church.—His function is that of guardian, or keeper of the holy things, utensils, vestments, &c. answering to our *sacrista*, or sexton.

* The word is composed of *ἱερός*, *sacer*, and *φυλάξ*, *keeper*, of *φυλάττω*, *I keep*.

HIEROSCOPY*, **HIEROSCOPIA**, a kind of divination, performed by considering the victim, and observing every thing that occurs during the course of the sacrifice.

* The word is formed of *ἱερός*, *sacer*, and *σκοπέω*, *I view*, or *consider*.

HIGH, *altus*, a term of relation, applied to a body, considered according to its third dimension, or its elevation above the horizon, or even above the ground.

The pike of Tenariff is reputed the *highest* mountain in the world.—The Monument is two hundred and two foot *high* from the ground. See **MONUMENT**.

The tower of St. Paul's, before its first burning down in 1086, was five hundred and twenty foot *high*, exclusive of a pole of copper, whereon was a cross fifteen foot and a half *high*.—The towers of Notre Dame at Paris, so much talked of, are but two hundred and twelve foot *high*; &c.

HIGH, is also used to denote a person in power, dignity, &c.

Thus God is frequently called in scripture the *Most High*. So on earth we say, *high* and puissant lord, prince, &c.—The states general of the united provinces, are called their *high* *nightinesses*. See **STATES**, &c.

So in England we say, *high* court of parliament.

Lord *high* chancellor, } See } **CHANCELLOR**.

Lord *high* treasurer, } See } **TREASURER**.

HIGH, in music, is sometimes used in the same sense with *loud*, in opposition to *low*; and sometimes in the same sense with *acute*, in opposition to *grave*.

HIGH bearing-cock, is a term used with respect to fighting cocks; denoting one larger than the cock he fights withal. —As a *low* bearing-cock is one overmatched for height.

HIGH DUTCH, is the German tongue in its greatest purity, as spoken in Misnia, &c. See **TEUTONIC**, &c.

HIGH Operation, in chirurgery, is a method of extracting the stone; thus called, by reason the stone is taken out at the upper part of the bladder.

For the method of performing the *high* operation. See **LITHOTOMY**.

The *high* operation is said to have been first practised by Rossietus, others say by Franco, a chirurgeon of Lausanne. It

has been lately retrieved by Mr. Douglas, and practised with good success by Mr. Chefelden, and others.

HIGH Relief. See the article RELIEVO.

HIGH Sea, or ocean, is that far from land. See SEA.

HIGH Water, is that state of the tides when they cease to flow up.

HIGHNESS, a quality; or title of honour given to princes. The kings of England and Spain had formerly no other title but that of *highness*; the first, till the time of James I. and the second, till that of Charles V.

The petty princes of Italy began first to be complimented with the title of *highness* in the year 1630.---And the duke of Orleans assumed the title of *royal highness* in the year 1631. to distinguish himself from the other princes of France.

The duke of Savoy, after king of Sardinia, bore the title of *royal highness*, on account of his pretensions to the kingdom of Cyprus.---It is said that duke only took the title of *royal highness*, to put himself above the duke of Florence, who was called *great duke*; but the great duke has since assumed the title of *royal highness*, to put himself on a level with the duke of Savoy.

The prince of Conde first took the title of *most serene highness*, leaving that of simple *highness* to the natural princes.

HIIS testibus, q. d. *these witnesses*; a phrase anciently added in the end of a deed, written in the same hand with the deed; upon which the witnesses were called, the deed read, and then their names entered. See WITNESS.

This clause of *hiis testibus*, in subjects deeds, continued till, and in, the reign of Henry VIII. but it is now omitted. *Col. on Littlel.*

HILARIA, in antiquity, feasts celebrated every year, by the Romans, on the eighth of the calends of April, in honour of Cybele, the mother of the gods.

The *hilaria* were solemnized with great pomp, and rejoicing. Every person dressed himself as he pleased, and took the marks, or badges, of whatever dignity, or quality, he had a fancy for.

The Romans took this feast originally from the Greeks, who called it *ANABASIS*, q. d. *ad ascensum*: the eve of that day they spent tears in and lamentations, and thence denominated it *KATABASIS*, *descensus*.

Afterwards, the Greeks took the name *ΙΑΡΙΑ*, from the Romans; as appears from Photius, in his extract of the life of the philosopher Iudore.

Casaubon maintains, that beside this particular signification, the word *hilaria* was also a general name for any joyful or festival day, whether public, or private and domestic. But Salmassius does not allow of this.

Trifan, T. I. p. 482. distinguishes between *hilaria* and *hilaria*. The former, according to him, were public rejoicings; and the latter, prayers made in consequence thereof; or even of any private feast, or rejoicing, as a marriage, &c. The public lasted several days; during which, all mourning, and funeral ceremonies, were suspended.

The *hilaria* were first instituted in honour of the mother of the gods, as is observed by Macrobius, L. I. c. 10. and Lampridius, in his life of Alexander Severus; being apparently intended to express the joy conceived at the birth of the gods.

HILARODI*, in the ancient music and poetry, a sort of poets among the Greeks, who went about singing little merry diverting poems or songs; though somewhat graver than the Ionic pieces.

* The word is Greek, *ἡλαροδοί*, compounded of *ἡλαρος*, joyful, and *ᾠδή*, singing, song.

The *hilarodi* appeared dressed in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the crepida, which was only a shoal, tied over the foot with straps.

They did not sing alone; but had always a little boy, or girl, to attend them, playing on some instrument.

From the streets, they were at length introduced into the tragedy, as the magodi were into comedy.

The *hilarodi* were afterwards called *simodi*, from a poet named Simus, who excelled in this kind of poetry.

HILARODIA, a poem, or composition in verse, made, or sung by a sort of rhapsodists called *hilarodi*. See HILARODI.

Scaliger holds *hilarodia*, *hilaro-tragedia*, *phylacography*, and the *rhintonic fabula*, to be all names for the same thing.

HILARO-TRAGEDIA, a dramatic performance, partly tragic, or serious; and partly comic, or merry.

Scaliger holds, the *hilaro-tragedia* and *hilarodia* to be one and the same thing. Others, rather take the *hilaro-tragedia* to have been pretty nearly what we call a *tragi-comedy*.

Others, again, will have it to have been a pure tragedy, only terminating with a happy catastrophe, which brings the

hero out of a wretched into a fortunate state.---But the first opinion seems the most probable, and the best warranted.

Suidas mentions one Rhinthon, a comic poet of Tarentum, as the inventor of this kind of poem: whence it was also called *Rhintonica fabula*.

HILARY Term. See the article TERM.

HILL. See the article MOUNTAIN.

HILLOCK. See the article MOUNT.

HIN, a Hebrew measure, containing the sixth part of an epha; or one wine gallon and two pints.

HIND, a female stag of the third year. See HUNTING.

HIND Calf, a hart of the first year. See HUNTING.

HIND Hand, in the manage. See the article HAND.

HINDENI Homines*, anciently signified a society, or class of men.

* The word is formed from the Saxon, *hindene*, a society, or company.

In the time of our Saxon ancestors, all men were ranked into three classes, or *hindenes*; the *lowest*, the *middle*, and the *highest*; and they were valued according to the class they were in; that in case an injury were done by any one, satisfaction might be made according to the value, or worth of the man it was done to. See SYXHYNDEMEN.

The *lowest* were those who were worth ten pounds, or two hundred shillings; called *virī ducentini*, or *twyhyndemen*, and their wives, *twyhynda's*.

The *middle* were valued at six hundred shillings; and were called *sixhyndemen*, and their wives *sixhynda's*.

The *highest* were valued at twelve hundred shillings, and were called *twelvehyndemen*, and their wives the *twelvehynda's*.

HINE, or **HIND,** in the Saxon language, signifies a servant, or one of the family; but it is now taken in a more restrictive sense, for a servant at husbandry: and the *master-hine*, is he that oversees the rest.

HINGES, in building, those necessary iron ligaments, by means whereof doors, lids, folds of tables, &c. make their motion, whether of opening, shutting, or folding.

The species of *hinges* are many, viz. bed, box, butts, cabinet; Lancashire, and smooth-filed; casting, chest-black, Lancashire, smooth-filed, coach, desk, dovetails, effes, folding, garnets, dozen-ware-long, dozen-ware-short, weighty-long, weighty-short, lamb-heads, port, side Lancashire, side-smooth-filed, side with rising joints; Lancashire, and smooth-filed, side with squares, screw, scuttle, shutter; Lancashire, and smooth-filed, stall, trunk of sundry sorts, joints; Lancashire, dozen-ware with hooks, dozen-ware long, dozen-ware short, weighty-long, weighty-short.

HIP. See the article HAUNCH.

HIP-SHOT, a disorder of a horse, when he has wrung or sprained his haunches, or *hips*, so as to relax the ligaments that are to keep the bone in its due place.

The signs are, that the horse will halt much, and go aside-long, trailing his leg after him; and the *hip* which is hurt will be lower than the other; the flesh falling away on the side of his buttock.

HIPS, in building, are those pieces of timber, placed at the corners of a roof.

The *hips* are much longer than the rafters, by reason of their oblique position, and are placed not with a right or square angle, but a very oblique one; and by consequence are not, at least ought not to be, square at any angle (as rafters are at all) but bevel at every one of them; and which is yet more, as rafters have but four planes, these commonly have five.

They are commonly, by country workmen, called *corners*: some call them *principal rafters*, and others *sleepers*. Indeed, *hips* and *sleepers* are much the same; only the *sleepers* lie in the valleys, and join at top with the *hips*; but those surfaces or plains, which make the back of the *hip*, are the under sides of the *sleepers*.

The backs of a *Hip*, are those two superficies, or planes, on the outside of the *hip*, which lie parallel, both in respect of their length and breadth, with the superficies of the adjoining side, and end of the roof.

HIP-MOULD, is by some used for the back of the *hip*.---Others understand it as a prototype, or pattern, commonly made of a piece of thin waincot; by which the back, and the sides of the *hip* are set out.

HIP-ROOF, among builders, called also *Italian-roof*, is a roof which has neither gable head, nor shread head, nor jirkin head; which last, are both gable and *hip* at the same end. A *hip-roof* has rafters as long, and with the angles at the foot, &c. at the ends of buildings, as it has at the sides; and the feet of the rafters on the ends of such buildings as have *hip-roofs*, stand on the same plane, viz. parallel with the horizon, and at the same height from the foundation, with rafters on the sides of the roof.

HIP

HIP-TYLES. See the article **TYLE**.

HIPPEUS, or **EQUINUS**, in physiology, a sort of comet which some writers suppose to bear a resemblance in its tail to a horse. But the shape of this kind of comet is not always alike; being sometimes oval, and sometimes imitating a rhomboides. Its train also is sometimes spread from the front, or forepart, and sometimes from the hind part.

Hence, this class of comets is distinguished into *equinus barbatus*, *equinus quadrangularis*, and *equinus ellipticus*. See **COMET**.

HIPPIATRICE*, the art of curing the diseases of brutes, and particularly horses.

The word is composed of *ἵππος*, horse; and *ιατρικη*, physician.

This makes what we rather call the *farrier's art*. See **FARRIER**.

HIPPOCENTAUR*, in antiquity, a fabulous monster, supposed to be half horse, and half man.

The word is pure Greek, formed of *ἵππος*, equus, horse; *κέντυρον*, pugio, I prick, spur, and *ταυρος*, taurus, bull.

What gave occasion to the fable, was, that a people of Thessaly, inhabiting near mount Pelion, became thus denominated, by reason they were the first that taught the art of mounting on horseback; which occasioned some of their neighbours to imagine that the horse and man made but one animal.

The *hippocentaurs* should seem to have differed from the centaurs, in this, that the latter only rode bullocks, and the former on horses, as the names themselves intimate. See **CENTAUR**.

Pliny affirms, he had seen a real *hippocentaur* at Rome, which was brought out of Egypt, embalmed in honey: But this we may well suspect to have been a cheat. V. Plin. *Hist. Nat.* l. 7. c. 2. — On the medals of Gallienus, is represented a centaur drawing a bow, or holding a globe in the right hand, and the helm of a ship in the left; with this inscription, **A POLLINI CONS. AUG.** To *Apollo* the conservator of *Augustus*. — Trifan considers both the one and the other, as a symbol of the protection Gallienus received from *Apollo* in his wars against the Persians.

HIPPOCRAS*, *Vinum HIPPOCRATICUM*, a kind of medicated wine. See the article **WINE**.

* Merug. approves the conjecture of those who derive *hippocras* from *Hippocrates*, as supposing him the inventor hereof: but we may better deduce it from the *manica Hippocrates*, or *Hippocrate's sleeve*, used in the filtration of it.

Hippocras is a drink composed of wine, with spices and other ingredients infused therein; much used among the French by way of a Cordial dram after meals.

There are various kinds of *hippocras*, according to the kind of wine, and the other additional ingredients made use of; as white *hippocras*, red *hippocras*, claret *hippocras*, strawberry *hippocras*, *hippocras* without wine, cyder *hippocras*, &c.

That directed in our late college dispensatory, is to be made of cloves, ginger, cinnamon, and nutmegs, beat, infused in canary, with sugar; to the infusion, milk, a lemon, and some slips of rosemary are to be put, and the whole strained through a flannel. It is recommended as a cordial, and as good in paralytic, and all nervous cases.

HIPPOCRATE'S SLEEVE, *Manica HIPPOCRATIS*, a kind of filter, or straining-bag, formed by joining the opposite angles of a square piece of flannel, in form of a pyramid; and used to percolate, or strain syrups, decoctions, &c. for clarification.

HIPPOCRATICA FACIES. See **FACIES Hippocratica**.

HIPPODROME*, **HIPPODROMUS**, in antiquity, a list, or course, wherein horse-races are performed; and horses exercised.

* The word is Greek, *ἵπποδρομος*, composed of *ἵππος*, equus, horse, and *δρομος*, cursus, of the verb *δρομαι*, curro, I run.

HIPPOLAPATHUM, in natural history, a species of lapathum, called also *monk's rhubarb*.

HIPPOMANES*, a sort of poison, famous among the ancients as an ingredient in amorous philters, or charms.

* The word is Greek, *ἵππομανης*, compounded of *ἵππος*, equus, horse, and *μανια*, furor, fury, madness.

Naturalists are not agreed about the nature of the *hippomanes*. — Pliny describes it as a blackish caruncle, found on the head of a new born colt; which the dam bites off, and eats, as soon as she is delivered. He adds, that if she be prevented herein by any other's cutting it off before, she will not take to, nor bring up, the young.

Virgil, and after him Servius and Columella, describe it as a poisonous matter, trickling from the pudendum of a mare, when proud, or longing for the foal.

At the end of M. Bayle's Dictionary is a very learned dissertation on the *hippomanes*; and all its virtues, both real, and pretended.

HIPPODES*, or **HIPPOPEDES**, in the ancient geography, an appellation given to certain people, situated on the banks of the Scythian sea; and being supposed to have horse's feet.

* The word is Greek, composed of *ἵππος*, horse, and *πῦς*, pes, foot.

HIS

The *hippopedes* are mentioned by Dionsysius, *Geogr.* v. 310. Mela, L. III. c. 6. Pliny, L. IV. c. 13. and S. Augustin, *De Civit.* L. XVI. c. 8. — But the truth is, that they had this appellation given them on account of their swiftnefs, or lightnefs of foot.

HIPPUS*, in medicine, a disorder of the eyes, wherein they continually shake, and tremble; and thus represent objects as if continually fluctuating.

* It is thus called from the Greek, *ἵππος*, horse; in regard according to Blanchard, objects appear to shift in it, as much as when we are riding.

HIRCUS*, *Tragus*, or *Goat*, in anatomy, a part of the auricle, or outer ear; being that eminence next the temples. See **EAR**.

* The word is Latin, and literally signifies *goat*.

HIRCUS, in astronomy, a fixed star of the first magnitude, the same with *capella*. See **CAPELLA**.

HIRCUS is also a denomination given to the rank smell exhaling from the arm-pits; and which has its source in the axillary glands.

HIRCUS, is also used by some writers for a comet, encompassed as it were with a main, seemingly rough and hairy. See **COMET**.

HISSING, an appellation given by grammarians to the three consonants, *s*, *x*, and *z*. See **S**, **X**, and **Z**.

HISTIODROMIA*, the art of sailing, or of conducting vessels on the sea.

* The word is Greek, composed of *ἵστος*, sail, of *ἵσται*, the mast of a ship, which comes from *ἵσται*, *ἵσται* I stand; and *δρομος*, course, of *δρομαι*, I run.

Histiodyromia is the same with what we otherwise call *navigation*.

Histiodyromia turns on four points, any two whereof being given, the other two are easily found from them, by the loxodromic tables, fines, tangents, secants, mercator's chart, &c. These four things are, the difference of latitude, difference of longitude, the course, and the distance run.

HISTORICAL, something that relates to history. See **HISTORY**.

Thus we say, *historical truth*, *historical style*, &c.

The donation of Constantine, the reality of a pope Joan, &c. are *historical points*, very much controverted.

Henry Stevens has published a *historical* and poetical dictionary, since improved and augmented by Lloyd, Morery, Hoffman, &c. Mr. Bayle has given us an *historical* and critical dictionary: Diodorus Siculus, Vignier, and bishop Nicholson, *historical libraries*.

The *historical art* consists chiefly in the arranging and disposing the various incidents, so as to constitute one uniform, well connected whole. F. Daniel.

The principal qualities of the *historical style*, are perspicuity and brevity.

HISTORICAL COLUMN, is that whose shaft is adorned with basso-relievo's carved all around from bottom to top, representing the history and actions of some illustrious person.

In *historical columns*, the figures may be either disposed in a spiral line, continued from one end to the other; as in the Trajan column at Rome: or in distinct bands, or circles, containing so many different subjects.

HISTORIOGRAPHER*, a professed historian, or writer of history; or a person who applies himself peculiarly thereto.

* The word is composed of the Greek, *ἱστορια*, history, and *γραφω*, scribo, I write.

The term is chiefly used for a person who has a peculiar charge and commission to write the history of his time. — The *historiographer* to his majesty, is an officer under the lord chamberlain: his salary 200 l. per ann.

HISTORY*, a recital, or description of things as they are, or have been; in a continued, orderly narration of the principal facts, and circumstances thereof. See **ANNALS**.

* The word is Greek, *ἱστορια*, *historia*, and literally denotes a search of curious things, or a desire of knowing, or even a rehearsal of things we have seen; being formed of the verb *ἵσται*, which properly signifies to know a thing by having seen it. Though the idea appropriated to the term *history*, is now much more extensive; and we apply it to a narration of divers memorable things, even though the relator only takes them from the report of others. The origin of the word is from the verb *ἵσται*, I know; and hence it is, that among the ancients several of their great men were called *polyhistores*, q. d. persons of various, and general knowledge.

History is divided, with regard to its subject, into the *history of nature*, and the *history of actions*.

HISTORY of Nature, or **Natural HISTORY**, is a description of natural bodies; whether terrestrial, as animals, vegetables, fossils, &c. water, air, meteors, &c. or celestial, as the stars, planets, comets, &c.

Such are Aristotle's, Dioscorides's, Aldrovandus's, &c. *histories*: such also are Ray's and Gessner's *history of quadrupeds*; Willughby's *histories of birds*, fishes, &c. Such, lastly, are

Mr. Flainthead's *Historia celestis*, or *history of the heavenly bodies*.

Natural history is much the same with what we otherwise call *physiology*.

HISTORY, with regard to actions, is a continued relation of a series of memorable events, in the affairs, either of a single person, a nation, or several persons and nations; and whether included in a great, or little space of time.

Thus, Thucydides has wrote the *history of Greece*; Livy, that of *Rome*; Mezeray, and F. Daniel, of *France*; Tyrrael, and Echarde, the *history of England*; Buchanan, of *Scotland*; Clarendon, the *history of the rebellion*; and Thuanus, bishop Burnet, &c. the *history of their own lives and times*.

Eusebius, Baronius, &c. have wrote the *history of the church*; bishop Burnet that of the *Reformation*, &c.

Several authors have wrote on the method of reading, and studying *history*; among the rest Lucian, Bodin, Vossius the elder, Wheaur, Patrici, Beni, Mascardi, De Silhon, F. le Moine, F. Rapin, the abbot de S. Real, F. Thomassin, Frenoy, &c. *History* is divided into *antient and modern, universal and particular, sacred and profane*.

F. Menestrier gives us the proper characters of the divers kinds of *history*, with great accuracy.—He distinguishes *history*, with regard to both its matter, and its form; and gives curious instances of each particular.

History, with regard to its matter, is either *sacred, or natural, or civil, or personal, or singular*.

Sacred HISTORY, is that which lays before us the mysteries and ceremonies of religion, visions or appearances of the Deity, &c. miracles, and other supernatural things, whereof God alone is the author.—Such are the book of Genesis, the Gospels, Apocalypse, &c. See **MIRACLE**, **PROPHECY**, **REVELATION**, &c.

Natural HISTORY, is a description of the singularities of nature; its irregularities and prodigies; and the alterations it undergoes in the birth, progress, end, and use of things.—Such is Aristotle's *history of animals*; Theophrastus's *history of plants*; and the entire body of *natural history*, by Pliny: Such also are Accosta's *natural history of the Indies*; Plott's *history of Staffordshire*, &c.

Civil HISTORY, is that of people, states, republics, communities, cities, &c.—Such are those of Thucydides, Halicarnassus, Livy, Polybius, Mezeray, F. Daniel, Milton, Buchanan, &c.

Personal HISTORY, is that which gives the portrait, or life of some single person.—Such are the Lives of Plutarch, Cornelius Nepos, Suetonius, &c. And the lives of the painters, poets, philosophers, saints, &c.

Personal history, is the same with what we otherwise call *biography*. See **BIOGRAPHY**.

Single HISTORY, is that which describes a single action, i. e. battle, or even a war, or expedition, &c. *History*, with regard to its form, is either *simple, or figurate, or mixed*.

Simple HISTORY, is that delivered without any art of foreign ornament; being only a naked, and faithful recital of things, just in the manner, and order wherein they passed.—Such are the chronicles of the eastern empire; the fasti; chronological tables, journals, &c.

Figurate HISTORY, is that which is further enriched with ornaments, by the wit, ingenuity, and address of the historian.—Such are the political, and moral *histories* of the Greeks, Romans, and most of the moderns.

This latter is a kind of *rational history*; which, without stopping at the shell or outside, the appearances of things, discovers the secret springs and movements of the several events; it enters into the thoughts, the breaths of the persons concerned therein; it discovers their intentions and views; and by the result of enterprizes, and undertakings, discovers the prudence or weakness, wherewith they were laid, conducted, &c.

These are much the most useful, and entertaining *histories*.—To this class, may be peculiarly referred the *histories* and Annals of Tacitus, among the antients; and those of Guicciardin, Thuanus, and bishop Burnet, among the moderns.

Mixed HISTORY, is that which, beside the ornaments of figured *history*, calls in the proofs and authorities of simple *history*; furnishing authentic memoirs, or original letters, manifestos, declarations, &c. to vouch the truth of what is said.—Such are the *histories*, or collections of Rushworth; M. Rapin, Thoyras's *history of England*; the genealogical *histories* of Duchesne; M. de Marca's *history of Bearn*, &c.

HISTORY, is also used for a romance; or a fabulous, but probable relation, of a series of actions, or adventures feigned, or invented by the writer. See **ROMANCE**.

Such is the *history of the civil wars of Granada*; the *history of Don Quixote*; the *Ethiopic history of Heliodorus*, &c.

HISTORY, in painting, denotes a picture composed of divers figures, or persons, representing some transaction, or piece of *history*, either real or feigned.

Painters are distinguished into portrait painters, flower and fruit painters, painters of beasts and land-skips, and *history* painters.—The first place is universally allowed to *history*

painters, as the most difficult, masterly, and sublime province. **HISTRIO**, in the antient drama, signified an actor, or comedian; but more especially a pantomime, who exhibited his part by gestures, and dancing.

HOAR-FROST, *Pruiua*. See **FROST**.

HOARSENESS, *Raucedo*, a diminution of the voice; sometimes attended with a preternatural asperity, or roughness thereof.

The part here affected is the aspera arteria, and particularly its head, or the larynx. See **ASPERA**, and **LARYNX**.

The proximate cause of *hoarseness* is a too copious effusion of thin lymph upon the part.

Hoarseness is a sort of catarrhus indispotionis, arising from a too great acrimony or saltiness of the lymph.

Sperma ceti, decoct. rapar. & rob. papular. are approved remedies herein.—Where the disorder is inveterate, incidents and expectorants are frequently of service.

HOBBY, a sort of hawk that preys upon small game, as pigeons, larks, &c. See **HAWK**.

HOBITS, a sort of small mortars, from six to eight inches diameter, mounted on carriages, made after the gun fashion; used for annoying the enemy at a distance with small bombs.

HOBLERS, or **HOBLERS**, **HOBELARII**, in our antient customs, were men, who by their tenure, were obliged to maintain a light horie, or hobby, for the certifying any invasion towards the sea-side.

The name was also used for certain Irish knights, who used to serve as light horsemen upon hobbies.

HOCK-Tuesday Money. See the article **HOCKE-DAY**.

HOD, a sort of tray for carrying mortar; in use among brick-layers.

HODEGOS, a term purely Greek, *hodes*, signifying *guide*. The word is chiefly used as the title of a book compiled by Anastasius the Sinaite, towards the close of the fifth century; being a method of disputing against the heretics, particularly the Acephali.

Mr. Toland has also published a dissertation under the same title. Its subject is the pillar of fire, &c. which went before the Israelites, as a guide in the desert.

HODGE-PODGE. See the article **HOTCH-POT**.

HODMAN, a young scholar admitted from Westminster school to be student in Christ's College in Oxford.

HOE, or **HOW**, a Husbandman's tool, made like a cooper's adz, to cut up weeds in gardens, fields, &c.

This instrument is of great use, and ought to be much more employed than it is, in hacking and clearing the several corners, creeks, and patches of land, in spare times of the year, which would be no small advantage thereto. See **Supplement: article HOING**.

HOG Steer, among hunters, a wild boar of three years old. See **HUNTING**.

HOGGET, or **HOGREL**, is a young boar of the second year.

HOGENHINE, **HOCHENHENE**, or rather **ACENHINE**, *q. d. own servant*; he that comes guestwise to an inn, or house, and lies there the third night: after this he was accounted of that family; and if he offended the king's peace, his host was answerable for him. See **THIRD night own bind**.

HOGGEE, properly, **HAUT-GOUT**, a mess in cookery, so denominated from its high flavour, or relish.

Its preparations, ingredients, &c. are various.—Its basis is usually some flesh, *e. g.* leg of mutton, minced with suet, and savoury herbs, as shallot, thyme, spinage, &c. added thereto, with seasoning of salt and pepper, and yolks of eggs: the whole worked up into a ball, and thus boiled; frequently in the body of a cabbage, first fashioned like a duck, or other fowl, with a head stuck on.—It remains to be served up with a proper sauce, as butter, yolks of eggs, anchovies, &c.

HOGSHEAD, a measure, or vessel of wine, or oil; containing the fourth part of a tun; or 63 gallons.

Two of these *hogheads* make a pipe or butt.

The distillers weigh their vessels when full, and for a *hoghead* allow four hundred weight, two quarters, and twenty two pound, cask and liquor.

HOCKE-DAY, **HOCKE-DAY** or **HOCK-TUESDAY**, in our antient customs, (*Dies martis quon quindenam pasche vocant*) the second tuesday after Easter week.

This day was very remarkable in former times, inasmuch as to be used on the same footing with Michaelmas, for a general term or time of account.—We find leases without date referring so much rent payable *ad duas anni terminos, scil. ad le hoke-day, & ad festum sancti Michaelis*. See the article **QUARTER**.

In the accounts of Magdalen college, Oxford, there is yearly an allowance, *pro mulieribus hockantibus*, of some manors of an allowance, where the men *hock* the women on Monday days

days, and the women hock them on Tuesdays.—The meaning of it is, that on that day the women in meriment stop'd the ways with ropes, and pull'd passengers to them, desiring something to be laid out in pious uses.

HOKE-DAY Money, or **HOKE-TUESDAY Money**, a tribute antiently paid the landlord, for giving his tenants and bondmen leave to celebrate *hock-day*, or *hoke-day*; in memory of the expulsion of the domineering Danes.

HOLD of a Ship, the lowest part of the ship; including all that part lying between the keelson and the lower-deck.—See *Tab. Ship*, fig. 2. *lit. G*, fig. 2. n. 116.

In the *hold* are the steward's room, the powder room, the bread room, and the boatwain's room; divided from each other by bulk-heads.

The *hold* is the store room in a merchant ship, or the place wherein the goods, at least all the heavier and more cumbersome, are stowed. The rest are disposed between the two decks; at least in Dutch ships, which have their *holds* very shallow, and the space between the decks, very high.

To find the burden of a ship, the *hold* is to be measured.

HOLD-FAST, an iron hook in shape of the letter S, fixed in a wall to retain and support it.

HOLLAND, in the linnen drapery, a fine, white, even, close kind of linnen cloth, chiefly used for shirts, sheets, &c.

It is principally wrought in the provinces of Holland, Friesland, and other parts of the united provinces; whence the appellation.

The principal mart or staple of this cloth is at Haerlem, whither it is sent from most other parts as soon as wove, there to be whitened in the ensuing spring.

That manufactured in Friesland is the most esteemed, and called *frize holland*. It is the strongest, and the best coloured of any of that fineness.—It is never calendered, nor thickened as the rest; but is imported just as it comes from the whistler.—It is distinguished by its being yard, quarter and half wide; which is half a quarter more than those commonly called *frize holland*, which are not right.

Gulix HOLLAND is very white and fine, and is chiefly used for shirts; being the strongest of any for its fineness, except true frize. It is just yard wide.

Almaer HOLLAND, is a very strong cloth, and wears exceedingly well. It is about yard, quarter and half wide.

HOLLOW, in architecture, a concave moulding, about a quadrant of a circle; by some called a *casement*, by others an *abacus*. See **CASEMENT**.

HOLLOW Square, is a body of foot drawn up with an empty space in the middle, for the colours, drums, and baggage; facing, and covered by the pikers every way to oppose the horse.

HOLLOW Tower, in fortification, is a rounding made of the remainder of two batteries, to join the curtain to the orillon: where the small fort is played, that they may not be so much exposed to the view of the enemy. *Harris*.

HOLM *, **HULMUS**, signifies as much as *insula amica*, a river-island, according to Bede; or a plain grassy ground upon the water-side, or in the water, according to Camden.

* Where any place is called by the name *holm*, or where this syllable is joined with any other in the name of a place, it signifies it to be surrounded with waters.—As the *flat holmer*, the *step holmer*, near Bristol.—If the situation of the place be not near the water, it may signify a hilly place; for *holm*, in Saxon, does also signify *an hill*, or *cliff*.

HOLOCAUST *, a kind of sacrifice, wherein the whole offering is burnt, or consumed by fire; called also, in scripture, a *burnt-offering*. See **SACRIFICE**, and **OBULATION**.

* The word is Greek, *holocauston*, formed from *holos*, *totus*, whole; and *kaio*, *ure*, *igne absumo*, I consume with fire.

HOLOGRAPHUM *, in the civil law, something written wholly in the hand-writing of the person who signs it.

* The word is Greek, composed of *holos*, all, and *grapho*, I write.

The word is chiefly used in speaking of a testament, written wholly in the testator's own hand. See **TESTAMENT**.

The Romans did not approve of *holographic* testaments; and though Valentinian authorized them by a novel, they are not used where the civil law is in full force.

HOLOMETER *, a mathematical instrument, serving universally for the taking of all sorts of measures, both on the earth, and in the heavens.

* The word is Greek, composed of *holos*, all, and *metron*, I measure.

The *holometer* is the same with what is otherwise denominated *pantometer*.

HOLSOM.—A ship is said to be *holsom* at sea, when she will hulk, try, and ride well, without rolling or labouring.

HOLYNES, or **HOLINESS**, sanctity; the quality which constitutes or denominates a person, or thing *holy*; i. e. pure, or exempt of sin.

HOLYNES is also used in respect of persons and things that are sacred, i. e. set apart to the service of God, and the uses of religion.

VOL I.

In this sense we say, *holy days*, *holy ordinances*, the *holy Bible*, *holy gospels*, *holy war*, &c.—The Roman catholics call the Inquisition, the *holy tribunal*; the sea of Rome, the *holy see*, &c.

Holy oil, *holy water*, &c. See **UNCTION**, **WATER**, &c.

Palestine is particularly called the *holy land*, and Jerusalem the *holy city*.—Princes formerly made a practice of going to signalize their religion, in the *holy land*; who, if they had any real religion, would have staid at home. See **CROISADE**.

In Romish countries, one third part of the year is taken up in *holy days*, *saints days*, &c. In Scotland, they observe no stated *holy days*, besides Sundays.

HOLY Thursday, is what we otherwise call *ascension day*; being ten days before Whit Sunday. See **ASCENSION**.

HOLY Week, is the last week of Lent, called also *passion week*.

HOLY Year, is sometimes used for the year of Jubilee. See **JUBILEE**.

In the Jewish tabernacle, and afterwards in the temple, there were two places; the one called the *holy*, *sanctum*; and the other, which was more retired, the *holy of holies*, *sanctum sanctorum*, or the sanctuary.

The *holy* was separated from the *holy of holies* by a veil.—In this latter place was the ark of the covenant kept. See **SANCTUM SANCTORUM**.

HOLYNES is also a title or quality attributed to the pope; as that of majesty is to kings.

Even kings, writing to the pope, address him under the venerable appellation of your *holyness*, or *holy father*; in Latin, *sanctissime*, or *beatissime pater*. See **POPE**.

Antiently the same title, *holyness*, was given to all bishops; as appears in S. Augustin, Fortunatus, Nicholas I. Caesiodore, &c.—S. Gregory compliments some of his contemporary bishops with, your beatitude, and your *holyness*.

The Greek emperors of Constantinople were also addressed under the title of *holyness*, in regard of their being anointed with *holy oil* at their coronation.—Du Cange adds, that some of the kings of England have had the same attribute; and that the Orientals have frequently refused it to the pope.

Order of the HOLY GHOST, is a military order in France, the principal, in point of dignity, in that kingdom.

It was instituted by king Henry III. in 1569, in memory of three great events happening on the same day, viz. his birth, accession to the crown of France, and election to that of Poland; the order is to consist of 100 knights only; who, to be admitted, are to make proof of their nobility for three descents.

The king is the grand master or sovereign, and takes the oath as such on his coronation day; whereby he solemnly vows to maintain for ever the order of the *holy Ghost*, and not to suffer it to shrink, fall, or diminish, so long as it is in his power to hinder it; nor ever to attempt to alter or dispense with any of the irrevocable statutes of the order.

The knights are all to wear a gold cross, hung about the neck by a blue silk ribbon or collar; and the officers and commanders are also to wear a cross sewed on the left side of their cloaks, robes, and other upper garments.

Before they receive the order of the *holy Ghost*, that of S. Michael is conferred, as a necessary step; for which reason their arms are always surrounded with a double collar.

HOLY GHOST, in heraldry.—*Crest of the HOLY GHOST*, consists of a circle in the middle of a cross, and on it the *holy Ghost* in figure of a dove: the four arms are drawn narrow from the centre, and widening to the ends, where the returning lines divide each of them into two sharp points, upon each of which is a pearl.

From the intervals of the circle between the arms, issue four flower-de-luces.—This is the cross worn by the knights of the order of the *holy Ghost* in France.

HOLY-Rood Day, a festival observed by the Roman catholics, in memory of the exaltation of our Saviour's cross. See **EXALTATION of the cross**.

HOLY-WATER Sprinkle, among hunters, signifies the tail of a fox. See **TAIL**.

HOMAGE *, in its general sense, denotes the reverence, respect, and submission which a person yields his master, lord, prince, or other superior.

* The word is formed of the Latin, *homo*, man; by reason when the tenant takes this oath, he says, *Ego devenio homo vestri*, I become your man: for the same reason, *homage* is also called *manhood*: so, the *homage* of his tenant, and the manhood of his tenant, is all one. *Coke on Littl.* fol. 64.

HOMAGE, **HOMAGIUM**, **HOMINIUM**, in law, is an engagement or promise of fidelity, which the vassal or tenant who holds a fee, renders to the lord when admitted thereto. See **FEE**, **VASSAL**, **LORD**, &c.

In the original grants of lands and tenements by way of fee, the lord did not only tie his tenants in certain services; but also took a submission, with promise and oath to be true and loyal to him as their lord and benefactor.

This submission, &c. is called *homage*, the form whereof, as appointed by stat. 17 Edward II. is in these words: When a free-man shall do *homage* to his lord, of whom he holdeth

in chief, he shall hold his hands together between the hands of his lord, and shall say thus: 'I become your man from this day forth for my life, for member, and for worldly honour; and shall owe you my faith for the land I hold of you; saving the faith that I owe unto our sovereign lord the king, and to mine other lords.'

In this manner the lord of the fee, for which *homage* is due, takes *homage* of every tenant as he comes to the land or fee. Glanvil, indeed, excepts women; who only perform *homage* by their husbands; in regard *homage* is supposed to have a more immediate relation to service in war; but Fitzherbert denies this exception. *Not. Brev. fol. 157.*

It is added, that bishops do no *homage*, but only fealty, and, probably, for the same reason as women. Yet do we read, that the archbishop of Canterbury does *homage* on his knees to our kings at their coronation; and that the bishop of Man is *homager* to the earl of Derby.

Fulbeck reconciles this: By our law, says he, a religious man may do *homage*; but may not say to the lord, *Ego devotus homo vestro*; because he has already professed himself to be only God's man; but he may say to him, 'I do unto you *homage*, and to you shall be faithful and loyal.'

Homage and fealty, or faith, are two distinct things, and different duties.

Originally, *homage* was performed by the gentleman, and fealty by the peasant. Others say, that *homage* was that performed to the lord himself; and fealty to his seneschal or steward, for his lord.—It is added, that he who holds lands for term of life, owes *homage*, but not fealty.

Bishops take the oath of fealty and loyalty to the king for the temporalities they hold of him; but without *homage* or vassalage.

HOMAGE-LIEGE, a more extensive kind of *homage*, whereby the vassal held of the lord, not only for his land, but for his person.—So that the lord might use him against all mankind, whether within or without the kingdom, excepting against the king.

This kind of *homage* was rendered bare-headed, with the hands joined on the gospels, one knee on the ground, and without sword, girdle, or spurs.—By which it was distinguished from *frank homage*.

There are also other distinctions of *homage*; as, Plain **HOMAGE**, or *homage* of a fee, where no oath of fidelity is taken.

HOMAGE of Devotion, which is a donation made to the church, and does not import any duty or service at all.

HOMAGE of Peace, which a person makes to another after a reconciliation, as an assurance that he will no longer disturb his peace, &c.

HOMAGE, again, is divided into *new*, or that performed upon the grant of the fee; and *ancestral*.

HOMAGE Ancestral, is where a man, and his ancestors, time out of mind, have held their land of the lord and his ancestors by *homage*.

If such lord have received *homage*, he is bound to acquit the tenant against all other lords above him, of every manner of service: and if the tenant has done *homage* to his lord, and is impleaded, and vouches the lord to warranty, the lord is bound to warrant him; and if the tenant lose, he shall recover in value against the lord, so much of the lands as he had at the time of the voucher, or any time after.

HOMAGE is also used for the jury in a court-baron; because commonly consisting of such as pay *homage* to the lord of the fee. See **JURY**, and **COURT-BARON**.

HOMAGE is also taken, in some cases, for the particular place or district where the services are to be performed.

HOMAGER, a person that does, or is bound to do, *homage* to another. See **HOMAGE**.

This lordship is so extensive, that there are above an hundred and twenty tenants or *homagers* therein.

HOMAGIO respectuando, a writ issued out to the escheator, commanding him to deliver seisin of lands to the heir that is at full age, notwithstanding his *homage* not being done.

HOMESOKEN*, or rather **HAMSOKEN**, sometimes also written **HAMSOCAN**, and **HAMSOCNA**, the privilege or protection which every man enjoys in his own house.

* *Hamsoken, hoc est quietus esset de amerciamenti pro ingressu hominis sponte et sine licentia contra pacem regis, et quod te vocatis placitis de huiusmodi transgressione in curia vestra. W. Thorn, 2030.*

Hence, he who invades that freedom, is properly said, *frangere hamsocan*, or *hamsocnam*.

This crime seems to amount to what we now call *burglary*, which is a crime of a heinous nature, as being not only a breach of the king's peace, but a breach of that liberty which a man hath in his house, which, as we commonly say, should be his castle, and therefore ought not to be invaded. *Bracton, lib. III.* See **BURGLARY**.

HOME-STALL, a mansion-house, or seat in the country. *Rust.*

HOMER, or **GOMOR**, a Jewish measure, containing the tenth part of the epha. See **EPHA**.

HOMICIDE, in common law, the killing of a man.

Homicide is divided into *voluntary* and *casual*.

Casual HOMICIDE, is either *merely casual*, or *mixed*.—*Merely casual*, is when a person kills another by pure mischance, being about his lawful occasions; as in the case of an ax slipping out of a man's hand, or falling off the helve while he is felling a tree.

It is accounted *mixed*, when there is negligence, or some other unwarrantable circumstance attending the action. See **MANSLAUGHTER**.

Voluntary HOMICIDE, is that which is deliberate, and committed with a set purpose, and mind to kill; and is either with a precedent malice, or without.—The former is murder, which is a felonious killing, with malice prepense, any person in the realm, living under the king's protection. See **MURDER**.

HOMILY*, originally signifies a conference or conversation; but the word has since been applied to an exhortation, or sermon delivered to the people.

* The word is Greek, *homilia*; formed of *homos*, *carus*, affably, council.

The Greek *homilia*, says M. Flcury, signifies a familiar discourse; like the Latin *sermo*: and discourses delivered in the church took these denominations, to intimate that they were not harangues, or matters of ostentation and flourish, like those of profane orators; but familiar and useful discourses, as of a master to his disciples, or a father to his children.

All the *homilies* of the Greek and Latin fathers are composed by bishops.—We have none of Tertullian, Clemens Alexandrinus, and many other learned persons; by reason, in the first ages, none but bishops were admitted to preach.

The privilege was not ordinarily allowed to priests, till toward the fifth century.—S. Chrysostom was the first presbyter that preached stately: Origen and S. Augustin also preached, but it was by a peculiar licence or privilege.

Photius distinguishes *homily* from sermon; in that the *homily* was performed in a more familiar manner; the prelate interrogating and talking to the people; and they, in their turn, answering and interrogating him: so that it was properly a conversation; whereas the sermon was delivered with more form, and in the pulpit, after the manner of the orators.

There are several fine *homilies* of the fathers still extant; and particularly of S. Chrysostom, St. Gregory, &c.

HOMINE capto in withernamium, a writ for apprehending him that has taken any bondman or woman, and led him or her out of the country; so that he or she cannot be relieved according to law. See **WITHERNAM**.

HOMINE replegiando, a writ for the bailing of a man out of prison. See **BAIL**.

HOMINICOLÆ*, in antiquity, a name which the Apollinarians gave to the orthodox, to denote them worshippers of man. See **APOLLINARISTS**.

* The word is formed of the Latin, *homo*, *homini*, man, and *colo*, I worship.

As the orthodox maintained that Jesus Christ was God-man; the Apollinarians accused them of adoring a man, and therefore called them *hominicole*.

HOMOCENTRIC*, in astronomy, a term of the same import with *concentric*. See **CONCENTRIC**.

* The word is Greek, composed of *homos*, alike, similar, and *kentron*, centre.

The hypothesis of Ptolemy is explained by means of divers *homocentric* and *excentric* circles.

HOMOEOPOTON, *ὁμοιοπότητον*, a figure in rhetoric, whereby several nouns end in like cases: *e. g. moerentes, flentes, lacrymantes, & miserantes.*

HOMOEOTELEUTON, *ὁμοιοτελευτόν*, a figure in rhetoric, whereby several verbs in a sentence are made to end alike: *as, eos deduci, evulsi quam deseri malui.—Or, ut vivis invidiose, delinquis studiose, loqueris ediose.*

HOMOGENEUS*, *ὁμογενής*, or **HOMOGENEAL**, is a term applied to various subjects, to denote, that they consist of similar parts, or of parts of the same nature and kind.—In contradistinction to *heterogeneous*, where the parts are of different natures, &c.

* The word is composed of the Greek, *homos*, like, similar, and *genos*, genus, kind.

Natural bodies, for the generality, are composed of *homogeneous* parts; as a diamond, a metal, &c.—Artificial bodies, on the contrary, are assemblages of heterogeneous parts, or parts of different qualities; as a building, of stone, wood, &c.

HOMOGENEAL Light, is that whose rays are all of one and the same colour, degree of refrangibility, and reflexivity. See **LIGHT**.

HOMOGENEAL Numbers, are those of the same kind and nature.

HOMOGENEAL Surds, are such as have one common radical sign; as $\sqrt[3]{27}$, and $\sqrt[3]{3}$. See **SURD**.

HOMOGENEUM Comparativis, in algebra, the known quantity

quantity in an equation; called also *absolute number*. See EQUATION.

It is called *homogeneous comparisonis*, of *comparison*, to distinguish it from the other terms; which, though *homogeneous* as well as this, *i. e.* always raised to the same degree of power, are not the quantities to which things are here compared or referred.

HOMOIOMERICAL Principles, a peculiar kind of principles, supposed by Anaxagoras in all mixed bodies; being determinate numbers of such similar principles, as, when they came to be parts, *e. g.* of an animal body, would there make such masses and combinations as their nature required, *viz.* the sanguinary particles would then meet all together and make blood, the urinous particles constitute urine, the officious ones bones, the carnosus flesh, &c. See PRINCIPLE.

HOMOLOGATION*, in the civil law, the act of confirming or rendering a thing more valid and solemn, by a publication, repetition, or recognition thereof.

* The word comes from the Greek, *ὁμολογία*, consent, assent. formed of *ὁμο*, *similis*, alike, and *λογος*, of *λογειν*, *dicere*, to say, *q. d.* to say the same thing, to consent, agree.

The creditors have signed the contract; there remains nothing but to get it *homologated*.

HOMOLOGOUS*, in geometry, is applied to the correspondent sides of similar figures; which are said to be *homologous*, or in proportion to each other.

* The word is Greek, composed of *ὁμο*, *similar*, and *λογος*, *ratio*, reason, *q. d.* quantities alike to each other in ratio.—So if the ratio of A to B, be the same as of C to D; here A is *homologous* to C, as B to D; by reason of the similitude between the antecedents and consequents. The two antecedents, and the two consequents, then, in any continued geometrical proportion, are *homologous* terms.

Thus, the base of one triangle, is *homologous* to the base of another similar triangle: so, in similar triangles, the sides opposite to equal angles, are said to be *homologous*. Equiangular, or similar triangles, have their *homologous* sides proportional.

All similar rectangles are to each other, as the squares of their *homologous* sides.

HOMOLOGOUS Things, in logic, are such as agree in name, but are of different natures.—These coincide with what we otherwise call *equivocal* and *homonymous terms*.

HOMONYMIA, in logic, an equivocation. See HOMONYMON, &c.

HOMONYMON*, 'OMONYMON, in logic, a word which has different meanings; or which is used to express things of different nature, and quality.

* The word is composed of *ὁμο*, *similis*, and the Ionic *ὄνυμα* for *ὄνομα*, name.

Homonymia are the same with what are otherwise called *polysemia*, *synonyma*, and *equivocals*.

HOMOIOUSIOS, 'ΟΜΟΙΟΥΣΙΟΣ, among divines, a being of the same substance, or essence with another.

The divinity of Christ having been denied by the Ebionites and Cerinthians in the first century: by the Theodotians in the second; by the Artemonians at the beginning of the third; and by the Samosatensians, or Paulians, towards the close of the same: A council was assembled at Antioch in 272, wherein Paulus Samosatenus, head of this last sect, and bishop of Antioch, was condemned and deposed; and a decree published wherein Christ is asserted to be God of God, and *ὁμοιούσιος*, *i. e.* consubstantial with the Father.

HOMOIOUSIANS*, HOMOUSIANS, HOMOUSIANISTS, HOMOUSIASTS, are names which the Arians antiently gave to the orthodox, by reason they held that God the Son is *homoioufios*, *i. e.* consubstantial with the Father.

* The word is formed of the Greek, *ὁμοιούσιος*, or *ὁμοούσιος*, signifying of the same substance.

Hunmeric, king of the Vandals, who was an Arian, published a rescript, directed to all the *homousian* bishops. See PERSON, &c.

HOMOPHAGI. See the article ΟΜΟΦΑΓΙ.

HOMUNCIONISTS*, HOMUNCIONISTÆ, a sect of heretics, the followers of Photinus; and from him also called *Photinians*. See PHOTINIANS.

* The word is formed of the Latin, *homuncio*, a diminutive of *homo*, man; *q. d.* little man.

They had this appellation in respect of their denying the two natures in Jesus Christ, and holding that he was only mere man.

HOMUNCIONITES, HOMUNCIONISTÆ, were a sect of antient heretics, whose distinguishing dogma it was, that the image of God was impressed on the body, not on the soul, or mind of man.

HOND-HABEND. See the article HAND-HABEND.

HONE, a fine sort of whet-stone, whereon to set a razor, or penknife.

It is of a yellowish colour, and is vulgarly, but erroneously, supposed to be holly-wood petrified or changed into stone, by lying in a petrifying water for a certain season.

Of these waters there are said to be some in Oxfordshire, that will thus petrify in a very short time. See Supplement: article PETRIFICATION.

HONEY, *Mel*, a sweet sort of juice sucked from vegetables by the bees, and deposited in their combs.

Honey is properly one of the juices afforded by the flowers, and is found to exude from all sorts thereof; the very bitterest, as those of aloes and colocynth, not excepted.

In all those flowers that have utricles at the bottom of the petala, there is found a viscid, ruddy, sweet juice in good plenty; whence it is, that we see the children gather cowslips, foxgloves, *honey-suckles*, &c. and suck the honey from them.—

The bees also visit these flowers; and putting in their proboscides, or trunks, suck out the *honey* juice, and load their stomachs therewith; this is to be afterwards discharged and laid up in their combs:—So that *honey* is evidently a vegetable substance.

In the belly of the bee is a small transparent bladder, which is the proper receptacle of the *honey*: when the animal finds this full, it returns, enters one of the cells, and discharges it there by that part of the head situate between the two jaws, which it extends wider than ordinary, moving its head at the same time this way and that.—If a drop happen to be ill placed, it sucks it up again by its proboscis, and discharges it anew.—When a cell is filled with *honey*, they stop it up with wax for winter store.

Honey was antiently taken for a dew that fell or descended on the flowers; but what proves this a mistake, is, that the bees only gather it after the sun is up, when there is no dew left: it must therefore be a liquor prepared in the flower, and excreted by its proper vessel, like manna.

It has been supposed by many, but erroneously, to be the fine dust, or farina fecundans of the apices.—According to the observations of M. du Vernay, the bees, when in search of their stores, fix on no other parts but the stamina and apices, and not on such as yield any other liquor: But it is in reality the wax not the honey, which they collect there.

What is very remarkable, is, that *honey*, in virtue of its vegetable nature, is discovered by M. Lemery to contain iron; which discovery may serve as an answer to M. Geoffroy's chemical question, *viz.* Whether there is any part of a plant without iron? For if so delicate an extract from the finest part of the flower, and this further elaborated in the little viscera of the insect, be not void of iron, we may despair of seeing any part so.

We have two kinds of *honey*, *white* and *yellow*.—The *white*, *mel album*, called also *virgin honey*, trickles out spontaneously from the comb, by turning it up, or breaking it.

The second kind, or *mel flavum*, is squeezed from the combs in a press, after having first softened them with a little water over the fire.—There is also an intermediate sort, of a yellowish white colour, drawn by expression, without fire.

Honey left to stand two or three days, purges itself; throwing up a scum of wax and other dross, which is to be taken off.

Some naturalists will have *honey* to be of a different quality, according to the difference of the flowers or plants the bees suck it from.—Accordingly, Strabo relates, that there is a kind of *honey* in Pontus, which is a strong poison; being procured by bees which feed upon aconite and hemlock.

F. Lambert, in his account of Mingrelia, assures us of the contrary; and affirms it the best *honey* in the world, by reason of the great quantity of bawm growing there.—He adds, that there is another very white kind of *honey*, hard as sugar, and which does not stick to the hands.

The antients ranked sugar and manna among the species of *honey*.

Honey has considerable medicinal virtues; being reputed a good detergent and cleanser; and in that quality it is used both internally and externally, for the viscera, wounds, ulcers, &c.

Honey is the basis of several compositions in pharmacy.—Of *honey*, with the addition of roses or violets, mercurialis, &c. is made *mel rosatum*, *mercuriale*, *belleboratum*, &c.

There is also a *mel scilliticum*, or a preparation of squills: *mel passulatum*, made with raisins boiled in hot water: and *mel anthosatum*, made with rosemary flowers.

The chemists also draw a water, a spirit, an oil, &c. from *honey*.

Honey is also an ingredient in several drinks, as mum, metheglin, &c. See MUM, and METHEGLIN. See Supplement: article MEL.

Wild HONEY.—S. Adaman, abbot of Hii, in his description of the holy places, observes, that in the place where S. John Baptist lived in the desert, there are locusts which the poor people boil with oil, and a sort of herbs with large long leaves of a milk colour, and a taste like that of *honey*; and that this is what in scripture is called *wild honey*. See ACRIDOPHAGI.

HONEY-COMB, a waxen structure, full of cells, framed by the bees to deposit their honey, eggs, &c. in. See **CELL**, **WAX**, **HONEY**, &c.

The great sagacity and contrivance of the bees in making their combs, have often been admired.—The labour is distributed regularly among them; sometimes those bees that carry the wax in their jaws and chaps, moisten and mollify it with some liquor that they distil upon it; the same sometimes build the walls of their hexagonal cells; but sometimes others do it; but those that form the cells never polish them.—Others come and make the angles more exact, and close and smooth the superficies.—And as in the doing of this, some small bits of wax are scraped off, there are some whole business to pick up these, that they may not be lost.

M. Maraldi has also observed, that those bees that polish the walls, work longer than those that build them; as if polishing were known to be not so laborious as building.

They begin their work at the top of the hive, fastening it to the most solid part thereof: thence it descends downwards, being continued from top to bottom, and from one side to another; and to make it the more solid, they use a sort of tempered wax that is pretty much like glue. The form of the cells of which the honey-comb is made, is hexagonal; a figure that, besides what is common with a square and equilateral triangle, has the advantage of including a greater space within the same surface. See **Supplement: article COMB**.

HONEY-COMB, in gunnery, is a flaw in the metal of a piece of ordnance, when it is ill cast, and spongy.

HONEY-Dew, is a sweet tasted dew, found early in the morning on the leaves of divers sorts of plants.

Honey-dews, are of a very different nature from blights, being caused by the condensing of a fat moist exhalation, raised in a hot dry summer, from plants and blossoms; as also from the earth; which, by the coolness and serenity of the air in the night, or in the upper clear region of the air, is thickened into a fat gluey matter, and then falls to the earth again; part whereof rests upon oak leaves, and those of some other trees, whose leaves are smooth, and do not easily admit the moisture into them.

Gassendus holds, that a viscid juice transpiring out of the leaves, helps to compose this honey, or to convert the dew falling on them into a honey substance, which ore had nothing of it: And hence he accounts for the reason why we find it on some trees, and not on others.

This honey-dew falling on the ears and stalks of wheat, besmears them with a different colour from the natural; and being of a clammy substance, so binds up the young, tender and close ears of the wheat, by the heat of the sun, that it prevents the growth and completing of the perfect grain therein.

A shower of rain succeeding presently after the fall thereof, or the wind blowing stiffly, are the only natural remedies against it. See **Supplement: article MILDEW**.

HONI *fait qui mal y pense, q. d. evil to him that thinks evil*; the motto of the most noble order of the knights of the garter. See **GARTER**, and **MOTTO**.

HONOR.
HONORABLE. } See the article { **HONOUR.**
HONORARY. } **HONOURABLE.**
HONOURARY. } **HONOURARY.**

HONORIACI, in antiquity, a species or order of soldiery under the eastern empire; who introduced the Goths, Vandals, Alani, Suevi, &c. into Spain.

Didymus and Verinianus, two brothers, had, with great vigilance and valour, defended the passages of the Pyreneans against the Barbarians for some time, at their own expence; but being at length killed, the emperor Constantius appointed the *honoriaci* to defend those passages, who, not contented to lay them open to all the nations of the North then ravaging the Gauls, joined themselves to them.

HONOUR, **HONOR**,—Beside its literal sense, wherein it denotes a testimony, or token of esteem and submission; *honour* is particularly applied in our customs to the more noble kind of feignories, or lordships; whereof other inferior lordships, or manors hold, or depend.

As a manor consists of several tenements, services, customs, &c. (See **SERVICE**, &c.) so an *honour* contains divers manors, knights-fees, &c.

It was also formerly called *beneficium* or *royal fee*; being always held of the king in capite. *Spelman*.—Antiently, *honour* signified the same as *baronia*.

By stat. 37 Hen. VIII. c. 18. the king is empowered by letters patent to erect four several honours, viz. Westminster, Kingston upon Hull, S. Olythe, and Donnington; and as many other honours as he will.—The manner of creating these honours, may be gathered from the stat. 33 Hen. VIII. cap. 37, &c.

Counsellors of Honour, or *honorary counsellors*, are such as have a right to enter or sit in assemblies, courts, &c. to deliberate or give judgment in the same, though they do not regularly and properly belong thereto.

The French call *chevaliers de honneur*, knights or gentlemen of honour, the gentlemen ushers of queens and

princesses, who attend them, give them their hand, &c. See **USHER**.

Maids of Honour, are young ladies in the queen's household, whose office is to attend the queen, when she goes abroad, &c. In England they are six in number, and their salary 300*l.* per annum each.

Honours of the Louvre, among the French, are certain privileges annexed to divers dignities or offices, particularly those of duke, peer, chancellor, &c. as to enter the Louvre in a coach; to have the tabouret or stool in the queen's presence, &c.

Honours of the House, are certain ceremonies observed in receiving visits, making entertainments, &c. performed either by the master himself, or by some person appointed for that purpose; as, to go and receive the guests, to conduct them out again, to see they be well seated, to help them to the choice bits, &c. And all this in a polite, agreeable manner.

Honours of the City, are the public offices or employments thereof.—He who has been constable, overster of the poor, and churchwarden of his parish; common-council-man, alderman, and lastly mayor: has passed all the honours of the city.

Honours of the Church, are the rights belonging to the patron, &c. As a seat and sepulchre in the chancel, to be first served with the consecrated bread and wine, &c.

Honours are also applied to the principal parts of the apparatus of great ceremonies; as coronations, consecrations, christenings, &c. Such are the oil, tapers, &c.

Such lords or ladies bore the honours at such a ceremony.

In obsequies, they antiently presented the honours, that is, the shield, crest, sword, gantlets, spurs, banner, horse, &c.

Funeral Honours, are the ceremonies performed at the interments of great men; as hangings, hearles, funeral harangues, &c.

Honour Courts, are courts held within the honours, or seignories abovementioned.

Honour Point, in heraldry, is that next above the centre of the escutcheon; dividing the upper part into two equal portions. See **POINT**, and **ESCUTCHEON**.

HONOURABLE Amends, *Amende honorable*. See the article **AMENDS**.

HONOURABLE, or **HONORABLE Ordinaries**, in heraldry, are the principal ordinaries or bearings, which, when in their full extent, may possess one third of the field.

Some only allow of nine, viz. the cross, chief, pale, bend, fesse, chevron, saltire, giron, and escutcheon; others add more, viz. the bar, bordure, &c. See each under its proper article, **CROSS**, **CHIEF**, **PALE**, &c.

HONOURARY, or **HONORARY**, is understood of a person who bears or possesses some quality or title, only for the name's sake, without doing any of the functions thereto belonging, or receiving any of the advantages thereof.

Thus we say, *honorary counsellors*. See **Counsellors of Honour**.

In the college of Physicians, London, are *honorary fellows*. The royal academy of sciences at Paris, consists of four classes of members, viz. *honorary*, pensionary, associates, and adjuncts. See **ACADEMY**.

Among these the *honorary* are to be twelve in number, and all inhabitants of the kingdom.

HONOURARY Services, are those incident to the tenure of grand serjeanty, and commonly annexed to honours.

HONOURARY Tutor, is a person of quality appointed to have an eye over the administration of the affairs of a minor; while the ordinary tutors have the real effective management thereof.

HONOURARY, **HONORARIUM**, is also used substantively, for a lawyer's fee; or a salary given to public professors of any art or science.

HONTFONGENETHEF, a thief taken hond-habend, i. e. having the thing stolen in his hand.

HOOD. See **CHAPERON**, and **CUCULLUS**.

Hoop, in falconry, is a piece of leather, wherewith the head of a hawk, falcon, or the like, is covered.

After feeling or sewing up the eyelids of a young hawk, she is to be fitted with a large easy hood, which is to be taken off and put on very often, watching her two nights; and handling her frequently and gently about the head. When you perceive she has no aversion to the hood, unfeel her in an evening by candle-light, continuing to handle, hood and unhood her, as before, till at last she takes no offence, but will patiently endure handling.

After unfeeling, anoint with the finger and spitte the place where the feeling thread was drawn through; then hood her, and hold her on your fist.

As soon as she is well reclaimed, let her sit upon a perch; but every night keep her on the fist three or four hours, stroaking, hooding, and unhooding, &c. And thus you may do in the day-time, when she hath learned to feed eagerly, and without fear.

HOOF, *Ungula*, the horny part which covers the feet of divers animals, as horses, bullocks, &c.

The hoof serves much the same purposes as the nails of some animals, and the claws of others.

HOP

HOP

The *hoof* of a horse furrounds the sole, and the coffin bone. —To be good, it should be of a dark colour, somewhat shining, high, smooth, of a round shape, but a little larger below than above; short, that the horse may tread more on the toe than on the heel; and somewhat hollow within, having a narrow frill, and broad heels.

The *hoof* should not have circles, which are a sign of its being brittle, and that the horse having been often shod, has had his feet spoiled by the many pieces broke out of it.—A white *hoof* also is commonly brittle.

To judge whether the *hoof* be good and stanch, lift up the foot, and consider if it have a shoe forged purposely for it, and be very much pierced, and the holes made in unusual parts, as wanting horn enough to take hold by in those places where the nails are commonly driven.

Sometimes they are forced to pierce the shoes nigh the heels, because the fore-part is bad; it being unusual to drive the nails near the heels, except the toe be so much split and broke as not to bear nails.

If the *hoof* be not round, but broad, and spreading out at the sides and quarters, the horse commonly has narrow heels, and, in time, will be flat-footed; which sort of foot is weak, and will not long carry a shoe, nor travel far, but furbate: add, that treading more on his heels than toes, will cause him to go low on his pasterns.

If the *hoof* be long, it will make him tread altogether on his heels.—If crooked, *viz.* broad without and narrow within, so that the horse is splay-footed, it will cause him to tread too much inward, and cut or interfere.—If the frill be broad, the heels will be weak and soft.—If the heel be narrow and tender, the horse will in time grow *hoof-bound*.

—The infirmities to which *hoofs* are liable, are, the casting of the *hoof*, *hoof-bound*, *hoof-hard*, *hoof-hurt*, loose *hoof*, false quarters, &c.

Casting of the Hoof.—A horse is said to *cast his hoof*, when the whole coffin of the *hoof* becomes loosened, and falls off from the bone.—This may be remedied by care and proper application; a new *hoof* being procurable, if the coffin bone, &c. be not hurt.

Horses sometimes cast their *hoofs* by reason of some prick, stub, foundering, furbating or other accident, that causes an impotumation in the foot; so that the *hoof*, and sometimes the coffin bone, being spongy and easily broken, fall off in large pieces. The last when it happens is a desperate case.

Hoof-bound, is a shrinking in of an horse's *hoof* on the top, and at the heel; which makes the skin stare above the *hoof*, and grow over the same.

It befalls an horse divers ways, either by keeping him too dry in the stable, by frost shoeing, or by some unnatural heat after foundering.

Hoof-hurt.—In labouring beasts, especially oxen, if the *hoof* be hurt with a coultter or share, it may be cured by a salve of pitch and grease mixed with powder of brimstone, dissolved together, and with an hot iron melted in the cleft of the *hoof*.

Hoof-loosened, is a dissolution or dividing of the horn or coffin of a horse's *hoof* from the flesh, at the setting on of the coronet.

If the parting be round about the coronet, it comes by means of foundering; if in part, then by a prick of some channel nail, quitter-bone, retreat, graveling, cloying, or the like.

The signs of being loosened by foundering, is its breaking first in the fore part of the coronet, right against the toes; because the humour always descends towards the toe.—If it proceeds from pricking, graveling or the like, the *hoof* will loosen round about equally, even at first.—If occasioned by a quitter-bone, or hurt on the coronet, it will break right above the grieved part, and rarely be seen to go any farther.

Hoof-swelled, is an infirmity that sometimes befalls young horses, when they are over-rid, or wrought hard, which makes them swell in that part, by reason of the blood falling down and settling there; which, if not speedily removed, will usually beget a wet favin.

HOOK, in angling, &c. See FISHING-HOOK.

HOOKS, in building, &c. are of various sorts; some of iron, and others of brass, *viz.*

1°. *Armour hooks*, which are generally of brass, and are to lay up arms upon, as guns, muskets, halberds, pikes, javalins, &c. 2°. *Casement hooks*. 3°. *Curtain hooks*, which are made both of brass and iron, and of different fashions: their use is to set the tongs and fire-shovel against. 4°. *Curtain-hooks*. 5°. *Hooks for doors, gates*, &c. 6°. *Double line hooks*, large and small. 7°. *Single-line hooks*, large and small. 8°. *Tenter hooks* of various sorts. See TENTER.

HOOK-PINS, in architecture, are taper iron pins, only with a hook-head, to pin the frame of a roof or floor together.

HOP, *Lupulus*, a plant of the reptile kind, whose flower is a principal ingredient in beer, and other malt-liquors. See BREWING.

The *hop* creeps like bind weed, unless it find pales or

shrubs to hang to; or unless they who cultivate it, plant poles for the purpose.—The stem is long, smooth, rough, and hairy.—Its leaf is incised like that of a vine, and covered with a kind of prickly down like that of the cucumber. Its flowers are of a greenish yellow, reflecting, both as to form and size, those of the female cone; and they grow in a kind of bunch or cluster. In this flower is a blackish bitter grain contained, which is the seed of the *hop*.

In the spring time, while the bud is yet tender, the tops of the plant being cut off, and boiled, are eaten like spongers; and found very wholesome and effectual to keep in the blood; the head and tendrils are good to purify the blood in the fever, and most cataneous diseases: decoctions of the flowers, and syrups thereof, are of use against pectilential fevers: juleps and apozems are also prepared with *hops*, for hypochondriacal and hysterical affections, and to promote the menses.

The propagation and culture of *hops*, being a part of some nicety, as well as great advantage, we shall lay down a rule system thereof.—It is custom there is making in all the rural employments, that, under prudent management, turns to more account; very large crops having been raised by this commodity in a few years. Switzer tells us, he has known ground yield 30 l. per annum per acre, planted therewith: To say nothing of the great number of poor that are employed therein, *viz.* in the planting, fending, digging, houghing, poling, tying, picking, &c.

Culture of Hops, and Hop Gardens.—*Hops* are of divers kinds: Mortimer reckons five, *viz.* the *white*, *pink*, *black*, *hop*, which is not worth propagating; the *leg and square*, *go-tick* *hop*, which, though valuable, yet on account of the runnels towards the stalk, do not bear the best price; the *lean*, *white* *hop*, which is the most beautiful and fertile; and the *red* *hop*.—Another author distinguishes the *hops* to be cultivated into the *white* and *grey*, the latter being a large *hop*, of a more hard, and bearing a plentiful crop than the former; though it does not ripen so early.

For the soil of Hops.—There are scarce any but may serve, except stoney, rocky, and stiff clay ground: the best, however, is that which is light, deep, and rich; which will be the better if land be mixed with it: a black garden mould is also excellent. If the ground be cold, stiff, and sour, the best means of improvement is to burn-beat it. Mortimer adds, that in Kent, where they esteem new land best for *hops*, they plant their *hop* gardens with cherry trees and apple trees, at a good distance; that when the land is put the best for *hops*, (which happens in about ten years) the cherry trees may begin to bear; and thirty years after, when the cherry trees are spent, the apple trees will be in perfection.

For the planting of Hops.—The ground is first to be prepared by tiling it the beginning of the winter, either with the plough or spade. In October, (and sometimes, though rarely, in March) they proceed to plant; marking out the places where each hillock or little plantation is to be. Some plant in squares, checker-wise, which is the most convenient form, where they intend, in the course of the tillage, to plough with horses between the hills: but the best form for the *hops*, as well as the most pleasing to the eye, is the quincunx. See QUINCUNX.

If the ground be poor, or stiff, it is necessary some good mould, or else a compost of manure and earth, be laid in holes a foot square, in the several places where the hills are to be.—The distance of the hills in dry hot ground may be six foot; but in moist and rich ground, subject to bear large *hops*, it should be eight or nine.

For planting, the largest sets are to be chosen, eight or ten inches long, having each three or four joints. These are to be fit in holes, made for the purpose, one at each corner of a hole, and a fifth in the middle, raising the earth two or three inches about.

For the dressing of Hops.—If the *hop*-ground be old, and wore out of heart, they find it convenient to dig about the plants, toward the beginning of each winter, and take away a quantity of the old earth; its place is then to be supplied with what is fatter and fresher.—If the *hops* be in good heart, manuring and pruning is most advisable. In order to this, they pull down the hills, and undermine all about, till they come near the principal roots. This done, taking off the earth from the roots, they find by the colour, &c. which are new shoots, and which old ones; and cut off all the new ones.—When the roots are thus dressed, the new mould or manure is to be applied.

For the poling.—The time is when the *hops* begin to appear above ground: the number and dimensions of the poles is to be adjusted to the distance of the hills, the nature of the soil, and strength of the *hop*.—To prevent leaning, the poles are to be made to lean outwards; and gradually toward the south, to receive more of the sun's beams; it being matter of observation, that a leaning pole always bears more *hops* than an upright one.

As to tying.—When the *hops* are got two or three foot above ground, the next business is to conduct and tie them to such

HOP

poles as are empty, and at a proper distance from them.—They are to be tied with withered rushes, or woollen yarn; but not to close as to hinder their climbing up the poles: two or three strings may suffice for a pole. This operation is to be attended to in April and May.

About Midsummer, when they cease to run in length, and begin to branch, such of them as are not yet got up to the tops of the poles, should have their heads nipped off, or else they should be diverted from the pole, that they may branch the better; which is more for the increase of the *hop*, than its extending in length.

Some time in May, after rain, the hills are to be made up with a hoe, or spade, or by ploughing; which will be a means to destroy the weeds: and it is necessary, if the spring or summer prove dry, to water them twice or thrice in a season.

Hops blow towards the latter end of July: and the forward ones are ripe by the close of August.—Their ripeness is discovered by their fragrant scent, their changing of colour, their being easily pulled, and by the brownish colour of the seed.

Hops are to be gathered when they look a little brownish, and that without delay: the most expeditious way is, to make a frame with four short poles or sticks, laid on four forks driven into the ground, of such breadth, as to contain either the hair-cloth of the kiln, or a blanket tacked round it about the edges.—On this device, the poles, with the *hops* on them, may be laid, being either supported by forks, or by the edges of the frame; at each side whereof, the pickers may stand and pick the *hops* into it.—When the blanket or hair-cloth is full, untack it, carry it away, and place another, or the same emptied, in the same frame again; and this frame may be daily removed, with little trouble, to some new place of the garden near the work.

Hops must not be gathered while wet; but if the dew be on them, or a shower of rain has taken them, the pole may be shaken, and they will dry the sooner: If they be over-ripe, they will be apt to shed their seed, wherein consists their chief strength; neither will they look so green, but somewhat brown, which much lessens their value; though some let them stand as long as they can, because they waste less in the drying; for four pounds of undried *hops*, thorough ripe, will make one of the dry; whereas five pounds of those scarcely ripe, yet in their prime, make but one; so that it is judged the proprietors get more in the thorough ripe *hop* by the weight, than they lose in the colour.

As fast as the *hops* are picked, they must be dried: some, especially the Flemmings and Hollanders, make use of an oost or kiln for this purpose: others dry them on the ordinary malt kiln in an hair-cloth: but the best way, is to make a bed of flat ledges, about an inch thick, and two or three inches broad, fawn, and laid one across the other, chequer-wise, the flat way; the distances are to be about three inches, or the like; the ledges so entered, are put into another, that the floor may be even and smooth: this bed may rest on two or three joists set edgewise, to support it from sinking; then cover it with large double tin plates folded together at each joint; and so order the ledges before they are laid, that the joints of the tin may keep up the *hops*, only let the one side be to remove, that the *hops* may be shovelled off as before. The *hops* may be turned on this tin-bed or floor with great safety and small expence of fuel; besides, that any manner of fuel will serve for this purpose as well as charcoal, the smoke not passing through the *hops*: but it must not be forgot, to make conveyances for it at the several corners and sides of the kiln.

The turning of *hops* after the easiest and most secure manner, is found to be not only a waste and injury to the *hop*, but also an expence of fuel and time; yet it may be prevented, in case the upper bed, whereon the *hops* lie, have a cover that may be let down and raised at pleasure; which cover may be tinned over, by nailing single tin plates to the face of it, that when the *hops* begin to dry, you may let down this cover within a foot and less of the *hops*, which will so reflect the heat upon them, that the uppermost *hop* will be as soon dry as the lower, and every *hop* equally dried.

The method of bagging *hops* (after they have lain a month more to cool and toughen) is to make a round or square hole in an upper floor, big enough for a man with ease to go up and down, and turn and wind in it; then tack a hoop about the mouth of the bag fast with packthread, that it may bear the weight of the *hops* when full, and of the man that treads them: that done, let the bag down through the hole, and the hoop will rest above, so as to keep the bag from sliding wholly through; into this bag cast a few *hops*, and before you go into tread, let an handful of *hops* be tied at each lower corner with a piece of packthread, to make, as it were, a tassel, whereby the bag, when full, may be conveniently lifted or removed; then go into the bag, and tread the *hops* on every side, another still casting in as fast as you require, till it be full; when it is well trodden and filled, let

HOR

the bag down by unripping the hoop, and close the mouth of the bag, filling the two upper corners as you did the lower: This bag, if well packed and dried, will keep several years in a dry place; only care must be taken, that mice do not spoil or waste the *hops*; nor that they will eat them, but they love to make their nests therein.

HOPLITES, * **HOPLITÆ**, in antiquity, were such of the candidates at the Olympic and other sacred games, as ran races in armour.

* The word is Greek, *ὁπλίτης*, formed of *ὅπλον* armour.

One of the finest pieces of the famous Parrhasius, was a painting which represented two *hoplites*; the one running, and seeming to sweat large drops; and the other laying his arms down, as quite spent and out of breath. *Pliny*, L. XXXV. c. 10. and *Paschas*, *De Coronis*, L. VI. c. 14.

HOPLOMACHI*, *ὀπλομαχοί*, in antiquity, were a species of gladiators, who fought in armour; either completely armed from head to foot, or only with a cask and cuirass.

* The word is composed of the Greek *ὅπλον*, armour, and *μαχόμενος*, I fight.

HOPPER, a vessel wherein feed-corn is carried at the time of sowing.

The word is also used for that wooden trough in a mill, into which the corn is put to be ground.

HORARY, something relating to *horæ*, hours. See **HOUR**. **HORARY** *Circles* of the globe.

HORARY *Circles*, or *Lines*, in dialling, are the lines or circles which mark the hours on sun-dials.

HORARY *Motion of the Earth*, is the arch it describes in the space of an hour.

This is 15 degrees; though not accurately so, (for the earth moves with different velocity, according to its greater or lesser distance from the sun) but it is near enough for ordinary computations.

HORD*, **HORDA**, in geography, is used for a company or tribe of wandering people, which have no settled abode or habitation, but strolc about, dwelling in chariots, or under tents, to be ready to shift as soon as herbage, fruits, and the present province is eaten bare.

* The term is Tartarian, and literally denotes a *multitude*.

HORD, is more properly the name which the Tartars, who inhabit beyond the Volga, in the kingdoms of Astracan and Bulgaria, give to their villages.

A *hord* consists of fifty or sixty tents ranged in a circle, leaving an open place in the middle.—The inhabitants of each *hord* usually form a military company or troop; the eldest whereof is commonly the captain, and depends on the general or prince of the whole nation.

HORDEATUM, a liquid medicine, made of barley, boiled till it burst.

Sometimes other ingredients are added, as the cold seeds, almonds, and the like.

HORDEOLUM*, in medicine, a small tubercle arising on the outer verge of the palpebræ, or eye-lids.

* It is thus called from the Latin *hordeum*, barley, as resembling a barley corn.

The cure of the *hordeolum* and *grando*, is by discutients and suppuratives.

HORDICALIA*, or **HORDICIDIA**, in antiquity, a religious feast held among the Romans, wherein they sacrificed cattle big with young.

* The word *hordicidia* is formed of *horda*; which Festus explains by *pregnans*, pregnant; and *caedo*, I sacrifice. Ovid, in his *Fastis*, L. IV. v. 631. describes *horda*, or *forda*, to be *hæ prægnans*; of *φουφῶ*, *gravidæ*.

This feast fell on the 15th of April; on which day they sacrificed thirty cows big with calf to the goddesses *Tellus*, or *Terra*; Earth: part of them were sacrificed in the temple of Jupiter.—The calves taken out of their bellies were burnt to ashes, at first, by the pontifices; afterwards, by the eldest of the vestal virgins.

Alexander ab Alexandro, *Genial. Dier.* writes *hordalis dies*; and from him, some of the moderns call the feast *hordalia*; but Varro writes it *hordicalia*, and Festus, *hordicidia*.

HORIZON*, or **HORISON**, in astronomy, a great circle of the sphere, dividing the world into two parts or hemispheres; the one upper, and visible; the other lower, and hid.

* The word is pure Greek, *ὁρίζων*, which literally signifies bounding or terminating the sight; being formed of *ὁρίζω*, *termino*, *definio*, I bound, I limit; whence it is also called *finitor*, finisher.

The *horizon* is either *rational* or *sensible*.

Rational, true, or *astronomical* **HORIZON**, which is also called simply and absolutely, the *horizon*, is a great circle, whose plane passes through the centre of the earth, and whose poles are the zenith and nadir. It divides the sphere into two equal parts, or hemispheres.

Such is the circle **HR** (*Tab. Astronom. fig. 52.*) whose poles are the zenith and nadir; whence it follows, that the several points of the *horizon* are a quadrant distant from the zenith and nadir.

The meridian and vertical circles, all cut the rational horizon at right angles, and into two equal parts.

Sensible, visible, or apparent HORIZON, is a lesser circle of the sphere, as $h r$, which divides the visible part of the sphere from the invisible.

Its poles, too, are the zenith and nadir: and consequently the *sensible horizon* is parallel to the *rational*; and it is cut at right angles, and into two equal parts by the verticals.

The *sensible horizon* is divided into *easterly* and *westerly*. The *easterly* or *ortive HORIZON*, is that part of the horizon wherein the heavenly bodies rise.

The *westerly* or *occidial HORIZON*, is that wherein the stars set.

HORIZON, in geography, is a circle passing over the earth, and dividing the visible part of the earth and heavens from that which is invisible.

The altitude or elevation of any point of the sphere, is an arch of a vertical circle, intercepted between it and the *sensible horizon*.

This is peculiarly denominated *sensible horizon*, to distinguish it from the *rational* or *true*, which passes through the centre of the earth; as already observed.

By *sensible horizon* is also frequently meant a circle, which determines the segment of the surface of the earth, over which the eye can reach; called also the *physical horizon*.

In this sense we say, a spacious horizon, a narrow scanty horizon.—To find the extent of the horizon, or how far a man's prospect reaches, by means of the height of his eye, supposing the earth an uninterrupted globe, is a common case of right-angled plane triangles, where two sides and an opposite angle are given.—Thus, suppose $A H B$ (*Tab. Geography*, fig. 8.) a great circle of the terraqueous globe, C the centre, $H C$ its semi-diameter, and E the height of the eye; since $H E$ is a tangent, the angle at H is a right angle; so that there are given $H C$, 398,386 miles, or 21,034,781 English feet, $C E$, the same length and the height of the eye on the mast of a ship, or at only a man's height, &c. added to it, and $E H C$ the opposite right angle.

By these three parts given, it is easy to find all the other parts of the triangle.—And first, for the angle at C , in order to find the side $H E$; the proportion is, as the side $C E$ to the angle at H , so is the side $H C$ to the angle at E ; which being subtracted from 90 degrees, the remainder is the angle at C . Then as the angle at E is to its opposite side $H C$; or else, as the angle at H is to its opposite side $C E$; so is the angle at C to its opposite side $E H$, the visible horizon.

Or the labour may be shortened by adding together the logarithm of the sum of two given sides, and the logarithm of their difference; the half of which two logarithms, is the logarithm of the side required, nearly. For an example, we will take the two sides in yards, by reason scarce any table of logarithms will serve us any farther: the semi-diameter of the earth is 7,011,594 yards; the height of the eye is two yards more, the sum of both sides is 14,023,190.

Logar. of which sum is ----- 7.1468468

Logar. of two yards, the differ. is ----- 0.3010300

Sum of both logar. ----- 7.4478768

The half sum ----- 3.7239384

is the logarithm of 5296 yards=three miles, which is the length of the line $E H$, or distance the eye can reach at six feet height.

This, at least, would be the distance on a perfect globe, did the visual rays come to the eye in a straight line; but by means of the refraction of the atmosphere, distant objects on the horizon appear higher than really they are, and may be seen at a greater distance, especially on the sea, which is a matter of great use, especially to discover the land, rocks, &c.

Farther Laval, professor of hydrography at Marseilles, found that the horizon of his observatory to the sea-ward was never more than 15 minutes, nor less than $13\frac{1}{2}$; that is, the arch of the circumference of the earth, intercepted between the observatory and the horizon, fluctuated between those two quantities; whence M. Cassini deduces, that the extent of the horizon is seven French leagues of three miles each; and that the observatory is 175 foot high.

The height of the horizon, at the same place, and the same elevation above it, is very subject to vary, by means of differences in the atmosphere, which occasion others in the refractions.

When the sea was full, or the north-west or south-east wind blew, and the air hazy about the horizon, F. Laval always found his horizon depressed, or lower; i. e. the refraction which should raise it in that case was less than ordinary.—And yet on the common principles, the air being now much charged with vapours, the very contrary was rather to be expected.—This makes M. Cassini suspect, that there is some other refractive matter in the atmosphere, beside the air itself.

The same author observes, that at a height ten times greater than that of F. Laval's observatory, he found the arch ter-

minated by the horizon to the seaward, 42', without any sensible variation; whence he concludes, that the variations are the greater, as the height is the less; which may seem contrary to what he had asserted in another place, viz. that the variations in the apparent altitudes of bodies are greater, as these objects are more remote, by reason they are seen through the larger quantity of air, which is all liable to be varied.—But the contradiction may be solved.

Another depression of the visible horizon, is caused by the height of the observer's eye above the surface of the sea.

HORIZON of the Globe. See the article **GLOBE**.

HORIZONTAL, something that relates to the horizon, or that is taken in the horizon, or on a level with the horizon. 1 We say, a horizontal plane, horizontal line, horizontal distance, &c.

HORIZONTAL Dial, is that drawn on a plane parallel to the horizon; having its gnomon, or style, elevated according to the altitude of the pole of the place it is designed for.

Horizontal dials are, of all others, the most simple and easy.—The manner of describing them, see under the article **DIAL**.

HORIZONTAL Distance. See the article **DISTANCE**.

HORIZONTAL Line, in perspective, is a right line drawn through the principal point, parallel to the horizon: or, it is the intersection of the horizontal and perspective planes.

Such is the line $P Q$ (*Tab. Perspective*, fig. 12.) passing through the principal point F .

HORIZONTAL Parallax. See the article **PARALLAX**.

HORIZONTAL Plane, is that which is parallel to the horizon of the place; or nothing inclined thereto.

The business of levelling, is to find whether two points be in the horizontal plane; or how much the deviation is.

HORIZONTAL Plane, in perspective, is a plane parallel to the horizon, passing through the eye, and cutting the perspective plane at right angles.

HORIZONTAL Projection. See the article **MAP**.

HORIZONTAL Range, or *Level Range* of a piece of ordnance, is the line it describes, when directed parallel to the horizon, or horizontal line.

Dr. Halley gives two very ready theorems, the one, to find the greatest horizontal range at 45 degrees elevation, in any shot made upon any inclined plane, with any elevation of the piece whatsoever; and the other, to find elevations proper to strike a given object with any force, greater than what is sufficient to reach it with the middle elevation.

1^o. A shot being made on an inclined plane: having the horizontal distance of the object it strikes, with the elevation of the piece, and the angle at the gun between the object and the perpendicular; to find the greatest horizontal range of that piece laden with the same charge; that is, half the latus rectum of all the parabolas made with the same impetus.—Take half the distance of the object from the nadir, and the difference of the given elevation from that half; subtract the versed sine of that difference from the versed sine of the distance of the object from the zenith: The difference of those versed sines, will be to the sine of the distance of the object from the zenith, as the horizontal distance of the object struck, to the greatest range at 45 degrees.

2^o. Having the greatest horizontal range of a gun, the horizontal distance and angle of inclination of an object to the perpendicular; to find the two elevations necessary to strike that object.—Halve the distance of the object from the nadir; this half is equal to the half sum of the two elevations sought: then say, as the greatest horizontal range is to the horizontal distance of the object, so is the sine of the angle of inclination, or distance of the object from the perpendicular, to a fourth proportional; which fourth being subtracted from the versed sine of the distance of the object from the zenith, leaves the versed sine of half the difference of the elevations sought; which elevations are therefore had, by adding and subtracting that half of the difference to and from the aforesaid half sum.

HORIZONTAL Refraction. See the article **REFRACTION**.

HORIZONTAL shelters, among gardeners, are defences, disposed parallel to the horizon, for tender plants, blossoms, and fruits in the spring, to defend them against blasts and pinching nights.

The usual shelters that have obtained, are bafs-mats, and other warm coverings, which are rolled up in the day-time, and let down in the night.—It was the reverend Mr. Lawrence who first proposed horizontal shelters, chiefly on this principle, that most of our frosts and blasts fall perpendicularly; i. e. the condensed vapours falling from the upper region, do, at night, form themselves toward the surface of the earth, into drops of dew, subject to be frozen by the coldness of the air.

Horizontal shelters are to be made by laying rows of tyles, at certain distances one above another, in the structure of the wall, so as to project or hang over the plane of the wall, to carry off the dew, wet, &c.—It is an inconvenience objected to

HOR

to this method, that it is difficult to lead a tree rightly among the tyles, or to keep its figure duly filled up.

HORN, *Cornu*, a hard callous substance growing on the head of divers animals.

It is laid down as a rule by some naturalists, that no animals have horns, but those that are cloven-footed.

The horns are usually a double part; inasmuch that there is but one exception, which is in the rhinoceros.

The horns of a deer are by huntmen called his head. See **HEAD**.—In the history of the French academy of sciences, we have an account of a bullock's horn dug out of the ground in ploughing, which had shot forth fibrous roots, and appeared to have grown or vegetated after the manner of a plant.

Horns make a considerable article in the arts and manufactures.—Bullocks horns softened by the fire, serve to make lanterns, combs, inkhorns, tobacco-boxes, &c.

HORN is sometimes also used for the hoof of a horse, &c.

Ammon's HORN. See the article *CORNU AMMONIS*.

Hart's HORN, *Cornu Cervi*.—The scrapings or rasings of the horn of this animal are medicinal, and used decoction pitfalls, &c.

It yields by distillation a very penetrative volatile spirit.

HORN is also a sort of musical instrument, of the wind kind; chiefly used in hunting, to animate and bring together the dogs, and the hunters.

The horn may have all the extent of the trumpet.

The term for founding antiently was, wind a horn; all horns being in those times compassed: but since straight horns are come in fashion, they say, blow a horn, and sometimes plainly, found a horn.

There are various lessons on a horn; as the recheat, double recheat, royal recheat, running or farwell recheat, &c. See **RECHEAT**.

The Hebrews made use of horns formed of rams horns, to proclaim the jubilee; whence the name jubilee.

HORNs of the uterus, two processes arising from the sides of the fund. See *CORNUA-UTERI*.

HORN, in architecture, is sometimes used for volute. See **VOLUTE**.

HORN of plenty. See the article *CORNUCOPIA*.

HORN with horn, or **HORN** under horn, (*cornutum cum cornuto*) is when there is common per causâ de vicinage, intercommoning of horned beasts. See **COMMON**, and **INTERCOMMON**.

HORN-WORK, in fortification, a sort of out-work, advancing toward the field, to cover and defend a curtain, bastion, or other place suspected to be weaker than the rest: as also to possess a height, &c.—See *Tab. Fort. fig. 21. lit. f.*

It consists of two demi-bastions, as LMN and OPQ, *Tab. Fort. fig. 9*, joined by a curtain NO.—Its sides or flanks are usually parallel; though sometimes they approach or contract towards the place, forming what they call a queue d'yronde, or *swallow tail*. See *QUEUE d'YRONDE*.

When the flanks are too long, they sometimes make epaulements to flank them.—The parts of the horn-work next the country, are to be defended by a parapet.

Two horn-works joined together, make a crown-work. See **CROWN-WORK**.

HORN-BEAM Pollengers, a denomination given by some to trees of this species which have been lopped, and are of about twenty years growth. See **TREE**.

HORNGELD*, signifies a tax within the forest, to be paid for the feeding of horned beasts. See **GELD**.

* *Quæritur esse omni collectione in foresta de bestii: cornuti, &c. Est fuit quærit de omnibus geldis, & dancgelis, & wadgelis, & fengeldis, & horngeldis, &c.*

To be free of *horngeld*, is a privilege granted by the king to such as he thinks good.

A horse is said to be **HORN-BIPPED**, when the tops of the two haunch bones appear too high.

HORNAGIUM, **HORNAGE**, in our antient law books, seems to import the same with *borngeld*.

HORODICTIC Quadrant. See the article **QUADRANT**.

HOROGRAPHY*, the art of making or constructing dials; called also *horologigraphy*, *gnomonica*, *sciatheica*, *photiatherica*, &c. See **DIALING**.

* The word is compounded of *hora*, hour, time, hour, and *graphein*, scribo, I write.

HOROLOGIOGRAPHY, the art of making or constructing dials. See **DIALING**.

HOROLOGIUM*, *ῥολογιον*, a common name among antient writers, for any instrument, or machine to measure the hours withal. See **CHRONOMETER**.

* The word is originally Greek, composed of *hora*, hour, time, hour, and *logos*, speech, discourse.

Such are our clocks, watches, sun-dials, &c. See **CLOCK**, **WATCH**, **DIAL**, &c. See also **CLEPSYDRA**.

HOROLOGIUM*, **HOROLOGION**, is also a name the Greeks give to their liturgy, or breviary; by reason it contains the

HOR

daily hours, or the several offices to be rehearsed each day.

* The Greeks call it *ἡμερολόγιον*, which answers to what in Latin and English we call *diurnum*, or diurnal.

The *ἡμερολόγιον* is the breviary of the Greeks.

HOROPTER, in optics, is a right line, drawn through the point where the two optic axes meet, parallel to that which joins the centres of the two eyes, or the two pupils.

Such is the line AB (*Tab. Optics. fig. 67.*) drawn through the point of concurrence C, of the optic axes of the eyes D and E, parallel to HI, which joins the centres of the eyes H and I.

It is called *horopter*, as being found by experience to be the limit of distinct vision.

Plane of the HOROPTER. See **PLANE** of the *Horopter*.

HOROSCOPE*, in astrology, the degree or point of the heavens, rising above the eastern point of the horizon, at any given time when a prediction is to be made of a future event; as, the fortune of a person then born, the success of a design then laid, the weather, &c.

* The word is Greek composed of *hora*, hour, and the verb *ορίζομαι*, *spedo*, consider, I consider.—The Latins call it *cardo orientalis*: sometimes, *ascendens*.

Mercury and Venus were in the *horoscope*, &c. They were formerly so infatuated with *horoscopes*, that Albertus Magnus, Cardan, and others, are said to have had the temerity to draw that of Jesus Christ.

HOROSCOPE is also used for a scheme or figure of the twelve houses, i. e. the twelve signs of the zodiac, wherein is marked the disposition of the heavens for any given time.

Thus we say, to draw a *horoscope*, construct a *horoscope*, &c. We call it more peculiarly calculating a nativity, when the life and fortune of a person are the subject of the prediction: for they draw *horoscopes* of cities, great enterprizes, &c.

Lunar HOROSCOPE, is the point which the moon illues out of, when the sun is in the ascending point of the east.

This is also called the *part of fortune*.

HOROSCOPE, is also a mathematical instrument, in manner of a planisphere; but now disused.

It was invented by J. Paduanus, who composed a special treatise thereon.

HORROR, **HORROUR**, strictly signifies such an excess of fear, as makes a person tremble.—In phycic it denotes such a shuddering or quivering as precedes an ague fit; and is often joined with rigours, and lumbagines. See **AGUE**, **FEVER**, &c.

Through ignorance of this acceptance, some have understood fear to be accounted by authors among the antecedent symptoms of those distempers.

HORS *de son fee*, q. d. out of his fee, is an exception to avoid an action brought for rent or other service, issuing out of certain lands, by him that pretends to be the lord.—For if the defendant can prove the land to be without the compass of his fee, the action falls.

HORSE, a domestic quadruped, of great use in the affairs of agriculture, commerce, war, sporting, &c.

The horse makes the subject of a very extensive art, called *horsemanship*, consisting of divers subordinate arts or branches. See **HORSEMANSHIP**.

From the same beast also arise the professions of chivalry, knight-hood, &c.

Authors are divided as to the time when men first began to mount horses.—The scholiast of Euripides, and Eustathius on the second book of the *Iliad*, speak as if the antients had been unacquainted with the use of saddle horses, and had only used them to draw chariots, &c. They add, that courses on horse-back were not introduced at the Olympic games, before the 85th Olympiad.—But this can scarce be; in regard the centaurs, to whom the invention is attributed, lived long before that time.

It appears likewise from Pausanias, that there were horse-courses even in the time of Hercules, the institutor of the Olympic games.

It was the custom among the antients to impress some mark on their horses; the most common were a Z, *sigma*, a K, *kappa*, and a bullock's head. Hence those marked with Z's, were called *Συμβατοι*; those with a K, *Κορυδατοι*; and those with a bull's head, *Βουκεφαλαι*, *bucephali*.—This mark was stamped on the horse's buttocks, and his harness: as appears from the scholiast on Aristophanes's *Clouds*, Helychius, &c.

The parts of a horse's body furnish a great variety of terms, by no means to be overlooked.—The skin and coat are called the *hair*; the long hair on the neck, the *mane*; the fore-top, the *topping*, or *tuft*; the hair behind, on the feet, the *fetlock*, or *fetter-lock*; that growing over the top of the hoof, the *coronet*, or *crown*; that on the eye-lids, the *brills*.—The ridge whereon the mane grows, is called the *crist*, or *crist*; the fore part, from the neck to the fore legs, the *brisket*, or *chest*; the mark frequently running down his face, the *rache*; and

and that in the forehead, the *flar*.—The top of the shoulder blades, at the setting on of the neck, is called the *withers*; the place where the saddle is set, the *dock*; and a bruise or hurt thereon, a *navel-gall*; the middle of the back, from the mane to the hips, the *reins*; the extremity of the reins above the hips, the *croupe*; the tail, the *dock* or *runt*; the hollow or sinking of the back-bone, the *sway*; the hind part of the belly, next the genital, the *flank*; that nearer the thighs, the *grain*; the loose skin wherein the yard is, the *sheath*; and the fore parts of the shoulders, next the breasts, the *fillets*.—The uppermost part of the hind leg, next the buttock, is called the *stifle* or *stifle joint*; the after joint, or bending of the hind leg, the *chanbrel* or *elbow*; the inner, the *ham* or *hough*; the joint at the fetlock, the *pastern ankle*, or *fetlock joint*; the foot, above the hoof of the ankle joint, the *coronet*.—The part from the withers to the top joint of the thigh, is called the *shoulder*; the middle joint of the fore leg, the *knee*; the right leg before, the *farther leg*; and the left, the *nearer*.—The hoof is called the *horn*; the hollow of the hoof, the *caffin*; the tender part of the hoof, next the heel, the *frush*; the ball of the foot, the *frog*; the part to be pared or cut off the hoof when overgrown, the *rif*; the fore part of the hoof, the *toe*; the hind part, where there is a rising in the middle of the sole, the *heel*; and the insides, meeting on the heel, the *quarters*.—Of most of these a further account will be found under the respective articles.

The masters in this art lay it down, that a *horse* to be good, and well made, must have three parts like those of a woman, *viz.* the breast, which is to be broad, the hips round, and the mane long; three of a lion, *viz.* countenance, intrepidity, and fire; three of a bullock, *viz.* the eye, nostril, and joint; three of a sheep, *viz.* the nose, gentleness, and patience; three of a mule, strength, constancy, and foot; three of a deer, head, leg, and hair short; three of a wolf, throat, neck, and hearing; three of a fox, ear, tail, and trot; three of a serpent, memory, sight, and turning; three of a hare or cat, running, walking, and suppleness.

Horses are distinguished into divers kinds, and are differently denominated, with regard to their train or country.—As, the *Neapolitan*, known by his hawk nose.—The *Spanish genet*, by his small limbs.—The *Barb*, by his fine head and deep hoof.—The *Dutch*, by the roughness of his legs.—The *English*, by his strong knitting together, &c.—The *Flan-drin*, &c.

Horses are also distinguished with regard to the uses or offices they are reserved for; as, the *coach-horse*, *war-horse*, *hunting-horse*, *running-horse*, *pack-horse*, &c.

Horses are also distinguished with regard to their colours; as—A *bay*, which admits of divers shades or casts, *viz.* a black bay, brown bay, dapple bay; all which have constantly black manes and tails.—*Dun* and *mouse-dun*, having frequently a black list along the back, which denominates them *flax-backed*.—*Flax-bitten*, which is white spotted with red.—*Grey*, dapple grey, silver-grey, fad or powdered grey, black grey, sandy grey, and iron grey.—*Griffel* or *rount*, a light flesh colour intermixed with white.—*Peach colour* or *blissom colour*.—*Pyebald*, which consists of two colours, one of them white.—*Rean*, a bay, black, or sorrel intermixed with white hairs.—*Rubican*, black or sorrel, with a few white hairs scattered about his body.—*Sorrel*, common sorrel, red or cow-coloured sorrel, bright or light-coloured sorrel, burnt sorrel; all chiefly distinguished by the colour of their manes.—*Starling colour*, resembling a brownish or blackish grey, only more freckled, or intermixed with white.—*Tiger colour*, much the same with the branded grey, only the spots smaller.—*Wolf colour*.—*Deer colour*.—*Black*.—*White*, &c.

These colours are generally considered as symbolical of the nature, qualities, &c. of the beasts; and accordingly their value is much influenced hereby.—The dapple grey is prized for beauty; the brown bay for service; the black with silver hair for courage; the roan for countenance; the sorrel, black without white, and iron grey, are reputed hot and fiery; the bright grey, flax bitten, and black with white spots, are sanguine; the white, dun, and pye-bald, phlegmatic and heavy; the mouse-dun, red bay, and bluegrey, are dull; the peach colour rarely prove obedient to the spur; the sorrel seldom fail of being good, especially if their legs, tails, and manes be black; and the fame may be said of the flax-bitten, at least those so marked in the fore parts, or over the whole body; for when only behind, it is an ill sign.

Indeed it is hard laying down any universal rules in this case.—The white, which promise the least often prove good when black about the eyes and nostrils. And there are excellent iron greys, though that is not reputed a good colour.

For the age, teeth, mark, &c. of *horses*. See AGE, TOOTH, MARK, &c.

For the furniture, &c. of a *horse*. See SADDLE, BRIDLE, BIT, &c.

Horse is also used, in the military language, to express the

cavalry; or the body of soldiers who serve on horseback. See CAVALRY.

The army consisted of 30000 foot, and 10000 *horses*.

The *horse*, includes *horse* guards, *horse* grenadiers, and troopers.—Dragoons are also frequently comprehended under this name, though they fight on foot. See GRENADIER and DRAGOON.

Horse guards, by the Spaniards called *guardas a cavallo*; by the French, *gardes de corps*; by the English usually *life-guards*; are the guards of the king's person and body, consisting with us of 800 men, well armed and equipped.

They are divided into four troops; to which are now added, by establishment, two troops of grenadiers, consisting of eighty men, under the command of a captain.

Each troop of *horse* guards is divided into four divisions or squadrons; two of which consisting of a hundred men, commanded by a principal commissioned officer, two brigadiers, and two sub-brigadiers, with two trumpets, mount the guard, one day in fix, and are relieved in their turns.

Their duty is, by parties from the guard, to attend the king's person when he goes out near home.—When he goes out of town, he is attended by detachments out of all the three troops.

One of three captains of the *horse* guards attends on the king when he walks on foot, immediately next his person; carrying in his hand an ebony staff, or truncheon, with a gold head.

One division of grenadiers mounts with a division of the troop to which they belong; and these go out on small parties from the guard, perform sentinel duty on foot, attend the king also on foot, &c.

Master of the Horse. See MASTER of the horse.

Light Horse, includes all the *horse* except those of the life-guard.

The term *light horse* is sometimes also applied to an independent troop; or a troop not embodied into a regiment.

The denomination arose hence, that antiently they were lightly armed, in comparison of the royal guards, which were armed at all points.

Horse is also a term used in various arts and manufactories, for something that helps to sustain their work from the ground, for the more commodious working at it.

The *horse* used by tanners and skimmers, called also the *leg*, is a piece of wood cut hollow and roundish, four or five foot long, and placed aloope; upon which they pare their skins to get off the dirt, hair, flesh, &c.

Horse is also used in carpentry for a piece of wood jointed across two other perpendicular ones, to sustain the boards, planks, &c. which make bridges over small rivers; and on divers other occasions.

Little Horse. See the article EQUULEUS.

Horse is also a rope in a ship, made fast to one of the fore-mast shrouds; having a dead man's eye at its end, through which the pennant of the sprit-fall sheats is reeved.—See Tab. Ship, fig. 1. n. 125.

Horse is also a cant name lately introduced into the affair of lotteries, for the chance, or benefit of a ticket, or number for one or more days, upon condition, if it be drawn a prize within the time covenanted for, of returning to the seller an undrawn ticket.

To determine the value of a *horse*.—Multiply the amount of the prizes in the lottery by the time the *horse* is hired for; and from the product subtract the amount of the number of prizes by the value of an undrawn ticket into the time of the *horse*: the remainder being divided by the number of tickets into the whole time of drawing, the quotient is the value of the *horse*.

HORSEMANSHIP, the art of breaking, disciplining, and managing horses.

Horsemanship, in its latitude, includes what relates to the knowledge of the make, colour, age, temper, and qualities of *horses*; their respective countries and climates with the manner of breeding, propagating, &c. the discovery of the uses or services they are fitted for; whether the wars, the race, the saddle, or labour; and forwarding and accommodating them thereto.

In this general sense, it also includes the knowledge of the defects and diseases of *horses*, and the remedies proper for the same; with the several operations requisite thereto, as *docking*, *gelding*, *shocking*, &c. and thus takes in the farrier's province.

But the word is in a more peculiar manner understood of the art of riding; or of directing a horse to advantage, not only in the ordinary motions, but more especially in the managing, or making him work, upon volts, airs, &c. See MANAGE.

HORSE-SHOE, a cover or defence for the sole of a horse's foot.

Of these there are several sorts; as, the *Planch Shoe*, or *Pancelet*, which is said to make a good foot, and a bad leg; as causing the foot to grow beyond the measure of the leg. It is chose for a weak heel, and will last longer than any other shoe; being borrowed from the moul, which has weak heels, and struts to keep the feet from stones and gravel.

SHOES with Calkins, which, though intended to secure the horse from sliding, yet are reputed by many to do him more harm than good, in that he cannot tread evenly upon the ground, whereby, many times, he wrenches his foot, or strains some sinew, especially upon stoney ways, where stones will not suffer the calkins to enter.—*Double calkins* are less hurtful, as he treads even with them than on the single calkins; but then they must not be over long, or sharp pointed, but rather short and flat.

SHOES with Rings, these were first invented to make the horse lift his feet up high; though such shoes are more painful than helpful, beside the unhandiness of the sight.—The fault of not lifting the feet high enough is most incident to horses that have not sound hoofs; for tender feet fear to touch the ground hard: but what is intended for remedy, proves a prejudice to the horse, by adding high calkins, or rings to his shoes, as by that means his heels are made weaker than before.

SHOES with fuelling welts or borders round about them, are used in Germany, &c. which being higher than the heads of the nails, save them from wearing.—These are the best sort of lasting shoes, if made of well tempered stuff, as they wear equally in all parts, and the horse treads evenly upon them. Others, who use to pass mountains and places where smiths are not so easily met with, carry shoes about them, with vices, whereby they fasten them to the horse's hoofs without the help of the hammer or nail: yet is this more for shew than service; for though such shoe may save a horse's feet from stones, yet it so pinches his hoof that he goes with pain, and perhaps injures it more than the stones do.—On such emergent occasions, therefore, it were better to make use of the

Joint Shoe, which is made of two pieces, with a flat rivet nail joining them together in the toe, so that it may be taken both wide or narrow, to serve any foot.

Panton, or Pantable Shoe, which opens the heels, and helps hoof-binding.—To which may be added, the *half panton shoe*.

Patten Shoe, is used for a horse that is burnt in the hip, stiffler, or shoulder, as it causes him to bear upon that leg the grief is on, and consequently makes him use it the better.

HORSE-SHOE, in fortification, is a work sometimes of a round, sometimes of an oval figure, inclosed with a parapet, raised in the ditch of a marshy place, or in low grounds; sometimes also to cover a gate; or to serve as a lodgment for soldiers, to prevent surprizes, or relieve an over-tedious defence.

HORSE-SHOE HEAD, a discale in infants, wherein the futures of the skull are too open, or too great a vacuity is left between them; so that the aperture shall not be totally closed up, or the cranium in that part be so hard as the rest for some years after.

This openness is found to be increased upon the child's catching cold. When the discale continues long, it is reputed a sign of weakness and short life. In this case, it is usual to rub the head every now and then with warm rum, or brandy, mixed with the white of an egg, and palm oil. Sometimes the disorder arises from a collection of waters in the head, called a *hydrocephalus*.

HORSE Measure, is a rod of box, to slide out of a cane, with a square at the end, being divided into hands and inches, to measure the height of horses.

HORSHAM Stone, is a kind of thin broad slate, of a greyish colour; formerly much used, especially in Suffex, to heal or cover churches and chancels, great houses, &c.

It is called *Horsham stone*, because chiefly brought from the town of Horsham in Suffex.

HORTAGILERS, in the grand seignior's court, are upholsters, or tapestry-hangers.

There is no city better or more orderly regulated than the grand seignior's camp; and to have a notion of the magnificence of that prince, he must be seen in that equipage; he being much better lodged and accommodated there, than at Constantinople, or in any other city of his dominions. He has always two tents or pavilions, and two sets of furniture entire; that while he is in one, they may pitch or spread the other.

In order to this, he has constantly four hundred *hortagilers*, or upholsters, in his retinue, who go a day's journey before him, to fix on a proper place. They first prepare the sultan's tent, and then those of the officers of the port, and the beglerbegs, according to their rank.

HORTICULTURE*, the art of gardening. See GARDENING.

* The word is compounded of *hortus*, garden, and *colo*, I till, dress, &c.

HOSANNA*, in the Hebrew ceremonies, a prayer which they rehearsed on the several days of their feast of tabernacles.

* It was thus called, by reason there was a frequent repetition therein of the word הושיענו יהוה *hosia nunc, or hosia precor, i. e. save us now; or, save us, we pray.*

There are divers of these *hosannas*.—The Jews call them *hosannoth*, i. e. the *hosannas*.—Some are rehearsed on the first day, others on the second, &c. which they call *hosanna* of the first day, *hosanna* of the second day, &c.

HOSANNA Rabba, or *Grand Hosanna*, is a name they give to their feast of tabernacles, which lasts eight days; by reason, during the course thereof, they are frequently calling for the assistance of God, the forgiveness of their sins, and his blessing on the new year; and to that purpose they make great use of the *hosannoth*, or prayers abovementioned.

The Jews, also, apply the term *hosanna rabba*, in a more peculiar manner, to the seventh day of the feast of tabernacles; by reason they apply themselves more immediately on that day to invoke the divine blessing, &c.

HOSE, from the Saxon *hosa*, a flocking. See STOCKING.

HOSE IN HOSE, among botanists, signifies one long hulk of a flower within another; as in the polyanthos.

HOSE-HUSK, in botany, a long round hulk; as in pinks, july-flowers, &c.

HOSPITAL*, popularly *SPITTAL*, a place or building erected out of charity, for the reception and support of the poor, aged, infirm, sick, and otherwise helpless.

* The word is formed of the Latin *hospes*, host, or stranger.

In the first ages of the church, the bishop had the immediate charge of all the poor, both found and diseased, as also of widows orphans, strangers, &c.—When the churches came to have fixed revenues allotted them, it was decreed, that, at least, one fourth part thereof should go to the relief of the poor; and to provide for them the more commodiously, divers houses of charity were built, which are since denominated *hospitals*.

They were governed wholly by the priests and deacons, under the inspection of the bishop.

In course of time, separate revenues were assigned for the *hospitals*; and particular persons, out of motives of piety and charity, gave lands, and money for erecting of *hospitals*.

When the church discipline began to relax, the priests, who, till then, had been the administrators of *hospitals*, converted them into a sort of benefices, which they held at pleasure, without giving account thereof to any body; reserving the greatest part of the income to their own use; so that the intentions of the founders were frustrated.—To remove this abuse, the council of Vienne expressly prohibited the giving any *hospital* to secular priests in the way of a benefice; and directed the administration thereof to be given to sufficient and responsible laymen, who should take an oath, like that of tutors, for the faithful discharge thereof; and be accountable to the ordinaries.—This decree was executed, and confirmed by the council of Trent.

In England, *hospitals* founded for the mere relief of the indigent and necessitous, are peculiarly called *alms-houses*; the name *hospital* being reserved to those destined for the sick, aged, young, &c.—The principal of these are, the

Royal HOSPITAL, for disabled soldiers, commonly called *Chelsea-College*.

It was founded by king Charles II. carried on by king James II. and finished by king William and queen Mary.

The building is very spacious and magnificent: Its figure is a *U*: the middle or front part whereof consists of a chapel and hall; the other two lines being four stories high, are divided into wards or galleries, two in each story containing each twenty-six distinct apartments for the foot-soldiers. At each of the four corners of the main building, there is a pavilion, in one whereof is the governor's lodging and the council chamber; the other being lodgings for several of the officers of the house. Beside the main building, there are four wings or out-buildings; one for the infirmary, another for several officers of the house, another for old maimed officers of horse and foot; and the fourth for the baker, laundress, &c.

The number of ordinary pensioners is 476; beside the officers and servants of the house: The out, or extraordinary pensioners, are also very numerous; and these, upon occasion, do duty in the several garrisons, from whence draughts are made for the army, &c.

The pensioners are all provided with clothes, diet, washing, lodging firing, and have one day's pay in every week for spending money.

The qualifications required to be admitted of this body, are, That the candidate bring a certificate from his superior officer, that he has been maimed or disabled in the service of the crown; or that he has served the crown twenty years, which must be made appear by muster-rolls.

To defray the charges of this *hospital*, there is a considerable sum paid yearly out of the poundage of the army; beside one day's pay of each officer, and each common soldier, every year; which, in time of war, amounts to 13 or 14000*l*.

HOS

HOS

For the administration of this *hospital*, there is a governor, lieutenant-governor, major, treasurer, &c.

Greenwich HOSPITAL, is a retreat for seamen, who, by age wounds, or other accidents, are disabled from service; and for the widows and children of such as are slain in the service.

This, in point of magnificence and spaciousness, greatly excels even Chelsea *hospital*. A good part of it was built in king Charles the second's time, at the expence of 36000*l*. It was much promoted by king William; and finished under queen Anne, and king George the first and second.

The number of pensioners entertained in this *hospital* is 300. To each hundred men are allowed six nurses, being the widows of seamen.

The victualling is according to the allowance of Chelsea, *hospital*, viz. four men to a mess; each mess to contain four pound of flesh, a gallon of beer, &c.

It is administered by a governor, lieutenant-governor, captain, lieutenant, chaplain, steward, physician, &c.

Christ's HOSPITAL, popularly called the *Blue-coat Hospital*, was antiently a monastery of grey friars, founded by Rahere, the first prior thereof, in the time of Henry I. It was dissolved by Henry VIII. and converted by Edward VI. into an *hospital* for poor children, who are supplied with all necessaries and conveniences, clothed, dieted, and taught.

Since its first endowment it has received abundance of new donations. A great part of it was burnt down by the great fire; but is again rebuilt by the care of the governors, though not without incurring a great debt, and anticipating the revenues of the *hospital*.

Formerly, a thousand poor children, most of them orphans, were maintained on this foundation; and six or seven score yearly put out apprentices, and the girls to service; but the number, through the deficiency of the funds, grew afterwards much less.

Here were two mathematical schools; the first founded by king Charles II; but they are now united. Youths are there taught several parts of practical mathematics, particularly navigation, to fit them for apprentices to masters of ships: To say nothing of the grammar school, (whence the most improved boys are yearly sent to the university) the writing school, drawing school, &c.

The officers of this *hospital* are a president, treasurer, governors, &c.

S. Bartholemew's HOSPITAL adjoins to Christ's *hospital*, and formerly belonged to the same grey friars.

At the dissolution of monasteries, Henry VIII. left five hundred marks a year to it for the relief of poor people; but it was more largely endowed for the use of sick and lame persons only, by Edward VI.

It is governed by a president, treasurer, &c. with other officers. It is furnished with two physicians, and three master surgeons, besides as many assistant surgeons.

In this *hospital*, with two others depending on it, the one at Kingland, called the *Lack*, the other in Southwark, are usually about three hundred patients, provided with lodging, diet, physic, chirurgery, &c.

S. Thomas's HOSPITAL, in Southwark, is for the same purposes as that of S. Bartholemew.

It was originally founded an *hospital*, by Richard, prior of Bermondsey, in 1213; surrendered to King Henry VIII; and given by Edward VI. to the citizens of London, for an *hospital* for infirm and lame people.

It consists of four quadrangular courts: In the first are six wards for women: in the second, two chapels, the lesser for the private use of the *hospital*, and the larger parochial: in the same court are the houses of the treasurer, and other officers: in the third court are six or seven wards for men. The fourth hath also three wards, baths hot and cold, a chirurgery, apothecary's shop, &c.

There are about three thousand persons taken in and discharged out of this *hospital* yearly.

The governors of this *hospital* are the lord mayor and court of aldermen, with about two hundred and sixty other citizens. Among which are a president, treasurer, &c. two physicians, and three surgeons.

Guy's HOSPITAL, or the *HOSPITAL of Incurables*, is the foundation of a wealthy citizen, and bookseller, Thomas Guy, Esq;

It is chiefly intended for reputed incurable persons; and is even to take in yearly a certain number of patients turned out of the other *hospitals*, particularly Bethlehem, as incurable.

The founder bestowed 50,000*l*. on the building in his lifetime; and, by will, endowed it with 200,000*l*. at his death, in 1724: the greatest benefaction, without dispute, that ever was left by any one private man.

Its officers are a president and governors, most of whom are the same with those of S. Thomas's *hospital*, which is in the neighbourhood thereof; with a treasurer, two physicians, two chirurgeons, &c.

Bridewell HOSPITAL

Sutton's HOSPITAL

HOSPITAL of Jerusalem

HOSPITALER, one that entertains and provides for poor people, travellers, &c.

The appellation is chiefly given to certain communities of religious; as, the *hospitalers* of Elfdort in Essex, instituted to take care of lepers; *hospitalers* of S. John Baptist of Coventry; *hospitalers* of S. Julian; *hospitalers* of S. Leonard at York, &c.

The religious *hospitalers* generally follow the rule of S. Augustine. Most of them pretend that S. Martha was their first foundress, and chose her for their patron, by reason she entertained Jesus Christ at her house. Some of them go back to the patriarch Abraham for their founder.

There are also *hospitalers* among the military orders, such are the knights of S. Lazarus, and S. John of Jerusalem.

HOSPITALERS, **HOSPITALARI**, more particularly denote an order of religious knights, who built an *hospital* at Jerusalem, wherein pilgrims were received.—To these pope Clement V. transferred the effects and revenues of the Templars; whom, by a council held at Vienne, he suppressed, for their many and great misdemeanors.

These *hospitalers* were otherwise called *knights of St. John of Jerusalem*, and are the same with those whom we now call *knights of Malta*.

HOSPITIUM, *Inn*; a term peculiarly used in our law-books for an inn of Court.

HOSPITIUM is also used for a little convent, which the religious built for the reception of strangers and travellers of the same order, who had occasion to stay with them some time.

Most of these *hospitia*, or inns, in time became fixed convents.

HOSPODAR, the title born by the prince of Walachia and Moldavia.

The *hospodars* of Walachia and Moldavia receive the investiture of those principalities from the grand seignior, by a vest and a standard which he gives them.

They are sometimes deposed by him; though in other respects they have the sovereign power within their states.

HOST*, **HOSPES**, a term of mutual relations, applied both to a person who lodges and entertains another, and to the person thus lodged, &c.

* The word is formed of the Latin *hospes*, which some will have thus called, *quasi hospitium*, or *ospium petens*; for *ospium* was antiently wrote with an aspirate.

Thus the innkeeper says, he has a good *host*, in speaking of the traveller who lodges with him; and the traveller, again, says, he has a kind *host*, in speaking of his landlord.

It must be observed then, that it was the custom among the antients, when any stranger asked for lodgings, for the master of the house, and the stranger, each of them to set a foot on each side of the threshold, and swear they would neither of them do any harm to the other.—It was this ceremony, that raised so much horror against those who violated the law, or right of hospitality on either side: inasmuch as they were looked on as perjured.

Instead of *hospes*, the antient Latins called it *hospis*; as Cicero himself informs us: though in course of time, *hospis* came to signify an enemy; so much was the notion of hospitality altered.

HOST is also used by way of abbreviation for *hostia*, a victim, or sacrifice offered to the Deity. See **HOSTIA**.

In this sense, *host* is more immediately understood of the person of the Word incarnate, who was offered up a *host*, or *hostia*, to the Father, on the cross; for the sins of mankind.

HOST, or **HOAST**, is chiefly used in the Romish church for the body of Jesus Christ, contained under the species of bread and wine, which is offered up every day, a new *host*, or sacrifice, in the mass.

Pope Gregory IX. first decreed a bell to be rung, as the signal for the people to betake themselves to the adoration of the *host*.

The vessel wherein the *host*s are kept, is called the *cibory*; being a large kind of covered chalice.

HOSTAGE*, a person left as surety for the performance of the articles of a treaty.

* The word is formed of *host*, and that of *hospes*.

When two enemies are on the point of concluding a treaty or capitulation, it is frequent for them to give *hostages* on each side, as sureties for the execution of what is contained therein.

The garrison of such a place has capitulated, and given *hostages*. Such an officer was given as an *hostage*.

A *hostage* is either a principal or an accessory, according to the state of the case. He is only an accessory, when, for instance a prince promises fidelity to another, and gives up his son, or some other great lord, to assure his engagement, without any further stipulation. For here if the prince fail of his word, the *hostage* is no ways accountable for it.

But the *hostage* becomes a principal, when it is expressly stipulated,

lated, that he shall be answerable for the event: for instance, if a city engage to surrender, in case it be not relieved in so many days; and, to secure the engagement, give hostages; these hostages are what a surety is to a creditor for the debt of his principal. So that, if the relief do not come, and yet the citizens refuse to surrender, the hostages stand in their place, become principals, and are liable to be punished for the prevarication of those they have become surety for.

A *hostage* given for another person, becomes free when that person dies.

HOSTEL, or **HOTEL**, a French term, antiently signifying a house, or dwelling-place.

It is now more commonly used for the palaces, or houses of the king, princes, and great lords.

In this sense they say, the *hotel del Conde*, *hotel de Conti*, *hotel de Louvre*, &c.

The grand prevot de l'*hotel*, is the first judge of the officers of the king's household. His jurisdiction is much like that of lord-steward of the household of the king of England.

The *hotel de ville* is what we call a *town-house*, or *town-hall*.

HOTEL-DIEU, is a common name for the chief hospital for the reception of sick persons in most of the cities of France.

The *HOTEL de Mars*, is an hospital near Paris, of the same nature with Chelsea hospital.

HOSTIA *, **HOST**, in antiquity, a victim offered in sacrifice to a deity.

* The word is formed from *hostis*, enemy, it being the custom to offer up a sacrifice before they joined battle, to render the gods propitious; or after the battle was over, to give them thanks.—Some chuse to derive the word from *hostia*, q. d. *ferio*, I strike.—Isidore, on this word, remarks, that the name *hostia* was given to those sacrifices which they offered before they marched to attack the enemy; *Ante quam*, says he, *ad hostem pergerent*; in contradistinction from *victimæ*, which were properly those offered after the victory: Ovid seems to distinguish otherwise when he says,

Victimæ quæ cecidit dextrâ victrice vocatur;
Hostibus a domitis hostia nomen habet.

As if the *hostia* might be slain by any priest, but the victim only by the hands of the victor: Fronton makes another distinction: According to him, *victimæ* was a grand oblation, and *hostia* a smaller and less considerable one.

HOSTILITY *, the action of an enemy.—During a truce, all *hostilities* are to cease on both sides: such a city stands neuter, and commits no *hostilities* on either side.

* The word is Latin, *hostilitas*, formed of the primitive *hostis*, which signifies *enemy*; and which antiently signified *stranger*, *hostis*.

HOT-BATH. See the articles **BATH**, and **THERMÆ**.

HOT-BED, a piece of earth or soil plentifully enriched with manure, and defended from cold winds, &c. to forward the growth of plants, and force vegetation, when the season or the climate of itself is not warm enough.

By means of *hot-beds* skilfully managed, we can so nearly imitate the temperature of other climates, that seeds of plants brought from any country between the tropics, may be made to flourish even under the poles.

Heat and humidity being the great instruments of vegetation; to promote the growth of any plants, these must be duly proportioned, so as neither to exceed nor come short of the bounds nature has allotted for it.—Too much heat we find rather scorches a plant than makes it grow; and too much moisture frequently chills it, unless quickly exhaled from the roots.—With us, a moderate heat is found the most eligible; such as is raised by the ferment of wet straw and horse-litter, which, from the earth lying thereon, will send forth, for some time, a gentle steam, richly impregnated with vegetative salts.

The usual way of making *hot beds*, is of horse-litter and grass mixed together, and left on an heap for eight or ten days to putrefy; and then removed into a bed, and covered up with glasses, or frames.—Others chuse to take horse-dung a month or six weeks old, and make a feed-bed of it about four foot high, and cover it up with straw a foot thick, which is to be removed in three or four days, and its place supplied either with cows dung, or with the last year's ridges. The process of ordering a good serviceable *hot bed*, for the customary raising of colliflowers, cucumbers, melons, radishes, and other tender plants and flowers, in January or February, is directed by Mr. Mortimer in manner following: Provide a warm place defended from all the winds, by being inclosed with a pale or hedge made of reeds or straw, about six or seven foot high, of such dimensions or capacity as occasion requires.—Within this inclosure raise a bed two or three foot high, and three foot over, of fresh horse-dung, about six or eight days old; then tread it down very hard on the top, make it level, and if you think fit, edge it round with boards or brick, laying fine rich mould about three or four

inches thick on it: When the extreme heat of the bed is over, which you may perceive by thrusting in your finger; plant your seeds at pleasure, and set up some forks four or five inches above the bed, to support a frame made of sticks, and covered with straw or baw-mat, in order to secure the seeds and plants from cold and wet; only the covering may be opened in a warm day, for an hour before noon, and an hour after.—But take care to earth up your plants as they shoot in height; and when able to bear the cold, they may be transplanted.

In Holland they make use of *hot beds* made of sand; which are not so apt to raise unwholesome damps as those of horse dung.—The Dutch likewise made *hot beds* of tanner's bark, which, when once rightly prepared, will maintain an equable heat for six months.

Brady, with very good reason, proposes a thermometer to be used to regulate the heat of *hot beds*.—For plants that are either to be brought up in a colder season, or a colder climate than what they naturally require; you are to take the height at which the thermometer stands in their proper season or climate, as a standard; and by applying a thermometer to the *hot bed*, judge whether the heat is to be increased or remitted.—Thus a *hot bed* for cucumbers must be kept, to raise the spirit in the glass, to the same height as the natural temperature of the weather will raise it to about the latter end of May and June, when cucumbers will grow abroad without any artificial heat or shelter. See Supplement: article **HOT BED**.

HOT-HOUSE. See **STOVE**, and **HYPOCAUSTUM**.

HOT-SHOOTS, or **HOVILSES**, a sort of factitious or compound fuel, made of a third part of any coal, pit, sea, or charcoal, mixed with two thirds of loam.

These ingredients are to be made up into balls, moistened with a little urine, round or in any other form at pleasure; and exposed to the air till thoroughly dry.—Then may they be built into the most orderly fire imaginable, affording a glowing, regular and constant heat for seven or eight hours, without stirring. This mixture is also used in some parts to slacken the impetuous devouring of the fire, and keep coals from consuming too fast.

HOTCH-POT, or **HODG-PONG**, primarily denotes a Flemish medley dish, made of flesh cut in pieces, and sodden with herbs, roots, &c.

HOTCH-POT, in law, signifies a mixture or blending of lands given in marriage, with other lands in fee accruing by descent.—A man seized of thirty acres of land in fee, hath two daughters, and gives with one of them ten acres in frank-marriage, and dies seized of the other twenty. If now the that is thus married will have any part of the twenty acres, she must put her lands given in frank-marriage in *hotch-pot*; that is, she must refuse to take the sole profits of the ten acres, but suffer them to be mingled with the other twenty, to the end an equal division may be made of the whole thirty between her and her sister.—Thus for her ten acres she will be entitled to fifteen. *Coke on Littl.*

HOTTS, or **HUTTS**, pounces and round balls of leather, stuffed, or tied on the sharp end of fighting cocks spurs; to keep them from hurting one another in sparring or breathing themselves.

HOUGH, *Ham*, the joint of the hind leg of a beast, which connects the thigh to the leg. See **HAM**.

To HOUGH, or *cut the Houghs*, is to ham-string. See **HAM-STRING**.

HOUGH bony, is a hard round swelling, or tumor growing upon the tip or elbow of the *hough*.

It generally proceeds from some stroke or bruise; and if neglected till the substance of the swelling becomes hard like glue, it proves difficult to cure.

HOUND, *Canis venaticus*, a hunting dog.

Hounds may be distinguished, with regard to the manner of their hunting, into such as find out and pursue the game by sight, and the quickness and swiftness of their motion; of which kind are the *gaze hound*, *agassus*; and *grey-hound*, *canis græius*; the *terrier*, &c.—And those which find and pursue the game by the goodness of their smell.

The species of scenting dogs may be divided farther into *hounds* simply so called, and *blood hounds*, each whereof admits of some diversities.

1^o. As to *hounds* simply so called, those which are all of one colour, as white, black, &c. are the most valued; then those spotted with red: Those spotted with dun are less prized, as usually wanting courage and boldness.—Fallow *hounds* are of good scent, and hardly not fearing the water: they keep the chase well without change; but are not so swift as the white: they love the hart above any other chase, having little stomach for the hare, &c. whence they are not so fit for private gentlemen; beside, that they are apt to run at tame beasts.

The *dun hounds* are of a more general use, being fit for all chases.—Their sagacity and fidelity in knowing and sticking to their master's voice and horn, and to none else, are much admired: They also understand each other, and know which are babblers, which liars, &c. They are of different sizes, and

and qualities in the several countries, &c. Mountainous and woodland parts breed a tall heavy sort, called *flow hounds*: moderate foils, where the champion and covert share pretty equally, produce a middle-sized *hound* of a nimble make.

The marks of a good and fair *hound*, are to be of a middle proportion, rather long than round; the nostrils wide; back bowed; fllets, great; haunches, large; ham, straight; tail, big near the reins, and the rest slender to the end; the legs, big: the sole, dry; and claws, large.

For the terms used in respect of *hounds*, their noises, &c. See HUNTING.

To enter a young *hound*; after having taught him to know the halloo and the sound of the horn, at about eighteen months old he may be taken into the field. The best method to initiate him, is to take a live hare, and trail her upon the ground, this way, then that; and, at length, hide her at a proper distance. Then setting the *hound* near the trail, he will take wind, and run to and fro about the fields, woods, paths, &c. till he find which way she has gone: as he approaches nearer the lodged hare, he will mend his pace, and at last leap on his prey, which he must be suffered to kill, and bringing it to his master with triumph, he must be rewarded and encouraged.—This done, he may be let run in a pack of old *hounds* to confirm and perfect him.

It ought to be noted, that whatever young *hounds* are first entered at and rewarded with, they will ever after covet most; so that if they be intended, e. g. for the hart, they must not be entered at the hare.

2'. The *grey-hound* might deserve the first place, by reason of his swiftness, strength, and sagacity in pursuing his game; such being the nature of this dog, that he is speedy and quick of foot to follow, fierce and strong to overcome, yet silent, coming upon his prey unawares.

The make and proportions required in a good *grey-hound*, are, that he have a long body, strong, and pretty large, a neat sharp head, sparkling eyes, a long mouth, and sharp teeth, little ears, with thin gristles in them, a straight, broad, and strong breast, his fore legs straight and short, his hind legs long and straight, broad shoulders, round ribs, fleshy buttocks, but not fat, and a long tail, strong and full of finews.

Of this kind, those are always fittest to be chosen among the whelps that weigh lightest; for they will be sooner at the game, and so hang upon it, hindering its swiftness, till the heavier and strong *hounds* come in to offer their assistance; whence, besides what has been already said, it is requisite for a *grey-hound* to have large sides, and a broad midriff, that he may take his breath in and out the more easily; his belly should also be small, which otherwise would obstruct the swiftness of his course; and his hairs thin and soft.

The huntsman is to lead these *hounds* on his left hand, if he be on foot, and on the right if on horseback.—The best time to try and train them to the game, is at twelve months old, though some begin sooner, with the males at ten, and the females at eight months old, which last are generally more swift than the dogs: They should be kept in a slip, while abroad, till they see their course; neither should you loosen a young dog till the game has been a considerable time on foot, he being apt, by over eagerness at the prey, to strain his limbs.

3'. The *gaze-hound*, or *beagle*, is a dog more beholden to the sharpness of his sight, than his nose or smelling; by virtue whereof he makes excellent sport with the deer and hare.—He is also noted as exquisite in chusing of one that is not lank or lean, but full, fat and round, which, if it happen to return, and be mingled again with the residue of the herd, he will soon spy out, and leave the rest untouched, never ceasing, after he has separated it from its company, and till he has wearied it to death.

These dogs are much used in the north of England, and on champion ground, rather than bushy and woody places, and by horsemen, more than footmen.—If at any time he happen to take a wrong way, upon the usual sign made by his master, he immediately returns, takes the right and ready course, beginning his chase afresh, with a clear voice and swift foot, following the game with as much courage as at first.

4'. The *blood-hound* differs nothing in quality from the *Scottish flat hound*, having that it is longer shap'd and not always of the same colour; but sometimes red, fawned, black, white spotted, &c. though most commonly either brown or red.

Their nature is, that being set on by the voice and words of their leader, to cast about for the sitting of the present game, and having found it, they will never cease pursuing it with full cry till it be tired, without changing for any other.

They seldom bark, except in their chase, and are very obedient and attentive to the voice of their leader.—Those that are really good, when they have found the hare, make shew thereof to the huntsman by running more speedily, and with gesture of head, eyes, ears, and tail, winding to the

form or hare's muse, never giving over prosecution, and running with a gallant noise.

They have good and hard feet, and stately stomachs; and are very properly denominated *sanguinary* or *blood hounds*, by reason of their extraordinary scent; for if their game be only wounded, so that it escapes the huntsman's hands, or if it be killed, and never so clearly carried away, these dogs, by their exquisite smell, will discover it, and not be wanting, either by nimbleness or greediness, to come at it, provided there be any stains of blood.—Nay, though by all the cunning and foresight imaginable, a beast be conveyed away without spot or blood, yet through the roughness and most crooked ways and meanders, will this dog find out the deer-stealer, and even in the thickest throng, will, by his smell, separate and pick him out.

5°. The *terrier*, or *tarrier*, only hunts the fox or badger; being thus called, because, after the manner of a ferret in searching for conies, he leaps into the ground, and affrights or attacks the beasts, either tearing them in pieces, or halting them out by force; or, at least, driving them out of their harbours to be taken in a net, or otherwise.

The huntsmen have commonly a couple of *terriers*, that they may put in a fresh one, as occasion serves, to relieve the other.

The time of entering the *terrier*, is when he is near a twelve-month old: if it be not done within that time, he will hardly be brought to take the earth. This entering and fleshing of them may be performed several ways.—First, when the foxes and badgers have young cubs, take an old *terrier*, set him into the ground, and when he begins to bay, hold the young one at the hole or mouth of the earth, that he may listen and hear the old one's bay.

The old fox or badger being taken, so that nothing remains within but the cubs, couple up the old ones, and put in the young in their steads, encouraging them by crying, To him, To him.—If they take any cub within, let them do with it what they list; not forgetting to give the old *terriers* their reward, which is blood and livers, fried with cheese and some of their grease; shewing them also heads and skins to encourage them.

HOURLY, *ἡμέρα*, *Hora*, an aliquot part of a natural day, usually a 24th, sometimes a 12th.

* The origin of the word *hora*, or *æra*, comes according to some authors, from a surname of the sun, the father of *hours* whom the Egyptians call *horus*. Others derive it from the Greek *ἡσυχία*, to terminate, distinguish, &c. Others, from the word *ἡμέρα*, to arise; pretending that Trimegistus was the first that settled the division of *hours*, which he did from observation of an animal consecrated to Serapis, named the *cynocephalus*, which makes water twelve times a day, and as often in the night, at equal intervals.

An *hour*, with us, is a measure or quantity of time, equal to a 24th part of the natural day, or nycthemeron or it is the duration of the 24th part of the earth's diurnal rotation. Fifteen degrees of the equator answer to an *hour*; though not precisely, but near enough for common use.

The hour is divided into 60 minutes; the minute into 60 seconds, &c.

The division of the day into *hours* is very ancient; as is shewn by Kircher, *Oedip. Egypt.* Tom. II. P. II. class VII. c. 8. Though the passages he quotes from scripture do not prove it.—The most ancient *hour* is that of the 12th part of the day. Herodotus, Lib. II. observes, that the Greeks learnt from the Egyptians, among other things, the method of dividing the day into twelve parts.

The astronomers of Cathaya, &c. bishop Beveridge observes, still retain this division. They call the *hour* *chag*; and to each *chag* they give a peculiar name, taken from some animal: The first is called *æth*, mouse; the second *chis*, bullock; the third *zæm*, leopard; the fourth *mau*, hare; the fifth *chin*, the crocodile, &c.

The division of the day into twenty four *hours*, was not known to the Romans before the first Punic war.—Till that time they only regulated their days by the rising and setting of the sun.

They divided the twelve *hours* of their day into four, viz. *prime*, which commenced at six o'clock; *third* at nine, *sixth* at twelve, and *nine* at three. They also divided the night into four watches, each containing three *hours*.

There are divers kinds of *hours*, used by chronologers, astronomers, dialists, &c.—Sometimes, *Hours* are divided into equal and unequal.

Equal *Hours*, are the 24th part of a day and night precisely; that is, the time wherein fifteen degrees of the equator mount above the horizon.

These are also called *equinoctial hours*, because measured on the equinoctial; and *astronomical*, because used by astronomers.

They are also differently denominated, according to the manner of accounting them in different countries.

Astronomical Hours are equal *hours*, reckoned from noon, or mid-day, in a continued series of twenty four.

Babylonish Hours are equal hours, reckoned from sun-rise in a continued series of twenty-four.

European Hours are equal hours, reckoned from mid-night; twelve from thence to noon, and from noon to mid-night twelve more.

Jewish, or planetary or ancient Hours, are twelfth parts of the artificial day and night.

Hence, as it is only in the time of the equinoxes that the artificial day is equal to the night, it is then only that the hours of the day are equal to those of the night: At other times they will be always either increasing or decreasing.

They are called *ancient* or *Jewish hours*, because used by the ancients, and still among the Jews. They are called *planetary hours*, by reason the astrologers pretend, that a new planet comes to predominate every hour; and that the day takes its denomination from that which predominates the first hour thereof: as, Monday from the moon, &c.

Italian Hours are equal hours, reckoned from sun-set, in a continued series of twenty-four.

Unequal or temporary Hours, are 12th parts of the artificial day and night.—The obliquity of the sphere renders these more or less unequal at different times; so that they only agree with the equal hours at the times of the equinoxes.

HOURS, HORÆ, in the ancient mythology, were certain goddesses, the daughters of Jupiter and Themis; at first only three in number, *Eunomia*, *Dice*, and *Irene*: to which were afterwards added two more, *Carpo* and *Thalote*.

Homer makes them the door-keepers of heaven. Ovid allots them the employment of harnessing the horses of the sun: *Jungere equos Titan velocibus imperat Horis.*

Hours, Horæ, in the Romish church, are certain prayers performed at stated times of the day; as *matins*, *vespers*, *lauds*, &c.

The lesser hours, are *prime*, *terce* *sixth*, and *nine*.—They are called *hours*, or *canonical hours*, as being to be rehearsed at certain hours prescribed by the canons of that church, in commemoration of the mysteries accomplished at those hours. These hours were anciently also called *course cursus*; F. Maillon has a dissertation on them, entitled, *De Cursu Gallicano*.

The first constitution enjoining the observation of the canonical hours, is of the ninth century, being found in a capital of Heito, bishop of Basil, directed to his curates, importing, that the priests shall never be absent at the canonical hours either by day, or night.

Prayers of forty Hours, are public prayers continued for the space of three days successively, and without intermission, before the holy sacrament, to obtain the assistance of heaven on some important occasion.

In these days, care is taken, that the holy sacrament be exposed forty hours viz. thirteen or fourteen hours each day.

Hour-Circles, or HORARY Circles, in astronomy, &c. are great circles, meeting in the poles of the world, and crossing the equinoctial at right angles; the same as *meridians*.

They are supposed to be drawn through every 15th degree of the equinoctial and equator, and on both globes are supplied by the meridian, *hour-circle*, and index. See **GLOBE**.

The planes of the *hour-circles* are perpendicular to the plane of the equinoctial, which they divide into 24 equal parts.

Hour-Glass, a popular kind of chronometer or clepsydra, serving to measure the flux of time, by the descent or running of sand out of one glass vessel into another.

The best *hour-glasses* are those, which, instead of sand, have egg-shells well dried in the oven, then beaten fine and sifted.

Hour-glasses are much used at sea for reckoning, &c.

There are also a sort of *hour-glasses*, which depend on the flux of water or some other liquid, more properly called *clepsydræ*. See **CLEPSYDRA**.

Hour-Lines, on a dial, are lines which arise from the intersections of the plane of the dial, with the several planes of the *hour-circles* of the sphere, and therefore must be all right lines. See **DIAL**.

HOUSAGE, a fee which a carrier, or other person pays for laving up goods in a house.

HOUSE, Habitatio; a place built with conveniences to live in; or a building wherein to shelter a man's person and goods from the inclemencies of the weather, and the injuries of ill-disposed persons.

We say a brick *house*, a stone *house* a *house* of two stories, of three stories, a manor *house*, a farm *house*, &c.

Ancient Rome consisted of 48000 *houses* all insulated or detached from one another.

A pleasure *house* or country *house*, is that built for a person to enjoy and divert himself occasionally in. This is the *villa* of the ancient Romans; and what in Spain and Portugal they

call *quinta*; in Provence, *cassine*; in some other parts of France, *closerie*; in Italy, *vigna*.

The word *vigna* is itself sometimes used in English to denote the country seats of the noble Romans; as the *vigna Farnese*, *vigna Borghese*, &c.

The citizens of Paris have also their *maisons de bouteilles*, *bottle-houses*, to retire to, and entertain their friends; which, in Latin, might be called *micae*: the emperor Domitian having a *house* built for the like purpose, mentioned under this name by Martial, Lib. II. Epig. 59.

It is a thing principally to be aimed at, in the site or situation of a country *house* or seat, that it have wood and water near it: If it cannot be conveniently built among trees, yet there are few places where trees may not be speedily raised about it.

It is far better to have a *house* defended by trees than hills; for trees yield a cooling, refreshing, sweet, and healthy air, and shade, during the heat of the summer, and very much break the cold winds and tempests, from every point in the winter.—The hills, according as they are situated, defend only from some certain winds; and if they are on the north side of the *house*, as they defend from the cold air in the winter, so they also deprive you of the cool refreshing breezes, which are commonly blown from thence in the summer.—And if the hills are situated on the south side, it then proves also very inconvenient.

A *house* should not be too low seated, since this precludes the convenience of cellars.—If you cannot avoid building on low grounds, let the first floor above the ground the higher, to supply what you want to sink in your cellar in the ground; for in such low and moist grounds, it conduces much to the driness and healthiness of the air, to have cellars under the *house*, so that the floors be good and ceiled underneath. *Houses* built too high, in places obvious to the winds, and not well defended by hills or trees, require more materials to build them, and more also of reparations to maintain them; and they are not so commodious to the inhabitants as the lower built *houses*, which may be built at a much easier rate, and also as complete and beautiful as the other.

In buildings or *houses* not above two stories with the ground room, and not exceeding twenty foot to the raison-place, and upon a good foundation; the length of two bricks, or eighteen inches for the heading course, will be sufficient for the ground work of any common structure, and six or seven courses above the earth to a water-table, where the thickness of the walls is abated, or taken in, on either side the thickness of a brick, namely two inches and a quarter.

For large and high *houses*, or buildings of three, four, or five stories with the garrets, the walls of such edifices ought to be from the foundation to the first water-table, three heading courses of brick, or twenty eight inches at least; and at every story a water-table, or taking in on the inside for the summers, girders, and joints to rest upon, laid into the middle, or one quarter of the wall at least, for the better bond.—But as for the innermost or partition wall, a half brick will be sufficiently thick; and for the upper stories, nine inches, or a brick length, will suffice.

The parts, proportions, &c. of the *houses* in London, are regulated by a statute made for rebuilding the city after the fire.

—By this it is enacted, That the *houses* of the first and least sort of building, fronting bye-streets or lanes, shall be two stories high besides cellars and garrets; the cellars six foot and an half high, if the springs of water hinder not; and the first story nine foot from the floor to the ceiling, and the second story as much: That all the walls in front and rear be, as high as the first story, full the thickness of the length of two bricks: and thence upwards to the garrets, of the thickness of one brick and an half; and that the thickness of the garret walls on the back part, be left to the discretion of the builder, so that the same be not less than one brick length; and that the thickness of the party wall in the garret, be of the thickness of the length of one brick at least.

—That the *houses* of the second sort of building, fronting streets, and lanes of note, and the river of Thames, consist of three stories high, besides cellars and garrets; that the cellars thereof be six foot and an half high, if the springs hinder not; that the first story contain full ten foot in height from the floor to the ceiling, the second ten foot, the third nine foot; that all the said walls in the front and rear, as high as the first story, be two bricks and a half thick, and from thence upward to the garret floor of one brick and an half thick; and the thickness of the garret walls on the back part, be left to the discretion of the builder, so that the same may not be less than one brick thick: And also that the thickness of the party walls between every *house* of this second and larger sort of building, be two bricks thick as high as the first story, and thence upward to the garrets of the thickness of one brick and an half.

Also, that the *houses* of the third sort of buildings, fronting the high and principal streets shall consist of four stories high, besides cellars and garrets; that the first story contain full ten

foot in height from the floor to the ceiling, the second ten foot and an half, and the third nine foot, the fourth eight foot and an half; that all the said walls in front and rear, as high as the first story, be two bricks and an half in thickness, and from thence upwards to the garret floor, of the thickness of one brick and an half; and that the thickness of the garret walls on the back part, be not less than one brick; and also that the party walls between every *house* of this third and larger sort of building, be two bricks thick as high as the first floor, and thence upwards to the garret floor one brick and an half.

Also, that in all *houses* of the fourth sort of buildings, being mansion *houses*, and of the greatest bigness, not fronting any streets or lanes as aforesaid, the number of stories, and the height thereof, shall be left to the discretion of the builder, so as he exceed not five stories.

The same act also enjoineth, that no timber be laid within twelve inches of the fore side of the chimney jambs; and that all joists on the back of any chimney, be laid with a trimmer, at six inches distance from the back; as also, that no timber be laid within the tunnel of any chimney, upon penalty to the workman for every day's default, of 10 s. and 10 s. every week it continues unreformed.

Add, That as the buildings of London join one upon another, and almost every several *house* hath a distinct proprietor; the parliament hath decreed, that the wall dividing the proprietors grounds, should be built at the equal charge of both the owners: whence it may not be impertinent to shew how these party walls are valued.

All brick-works, whether one, two, three, four, or any other number of brick lengths in thickness, are to be reduced to the thickness of a brick and a half.

It hath been observed, that about 4500 bricks, of about 16 s. per thousand: a hundred and a quarter of lime, at 10 s. per hundred; and two loads and a half of sand, at 3 s. per load, will completely raise one rod of brick-work of a brick and a half thickness.

And thus much will a rod of party wall, the materials only reduced to a brick and half thick, amount to, at the former supposed rates; to which may be added, for workmanship, 1 l. 8 s.

So that for every rod of party wall, they allow 3 l. apiece; whence, if a party wall be measured, and the measure when reduced to a brick and a half, be found to contain sixteen rods; that sixteen multiplied by 3 l. giveth 48 l. and so much is the one proprietor to allow the other.

Town-House, or *Hall*, is a place where the officers and magistrates of a town or city hold their meetings, for the due administration of their laws and policy. See **HALL**, and **GUILD**.

Work-House. See **WORK-HOUSE**; see also the article **RASHOUSES**.

HOUSE is also used for a convent or monastery.

The chief abbot of such an order has so many *houses* dependent on it.—There have been reforms made of several religious *houses*.

Regular priests give the name *houses* to the places they reside in, and not that of convents or monasteries, which properly belong to simple friars.—Thus we say, the *Jesuits house*, and the *Barnabites* or *Theatins house*.

The Jesuits have both professed *houses*, and colleges for novices, which they call *houses of probation*.

They have also *houses of retreat* for spiritual exercises, where they receive secular persons and ecclesiastics, disposed to practise the same with them, for eight or ten days.

HOUSE is also used for one of the estates of the kingdom assembled in parliament.

Thus we say, the *house of lords*, the *house of commons*, &c. See **PEERS**, and **COMMONS**.

HOUSE is also used for a noble family; or a race of illustrious persons issued from the same stock. See **GENEALOGY**.

In this sense we say, the *house* or family of the Stuarts, the Bourbons, the *house* of Hanover, of Austria, of Lorain, of Savoy, &c.

HOUSE, in astrology, a *dodecatemory*, or twelfth part of the heavens. See **DODECATEMORY**.

The division of the heavens into *houses* is founded on this, that the stars and planets when found herein are supposed to have certain influences, either good or evil, upon sublunary bodies; and to each *house* is assigned its particular virtue or influence; upon the consideration whereof they draw horoscopes. See **HOROSCOPE**.

This division is made by fix great circles, called *circles of position*, which cut each other in the common intersection of the meridian and horizon, in the ordinary way of domifying, which is that of Regiomontanus: for the antients had three other ways.

These circles divide the equator into twelve equal parts, of

30 degrees each, without any regard to the zodiac.—The horizon and meridian are two circles of the celestial *houses*, which divide the heavens into four equal parts, each whereof comprehends three *houses*.—There are six above the horizon, and as many below it; and six eastern and six western *houses*.

The scheme or figure of the heavens consists of twelve triangles, which are likewise called *houses*; wherein are laid down the stars, signs, and planet, comprized within the respective spaces of the circles of position.

Each planet has two certain *houses*, wherein they fix it: exerts itself with peculiar vigour; Leo is the Sun's *house*, and Cancer that of the Moon; Capricorn is Saturn's, &c.

Some call the *houses*, *dodecatemories*; but that name is more immediately appropriated to the twelve signs or divisions of the zodiac. See **DODECATEMORY**.

The astrological *houses* have their particular names according to their qualities.—The first is the *house of life*; being the ascendant, and containing five degrees above the horizon, the rest beneath it. The second is the *house of riches*. The third, the *house of brothers*. The fourth, in the lowest part of heaven, the *house of relations*, and angle of the earth. The fifth, the *house of children*. The sixth, the *house of health*. The seventh, the *house of marriage*, and the angle of the west. The eighth, the *house of death*, and upper gate. The ninth, the *house of piety*. The tenth, the *house of affairs*. The eleventh, the *house of friends*. And the twelfth, the *house of enemies*.

It is popularly, and, as it were, poetically said, that the sun has twelve *houses*; by which are meant the twelve signs; though, in reality, it has only one sign; viz. Leo: beside, the division of *houses* is accommodated to the equator, and not the zodiac.

They begin numbering the *houses* with the ascendant, and pass thence to the immovable zodiac; so that the vernal point makes the beginning of the fourth.

HOUSE-BOAT, *Esfovers*; or an allowance of timber out of the lord's wood, for the repair, and upholding a *house*, or tenement.

Some make *house-bote* twofold, viz. *Esfoverium edificandi* & *ardendi*. See **ESTOVERS**.

HOUSE-ROBBERING, or **HOUSE-BREAKING**, the robbing or plundering a man in some part of his *house*, or his back, or in a fair or market; the owner, or his wife, children, or servants, being within the same.

This was made felony by stat. 23 Hen. VIII. and 3 Ed. VI. but it is since also made felony, though none be within the *house*, 26 Eliz. See **BURGLARY**.

HOUSE-WIFE'S CLOTH, is a middle sort of linnen cloth between fine and coarse, fit for family uses.

HOUSEHOLD, the family or domestics of a prince or private person.

The civil government of the king's court belongs chiefly to the lord steward of the *household*. He has authority over all officers and servants of the king's house, except those of the chapel, chamber, and stable, who are under the jurisdiction of the lord chamberlain, master of the horse, and dean of the chapel.

Under the lord steward are a treasurer of the *household*, comptroller, cofferer, master of the *household*, clerks of the green cloth, &c.

The troops of the *household* are the horse guards, horse grenadiers, and foot guards.—The *household* troops of France are called the *gendarmes*.

HOUSEHOLD DAYS, are four solemn festivals in the year, when the king after divine service offers a befant of gold to God on the altar. See **BESANT**.

These *household days* are *Christmas*, *Easter*, *Whituesday*, and *All-Saints*.

The *household days* are a part of the twelve collar and offering days.

HOUSING*, or **HOUSE**, a cover laid over the saddle of a horse in order to save it from the weather, dirt, &c.

* The word is formed of the French *houff*, which signifies the same thing; though it antiently denoted a kind of *bed*, wore by country people.

The cavaliers appeared with their embroidered *housing*.

BOOT HOUSING, is a piece of stuff fastened to the hinder part of the saddle, that covers a horse's croupe; either for the sake of ornament, to hide the horse's leanness, or to save the clothes of the rider from being daubed and soiled by the sweat of the horse.

SHOE HOUSING, a piece of cloth bordered with a fringe, oftentimes put round the saddle, to cover the croupe, and hang down to the lower part of the belly, to save the stockings of those that ride without boots.

HOW, among gardeners. See the article **HOE**.

HOWKER, or **HOOKER**, vessel much used by the Dutch; bulk,

HUL

built something like a pink, but rigged and masted like a hoy. *Houkers* carry from fifty to two hundred tun; and with a small number of hands will go to the East-Indies.

They tack soon and short, will sail well, and lie near the wind; and live almost in any sea.

HOY, a small vessel or bark, whose yards are not across, nor the sails square, like those of ships, but the sails like a misfen, so that the can sail nearer the wind than a vessel with cross sails can do.

HOYSE, or **HOISE**, the sea word for haling up any thing into the ship; or getting up a yard, &c.

Thus they say *hoise* up the yard, *hoise* the water in, &c.

HOZING of *Dogs*, the cutting out the balls of their feet.

See **EXPEDITATING**.

HUCKLE *Bone*, the hip bone. See **COXE** *Os*.

HUCKSTER, one that sells provisions or small wares by retail.

HUDSON'S-BAY *Company*. See the article **COMPANY**.

HUE and **CRY**, the pursuit of one who has committed felony, &c. on the highway.

If a party robbed, or any in the company of one murdered or robbed, come to the constable of the next town, and require him to raise *hue and cry*, or to pursue the offender, describing him, and shewing, as near as he can, which way he is gone: the constable is forthwith to call for aid from the parish to seek the felon: and if he is not found there, he is to give the next constable warning; till he be apprehended, or at least pursued to the sea-side.

The Normans had a pursuit with a cry after offenders, not unlike this; which they called *clamor de baro*. See **CLAMOR** *de baro*.

Hue is also used alone, ann. 1 Edw. I. stat. 2.—In ancient records it is called *hutesum* & *clamor*.

HUERS. See the article **CONDERS**.

HUG, or *Cornish* **HUG**, a term used in wrestling, when one has an adversary on his breast, and holds him fast there.

HUGUENOTS, an appellation given by way of contempt to the Reformed, or Calvinists of France.

The name had its first rise in 1560; but authors are not agreed as to the origin and occasion thereof. Pasquier, Menage, &c. give us divers etymologies, but none of them are stuck to.

Du Verdier derives it from John Hus, whose opinions the *huguenots* chiefly receive, and *guenon*, ape, *q. d.* Hus's ape. See **HUSITES**.

Coquelle deduces the name from *Hugues Capet*, whose right of succession to the crown, the Calvinists maintained against those of the house of Guise, who pretended to be the successors of Charlemaign.

Others derive it from one *Hughes*, or *Hugh*, a Sacramentarian, who had asserted much the same doctrines as the *huguenots*, under Charles VI.

Others fetch it from the Swiss word *benquenaux*, i. e. seditious people; or from *eidgenossen*, i. e. allies, or associates in faith, which is the opinion Maimbourg most inclines to; who hence concludes, that *huguenot* is originally no term of reproach.

Castelnau Maurissiere, in his *Memoirs*, will have the *huguenots* to have been thus called by the populace, to denote them of less value than a little piece of money of the same name, being a maille, or farthing; which, in the time of Hugh Capet, was called *huguenot*, *q. d.* not worth more than a farthing.

Others take the name to have been first given by way of derision to a certain German Protestant, who being taken and examined as to the conspiracy of Amboise, before the cardinal de Lorraine, was confounded and stopped short in the beginning of his harangue, which began with *Huc noi venimus*. But the most plausible opinion is that of Pasquier, who observes, that at Tours the people have a notion of a sprite or goblin, called *king Hugon*, who strols about in the night time; whence, as those of the religion met chiefly in the night time to pray, &c. they call them *huguenots*; *q. d.* disciples of king Hugon: for it was at Tours that they were first thus denominated.—This opinion F. Daniel assents to.

HUISSIER, a French name for an *usher*, *serjeant*, or *beadle*.

HULKS, are large vessels, having their gun-decks from 113 to 150 feet long, and from 31 to 40 feet broad.—They will carry from 400 to 1000 tuns.

Their chief use is for setting masts into ships, and the like.

Antiently, the word *bulka* seems to have signified a *small vessel*.

HULL of a *Ship*, is her main body, without any masts, yards, sails, or rigging.—See *Tab. ship. fig. 1. litt. A to R*.

To **HULL**, or *lie a HULL*, is understood of a ship, when, either in a dead calm, or in a storm, she cannot carry all her sails, but they are taken in to preserve them; so that nothing but her masts, yards, and riggings are abroad, and her helm tied down to the lee-side of the ship.—In this state she will lie easily under the sea, if she be a good sailer; and make her way one point before the beam.

HUM

To **strike a HULL**, is to lie closely or obscurely in the sea in a storm, or to tarry for some comfort, bearing no sail, with the helm lashed a-lee.

HUMAN, something that relates to man, or the nature of man. See **NATURE**.

The *human* body is the subject of medicine.

Epicurus and his followers deny that the gods concern themselves with *human* affairs.

Faith is distinguished into divine and *human*.

HUMANITY, the nature of man, of that which denoteth him *human*.

Nestorius would not allow the infirmities of *humanity* to be attributed to the Deity; nor the attributes of the Deity to *humanity*.

HUMANITIES is used plurally, for the *humaniores literæ*, i. e. the study of the Greek and Latin tongues, grammar, rhetoric, poetry, and the ancient poets, orators, and historians. Such a student has gone through his *humanities* with applause.

—Calvin performed his *humanities* in the college de la Marche at Paris.

HUMECTATION*, *Moistening*, in pharmacy; the preparing of a medicine, by steeping it awhile in water, in order to soften and moisten it when too dry; or to cleanse it, or to prevent its subtle parts from being dissipated in grinding or the like.

* The word is Latin, *humectatio*, formed of *humor*, moisture.

HUMECTATION is also used for the application of moistening or suppling remedies.

In this sense we say, embrocations, emplaisters, unctions, *humectations*, fomentations, &c.

HUMERUS, or *Os HUMERI*, in anatomy, the uppermost bone of the arm, popularly called the *shoulder bone*; extending from the scapula, or shoulder-blade, to the upper end of the cubitus, or elbow.—See *Tab. Anat. (Ofscol.) fig. 3. n. 6. fig. 7. n. 8. fig. 3*.

The *humerus* is a large, long, round fistular bone, of a pretty hard, compact substance; and its inward cavity, which contains the marrow, is considerably long and large.

At its upper end it has a large round head, which is covered with a very smooth cartilage and is received into the cavity of the scapula, which makes a juncture per Arthrodiam.—This head of the bone being much larger than the socket into which it is received, the part extant is strictly embraced by a ligament, one edge of which is fastened to the margin of the cartilaginous socket of the scapula, and the other to the lower part of the head of this bone, hereby uniting them firmly together; yet so as to leave the motion the freest of all the articulations of the body, and therefore the bone very liable to dislocations.

At the lower end of the *humerus* are two processes, covered each with a cartilage; the external and lesser receiving the extremity of the radius; and the internal, the head of the cubitus.

On the outside of each of these processes is a small eminence, to which are fastened the ligaments and heads of the muscles that move the carpus and fingers.

In this bone are also three finus's; one on the fore side of the large process, receiving a process of the cubitus; another on the back part which receives the olecranon; and the third, a small feminar one between the two processes, answering to the eminence of the finus of the cubitus.

The later anatomists allow this bone five different motions, *viz.* upwards, downwards, forwards, backwards, and rotatory; and five pair of muscles for performance of the same, *viz.* the deltoides, teres, pectoralis, infraspinatus, subscapularis, &c. See each under its proper article.

HUMID, **HUMIDUM**, *Moist*.

The school philosophers make water the *primum humidum*, the first of *humid* bodies, and the cause or principle of humidity in others, which are more or less moist, as they partake more or less of this element.

HUMIDITY, *Moisture*; the quality or power of wetting, or moistening other bodies.

Aristotle defines *humidity*, by a passive quality which indispotes a body from being retained within its own bounds, but makes it easily retained in those of another: which amounts to the same as his definition of fluidity.

Others of the peripatetic school, define *humidity* a quality whereby a body becomes humid, i. e. disposed to moisten other bodies, and in moistening, to soften and dispose them to receive any figure, or impression.

Modern writers consider *humidity* as a particular species of fluidity; and define it a fluid, which being applied on a solid body, adheres thereto, and communicates the quality to other bodies. Others, somewhat more accurately, call *humidity* the power whereby a body moistens another: but what that power is, they do not shew.

But

But of this we are certain, *humidity* is only a sort of relative mode.—So far as the component particles of a fluid, compared with respect to the pores and particles of other bodies, or the texture thereof, are apt and disposed to enter those pores, or stick to those particles; so far is that fluid humid: on the contrary, so far as there is a repugnance or incongruity between the particles, &c. in respect of such bodies, the fluid is not humid.

Thus quicksilver is not moist in respect to our hands or clothes, and other things, which it will not stick to; but it may be called *humid*, in reference to gold, tin, or lead, to whose surfaces it will presently adhere, and render them soft and moist. —Even water itself, which wets almost every thing and is the great standard of moisture and *humidity*, is not capable of wetting all things; for it stands, or runs off in globular drops from the leaves of cabbages, and many other plants; and it will not wet the feathers of ducks, swans and other water fowl.

Add; that the texture alone may cause the fluid to be humid, as is plain, in that neither quicksilver, lead, or bismuth alone will stick upon glass; yet being mixed together, they will form a mass that will do so; as appears from such a composition being frequently used in foliating looking-glasses.

HUMIDUM Radicale, or Radical Moisture.

This, in reality, seems to amount to no more than the purest and most defecate part of the nutritious matter, in a condition ready to be assimilated.

By too much heat, as in fevers, hectic, &c. this *humidity* is too hastily exhausted and spent.

HUMILIATION, the act of humbling, i. e. of abating a person's pride, and bringing him lower in his opinion.

In this sense, *humiliation* stands distinguished from mortification: *humiliation* brings down the mind; mortification subdues the flesh.

HUMILIS Musculus. See the article EYE.

HUMOR, or HUMOUR. See the article HUMOUR.

HUMORISTS, or GLI HUMORISTI, the title of a celebrated academy of learned men at Rome.

The academy of *humorists* was established by Paul Mancini, who made use of Gaspar Salviani to assemble together all the men eminent for learning about Rome, and form them into a society; as is observed by Janus Nicius, in his elogy of Salvinius, Part I. p. 32.

The device of this academy is a cloud, which being raised from the salt water of the sea, returns again in fresh water; with this hemistic of Lucretius, Lib. VI. *Redit agmine dulci*. Jerom Alexander, a *humorist*, has three express discourses on this device.

The obsequies of M. Peiresc were celebrated in the academy of the *humorists*, whereof he was a member, in above forty different languages. Gassend. *Vita Peiresk.* L. VI. p. 399.

HUMOROSI, the name of an academy established at Cortona in Italy.

The *humorosi* of Cortona must not be confounded with the *humoristi* of Rome. See HUMORISTS.

HUMOUR, or HUMOR, in its general sense, signifies the same as liquor, or liquid. See LIQUID.

HUMOUR, in medicine, is applied to any juice, or fluid part of the body, as the chyle, blood, milk, fat, serum, lymph, spirits, bile, feed, salivary and pancreatic juices, &c. See each of these under its proper head, CHYLE, BLOOD, BILE, &c.

The four humours, so much talked of by the ancient physicians, are four liquid substances which they suppose to moisten the whole body of all animals, and to be the cause of the divers temperaments thereof.

These are phlegm, blood, bile, and melancholy.

But the moderns do not allow of these divisions. The humours they rather chuse to distinguish into nutritious, called also elementary, as chyle and blood; those separated from the blood, as bile, saliva, urine, &c. and those returned into the blood.

Humours, again, are distinguished into natural or salutary, and morbid, or corrupted.—To the former class belong all the juices ordinarily secreted for the uses of the body.

To the latter belong those compound humours, which thickening and growing putrid, cause tumors, abscesses, obstructions, and most diseases.

These are distinguished by various names, malignant, adust, acrimonious, corrosive, crude, peccant, &c.

HUMOUR is also used for the particular temperament or constitution of a person, considered as arising from the prevalence of this or that humour, or juice of the body.

Thus we say, a bilious, choleric humour; a phlegmatic humour; a melancholic, hypochondriac humour; a sanguine, gay, sprightly humour, &c.

HUMOURS of the Eye.—Anatomists and opticians distinguish three particular humours of the eye, which they call the aqueous, crystalline, and vitreous.

VOL. I.

The aqueous, or watry humour, is placed in the anterior or fore part of the eye, which it possesses; and is thus called, because clear and fluid like water.

The crystalline humour is placed between the other two; and is thus called from its solidity and transparency, resembling that of a crystal.

The vitreous, or glassy humour, fills the posterior part of the eye; and is denominated from its resemblance of melted glass.

These three humours have each their share in the refraction of the rays of light necessary to vision.

Authors, both ancient and modern, speak of the regeneration of the humours of the eye; and give us instances of their reproduction, when by any accident they had been let out. But their instances strictly considered generally go no farther than to the aqueous and vitreous humours.

Borri only, in a letter to Bartholine, says as much of the crystalline.—He affirms, that he has slit the pupil of the eye of divers animals, and squeezed out all the humours, even the crystalline, and has afterwards perfectly refitted them again to fight; and that the eyes of the birds, whereon the operation had been performed, instead of being damaged thereby, were rendered more lively and vigorous than usual. He adds, that he had performed the same experiment on divers persons, with so much success, that there remained not the smallest appearance of a cicatrix in the eye. See CATARACT.

HUMOUR is also used in dramatic poetry, for a subordinate or weaker species of what the critics call *manners*.

Humour is usually looked on as peculiar to the English drama; at least, our comic poets have excelled therein, and carried it beyond those of any other nation: and ours is perhaps the only language that has a name for it.

Humour is usually considered by critics, as a fainter or weaker habitual passion peculiar to comic characters, as being chiefly found in persons of a lower degree than those proper for tragedy.

Every passion may be said to have two different faces, one that is serious, great, formidable, and solemn, which is for tragedy; and another that is low, ridiculous, and fit for comedy; which last is what we call its humour.

Wit only becomes few characters: it is a breach of character to make one half the persons in a modern, or indeed in any comedy, talk wittily and finely; at least at all times, and on all occasions.—To entertain the audience, therefore, and keep the dramatic persons from going into the common, beaten, familiar ways and forms of speaking and thinking, recourse is had to something to supply the place of wit, and divert the audience, without going out of character: and this does humour; which therefore is to be looked on as the true wit in comedy.

A very good judge, the duke of Buckingham, makes *humour* to be all in all: wit, according to him, should never be used, but to add an agreeableness to some proper and just sentiment, which, without some such turn, might pass without its effect.

HUNDRED, Centum, Cent. the number of ten times ten, or the square of ten.

The place of hundreds makes the third in order in the Arabic numeration.

We usually express the quantity or proportion of the profits made in the way of commerce, &c. by the hundred.—They ask two and a half per cent. or in the hundred, for remitting money to such a city. The legal interest of money is five per cent. or five pounds in the hundred.

HUNDRED is also used as a measure, to express a certain quantity, or number of things.—A hundred of salt at Amsterdam, is fourteen tuns.

Deal boards are sold at sixscore to the hundred, called the long hundred.—Pales and laths are counted at five score to the hundred, if five foot long, and six score if three foot long.

HUNDRED Weight, or the great hundred. See QUINTAL.

HUNDRED, HUNDREDUM, Centuria, is also a part or division of a shire, or county. See SHIRE, and COUNTY.

It was so called, according to some, because of old each hundred found 100 fidejussors or sureties of the king's peace, or 100 able men for his war.

Others rather think it to have been so called, because originally composed of an hundred families.—It is true, Brompton tells us, that an hundred contains centum villas; but then Giraldus Cambrensis writes that the Isle of Man hath 343 villas. In both these places the word villa must be taken for a country family; for it cannot mean a village, because there are not above forty villages in that island.

So, where Lambard tells us that an hundred is so called, a numero centum hominum, it must be understood of an hundred men, who are heads and chiefs of so many families.

Hundreds were first ordained by king Alfred, the 29th king of the West Saxons: Alfredus rex (says Lambard, *verbo* centuria)

turia) ubi cum Guthrino Dano sædus inierat, prudentissimum olim a Jethrone Moysi datum secutus consilium, Angliam, primum in satrapias, centurias, & decurias partiti sunt. — Satrapiam, sive, a Scyrian, (quod parti significat) nominavit, centuriam hundred; & decuriam, teaching sive tiemmantale, i. e. decemvirale collegium, appellavit; atque iidem nominibus vel hodie vocantur, &c. See COUNTY, and TITHING. This dividing of counties into hundreds, for the better government, king Alfred borrowed from Germany, where *centa* or *centina* is a jurisdiction over an hundred towns. Such is the original of *hundreds*, which still retain the name; though their jurisdiction be devolved to the county-court, some few excepted, which have been by privilege annexed to the crown, or granted to some great subject, and so remain still in the nature of a franchise.

This has been ever since the stat. 14 Edw. III. whereby these *hundred courts*, formerly farmed out by the sheriff to other men, were all, or most part, reduced to the county-court, and so remain at present: so that where we read now of *hundred courts*, they are to be understood of several franchises, wherein the sheriff has nothing to do by his ordinary authority, except they of the *hundred* refuse to do their office.

HUNDRED, or **HUNDREDUM**, is sometimes also used for an immunity or privilege, whereby a man is quit of the *hundred-penny*, or custom due to the *hundred*.

HUNDRED-LASH, signifies the *hundred court*; from which all the officers of the king's forest were freed by the charter of Canutus.

HUNDRED SUIT, the payment of personal attendance, ordering suit, and service at the *hundred court*.

HUNDREDERS, or **HUNDREDORS**, **HUNDREDARII**, are men impanelled, or fit to be impanelled, of a jury, upon any controversy, dwelling within the *hundred* where the land in question lies.

HUNDREDER is also used for him who hath the jurisdiction of an *hundred*, and holds the *hundred court*. See **HEADBOROUGH**. Sometimes it is also used for the bailiff of an *hundred*. See **BAILIFF**.

HUNGARY Water, *Aqua HUNGARICA*, a distilled water, so denominated from a queen of Hungary, for whose use it was first prepared.

Hungary water is one of the distilled waters of the shops; and is directed in the college dispensatory, to be made of rosemary flowers infused some days in rectified spirit of wine, and the spirit then distilled.

It is an agreeable perfume, and its virtues are much the same as those of the fimple it is drawn from. See **ROSEMARY**.

HUNGER, *Fames*, a natural appetite or desire of food. *Hunger* is properly distinguished into *natural* and *animal*: *natural hunger* is an irritation of the stomach, occasioned by fasting; *animal hunger* is the sensation or perception of that irritation, and the desire of food consequent thereon.

There are various opinions as to the nature, cause and definition of *hunger*; the point having been controverted from Aristotle to our time. — Galen defines it a painful sensation, arising from a divulsion of the stomach; the other Peripatetics call it an appetite or desire of hot and dry: which two systems some authors have endeavoured to reconcile by taking them both in; and accordingly define *hunger* a natural appetite of hot and dry, occasioned by a painful divulsion of the membranes of the stomach, arising from an emptiness thereof.

The modern philosophers speak much more accurately and intelligibly on the point. — *Hunger* is generally considered by them as owing to the sharpness or acrimony of the liquor contained in the stomach, which vellicating the fibres thereof, occasions this uneasy sensation. — They add, that the occasional cause of this vellication, is the emptiness of the stomach, which not furnishing food for the stomach-liquor to be employed on, exposes its inner membrane to the action thereof.

In effect, it is generally agreed, that there is some menstruous juice or humour continually discharged from the excretory ducts of the neighbouring glands into the stomach, to assist in the dissolution and digestion of the food; and that this liquor, after the food is gone, falls upon the stomach itself, and irritates its nerves so strongly, as to propagate the impression to the brain, and thus produce the perception of *hunger*.

This juice some will have to be acid, by reason bodies of that class are used to whet the appetite and excite *hunger*; and that fatty bodies more readily remove it than others, by their adhering to the acid spicula, and blunting the points thereof.

Others, denying the existence of any such stomach-liquor, and accounting for digestion without it; consequently deny *hunger* to have any dependence thereon. — The dry attrition of the coats of the stomach, according to them, is the only cause of it.

On both these principles they say it is that the Indians elude their *hunger*, by swallowing pills made of tobacco leaves and

calcined shells: These pills take away the appetite, both as the tobacco leaves gradually diminish the sensibility of the stomach, and as the calcined shells absorb the salino-acid menstruum. Thus also it is, that poor people frequently smoke tobacco to deceive their *hunger*, not to satisfy it; for tobacco affords no nutriment; but it occasions a plentiful spitting, and by this means discharges the body of the acrid humour which causes *hunger*.

The latter system Dr. Drake thus lays down: — When all the chyme and chyle is pressed out of the stomach, it follows the motions of its contents, and is again, by means of its muscular coat, reduced to a state of contraction, and by that means the inner coat is brought to lay in folds, which touching, and by means of the peristaltic motion, rubbing lightly, upon one another, produce that gentle sense of fretting or vellication, which we call *hunger*, which being felt first in the upper orifice, which is first evacuated, begins there to prompt us to replenish: but as by degrees the remainder of the contents are expelled, this friction or rubbing of the membranes upon each other, spreads gradually over the whole stomach, and renders our *hunger* more urgent and impatient, till, by a new repulsion, we take away the cause.

Others think the blood, derived from the adjacent ramifications of the arteries into the stomach, sufficient to account for *hunger*, without the mediation either of the attrition or the menstruum. — The mass of blood itself, they observe, is rendered acid through abstinence from food; its soft balsamic parts having been carried into all parts of the body, and lodged therein as nutriment, to supply the absence of those wore off and exhaled: To which it may be added, that the velocity of the blood is considerably augmented a good while after eating, beyond what it was during the action of digestion.

Hence it is, that persons of a bilious constitution, young people, and those who labour hard, must sooner find themselves *hungry* than others. 2^d. That *hunger*, if it hold long, occasions a violent heat, and even sometimes a fever. 3^d. That those whose humours are crass and viscid, are less incommoded with *hunger* than others.

In effect, we observe, that some animals, whose humours are found to have those conditions, as tortoises, &c. will live a long time without food. — For man, six or seven days are commonly supposed the limit within which, if he take no solid food, he dies; though we have instances of abstinence which far surpasses this. See **ABSTINENCE**, and **FASTING**.

HUNGRY Evil, is an unnatural and over-hasty greediness in a horse, to devour his meat faster than he can chew it; and may be known by his snatching at it as if he would devour it whole.

HUNTING, the art or act of pursuing, and chasing beasts of game. See **GAME**.

In its general sense, *hunting* includes the pursuit both of hairy and feathered game; but in its more proper and restrained signification, it is only applicable to beasts of venery and chase.

F. de Launay, professor of the French laws, has an express treatise of *hunting*. — From those words of God to Adam, Gen. i. 26, and 28. and to Noah, Gen. ix. 2, 3, *hunting* was considered as a right devolved, or made over to man; and the following ages appear to have been of the same opinion. Accordingly we find that among the more civilized nations, as the Persians, Greeks, and Romans, it always made one of their genteeler diversions; and as to the wilder and more barbarous, it served them with food and necessities. — The Roman jurisprudence, which was formed on the manners of the first ages, made a law of it; and established it as a maxim, that as the natural right of things which have no master, belongs to the first possessor, wild beasts, birds, and fishes, are the property of whoever can take them first.

But the northern nations of Barbarians who over-run the Roman empire, bringing with them a stronger taste for the diversion; and the people being now possessed of other, and more easy means of subsistence from the lands and possessions of those they had vanquished: their chiefs and leaders began to appropriate the right of *hunting*, and, instead of a natural right, to make it a royal one. — Thus it continues to this day; the right of *hunting*, among us, belonging only to the king, and those who derive it from him.

And hence have arisen all our laws and charters of the forest, laws and regulations for preservation of the game. &c. See **FOREST**.

Hunting is practised in a different manner, and with a different apparatus, according to the nature, genius, and address of the particular beast which is the object thereof. — These beasts are the hart, hind, hare, boar, wolf, buck, doe, fox, marten, and roe; the five first whereof are denominated beasts of the forest, or venery, *sylvæstræ*; and the five latter, beasts of the field, or of chase, *campæstræ*.

The gentlemen and masters of the sport have framed a new set of terms, which may be called the *hunting language*; a little

little view or vocabulary whereof we shall here give the reader.

The terms, then, used for beasts of venery and chase, as they are in company, are these.—They say, *a herd of harts*, and all manner of deer.—*A bevy of roes*.—*A founder of swine*.—*A roat of wolves*.—*A riches of martens*.—*A brace or leash of bucks, foxes, or hares*.—*A couple of rabbits or conies*.

There are also terms for their lodging.—A hart is said to *harbour*.—A buck *lodges*.—A roe *beds*.—A hare *seats or forms*.—A coney *sits*.—A fox *kennels*.—A marten *tree*.—An otter *watches*.—A badger *earths*.—A boar *couches*.

Hence, to express their dislodging, they say, *unbarbour the hart*.—*Rouse the buck*.—*Start the hare*.—*Bolt the coney*.—*Unkennel the fox*.—*Tree the marten*.—*Vent the otter*.—*Dig the badger*.—*Rear the boar*.

The terms for their noise at rutting time are as follows:—

A hart *bellets*.—A buck *grows or troats*.—A roe *bellows*.—A hare *beats or taps*.—An otter *whines*.—A boar *freams*.—A fox *barks*.—A badger *strikes*.—A wolf *howls*.—A goat *rattles*.

Terms for their copulation.—A hart or buck goes to *rut*.

—A roe goes to *turn*.—A bear goes to *brim*.—A hare or coney goes to *buck*.—A fox goes to *clicketing*.—A wolf goes to *match or make*.—An otter *bunteth* for his kind.

Terms for the footing and treading.—Of a hart, we say the *foot*.—Of a buck, and all fallow deer, the *view*.—Of all deer, if on the grass, and scarce visible, the *fauling*.—Of a fox, the *print*; and of other the like vermin, the *footing*.

—Of an otter, the *mark*.—Of a boar, the *track*.—The hare, when in open field, is said to *fore*; when the winds about to deceive the hounds, the *doublets*; when the beats on the hard highway, and her footing comes to be perceived, the *pricketh*: in snow, it is called the *trace of the hare*.

The tail of a hart, buck, or other deer, is called the *single*.

—That of a boar, the *wreath*.—Of a fox, the *brush or drag*; and the tip at the end, the *chape*.—Of a wolf, the *stern*.—Of a hare and coney, the *scut*.

The ordure or excrement of a hart, and all deer, is called *sewmet* or *sewming*.—Of a hare, *cretiles or crotling*.—Of a boar, *lesse*.—Of a fox, the *billiting*; and of other the like vermin, the *fuants*.—Of an otter, the *spraints*.

As to the heads of deer, something has already been spoken under the article H E A D.

For the attire, or parts thereof, those of a stag, if perfect, are the *bar*, the *pearls*, the little *knobs* on it, the *beams*, the *gutters*, the *antlers*, the *sur-antlers*, *royal*, *sur-royal*, and all at top, the *croches*.—Of the buck, the *bar*, *beams*, *brown-antler*, *black-antler*, *advancer*, *palm*, and *spellers*.

If the croches grow in the form of a man's hand, it is called a *palm head*.—Heads bearing not above three or four, and the croches placed aloft, all of one height, are called *crown-heads*.—Heads having double croches, are called *forked heads*, because the croches are planted on the top of the beam like forks.

They say, a *litter* of cubs, a *nest* of rabbits, a squirrel's *dray*.

The terms used in respect of the dogs, &c. are as follow.

—Of greyhounds, two make a *brace*; of hounds, a *couple*.—Of greyhounds, three make a *leash*; of hounds, a *couple and half*.—They say, *let slip* a greyhound; and *cast-off* a hound.——The string wherewith a greyhound is led, is called a *leash*; and that of a hound, a *hyme*.—The greyhound has his *collar*, and the hound his *couplets*.—We say a *kennel* of hounds, and a *pack* of beagles.

Styles or manners of HUNTING, are various, according to the country, the beast, and the means whereby he is to be caught.

The hunting used by the antients, was much like that now practised for the rain deer; which is seldom hunted at force, or with hounds; but only drawn with a blood-hound, and forestalled with nets and engines.——Thus did they with all beasts; whence a dog is never commended by them for opening, before he has discovered where the beast lies: Hence, they were not in any manner curious as to the music of their hounds, or the composition of their kennel or pack, either for deepness, loudness, or sweetness of cry, which is become a principal point in the hunting of our days.

Their huntmen, indeed, were accustomed to shout and make a great noise, as Virgil observes in the third of his *Georgics*: *ingentem clamore preme ad retia ceruvm*. But that clamour was only to bring the deer to the nets laid for him.

The Sicilian way of hunting had something in it very extraordinary.——The nobles or gentry being informed which way a herd of deer passed, gave notice to one another, and appointed a meeting; every one bringing with him a cross-bow or long-bow, and a bundle of flaves shod with iron, the heads bored, with a cord passing through them all: Thus provided, they came to the herd, and casting themselves about in a large ring, surrounded the deer.——Then, each

taking his stand, unbound his faggot, set up his stake, and tied the end of the cord to that of his next neighbour, at the distance of ten foot from one another.——Then taking feathers, died in crimson, and fastened on a thread, they tied them to the cord; so that with the least breath of wind, they would whirl round.——Which done, the persons who kept the stands withdrew, and hid themselves in the next covert. Then the chief ranger entering within the line with hounds to draw after the herd, roused the game with their cry; which flying towards the line, were turned off, and still gazing on the shaking and flapping feathers, wandered about as if kept in with a real wall or pale.

The ranger still pursued, and calling every person by name, as he passed by their stand, commanded him to shoot the first, third, or sixth, as he pleased; and if any of them missed, or singled out another than that assigned him, it was counted a grievous disgrace.

By such means, as they passed by the several stations, the whole herd was killed by the several bands. *Pier. Hieroglyphic*. Lib. VII. cap. 6.

Hunting, as practised among us, is chiefly performed with dogs; of which we have various kinds, accommodated to the various kinds of game; as *hounds*, *grey-hounds*, *staunch-hounds*, *blood-hounds*, *terriers*, &c. See HOUND.

In the kennels or packs they generally rank them under the heads of *enterers*, *drivers*, *flyers*, *tyers*, &c.

On some occasions, nets, spears, and instruments for digging the ground, are also required: nor is the *hunting-horn* to be omitted.

The usual chases among us, are the *hart*, *buck*, *roe*, *hare*, *fox*, *badger*, and *otter*.——We shall here give something of what relates to each thereof.

By the way let it be observed, with regard to the seasons of beasts, that hart and buck hunting begins at the end of fence month, which is a fortnight after Midsummer, and lasts till Holy-Rood-Day.——The hind and doe come in course on Holy-Rood-Day, and last till Candlemas.——Fox hunting comes in at Christmas, and holds till the Annunciation.

Roe hunting begins at Michaelmas, and ends at Candlemas.——Hare hunting commences at Michaelmas, and goes out at the end of February.——Where the wolf and boar are hunted, the season for each begins at Christmas; the first ending at the Annunciation, the second at the Purification.

Here, too, is the place for some general terms and phrases, more immediately used in the progress of the sport itself: what belongs to the several sorts of game, in particular, being reserved for the respective articles.

When the hounds then, being cast off, and finding the scent of some game, begin to open and cry; they are said to *challenge*.——When they are too busy, before the scent be good, they are said to *babble*.——When too busy, where the scent is good, to *barwl*.——When they run it end-ways orderly, holding in together merrily, and making it good, they are said to be in *full cry*.——When they run along without opening at all, it is called *running mate*.

When spaniels open in the string, or a grey-hound in the course, they are said to *lapse*.

When beagles bark and cry at their prey, they are said to *yearn*.

When the dogs hit the scent the contrary way, they are said to *draw amiss*.

When they take fresh scent, and quit the former chase for a new one, it is called *hunting change*.

When they hunt the game by the heel or track, they are said to *bunt counter*.

When the chase goes off, and returns again, traversing the same ground, it is called *hunting the foil*.

When the dogs run at a whole herd of deer, instead of a single one, it is called *running riot*.

Dogs set in readiness where the game is expected to come by, and cast off after the other hounds are passed, are called a *relay*.——If they be cast off ere the other dogs be come up, it is called a *vaindelay*.

When finding where the chase has been, they make a proffer to enter, but return, it is called a *blenish*.

A lesson on the horn to encourage the hounds, is named a *call*, or a *recheat*.——That blown at the death of a deer, is called the *mort*.——The part belonging to the dogs of any chase they have killed, is the *reward*.——They say, *take off* a deer's skin; *strip* or *chase* a hare, fox, and all sorts of vermin; which is done by beginning at the snout, and turning the skin over the ears, down the tail.

Badger HUNTING.——A badger is called by several names, viz. a *gray brock*, *bore-fen*, or *baulon*.——The male is called a *badger* or *bore-pig*, and the female a *fow*.

This beast is very frequent in Italy, Sicily, the Alpine, and Helvetian coasts; and is not uncommon in France and England.

There are two kinds, the one resembling a dog, and the other a hog; they differ in their snout and colour, the one resembling that of a dog, the other of a swine: The first has a greyer or whiter coat than the other, and goes farther out to prey:

They sfer also in their meat, the one eating flesh and carrion, like a dog, the other roots and fruit, like a hog.

Tuberville mentions two sorts of badgers, but in a somewhat different manner; the one, according to him, casting his fimaunts long, like a fox, having his residence in rocks, and making his burrow very deep; whereas the burrows of the other are made in light ground, and have more variety of cells and chambers: The one is called the *badger-pig*, and the other the *badger-whelp*; or the one may be called *canine*, and the other *swinish-badger*: The first has his nose, throat and ears yellowish, and is in other parts much blacker and higher legged than the latter. He says both live on flesh, hunting greedily after carrion; and are pernicious to warrens, especially when big with young. When the badgers earth, after they have dug a good depth, they make use of an expedient to carry off the earth.—In order to which, one of them lies down on his back, and upon his belly the rest lay the earth; thus taking his hind feet in their mouth, they draw the belly-laden badger out of the hole or cave, and having disburdened him, he re-enters, and repeats the labour till the work be completed.

The badger is a very sleepy beast, especially in the day time, seldom stirring abroad but in the night, whence the denomination *lucifuga*, *q. d.* avoider of the light.

The badger is a deep biting beast, having very sharp teeth: to guard against the effects whereof, it is usual to put great broad collars about the dogs necks. His back is broad, and his legs are longer on the right side than the left, whence he runs best on the side of a hill or cart-road way. He fights on his back, and by this means is at liberty to use both his teeth and nails: He has a faculty of blowing up his skin after a strange manner, by which he defends himself against any blow or bite of the dogs; so that you may thrash your heart out on his back to no purpose; but a small stroke on the nose dispatches him presently. In Italy and Germany they eat the flesh of badgers, boiling it with pears; but in England it is not liked, being of a sweetish and rankish taste. It is best in September; and of the two kinds, the *swinish-badger* is the best meat.

They are long livers, and generally grow blind by mere age; from which time they never stir out of their holes, but are fed by the rest.

The method of *hunting* the badger is thus:—Seek the earth and burrows where he lies, and in a clear moon-shine night go and stop all the holes but one or two, and therein place facks, fastened with drawing strings, which may shut him in as soon as he strains the bag.—The bags thus set, cast off your hounds, and beat all the groves, hedges, or tufts within a mile or two. What badgers are abroad, being alarmed by the dogs, will strait repair to their earths, and so be taken.

He that stays to watch the facks, must stand close, and upon a clear wind; else the badger will find him, and fly some other way for safety. If the hounds either encounter him, or undertake the chase before he can get into his earth, he will stand at bay like a boar, and make excellent sport.

If the badger be attacked in his earth; as soon as he perceives the terriers yearn him, he will stop the hole between the dogs and himself; and if the dogs continue baying, he removes his baggage with him, and goes into another apartment or chamber, of which he usually has half a dozen in the burrow; thus retreating from one to the other, till he can go no farther, and barricading the way as he goes.

Buck HUNTING, or HUNTING of fallow deer.—The buck the first year, is called a *fawn*.—The second year, a *pricket*.

—The third, a *forel*.—The fourth, a *fore*.—The fifth, a *buck of the first head*.—The sixth year, a *great buck*.

The female is called *doe* or *doe*.—The first year, a *fawn*—The second a *tegg*.—The third, a *doe*.

This beast is common in most countries, being as corpulent as a hart, but in most things resembling more a roe, except in colour; which is various, but most commonly branded or sandy on the back, having a black list all along on the ridge, and the belly and sides spotted with white.

The male has horns not much differing from a hart, except in largeness, and they grow out of the head like fingers out of the hand; whence it is called *cervus palmatus*. The female is without horns.

Less art and skill are required in lodging a buck, than in harbouring a hart; nor does there need so much drawing after: It is sufficient that you judge by the view, and mark what grove or covert he enters; for he does not wander and rove so often as a hart, nor so frequently change his layer. When hard hunted, he usually takes to some strong hold or covert he is acquainted with; not flying far before the hounds, nor crossing nor doubling, nor using any of the subtleties the hart is accustomed to.

The buck will beat a brook, but seldom a great river, as the hart; nor can he stay so long at foil.

The greatest subtlety a huntsman need use in *hunting* the buck, is to beware of *hunting* counter or change, because of the plenty of fallow deer, which use to come more directly upon the hounds than the red deer do.

The buck herds more than the hart, and lieth in the driest places: but if he be at large, unconfined in a park, he herds but little from May to August, because the flies trouble him. He takes delight in hilly places, but chuses the dales to feed in.

FOX HUNTING.—This animal, the first year, is called a *cub*.—The second, a *fox*.—The third, an *old fox*.

His nature, in many respects, is like that of a wolf; and both bring the same number of cubs at a litter; but the fox litters deep under ground, which the wolf does not.

A bitch fox is hard to take, when bragged, and with cub, in regard she lies near her burrow, into which she runs upon hearing the least noise; indeed it is no easy matter to take her at any time, as being a beast of exceeding subtlety. What makes *fox-hunting* the more entertaining, is, the strong hot scent this creature affords, which keeps up an excellent cry; but as his scent is hotter at hand, so it dies sooner than that of a hare, &c. Add, that he never flies far before the hounds, as not trusting to his legs, or the champion ground, but has recourse to the strongest coverts.—When he can no longer stand up before the hounds, he takes earth, and must be dug out.—When coursed by grey-hounds on a plain, his last refuge is usually to piss on his tail, and flap it in their faces as they come near him; sometimes squirting also his thicker excrement upon them, to make them give over their course.

When a bitch fox goes a clicketing, and seeks the dog, she cries with a hollow voice, not unlike the howling of a mad dog; and the like noise she makes when the misses any of her cubs; but the never cries at all when she is killing, but defends herself in silence to the last gasp.

The fox is taken with hounds, grey-hounds, terriers, nets, and gins.—Of terriers there are two sorts, the one crook-legged, and commonly short-haired, which take earth well, and lie long at fox or badger; the other is shagged and straight-legged, which will not only *hunt* above ground as others, but also enter the earth with great fury, though these cannot stay in so long, by reason of their vehemence.

The fox chuses to earth in ground hard to dig, as in clay or stony ground, or amongst the roots of trees; and his earth has commonly but one hole, which goes straight along in, before it come at their couch. He sometimes by craft possesses himself of a badger's old borrow, which has variety of chambers, holes, and angles. Gensler relates, that he frequently cheats the badger of his habitation, by laying his excrement at the mouth of the other's burrow: Some pretend, that the wolf being an enemy to the fox, this latter secures his earth, by laying an herb called sea-onion in the mouth thereof, which the wolf has a natural aversion to, so that he never comes near the place where it either lies or grows.

Hare HUNTING.—A hare, the first year, is called a *leveret*.—The second year, a *hare*.—The third, a *great hare*.

A hare is called in Hebrew, *arnabet*; which being feminine, possessed a great many with the notion that all hares were females.—He is called *lag-s*, by the Greeks, for his immoderate lust, and by the same nation *ptox*, for his fear; and by the Latins, *lepus*, quasi *levis-pes*, to denote his swiftness of feet. There are four sorts of hares.—Some live in the mountains, some in the fields, some in the marshes, and some any where indifferently.

Those of the mountains are the most swift, and those of the marshes the slowest: The wandering hares are the most difficult and dangerous to follow.

Each part and member of the hare is formed for celerity; the head is round and short, of a convenient length; the ears long and lofty, to hear the enemy at a distance, and save itself in time; the lips continually move, sleeping and waking; and the eye is too big and round for the lid to cover it, even when asleep, so that the creature sleeps as it were on the watch. The breast is capacious, and fitted to take more breath than that of any other beast.

They feed abroad to conceal their forms; and never drink, but content themselves with the dew. The hare's ears lead the way in her chase; for with one of them she hearkeneth to the cry of the dogs, the other being stretched forth like a sail to promote her course.

The hares of the mountains often exercise themselves in valleys and plains, and through practice grow acquainted with the nearest way to their forms. Those which frequent bushes and brakes, are not able to endure labour, nor are very swift, being tender footed, and growing fat through discontinuance of exercise.

When the hare has left the dogs far behind, she goes to some hill or rising ground, where, rearing on her hinder legs, she observes at what distance her pursuers are.

The scent is naturally stronger in wood hares than field hares; but in all sorts it is strongest when they feed on green corn.—In winter mornings, the scent does not lie till the frost be a little thawed: and it may be added, that a hare always leaves more scent when she goes to relief, than when she goes to form.

Hare footsteps are more seen in winter than summer, because as the nights are longer, they travel farther.—Their prints

are very uncertain at the full moon; at which time they leap and play together. The young, it is to be observed, tread heavier than the old, by reason their limbs are weaker. A buck, or male hare, is known by his beating the hard high-ways, feeling farther but in the plains, and making his doublings of a greater compass than the female, who keeps close by some covert side, turning, winding and crossing in the bushes like a coney, and rarely running out an end; whereas the buck, having once made a turn or two about his form, then farewell turns, for he will frequently lead them five or six miles without once turning his head: Add, that the buck is known at his rising out of form, by his hinder parts, which are more white, and his shoulder which is redder than the does.

The hare regulates its conduct according to the weather.—In a moist day she holds the highways more than at any other time, by reason the scent is then most apt to lie; and if she come at the side of any young grove or spring, she forbears to enter, but squats down aside thereof, till the hounds have over-shot her; upon which she returns the same way she came without turning into any covert, for fear of the wet and dew hanging on the boughs.

Regard is also to be had to the place where the hare sits, and upon what wind; for if her form be either upon the north or south wind, she will not willingly run into the wind, but aside, or down the wind: On the contrary, if the form in the water, it is a sign she is foul and muddled, and in the course will make all her doubling and crossing about brook-sides, and near plashes; for her scent, under this condition, being very strong, she needs a place that will take but little. Sometimes, when hunted down, she will start a fresh hare, and squat in the same form: At other times she will creep under the door of a sheep coat, and hide among the sheep, or run among a flock of sheep; and will not without the utmost difficulty be taken from among them.—Add, that some will take the ground like a coney; this is called going to vault.

Some hares will go up one side of the hedge, and come down the other; and we have known a hare, that being sorely hunted, has got upon a quick-set hedge, and ran a good way on the top thereof, and then leaped off upon the ground: And it is no unusual thing for them to take themselves to furz-bushes, and leap from one to another, whereby the hounds are frequently in default.

A hare it is said does not live above seven years, at most, especially the buck: And if he and the doe keep one quarter, they will not suffer any strange hare to fit by them; whence the proverb, 'The more you hunt, the more hares you shall have;' since, having killed one hare, another comes and possesses his form. By the way it is to be observed, that to enter a young kennel of hounds, regard must be had to the nature of the country, and of the quarry; for, according to the place wherein they are entered, and the game first given them, will they afterwards prove. Thus, if they be entered in a champion country, they will ever after more delight to hunt there than on any other ground.

Having found where a hare hath relieved in some pasture or corn-field; to find her form, the season of the year, and the state of the weather, are to be considered.—In the spring or summer, a hare will not fit in the bushes, because frequently offended with pismires, snakes, and adders; but will fit in cornfields and open places.—In winter they chuse to fit near towns and villages, in tufts of thorns and brambles, especially when the wind is northerly or southerly.—According to the season and nature of the place where the hare is accustomed to fit, there beat with your hounds and start her; which is better sport than trailing of her from her relief to her form.—Having started her, step in; and halloo in the hounds till they have undertaken it, crying, 'That, That or There, There, and go on with full cry; then recheat them, and follow at a distance, taking care not to forward them too much at first, as being apt, in the first heat to overshoot the game.—Above all things mind the first doubling the hare makes, which is to be a key or direction for the whole day; all the other doublings the afterwards makes being like the first.—According to the policies you see her use, and the place where you hunt, make your compass, to help the defaults, great or little, long or short; always seeking the most secret and most commodious places for the hounds to scent in.

Hart HUNTING, or HUNTING of red deer.—This animal, the first year is called a *calf*, or *hind calf*.—The second year, a *knobber*.—The third, a *brock*.—The fourth, a *flag-gard*.—The fifth, a *stag*.—The sixth, a *hart*.
The female is called a *hind*.—The first year she is a *calf*.—The second, a *beast*, and sometimes a *bracket's sister*.—The third, a *hind*.

Terms occurring more especially in hunting the hart, and not yet explained, are as follow.—The print or impression where a deer has lain, is called a *layer*: if it be in covert, or a thicket, it is called his *harbour*.—Where a deer has pulled into a thicket, leaving marks whereby his bulk may be guessed at, it is called an *entry*.—When they cast their heads,

they are said to *new*.—When they rub their heads against trees, to bring off the peels of their horns, they are said to *fray*.—When a deer hard hunted takes to swimming in the water, she is said to go to *fall*.—When they turn head against the hounds, they are said to *bay*.—When the hounds touch the scent, and draw on till they put up the hart, they are said to *draw on the flat*.

As to the nature and qualities of the hart, it is to be observed that he is an excellent swimmer; there being instances, when fore hunted, of his plunging in the sea, and being killed by fishermen twelve miles from land.—When in going to rut, they have occasion to cross a great river, or arm of the sea, it is said they assemble in great herds; the strongest goes in first, and the next of strength follows; and so one after the other, relieving themselves by staying their heads on the buttocks of each other.

The hind commonly carries her calf eight or nine months, which usually falls in May: Some have two at once; and they always eat up the skin wherein the calf laid.—As the young grows up, the old one teaches it to run, and leap, and how to defend itself from the hounds.

The hart is amazed at hearing any one call or whistle in his fit: If you cry ware, ware, or take heed, you will see him instantly turn back, and make some little stand.—His sense of hearing is very perfect when his head and ears are erect; but very imperfect when he holds them down: Hence, when he pricks up his ears, he is known to be apprehensive of danger. When he is on foot, and not afraid, he wonders, and takes pleasure to gaze at every thing he sees.

The hart is very long lived, commonly reaching to an hundred years, or upwards.—The principal marks of his age are taken from his head; yet is this somewhat precarious, some having more croches thereon at the same age than others.—Those are accounted to excel in beauty of horns, which bear them high.

The horns do not grow to the bone or scalp of the head, but only to the skin, branching into many spears, and falling off once a year, in the spring.—Though solid throughout as stone, yet if they remain a while in the air, they grow very light and friable, discovering themselves to no other than an earthy substance, concrete and hardened with a strong juice into the form of bones.

The horns being fallen, they retire and hide themselves in the shades to avoid the annoyance of flies; and only come out to feed in the night.—Their new horns appear at first like bunches, very soft and tender; but by the increase of the sun's heat, they at length grow harder, and are covered with a rough skin called a *velvet head*.—As that skin dries, they daily try the strength of their new heads upon trees, which not only burnishes and scrapes off the roughness, but, by the pain they feel hereby, admonishes them how long to forbear the company of their fellows; for when the horn grows insensible, they return to their former condition.

The taking of this beast requires a deal of art and attention.—'The deceitful and subtle hart, says Genser, by windings and turnings deceives its hunters, no less than the harts of Mæandros, flying from the terrible cry of Diana's hounds.'—The prudent hunter, therefore, must frame his dogs, as Pythagoras did his scholars, with words of art, to set them on, and take them off at pleasure.

When he goes for sport, he is first to encompass the beast on four sides, in her own layer; and thus unharbour her in the view of the dogs, that so they may never lose her slot or footing.—But note, a deal of choice and discretion is here required; for he may not set off upon every one, either of the herd, or those which wander solitary: The young, the small, &c. are to be passed over; and partly by sight, and partly by the footing, fewness, the largeness of the layer, &c. he must make judgment of the game, singling out for that purpose the largest head in the whole herd.

There are divers means for knowing an old hart, viz. by the *slot*, the *entries*, the *abatures*, and *falls*, the *sewetts*, *gate* and *walks*, *fraying-stocks*, and the *head* and *branches*.

1°. As to the *slot*.—The treadings of the hart's foot are to be carefully noted: If you find the treadings of two, the one long, and the other round, yet equally big, the longest slot declares the largest hart: Add, that the old hart's hind foot never over-reaches the fore-foot, as that of the young one does.—2°. The fewmishing is chiefly to be judged of in April or May: If it be large and thick, it signifies the hart to be old.—3°. To know the height and thickness of the hart, observe his entries and galleries into the thickets, and what boughs he hath over-stridden; and mark from thence the height of his belly from the ground; for a young deer usually creeps low, as he passes to his harbour, and goes through places, which the old one, being stiff and flatly, will not stoop to.—4°. By his gate it may be known whether the hart be large, and whether he will stand long before the hounds: If he have a long step, he will stand long; being swift, light, and well braced: If he have a great flat, which is the sign of an old deer, he will be a latter.—As to his fraying post, note, that the older the hart is, the sooner he goeth to fray, and the greater is the tree he chuses to

fray upon; it being necessary it be such as may not bend.—Now, to seek or find out a hart in his haunt, or feeding-place, it is to be observed, that he changes his manner of feeding every month.—From the conclusion of the rutting time, which is in November, they feed in heaths and broomy places.—In December they herd together, and withdraw into the strength of the forests, to shelter themselves from the feverish weather, feeding on holm trees, elder trees, brambles, &c. The three following months they leave herding, but keep four or five in a company, and in the corners of the forest, will feed on the winter pasture, sometimes making their excursions into the neighbouring corn fields, if they can perceive the blades of wheat, rye, &c. appear above ground.—In April and May they rest in thickets and shady places, stirring very little till rutting time, unless disturbed.—The three succeeding months they are in their pride of grease, and resort to springs, copses and corn fields.—In September and October they leave the thickets, and go to rut; during which season, they have no certain place either for food or harbour.

Having found out the game, the hunters disengage and cast off the dogs; and, some on horseback, others on foot, follow the cry with the utmost art, observation, and speed; remembering and preventing the subtle turning and headings of the hart; standing with dexterity and intrepidity to leap hedge, pale, ditch, &c.

The utmost address and circumspection is to be used to keep to the beast first attempted, and to prevent the dogs from pursuing any other: This, in effect, makes one of the principal difficulties and glories of the chase; the beast having a hundred devices to put off some other head for his own: Sometimes he will send forth some other little deer in his stead into the dogs way, lying close the while himself; on which occasion the huntsman is to find a retreat, and break off the dogs, and take in leam, till the game be recovered.

Sometimes he will purposely seek out for other deer at layer, and route them, to make the hounds hunt change, himself lying down flat in some of their layers upon his belly, to make the hounds over-shoot him: Add, that they may neither scent nor vent him, he will gather up his fore feet under his belly, and blow or breathe on some moist place of the ground, so that the hounds shall pass within a yard, without apprehending him.—He will break into one thicket after another, to find deer, rousing, gathering them together, and herding with them; and even beating some of them into his treads, that he may the more easily escape.—Finding himself spent, he will break herd, and fall to doubling and crossing in some hard beaten high way; always running against the wind, not only to cool himself, but the better to hear the voice of his pursuers.

The last refuge of a hart forely hunted, is the foil; keeping the middle, for fear, left by touching a bough, or the like, he may give scent to the hounds. He always swims against the stream, whence the old rule, 'He that will his chafe find let him try up the river, and down the wind.' In taking foil, he will sometimes cover himself under water, so as to shew nothing but his nose.

Where opportunity of water fails, he will fly into herds of cattle, as cows, sheep, &c. and will sometimes leap on an ox, cow, or the like, laying the fore part of his body thereon, that so touching the earth only with his hinder feet, he may leave a small, or no scent behind.—What is further still, the chief huntsman to Lewis XII. relates, that a hart which they were in hard chase of, leaped into a great tall white thorn, which grew in a shadowy place, and there stood aloft till he was thrust through by a huntsman, rather than he would stir.

The hart being killed, the huntsman with his horn windeth the fall of the beast; upon which every one approaches, the skilfullest opens the beast, rewarding the hounds with what properly belongs to them; the huntsman, at the same time, dipping bread in the skin and blood of the beast to give the hounds their full satisfaction.

The hart is known to be spent by his running stiff, high, and lampering; by his mouth being black and dry, without foam on it, and his tongue hanging out; though he will sometimes close his mouth to deceive the spectators: And by his flut; for he will sometimes close his claws together, as if he went at leisure, and frisk again open them wide, making great glidings, and hitting his dew-laps upon the ground, &c. When quite spent, and close beset, or intercepted on all sides, the hart usually takes to bay, and makes force with his head against the first man or dog that closes in upon him, unless prevented with a spear, sword, or the like.—Hence it is very dangerous going into a hart at bay, especially at rutting time, for then they are more than ordinarily fierce.

The hart being killed, his death is solemnized with great ceremony.—The first thing, when the huntsmen come in, is to cry, *Ware haunch*, that the hounds may not break into the deer: Having secured this, they cut his throat, and blood the younger hounds, to make them love a deer, and learn to leap at his throat. Then having blown the mort, and all the

company being come in, the most distinguished person, who has not taken *jay* before, takes up the knife, and lays it cross the belly of the deer (some of the assistants holding by the fore legs, and at the same time the huntsman drawing down the pizzle) and thus he draws the knife along the middle of the belly, beginning near the brisket, cutting deep enough to discover how fat he is. Then the most skilful person breaks up the deer, by first lifting the skin from the cutting of the throat downward, making the arter, that the ordure may not break forth, and then paunching him, and rewarding the hounds therewith.

Lastly, the person that took the *jay*, being presented with a drawn hanger, he is to cut off the head; which done, and the hounds rewarded therewith, the concluding ceremony, if a buck, is a double, if a stag, a treble more blown by one, and a recheat in comfort by all that have horns: the whole is then concluded with a general whoo whoop.

Otter HUNTING.—The otter is supposed by some, to be of the castor or beaver kind, being, like it, an amphibious creature, and living both in the water, and on land; beside that the resemblance in point of shape is such, as, were his tail off, he were in all respects like the beaver; differing in nothing but habitation, the beaver frequenting both the salt water and the fresh, but the otter only the fresh.

Though the otter lives much in the water, he does not breathe like fishes, but after the manner of quadrupeds.—He is web-footed, like our water-fowl, and can endure to be under water a long time without respiration; and yet in fishing he is frequently found to pop up his nose for breath.—He has an admirable smell, whereby some say he will directly wind a fish in the water a mile or two off; and is a most pernicious beast to a fish-pond, his dexterity at diving, and hunting under water, being such, that scarce any fish can escape him: if by painful hunting ashore he cannot fill his belly, he will feed on herbs, snails, or frogs: He will swim a fishing two miles together, always against the stream, that when his belly is full, the current may carry him down again to his lodging, which is always near the water, and artificially built with boughs, sprigs, and sticks, couched together in fine order.

The flesh of this beast is cold and fishy, as often feeding on stinking fish: for which reason it is not eaten among us: Though among the Germans it is a pretty common food; and the Carthusian friars, who are forbidden to eat all manner of flesh beside, are allowed this. Some in England also have, of late, said much in praise of otter pye.

The otter is to be hunted by particular dogs, called *otter hounds*; and also with special instruments, called, *otter spears*.—To find him out, some are to go on one side of the river, and some on the other; beating all the way on the banks, with the dogs following.—Thus it is soon found if there be an otter in that quarter; for the otter cannot endure long in the water, but must come forth to make his spraints, and in the night sometimes to feed on grass and other herbs. If the hounds find an otter, look in the soft and moist places, to learn by the prints, which way he bent his head: If there make no discovery, it may be partly perceived by its spears.—This done, follow the hounds and lodge him as a hart or deer.

The otter always endeavours to keep to the water, where he is master.—In hunting him therefore, you are to be ready with your spears, to watch his vents, for that is the chief advantage: If you perceive where he swims under water, strive to set a stand before him, where you expect he will vent, and there endeavour to strike him with the spear: If you miss, pursue him with the hounds; which, if they be good, and well entered, will come chaunting and trailing along the river side, and beat every tree root, every osier bed, and tuft of bulrushes; nay, sometimes, they will take the water, and beat it like a spaniel; by which means the otter can hardly escape.

If the beast find himself wounded with a spear, he usually makes to land, where he will maintain a furious battle with the dogs.

Roe-buck HUNTING.—The roe-buck, the first year, is called a *hind*.—The second, a *gyle*.—The third, a *hemise*.—The fourth, a *roe-buck of the first head*.—The fifth year, a *fair roe-buck*.

We have no roe deer in England; but they abound in Scotland, Germany, Africa, &c. And it should seem they had been more common among us, our huntsmen still retaining the proper terms for the chase.

They make good chase, stand long, and fly end-way.—When a roe crosses and doubles, it is called *trapping*. Their swiftness appears not only on earth, but in waters, through which they cut their way as with oars; whence they love lakes and streams, breaking the floods to come at fresh pasture, feeding on rushes, &c.

Horns grow only on the male; being set with six or seven branches, not palmed, but branchy, yet shorter than fallow deer. After rutting he casts his head.

They

HUR

They are said never to wink, not even when asleep; for which conceit their blood is by some fanciful people prescribed to persons dim-sighted or pur-blind.—The tail of this beast is less and shorter than that of a fallow deer, inasmuch, that it is questioned whether it ought to have that denomination.

They keep most in mountains among the rocks; and when *hunted*, Martial tells us, will hang thereon with their horns, to delude the dogs.—They are often taken by counterfeiting their voice, which the huntsman does by the assistance of a leaf in his mouth.

When *hunted*, they turn much, and often, and will come back on the dogs directly, when they can no longer endure.

They also take soil, as the hart; and will sometimes hang by a bough in such a manner, as that nothing shall appear but their snout.

HURDLES, in fortification, twigs of willows or osiers, interwoven close together, sustained by strong stakes, and usually laden with earth.

Hurdles, called also *clayes*, serve to render batteries firm, to consolidate the passage over muddy ditches, and to cover traverses, and lodgments for the defence of the workmen against the artificial fires or stones that may be cast upon them. See **CLAYES**.

HURDLES, in husbandry, are frames made either of split timber, or of hazle rods, platted together; to serve for gates in enclosures, or to make thepolds, &c.

HURDS, or **HARDS** of *Flax* or *Hemp*, the coarser parts, separated in the dressings from the tear or fine stuff. See **HEMP**, and **FLAX**.

HURLE Bone, in a horse, is a bone near the middle of the buttock; very apt to go out of its sockets with a slip or strain.

HURLERS, a number of large stones, set in a kind of square figure near St. Clare in Cornwall; so called from an odd opinion held by the common people, that they are so many men petrified or changed into stones, for profaning the sabbath-day by *hurling* the ball, an exercise for which the people of that country have been always famous.

The *hurlers* are oblong, rude, and unhewn.—Many authors suppose them to have been trophies erected in memory of some battle: Others take them for boundaries to distinguish lands. Lastly, others, with more probability, hold them to have been sepulchral monuments.

HURTS, in heraldry, by some wrote **HEURTS**, and by others **HUERTS**, are azure or blue rundles.

The English heralds distinguish between the colours of rundles, and give them different names agreeable thereto: those of other nations content themselves to call those *tortoiseux d'azure*; and in other cases, only add the respective colour to the term *tortoiseux*.

But these being blue, some will have them to signify bruises or contusions in the flesh, which often turn to that colour; others suppose them whorle berries.

HURRICANE, a furious storm of wind, arising from a contrariety and opposition of several winds.

Hurricanes are frequent in the East and West Indies; making terrible ravages in the islands thereof; blowing down houses, rooting up trees, and even whole woods, &c.

They usually begin in the north, some say the west, but turn round; and in a little time veer through all points of the compass.

It is the custom for the French and English Inhabitants in the Caribbee Islands, to send every year about June to the native Caribbees of S. Dominico and S. Vincent, to know whether there will be any *hurricanes* that year; and about ten or twelve days before any *hurricane* come, they constantly send them word.

The prognostics those Barbarians go by, are given us by captain Langford, who, in 1697, engaged one of them, by civilities, to reveal them to him.

It is one of their principles, that all *hurricanes* come either on the day of the full, or of the change, or quarter of the moon; each of which is discovered by a number of phenomena, in the preceding quarters, as, a turbulent sky, fun red, universal calm, the stars appearing red, noises in hollows or cavities of the earth, strong smell of the sea, a settled westerly wind, &c. That author assures us, he received this benefit from the information, that whereas *hurricanes* are so dreadful, that all ships are afraid to put out to sea while they last, and chuse rather to perish at anchor in the roads; yet, with good management, he found that a vessel may lie out at sea in these, as safely as in other storms, by taking care the ports be well barred and calked, the topmasts and tops taken down, the yards a-port last, and the doors and windows secured.—With these precautions that experienced navigator preserved his vessel in two great *hurricanes*, and taught others how to do the same, by putting out from port, where they would inevitably have perished. And from the prognostics above, he foretold several *hurricanes* at land.

He adds, that all *hurricanes* begin from the north, and turn to the westward, till arriving at the south-east, their force is spent.

HUS

The cause he suggests to be the furs leaving the zenith of those places, and going back towards the south; and the repelling or bounding back of the wind, occasioned by the calming of the general trade wind. *Philosophical Transactions*, N^o 246.

HUSBAND, *Maritus*, a man joined, or contracted with a woman, in marriage.

By the laws of England, the wife is supposed wholly under the dominion of her *husband*, nor can act or will any thing of herself.

In Germany, the power of the *husband* is not so extensive; even the princes of the empire have not a sovereign and despotic power over their wives and children.—Pagentecher, a German lawyer, has a dissertation to prove, that, by the law of nature, a *husband* has not a despotic power over his wife; and that marriage is not monarchy. He struggles hard to explain that passage of S. Paul to the Ephesians, cap. v. ver. 22. consistently with his scheme.

J. Philip Falthen, professor of law at Gripswald, gives us a very learned dissertation on the *husband* of a queen, who is not king, *De Marito Reginae*. He defines him a man married with a princess that holds a crown by right of inheritance, but who only contracted marriage with him, on condition that the marriage should not change his condition, nor give him any command over his wife, or any joint authority with her; nor entitle him to succeed to any of her royalties after her decease, without the intervention of some further act. Hence he concludes, that in such case it is the queen who is really king.

This, however, does not hinder but the *husband* may be a king elsewhere, and in that quality superior to his wife; for a maiden queen may either marry a sovereign prince, or a subject, and that either of her own realm, or another: of all which cases he gives instances: as, that of Ferdinand and Isabella, whose marriage did not give any authority to the one over the kingdom of Arragon, nor to the other over that of Castile; of Joan daughter of Isabella, and Philip of Austria; Philip II. of Spain, and Mary queen of England; the two Joans queens of Naples; Mary queen of Scots, and the dauphin of France; and lastly, queen Anne, whose *husband* was her subject, and who yielded homage to her as a vassal, and took an oath of fidelity to her as her minister.—M. Falthen proceeds to examine in what kingdoms this may happen: and shews, that it cannot be in an elective kingdom, nor in an usufructuary one; whence he concludes, that we shall never see it in Poland, France, or Germany; but that there are instances of it in all the other monarchies, of any standing in Europe. He goes on to shew, that a queen ought not to marry a king; that it is no violation of the conjugal society, for her *husband* to be subject to her; and finally he answers all the difficulties that may be started with regard thereto, particularly from passages of scripture, as 1 Cor. xiv. 34. Gen. iii. 16. Eph. v. 22. Col. iii. 18, &c.

HUSK, among botanists, the part which a flower grows out of.

Of these there are several kinds, as, *bulbous* or *round husks*, *bottle* *shks*, *middle husks*, *fest husks*, *hoof husks*, &c. See Supplement: article **CALYX**.

HUSSARS, **HUSSARDS**, or **HUSSARTS**, an order or species of soldiery in Poland, and Hungary, commonly opposed to the Ottoman cavalry.

The *hussars* are horsemen, clothed in tygers and other skins, and garnished and set out with plumes of feathers. Their arms are the sabre, and bayonet.

They are very resolute; firm partisans; but they are better in a hasty expedition, than in a set battle.

The emperor and king of France have of these *hussars* in their service.

HUSSITES, a party of reformers, the followers of John Hus.

John Hus, from whom the *Hussites* take their name, was born in a little village in Bohemia, called *Husi*.—He fell into the sentiments of Wickliff, and the Waldenses; and in the year 1407, began openly to oppose and preach against divers errors in doctrine, as well as corruptions in point of discipline, then reigning in the church.

He was condemned with Jerom of Prague, by the council of Constance, and burnt, in the year 1415; but his disciples still stuck to his doctrines.—Joh. Zisca, being put at their head in Bohemia, maintained a war a long time against the emperor Sigismund, with great success. And Procopius Holy, another of their leaders, afterwards conducted them with equal courage.

The *Hussites* spread over all Bohemia and Hungary, and even Silesia and Poland; and there are some remains of them still subsisting in all those parts.

HUSTINGS, **HUSTINGUM**, a court of Common Pleas held before the lord mayor and aldermen of London, in Guild-Hall.

Of the great antiquity of this court we find this mention in the laws of king Edward the confessor.—*Diets etiam in London*

H Y B

London *quæ est caput regni & legum, semper curia domini regis singulis septimanis, die lunæ hustingis sedere & teneri: fundata erat olim & edificata ad instar & ad modum & in memoriam veteris magnæ Trojæ, & usque in hodiernum diem, leges, & jura & dignitates, & libertates regisq; consuetudines suas una semper inviolabilitate conservat.* Taylor, *Hist. of Great-Britain*.

The court of *hustings* is the principal and highest of all the courts of the city.—Error or attain lies there of a judgment or false verdict in the sheriff's courts.

Other cities and towns had also courts of the same name, as Winchester, Lincoln, York, &c.

HUT, or **HUTT**, from the Saxon, *hutte*, a small cottage or hovel.

The word is also used for the soldiers lodges in the field; otherwise called *baracks*, or *caserns*. See **BARACK**.

HUXING of Pike, among fishermen, a particular method of catching that fish.

For this purpose, they take thirty or forty as large bladders as can be got; blow them up, and tie them close and strong; and at the mouth of each, tie a line, longer or shorter, according to the depth of the water. At the end of the line is fastened an armed hook, artfully baited; and thus they are put into the water with the advantage of the wind, that they may gently move up and down the pond.

When a master pike has struck himself, it affords a deal of entertainment to see him bounce about in the water with a bladder fastened to him; at last, when they perceive him almost spent, they take him up.

HYACINTH, or **JACINTH**, in natural history, a precious stone; originally thus called from its resemblance of the purple flower named *hyacinth*.

Though this, it has been observed, holds of the antient, rather than the modern *hyacinth*, the modern kind being usually of a deep reddish yellow, approaching to a flame colour, or that of the deepest amber. The antient seems to have been a different stone, of a purple colour tending to blue.

There are four sorts of *hyacinths* among our Jewellers: those intermixed with a vermilion colour; those of a saffron colour; those of an amber colour; and, lastly, those of a white, intermixed with a slight red.

Hyacinths, again, are distinguished into *oriental* and *occidental*. The *oriental* come from Calicut and Cambaya, and are equal in hardness to the oriental amethyst.—The *occidental* are found in Bohemia and Portugal, which are a degree softer.

The stone graves or cuts fine, and would be more used for seals, &c. but that the graving frequently costs more than the stone.

The antients used it for amulets and talismans; and bore it about their neck, or set in rings, &c. supposing it to have the virtue of securing them from the plague, &c.

The *hyacinth* used in medicine, and whereof the confection of *hyacinth* is made, is a different stone from all these, of which there are three several sorts: the first about the bigness and figure of a grain of salt, and pretty soft: the second ruddy, and shaped like the point of a diamond, found in divers parts of Italy, Silesia, Bohemia, &c. The third is white, intermixed with yellow, and some other colours; being found in the same places as the red.

In strictness, only the first kind should be used in the confection of *hyacinth*; but the druggists and apothecaries frequently substitute the other. See *Supplement: article HYACINTH*.

Confection of HYACINTH, is a thin cordial electuary, composed of divers kinds of precious stones, particularly of that whose denomination it bears, with certain earths, seeds, roots, coral, hawthorn, and divers other ingredients, well mixed, and ground together.

HYACINTHIA, in antiquity, feasts held at Sparta, in honour of Apollo, and in commemoration of his favourite Hyacinth.

This Hyacinth was the son of Amyclas, king of Sparta, and was beloved both by Apollo and Zephyrus. The youth shewing most inclination to the former, his rival grew jealous; and, to be revenged, one day, as Apollo was playing at the discus, i. e. quoits, with Hyacinth, Zephyrus turned the direction of a quoit which Apollo had pitched, full upon the head of the unhappy Hyacinth, who fell down dead. Apollo then transformed him into a flower of the same name: and as a farther token of respect, they say, commanded this feast.

The *hyacinthia* lasted three days; the first and third whereof were employed in bewailing the death of Hyacinth, and the second in feasting and rejoicing.

The persons who assisted at the ceremony were crowned with ivy, by reason, says Vossius, *De Idolol.* lib. II. c. 14. that Bacchus and Apollo were the same person.

HYBRISTICA, in antiquity, a solemn feast, held among the Greeks, with sacrifices and other ceremonies; whereat the men attended in the apparel of women, and the women in that of men, to do honour to Venus in quality either of a god, or a goddess, or both.

H Y D

Or, according to the account given by others, the *hybristika* was a feast celebrated at Argos, wherein the women, being dressed like men, insulted their husbands and treated them with all marks of superiority, in memory of the Argian dames having antiently defended their country with singular courage against Cleomenes and Demaratus.

Plutarch speaks of this feast in his treatise of the great actions of women.—The name, he observes, signifies *infamy*; which is well accommodated to the occasion, wherein the women strutted it about in men's cloaths, while the men were obliged to dangle in petticoats.

HYADES*, in astronomy, are seven stars in the bull's head, famous among the poets for the bringing of rain.

* Whence their name, *Ἰάδης*, from the Greek, *ὕδω* *pluisse*, to rain.

The principal of them is in the bull's left eye, by the Arabs called *aldebbaran*. Their longitudes, latitudes, &c. see among those of the other stars in the constellation **TAURUS**.

The poets feign them to have been the daughters of Atlas and Pleione. Their brother Hyas being torn in pieces by a lioness, they wept his death with such vehemence, that the gods, in compassion to them, translated them into heaven, and placed them in the bull's forehead, where as they say, they continue to weep; this constellation being supposed to presage rain.

Others represent the *Hyades* as Bacchus's nurses, and the same with the *Dadonides*, who fearing the resentment of Juno, and flying from the cruelty of king Lycurgus, were translated by Jupiter into heaven.

HYDATIS, *ὑδατίς*, in medicine, a disease of the eyes; being a fatty substance, growing under the skin of the upper eye-lid; by which the whole eye-lid, in children, is sometimes rendered oedematous.

HYDATIS is also used among the modern physicians, for a little bladder of water, occasionally found in divers parts of the body.

HYDATIDES*, in medicine, are little transparent bags or bladders full of water, frequently found in divers parts of the body.

* The word is formed of the Greek, *ὑδω*, water, which in the genitive case, gives *ὑδατος*, whence *ὑδαρίς*, *hydatis*.

Hydatides are most common in dropical persons, and are supposed to arise from a distention and rupture of the lymphatics; being found chiefly in the parts abounding in those vessels, as the liver, lungs, &c.—They are also sometimes found in *icterical* cases. See **DROPSY**, **JAUNDICE**, &c.

We have instances of *hydatides* voided both by stool, by urine, and by vomiting.—They are of all sizes, from a pin's head to that of a pullet's egg.

HYDATOIDES*, *ὑδατοειδής*, a name some authors give to the aqueous humour of the eye, inclosed between the cornea and uvea.

* The word is composed of *ὑδω*, *ὑδατος*, water, and *ειδής*, form, resemblance. See **EYE**.

HYDATOSCOPIA*, called also **HYDROMANCY**, a kind of divination, or method of foretelling future events, by means of water.

* The word is compounded of *ὑδατος*, the genitive of *ὑδω* water, and *σκοπεω*, I view, I consider.

There is a natural or allowable kind of *hydatoscopia*: it consists in foretelling storms, tempests, hurricanes, &c. from natural signs or indications in the sea, air, clouds, &c.

HYDE of Land. See the article **HIDE**.

HYDE-gild. See the article **HIDE-gild**.

HYDRA, a southern constellation, consisting of twenty-five stars, imagined to represent a water-serpent.

The stars in *hydra*, in Ptolemy's catalogue, are twenty-five; in Dr. Halley's sixty-eight; the longitudes, latitudes, &c. whereof are as follow.

HYDRAGOGUES *, $\gamma\alpha\rho\alpha\gamma\omega\gamma\epsilon$, a species of purgative medicines; being such as are supposed peculiarly fitted to discharge ferrous, or watry humours.

* The word is formed of $\gamma\delta\rho\omega$, water, and $\alpha\gamma\iota\upsilon\omega$, to draw, to lead.

The strongest cathartics, Dr. Quincy observes, chiefly answer to the character of *hydragogues*; in that by their forcibly shaking and vellicating the bowels and their appendages, they squeeze out water enough to make the stools appear little else.

The principal *hydragogues*, in the common opinion, are the juices of the root of iris, of soldanella, mechoacan, jalap, &c. In the general, all sudorific, aperitive, and diuretic medicines, are truly *hydragogues*.

HYDRARGYRUM *, $\gamma\alpha\rho\alpha\rho\gamma\iota\rho\omega\mu$, a name given to mercury, or quicksilver. See **MERCURY**.

* The word is Greek, formed of $\gamma\delta\rho\omega$, aqua, water, and $\alpha\gamma\gamma\upsilon\rho\omega$, argentum, silver, q. d. water of silver, by reason of its resembling liquid, or melted silver.

HYDRAULICS *, that part of statics which considers the motion of fluids, and particularly water; with the application thereof in artificial water-works.

* The word is derived from the Greek, $\gamma\delta\rho\omega\kappa\lambda\omicron\varsigma$, founding water, formed of $\gamma\delta\rho\omega$, aqua, water, and $\alpha\iota\lambda\omicron\kappa\lambda\omicron$, tibia, pipe or flute: the reason whereof is this; that at the time of the first invention of organs, being unacquainted with the method of applying bellows to blow them, they made use of a cataract or fall of water to make a wind, and found them.

To *hydraulics* belong not only the conducting and raising of water, with the contructing of engines for those purposes; but also the laws of the motion of fluid bodies.

VOL. I.

H Y D

Hydrostatics explain the æquilibrium of fluids, or the gravitation of fluids at rest: upon removing that æquilibrium, motion ensues; and here *hydraulics* commence.

Hydraulics, therefore, suppose hydrostatics; and the generality of writers, from the immediate relation between the two, join them together, and call them both either *hydraulics* or *hydrostatics*.

The laws of *hydraulics* the reader will find under the article **FLUID**.

The art of raising waters; with the several machines employed for that purpose, as *siphons*, *pumps*, *syringes*, *fountains*, *jets d'eau*, *fire-engines*, &c. are described under their proper articles, **SIPHON**, **PUMP**, **SYRINGE**, **FOUNTAIN**, **HYDROCANISTERIUM**, &c.

The principal writers who have cultivated and improved *hydraulics*, are Jo. Ceva, in his *Geometria Motus*; Jo. Bap. Balianus, *De Motu Naturali Gravium, Solidorum & Liquidum*; Mariotte, in his *Movement des Eaux & autres Fluides*; D. Guglielmini, in his *Mensura Aquarum Fluentium*, where the higher laws of *hydraulics* are reduced to practice: Sir Isaac Newton, in his *Phil. Nat. Princ. Mathemat.* and Varignon, in the *Memoirs of the Royal Academy of Sciences*.

As to *hydraulic machines*, Hero of Alexandria is the first who has wrote thereon. Of the moderns, the principal are, Solomon de Caux, in a French treatise of *Machines*, and chiefly *hydraulic ones*: Casp. Schottus, in his *Mechanica Hydraulica Pneumatica*; De Chales, in his *Mundus Mathematicus*; Boecler in his *Architectura Curiosa*; and Luc. Anthonius Portius.

HYDRAULO-PNEUMATICAL, a compound term applied, by some authors, to such engines as raise water by means of the spring of the air. See **AIR**, **WATER**, and **ENGINE**.

Mr. Boyle mentions a very pretty fountain, which he calls *hydraulico-pneumatical*; made by the spring of the air pressing up water in a pipe, upon the air's being exhausted out of a receiver, and thus the weight of the atmosphere taken off. See **FOUNTAIN**.

HYDRELEON *, $\gamma\alpha\rho\epsilon\lambda\epsilon\omega\omicron\varsigma$, in pharmacy, a mixture of common oil and water.

* The word is a compound of the Greek, $\gamma\delta\rho\omega$, aqua, water, and $\epsilon\lambda\epsilon\omega\omicron\varsigma$, oleum, oil.

The *Hydreleon* was taken internally, to excite vomiting; externally, it is anodyne, and promotes suppuration.

HYDRENTEROCELE *, $\gamma\alpha\rho\epsilon\tau\epsilon\rho\kappa\eta\alpha\eta$, in medicine, a hernia, or tumor occasioned by a descent of the intestines, and water along with them, into the scrotum. See **HERNIA**.

* The word is compounded of $\gamma\delta\rho\omega$, water, $\epsilon\tau\epsilon\rho\epsilon\omega\varsigma$, intestine, and $\kappa\epsilon\lambda\eta$, tumor.

HYDROCANISTERIUM, a fire-engine; or a machine which spouts water plentifully, and with force, us'd to be applied to the extinguishing of fires and conflagrations of houses, &c.

We have various contrivances to this effect.—The first, and which is, as it were, the basis of all the rest, is a pump inclosed in a cistula or wooden vehicle filled with water, and mounted on wheels; the pump being wrought with long levers which come out of the cistula; and the water it raises directed to the place by means of a jointed tube.

The Dutch and others use a long flexible tube of leather, sail cloth, or the like, which they carry or conduct in the hand from one room to another, as occasion requires; so that the engine may be applied where the fire is only within-side, and does not burst out to expose it to its external action. To improve on this original fire-engine, they have since contrived to make it yield a continued stream; by substituting a forcing or pressing pump in lieu of the sucking pump. See **FORCING PUMP**.

HYDROCELE *, $\gamma\alpha\rho\kappa\eta\alpha\eta$, in medicine, a swelling or bloating of the outer integument or skin of the scrotum, occasioned by watry humours detained therein.

* The word is formed of the Greek, $\gamma\delta\rho\omega$, water, and $\kappa\epsilon\lambda\eta$, tumor.

The *hydrocele*, is distinguished from a hernia, in that the first is formed by slow degrees, and the latter all at once. Youth is most exposed to the *hydrocele*.—It is remedied by drying medicines; or by letting out the water with a lancet, a seton, or the like.—But these only amount to a palliative cure: to go to the bottom of the disease, recourse must be had to cauterics.

HYDROCEPHALUS *, $\gamma\alpha\rho\kappa\epsilon\phi\alpha\lambda\omicron\varsigma$, in medicine, a watry head, or dropy in the head.

* The word is Greek, formed of $\gamma\delta\rho\omega$, water, and $\kappa\epsilon\phi\alpha\lambda\eta$, caput, head.

The *hydrocephalus* is a congection of water in the head, so as to distend and render it soft.

There are three kinds of *hydrocephali*. The first, when the water is gathered between the skull and the skin: the second, when between the skull and the brain: and the third, when the water is collected in the ventricles of the brain.

Children are more liable to *hydrocephali*, than adults; by reason their head is soft, and has been much compressed in the womb; or, perhaps, by their having been too roughly

5 U handled

handled by the midwife.—Add, that the bones of children's heads being very soft, and their futures not yet exactly closed; they easily open, and give way to an influx of water from without; whereas in adults, the bones of the cranium are very hard, and closely bound together.

The internal *hydrocephalus* is a disease very difficult to cure.—There is no remedy but severe blistering on the futures.—It sometimes ends in mortal convulsions, and sometimes in lethargies or apoplexies.

The head, in this case, is sometimes extended to a prodigious bulk; so that the person cannot bear or sustain it. Of this we have an extraordinary instance given us by Dr. Freind, of a girl two years old, whose head was 26 inches in circumference. *Philosop. Transact.*, N^o. 318. See supplement: article *HYDROCEPHALUS*.

HYDROGRAPHICAL Maps, more usually called *sea charts*, are projections of some part of the sea, in plano; for the use of navigation.

In these are laid down all the rhumbs or points of the compass, the meridians, parallels, &c. with the coasts, capes, islands, rocks, shoals, shallows, &c. in their proper places, proportions, &c.

Christopher Columbus, the first great discoverer of America, was a man that earned his living by making and selling *hydrographical maps*. He happened to be heir to the memoirs or journals of a noted pilot, one Alonso Sanchez de Huelva, captain of a ship, who, by chance, had been driven by a storm to the island of S. Domingo, and died at Columbus's house soon after his return. This gave Columbus the first hint to attempt a discovery of the West Indies, in which he succeeded.

For the construction of the several kinds of *hydrographical maps*; see *CHART*.

For their uses; see the article *SAILING*.

HYDROGRAPHY *, that part of geography which confines the sea; principally, as it is navigable.

* The word is compounded of the Greek, *ὕδωρ*, *agua*, water, and *γραφειν*, *scribo*, *describo*, I write, describe.

Hydrography teaches how to describe, and measure the sea; it gives an account of its tides, counter-tides, currents, soundings, bays, gulphs, &c. as also of its rocks, shelves, sands, shallows, promontories, harbours, distances, &c. from port to port, with all that is remarkable, either out at sea, or on the coast.

Some of the best authors use the term in a more extensive sense; so as to denote the same with *navigation*.

In this sense *hydrography* includes the doctrine of sailing; the art of making sea charts, with the uses thereof; and every thing necessary to be known, in order to the safest and most expeditious performance of a voyage. See *SAILING*.

Hydrography is the most perfect of all the mathematical sciences; there being scarce any thing wanting to its perfection, but the discovery of the longitude.

The Jesuits Ricciolus, Fournier, and de Chales, are the principal writers on the subject of *hydrography*.

In France they have professors of *hydrography* established in all their sea ports, who are to instruct the youth intended for the sea, in all the parts of navigation, sailing, steering, &c. with the several branches of mathematics necessary thereto; as arithmetic, and the doctrine of the sphere, and trigonometry.

They are royal professors, and teach gratis; having salaries allowed them by the king. They are also charged with the examination of pilots, &c.

HYDROMANCY *, *ὑδρομαντεία*, the act or art of divining or foretelling future events by means of water.

* The word is Greek, composed of *ὕδωρ*, water, and *μαντις*, divination.

Hydromancy is one of the four general kinds of divination; the other three, respecting the other elements, *viz.* fire, air, and earth, are denominated *pyromancy*, *aeromancy*, and *geomancy*.

Varro mentions the Persians as the first inventors of *hydromancy*, adding, that Numa Pompilius and Pythagoras made use thereof.

The writers in optics furnish us with divers *hydromantic machines*, vessels, &c.

To construct a *hydromantic machine*, by means whereof an image or object shall be removed out of the sight of the spectator, and restored again at pleasure; without altering the position either of the one or the other.—Provide two vessels ABF and CGLK, (*Tab. Hydraulics*, fig. 31.) the uppermost filled with water, and sustained by three little pillars, one whereof, BC, is hollow, and furnished with a cock B. Let the lower vessel CL be divided by a partition HI, into two parts; the lower whereof may be opened or closed by means of a cock at P.

Upon the partition place an image, which the spectator in O cannot see by a direct ray GL.

If now the cock B be opened; the water descending into the cavity CI, the ray GL will be refracted from the perpen-

dicular GR to O; so that the spectator will now see the image by the refracted ray OG.—And again, shutting the cock B, and opening the other P, the water will descend into the lower cavity HL; whence, the refraction ceasing, no rays will now come from the object to the eye.—But, shutting the cock P again, and opening the other B, the water will fill the cavity again, and bring the object in sight of O afresh.

To make a *hydromantic vessel*, which shall exhibit the images of external objects, as if swimming in water.—Provide a cylindrical vessel ABCD, (*Tab. Hydraulics*, fig. 32.) divided into two cavities by a glass EF; not perfectly polished: In G apply a lens convex on both sides; and in H incline a plain mirror of an elliptic figure under an angle of 45°; and let IH and HG be something less than the distance of the focus of the lens G; so that the place of the images of object radiating through the same, may fall within the cavity of the upper vessel.—Let the inner cavity be blackened, and the upper filled with clear water.

If now the vessel be disposed in a dark place, so as the lens be turned toward an object illuminated by the sun; its image will be seen as swimming in the water.

HYDROMEL *, *ὑδρομελί*, a drink made of water, and honey; called also by the Greeks *μυδιγαλίον*.

* The word is composed of *ὕδωρ*, water, and *μέλι*, honey.

Hydromel is honey diluted with a sufficient quantity of water, and fermented by a long and gentle heat.

Under the class of *hydromels* come our mead, and methelin.

Hydromel is either *simple* called also *aqueous*, where honey and water are the only ingredients, which may be prepared at any time; or *compound*, when other drugs are added to improve and exalt the flavour and virtues.

It is particularly called *vinous hydromel*, when it equals the strength of wine; which it is brought to do, not only by the great quantity of honey used in it, but also by its long coction, insolation, &c. This is only to be made in the heat of summer.

Vinous hydromel, (the same with what we usually call mead, &c.) is made of rain water and the best honey, boiled together, and scummed from time to time, till they become of a consistence to sustain an egg. This done, the liquor is exposed to the sun for forty days, to dispose it to ferment; then adding some Spanish wine, and keeping it two or three months, it acquires a flavour scarce inferior to malmsiey.—It fuddles readily; and the drunken fit from it holds longer than that produced by wines, by reason of its more viscid consistence.

Hydromel is the common drink of the Poles and Russians. Diodorus Siculus, Lib. V. and Aristotle, relate, that the Celtiberi and Taulanti, ancient people of Illyria, drank *hydromel* instead of wine.

HYDROMETER *, an instrument wherewith to measure the gravity, density, velocity, force, or other properties of water.

* The word is compounded of the Greek, *ὕδωρ*, water, and *μέτρον*, measure.

That wherewith the specific gravity of water is determined, is more usually called an *areometer*, or *water-poise*. See *AREOMETER*, and *WATER-POISE*.

HYDROMETRIA, *HYDROMETRY*, the mensuration of waters, and other fluid bodies, their gravity, force, velocity, quantity, &c.

Hydrometria includes both hydrostatics, and hydraulics.

The term is modern, but very little in use.—The first instance where we meet with it is in the year 1694, when a new chair or professorship of *hydrometry* was founded in the university of Bologna, in favour of S. Guglielmini, who had carried the doctrine of running waters, with respect to rivers, canals, dikes, bridges, &c. to an unusual length.

HYDROMPHALUS *, *ὑδροφάλλος* in medicine, a tumour in the navel, arising from a collection of water.

* The word is formed of the Greek *ὕδωρ*, water, and *φάλλος*, umbilicus, navel.

The *hydromphalus* is distinguished from other tumors of the navel by its being very soft, and yet not tractable and obedient to the touch, so as to diminish or enlarge by compressing it. When viewed, placed between the eye and the light, it is found transparent.

The *hydromphalus* is to be dissipated by emollient and resolutive medicines. It is also cured by a puncture made in the middle of the navel.

HYDROMYSTES *, or *HYDROMYSTA*, a name antiently given to certain officers in the Greek church; whose business was to make the holy water, and sprinkle it on the people. See *Holy WATER*.

* The word is compounded of *ὕδωρ*, *agua*, water, and *μύστης*, a person set apart for the offices of religion.

HYDROPARASTATÆ *, or **HYDROPARASTÆ**, a sect of heretics, the followers of Tatian: called also *Encratite*, *Apotactite*, *Sacophori*, *Severiani*, and *Aquarians*.

* The word is formed of the Greek, ὕδωρ, water, and παρισταίω, I prevent, I offer.

The *Hydroparastatæ* were a branch of Manichees, whose distinguishing tenet was, that water should be used in the eucharist instead of wine.

HYDROPHOBIA*, ὕδροφοβία, in medicine; an aversion or dread of water; a symptom arising in persons bitten by a mad dog, or other beast made mad by the bite of that creature.

* The word is Greek, compounded of ὕδωρ, water, and φοβέομαι, fear.

Though the term *hydrophobia* do, in strictness, only denote this one symptom; yet it is frequently applied to the whole disease consequent on such a bite, with all its symptoms.

The history of this horrible disease, as given by Celsus Aurelianus, Dr. Mead, Etmuller, Lister, &c. is as follows:—The bite of a mad dog is attended with this surprising circumstance, that its effects frequently do not discover themselves till after the cause is forgot; the wound itself closing and healing like any other common wound. But, some time after, direful symptoms ensue: usually they commence in about forty days; sometimes in sixty, sometimes not till six months, and sometimes not till a year, or even two years. The first thing observed, is a wandering pain throughout the whole body, but chiefly about the wounded part; the patient grows anxious and melancholy, and very prone to anger; complaining of every thing, as the ambient air, the heaviness of his bed-cloaths, &c. He vomits; his pulse intermits, and somewhat of a tremor is observed, with convulsions of the nerves and tendons: Along with these he feels an inward heat and thirst: at last the grand symptom appears, which denominates the disease, viz. the *aquæ pavor*, or dread of water, so that he cannot bear so much as the sight of any liquid, without the utmost contumacious; much less can he swallow the smallest drop. This is the pathognomonic sign of the disease's being, come to its height; and never happens till two or three days before the patient's death; the disease being then, by the unanimous consent both of ancient and modern physicians, absolutely incurable.

With this there are other concomitant symptoms.—He foams at the mouth, his eyes flare, he cannot swallow his spittle without pain, and his penis is constantly erected: some bark and snarl like dogs, and actually fancy themselves transformed into those creatures, and, in the height of their madness, are ready to fly upon and tear to pieces the by-standers.—Palmarius observes, that the *hydrophobus* patient cannot bear to look in a glass, or any transparent body: and adds that he never recovers, unless he knows himself in a glass; this being a sign that the poison has not laid hold of the vital parts. An absolute bite or wound is not at all necessary to produce this terrible disease; the saliva of a mad dog, &c. being able to convey the disease by mere contact, or application to the skin.—Thus we have an instance in the *Philosophical Transactions*, of two men catching the disease by putting their fingers in the mouth of a puppy that had been bit by its mad dam, and feeling its tongue and throat; and the like instance we have in the same work, of two children in Ireland, who, by touching and handling the head of a dog that had been bit by a mad dog, and washing the wound, cured the dog, but caught the disease themselves, though not bitten.

For the nature and cause of the *hydrophobia*;—Dr. Mead, from several histories of particular cases, concludes, that it is the effect of a particular kind of inflammation of the blood, accompanied with so great a tension and distension of the nervous membranes, and such an elasticity and force of the fluid with which they are filled, that the most common representations are made to the mind with too great effect; so that the usual impressions on the organs cannot be suffered.—Hence that timorousness, unaccountable anxiety, and diffidence, which are always the forerunners of the dread of liquids; as also, the pain often felt in making of water, and the strange aversions sometimes found in patients at the sight of any thing white, the retina being hurt and grieved by the lively impressions of that colour thereon.—Nor is it hard to conceive, that when the saliva is hot, and the throat inflamed and dry, the swallowing of drink should cause such an intolerable agony.

M. Taurvy, from a nice dissection and examen of the parts of a person dead hereof, conjectures, that the saliva and bile are the fluids first infected; and that the patient vomiting a mixture hereof, the throat becomes excoriated thereby; and hence that horror for all foods, and particularly for fluids, in regard these dissolve those grievous salts contained in the saliva and bile. He adds, that the nature of the poison is such, as dissolves the balsamic and nutritious part of the blood, whence the veins are dried up, so as not easily to admit any blood from the arteries; and the arterial blood by this means suf-

ficiently the action and impression of its vessels for so long a time, is still further dissolved, attenuated, and spiritualized, and thus sent, in too great quantity, and with too great rapidity to the brain; whence those convulsions, distractions, &c.

Dr. Lister, from the remarkable history of J. Corton, whom he attended under this disease, concludes, 1^o. That some of the organic parts of his body were actually transformed into, or affected after the nature of a dog, especially the gula, tongue, &c. so that any fluid offered him in the erect posture of a man, was frightful, as well as difficult to take, as much as it would be for us to get a dog to drink standing on his hind legs. But this was not all; for when he was turned upon his belly, and would have acted the dog, he could not drink; though the sight of the liquor in that posture gave him as much pleasure, as in the other posture it did pain; and though he frequently put out his tongue, and lapped, yet he could not endure to take any thing liquid into his mouth, as though something hindered him within. 2^o. That his spittle was venomous; for as oft as he swallowed it, his stomach vehemently abhorred it, it went to his heart, as he said, and was present death to him: And, so liquid things coming nearer to the confluence of spittle, might give him the greater terror, as they tended to promote the discharge of saliva into his mouth: and for the same reason might be more difficult to swallow than solid things.

As to the cure of the *hydrophobia*, D. Mead, after Galen, recommends it, in this as in other venomous cases, to enlarge the wound made by the bite by a circular incision, to apply a caustery to it, and to keep it open for at least forty days. But if this method seem too cruel, it may suffice to extract the poison by clapping a cupping-glass on the place, having first made a deep scarification. The doctor adds, he has known a person fresh bitten, happily saved by the sole application of the unguentum ægyptiacum made exceedingly hot.

If these external precautions have not been used, or not in time, recourse must be had to internal remedies: Alexipharmatics must be drank; among which, the ashes of river lobsters, or cray fish, are principally extolled by all the ancient physicians; so that Galen affirms, no body had ever died who used this remedy. These ashes to be taken to the quantity of one or two spoonfuls every day for forty days successively, either alone, or with gentian root and frankincense in wine.

But the frequent and sudden plunging of the patient over head and ears in the sea water after the bite, is the best and surest preservative against this disease.

Etmuller recommends cardiacs and alexipharmatics, but all in a double dose, and long continued; and garlic, rue, and salt, to be beat together, and applied in form of a cataplasm over the wound. Purgings with hellebore and mercurius dulcis is also good; and cantharides are a sort of specific. Scarifying is commended; and after the scarification, an onion roasted under the ashes, is to be applied. But the readiest remedy, he adds, is burning the place affected with a red-hot iron, which effectually removes all the malignity. If the physician be not called till late, a cupping-glass is to be applied very hot: An issue near the place may likewise be of service. Sir Theodore Mayerne gives the following prescriptions for the bite of a mad dog. Pluck the feathers from the breech of an old cock, and apply it bare to the bite: if the dog were mad, the cock will swell and die, and the person bitten, will do well: If the cock dies not, it is a proof the dog was not mad. *Philosoph. Transact.* N^o. 101.

It is a common notion that a hair of the same dog applied on the bite, attracts the venom, and works a cure: but a physician of Rostock, in a formal dissertation some years ago, proved this a popular error; and that the remedy was more like to do harm than good.

The marks whereby to know that a dog is mad, are, his neither eating nor drinking, foaming at the mouth and nostrils, looking sad and sullen, and running at any thing in his way, whether man or beast, known or unknown, without barking.—Baldus, a famous lawyer, died of the *hydrophobia* four months after his being bit in the lip by a little dog. And the same is said of Diogenes the Cynic.

The members of the royal academy of sciences furnish us with various instances of persons cured of the disease by various means.—M. Poupert mentions a woman perfectly recovered by bleeding her to deliquium, binding her in a chair for a year, and feeding her all that time with bread and water.—M. Berger relates, that of several persons bitten, two were cured by bleeding them in the forehead.—M. du Hamel adds, that he has known salt water applied on the wound, effect a cure.—Divers cases are produced of those cured of the *aquæ pavor*, by being overwhelmed with a great quantity of water; and one, by being only tied to a tree, and 200 pails of water thrown on him.—But the best instance is that of M. Morin. A man of twenty years of age having all the symptoms, was bathed in a tub of river water, wherein a bushel of salt had been dissolved. They plunged her in naked again and again, till, harassed almost to death

HYD

death, they then left her sitting in it quite senseless.—When she came to herself, she was surprized to find herself looking at the water without any concern. *Histoire de l'Acad. an. 1709.*

HYDROPHORIA *, in antiquity, a feast, or funeral ceremony, held among the Athenians and people of Ægina, in memory of those who perished in the deluge.

* The word is formed of the Greek, ὕδωρ, water, and φορεῖν, I bear, or carry off.

HYDROPIC *, a dropical patient; or a person swelled and bloated with the abundance of water.

* The word is Greek, ὑδρωτικός, formed of ὕδωρ, water, and πικρῶς, facies, face.

HYDROPS *, in medicine. See the article **DROPSY**.

* The word is Greek, ὑδρῶς, of ὕδωρ, aqua, and ὥς, vultus.

HYDROPS ad matulam, a term sometimes used for a diabetes.

HYDROPOTA *, ΤΑΡΟΠΟΤΗ in medicine, a person who drinks nothing but water.

* The word is Greek, formed of ὕδωρ, water, and ποτῶν, poto, drinker, of ποῖν, bibo, I drink.

It has long been controverted among physicians, whether or no the *hydropota* live longer than other persons? See **DRINK**.

HYDROSCOPE *, an instrument antiently used for the measuring of time.

* The word is Greek, ὑδροσκόπος, formed of ὕδωρ, water, and σκοπεῖν, I view, I consider.

The *hydroscope* was a kind of water-clock; consisting of a cylindrical tube, conical at bottom: The cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively contiguous, as it trickled out of the vertex of the cone, pointed out the hour. Synesius describes the *hydroscope* at large in one of his letters. See **CLEPSYDRA**.

HYDROSTATICAL Balance, a kind of balance contrived for the easy and exact finding the specific gravities of bodies, both liquid and solid.

The instrument is of considerable use in estimating the degree of purity of bodies of all kinds; the quality and richness of metals, oars, minerals, &c. the proportions in any mixture, adulteration, or the like: of all which, the specific weight is the only adequate judge.

The *hydrostatical balance* is founded on this theorem of Archimedes, that a body heavier than water, weighs less in water than in air, by the weight of as much water as is equal to it in bulk.—Whence, if we subtract the weight of the body in water from its weight in air, the difference gives the weight of as much water as is equal in magnitude to the solid proposed.

Having, therefore, two bodies, the one firm, the other fluid, together with the weight of each apart; to find their proportion, divide the greater by the lesser, the quotient compared to one, that is unity, will be the antecedent of the proportion desired.

The instrument, with all its apparatus, is represented *Tab. Hydraulics, fig. 34.* and needs little description.

To use it, the weights E are so adjusted as to balance what is to be hung on the other end of the beam; in which state the instrument is ready for application.

Now, to find the specific gravity of a fluid.—Hang to the other end of the beam the little scale F, and to the bottom of the scale the bubble G; then fill a cylindrical vessel O P, about two thirds with common water; and when the bubble is let into it, the beam will remain in an horizontal position, if the water be of the same specific gravity as that in which the bubble was adjusted: If it be not, there will be a variation; which is to be corrected by means of little weights for that purpose.

Having thus adjusted the bubble in that water, the specific gravity of any other fluid will be found by weighing the bubble therein; and since you always weigh so much of the liquid as is equal to the bulk of the bubble, if there be any variation between such quantity, and the like quantity of water, it will be discovered by putting weights into the ascending scale.

2^d To find the specific weight of a solid.—Instead of the bubble, hang on the bucket H I K, and the beam will be in æquilibrium: put the solid intended to be examined therein, and counterpoize it with weights in the other scale: this done, note the weight, and disburden the scale of the solid and its counterpoize, and sink the bucket into the glass of water.—Then, as the bucket will lose as much of its weight, as is the weight of an equal bulk of water; add the scale R upon the part, which will bring all to an equilibrium.—Lastly, Put the solid into the bucket, and counterpoize it again with weights; and as it answers in its proportion to water, it may be judged either genuine or adulterate, by comparing it to a standard of that species of bodies to which it is supposed to belong.

HYDROSTATICS *, the doctrine of gravitation in fluids; or that part of mechanics which considers the weight or gra-

HYG

vity of fluid bodies, particularly of water; and of solid bodies immersed therein.

* The word is Greek, composed of ὕδωρ, water, and στατική, statics; of σταῖς, stans, standing, of ἵστημι, sto, I stand, I stop: *Hydrostatics* being conceived as the doctrine of the æquilibrium of liquors. See **ÆQUILIBRIUM**, and **STATICS**.

To *hydrostatics* belong whatever relates to the gravities and æquilibria of liquors; with the art of weighing bodies in water, in order to estimate their specific gravities.

Mr. Boyle has applied *hydrostatics* to good purpose, in examining and proving the goodness and purity of metals, minerals, and other bodies, particularly fluids, in an express treatise, entitled *Medicina Hydrostatica*.

The laws of *hydrostatics*, with the application thereof; see delivered at large under the articles **FLUID**, and **SPECIFIC GRAVITY**.

Hydrostatics are frequently confounded with hydraulics, by reason of the affinity of the subjects; and several authors chuse to treat of the two promiscuously.

The oldest writer on *hydrostatics* is Archimedes, who first delivered the laws thereof in his book *De insidentibus Humida*. Marin Ghetaldus first brought his doctrine to experiment in his *Archimedes Promotus*; and from him Mr. Oughtred took the greatest part of what he has given us on this subject.—M. Mariotte, in a French treatise, published at Paris in 1686 *Of the motion of Water and other Fluids*, gives most of the propositions of *hydrostatics*; and hydraulics, proved by reason, and confirmed by experiments. The Jesuit F. Tertius de Lanis, in the third tome of his *Magisterium Naturæ & Artis*, lays down the doctrines of *hydrostatics* more amply than they are elsewhere found. F. Lamy, in the second part of his mechanics, entitled, *Traité de l'équilibre des Liquours*, delivers the fundamental laws of *hydrostatics* and hydraulics; and the like is done by Dr. Wallis, in his *Mechanica*. Lastly, Sir Isaac Newton gives some of the sublimer matters, in the second book of his *Philosoph. Nat. Princ. Mathematicæ*.

HYDROTICS *, in medicine. See the article **HYDROTICS**.

* The word is Greek, formed of ὕδωρ, aqua, water.

HYGIENE *, ΤΙΕΙΝΗ, that branch of medicine which considers health; and discovers proper means and remedies, with their use in the preservation, of that state.

* The word is Greek, formed of ὕγις, sound, healthy.

The objects of this branch of medicine are the non-naturals. See **NON-NATURALS**.

Hygiene more largely taken is divided into three parts; *prophylactica*, which foresees and prevents diseases; *synteritica*, employed in preserving health; and *analeptica*, whose office is to cure diseases, and restore health.

HYGROCISCOCELE *, in medicine, a branch of a vein swelled with ill blood, or other humours; or, a varicose tumor of some of the veins of the testis, attended with a gathering of water in the scrotum.

* The word is compounded of the Greek ὕγρως, humidus and κισκοκέλη, ramex varicosus.

HYGROMETER *, a machine, or instrument whereby to measure the degrees of dryness, or moisture of the air.

* The word is compounded of the Greek ὑγρῶς, humidus, moist, and μέτρον, metron, I measure. See **HYGROSCOPE**.

There are divers kinds of *hygrometers*; for, whatever body either swells or shrinks by dryness or moisture, is capable of being formed into an *hygrometer*.—Such are woods of moist kinds, particularly ash, deal, poplar, &c. Such also is a catgut, the beard of a wild oat, &c.

The best and most usual contrivances for this purpose are as follow.

Construction of HYGROMETERS.—Stretch a hempen cord, or a fiddle-string, as A B (See *Tab. Pneumatics, fig. 7.*) along a wall, bringing it over a truckle, or pulley B; and to the other extreme D, tie a weight, E; into which fit a style or index, F G.—On the same wall fit a plate of metal, H I, divided into any number of equal parts; and the *hygrometer* is complete.

For it is matter of undoubted observation, that moisture sensibly shortens the length of cords and strings; and that, as the moisture evaporates, they return to their former length: and the like may be said of a fiddle-string.—The weight therefore, in the present case, upon an increase of the moisture of the air, will ascend; and, upon a diminution of the same, it will descend.

Hence, as the index F G will show the spaces of ascent and descent; and those spaces are equal to the increments and decrements of the length of the cord, or gut, A B D; the instrument will discover, whether the air be more or less humid now, than it was at another given time.

Or thus: If a more sensible and accurate *hygrometer* be required; strain a whipcord or fiddle-string over several truckles, or pulleys, A, B, C, D, E, F, and G, (Fig. 8.) and proceed

proceed with the rest as in the former example. Nor does it matter whether the several parts of the cord A B, B C, C D, D E, E F, and F G, be parallel to the horizon, as expressed in the present figure, or perpendicular to the same.

The advantage of this, above the former *hygrometer*, is, that we have a greater length of cord in the same compass: and the longer the cord, the greater its contraction and dilatation. Or thus:—Fasten a hempen cord, or fiddle-string, A B, (Fig. 9.) to an iron hook, and let the other end, B, descend upon the middle of a horizontal board, or table, E F; near B hang a leaden weight of a pound, C, and fit an index C G. Lastly, from the centre B describe a circle; which divide into any number of equal parts.

Now, it is matter of observation, that a cord or gut twists itself as it is moistened, and untwists again as it dries.—Mr. Molyneux, secretary of the Dublin society, writes, that he could perceive this alternate twisting and untwisting in a cord, by only breathing on it eight or ten times, and then applying a candle toward it. Hence, upon an increase or decrease of the humidity of the air, the index will shew the quantity of twisting or untwisting; and, consequently, the increment or decrement of humidity, or ficcity.

Or thus:—Fasten one end of a cord, or fiddle-string, H I, (Fig. 10.) to a hook, H; and to the other end fasten a ball, K, of a pound weight. Draw two concentric circles on the ball, and divide them into any number of equal parts. Fit a style, or index, N O, into a proper support, N, so as the extremity O may almost touch the divisions of the ball. Here, the cord or gut twisting or untwisting, as in the former case, will indicate the change of moisture, &c. by the successive application of several divisions of the circles to the index.

Or thus:—Provide two wooden frames, A B and C D, (Fig. 11.) with grooves therein; and between those grooves fit two thin leaves of ash, A E F C, and G B D H, so as they may easily slide either way. At the extremes of the frames A, B, C, D, confine the leaves with nails, leaving between them the space E G H F, about an inch wide. On I fasten a slip of brais dented, I K; and in L a little dented wheel, upon whose axis, on the other side of the machine, an index is to be put. Lastly, from the centre of the axis, on the same side, draw a circle, and divide it into any number of equal parts.

Now, it being found by experience, that ashen wood readily imbibes the moisture of the air, and swells therewith; and as that moisture slackens, shrinks again; upon any increase of the moisture of the air, the two leaves A F and B H growing turgid, will approach nearer each other: and again, as the moisture abates, they will shrink, and again recede.—Hence, as the distance of the leaves can neither be increased nor diminished without turning the wheel L, the index will point out the changes in respect of humidity, and ficcity.

It is to be noted, that all the *hygrometers* above described become sensibly less and less accurate; and, at length, undergo no sensible alteration at all from the humidity of the air. The following is much more lasting.

Take the *MANOSCOPE*, described under that article, and instead of the exhausted ball, E, (Fig. 21.) substitute a sponge, or other body, which easily imbibes moisture. To prepare the sponge, it may be necessary first to wash it in water; and when dry again, in water or vinegar wherein sal ammoniac or salt of tartar has been dissolved, and let it dry again.

Now, if the air become moist, the sponge growing heavier will preponderate; if dry, the sponge will be hoisted up; and, consequently, the index will shew the increase or decrease of humidity of the air.

In the last mentioned *hygrometer*, Mr. Gould, in the *Philosophical Transactions*, instead of a sponge, recommends oil of vitriol, which is found to grow sensibly lighter or heavier, in proportion to the lesser or greater quantity of moisture it imbibes from the air; so that being fatiated in the moistest weather, it afterwards retains or loses its acquired weight, as the air proves more or less moist.—The alteration in this liquor is so great, that in the space of fifty seven days, it has been known to change its weight from three drams to nine; and has shifted an index or tongue of a balance 30 degrees.—A single grain, after its full increase, has varied its equilibrium so sensibly, that the tongue of a balance only an inch and half long, has described an arch one third of an inch in compass; which arch would have been almost three inches, if the tongue had been one foot, even with so small a quantity of liquor; consequently, if more liquor, expanded under a large surface, were used, a pair of scales might afford as nice an *hygrometer* as any kind yet invented.—The same author suggests, that oil of sulphur per campanam, or oil of tartar per deliquium, or the liquor of fixed nitre, might be substituted in lieu of the oil of vitriol.

This balance may be contrived two ways; by either having the pin in the middle of the beam, with a slender tongue a foot and half long, pointing to the divisions on an arched plate; as represented in Fig. 12.

Or, the scale with the liquor may be hung to the point of the beam near the pin, and the other extreme be made so long,

as to describe a large arch on a board placed for the purpose; as represented in Fig. 13.

From a series of *hygroscopical* observations, made with an apparatus of deal wood, described in the *Philosophical Transactions*, Mr. Coniers concludes; 1^o. That the wood shrinks most in summer, and swells most in winter; but is most liable to change at spring and fall. 2^o. That this motion happens chiefly in the day-time; there being scarce any variation in the night. 3^o. That there is a motion even in dry weather; the wood swelling in the morning, and shrinking in the afternoon. 4^o. The wood, by night as well as day, usually shrinks when the wind is in the north, north-east, and east, both in winter and summer. 5^o That by constant observation of the motion and rest of the wood, with the help of a thermometer, one may tell the situation of the wind without a weather-cock.

He adds, that the time of the year may be known by it; for in spring it moves quicker, and more than in winter; in summer it is more shrunk than in spring; and has less motion in autumn than in summer.

HYGROSCOPE*, is commonly used in the same sense with *hygrometer*. See *HYGROMETER*.

* The word is compounded of *ὕγρος*, moist, and *σκοπεῖν*, *σκοπεῖν*, I see, or consider.

Wolfius, however, regarding the etymology of the word, makes some difference. According to him, the *hygroscope* only shews the alterations of the air in respect of humidity and driness; but the *hygrometer* measures them. A *hygroscope*, therefore, is a less accurate *hygrometer*.

HYIOTES, *ΥΙΩΤΗΣ*, *Filiatio*. See *ADOPTION*.

HYKES, a sort of blankets, in great use among the natives of Barbary. They are wove by the women, who make no use of a shuttle therein, but conduct every thread of the woof with their fingers. One of these *hykes* is usually six yards long, and five or six broad, serving the Kabyle as well as Arab, both male and female, for a complete dress in the day, and for his bed and covering in the night.—It is a loose and troublesome kind of garment; being frequently disconcerted, and falling on the ground; so that the wearer is every moment to be tucking it up, and folding it a-new round his body. Dr. Shaw (*Trav.* p. 289.) takes it to be much the same with the peplus, if not with the toga of the antients.

HYLE*, or *HYLEC*, among alchymists, is their first matter; or it is matter considered as produced by nature herself; called also *chaos*.

* The word is Greek, *ὕλη*, which signifies *matter*.

HYLEG, or *HYLECH*, in astrology, an Arabic term for a planet, or for a point of the heavens, which in a man's nativity becomes as is pretended the moderator and significator of life.

HYLEGIAL Places, among astrologers, are those wherein a planet being found, is qualified to have the government of life attributed to it.

HYLOBII*, or *HYLOBIANS*, a sect of Indian philosophers, thus denominated by the Greeks, in regard they retired to forests, to be more at leisure for the contemplation of nature.

* The name is compounded of the Greek, *ὕλη*, which, beside matter, signifies also wood, forest; and *βίος*, life.

HYMEN, in poetry, a term of invocation.—*HYMEN*, or *HYMENÆUS*, is properly a fabulous divinity, supposed by the antients to preside over marriages; and who accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, *Hymen o Hymenæe*!

The poets generally crown this deity with a chaplet of roses; and represent him as it were dissolved and enraptured with pleasures; dressed in a yellow robe, and shoes of the same colour; with a torch in his hand.—Catullus, in one of his epigrams, addresses him thus:

*Cinge tempora floribus,
Suaveolentis amara.*

It was for this reason, that the new married couple bore garlands of flowers on the wedding-day: which custom also obtained among the Hebrews; and even among the Christians, during the first ages of the church, as appears from Tertullian, *De Corona Militari*, where he says, *Coronant & nuptia sponsas*.—S. Chrysostom likewise mentions these crowns of flowers; and to this day the Greeks call marriage *γάμος*, in respect of this crown of garland.

HYMEN, *ΥΜΗΝ*, in anatomy, a thin membrane of skin, resembling a piece of fine parchment, supposed to be stretched in the neck of the womb of virgins, below the nymphæ; and to be broke when they are deflowered; an effusion of blood following the breach.

The *hymen* is generally looked upon as the test of virginity; and when broke, or withdrawn, shews that the person is not in a state of innocence.—This notion is very ancient. Among the Hebrews, it was the custom for the parents to save the blood shed on this occasion, as a token of the virginity of their daughter; and to send the sheets, next day, to the husband's

H Y O

husband's relations. And the like is said to be still practised in Portugal, and some other countries.

And yet authors are not agreed as to the existence of such a membrane. Nothing, Dr. Drake observes, has employed the curiosity of anatomists, in dissecting the organs of generation in women, more than this part: They have differed not only as to its figure, substance, place, and perforation, but even its reality; some positively affirming, and others flatly denying it.

De Graaf himself, the most accurate inquirer into the structure of these organs, confesses he always fought it in vain, though in the most unsuspected subjects and ages: all he could find, was a different degree of straitness or wideness; and different corrugations, which were greater or less, according to the respective ages; the aperture being still the less, and the rugosities the greater, as the subject was younger, and more untouched.

Dr. Drake, on the other hand, declares, that in all the subjects he had had opportunity to examine, he does not remember to have missed the *hymen* so much as once, where he had reason to depend on finding it. The fairest view he ever had of it, was in a maid who died at thirty years of age: in this, he found it a membrane of some strength, furnished with fleshy fibres, in figure round, and perforated in the middle with a small hole, capable of admitting the end of a woman's little finger, and situate a little above the orifice of the urinary passage, at the entrance of the vagina of the womb.

In infants, it is a fine thin membrane, not very conspicuous, because of the natural straitness of the passage itself, which does not admit of any great expansion in so little a room; which might lead De Graaf into a notion of its being no more than a corrugation.

This membrane, like most others, does probably grow more distinct, as well as firm, by age. That it not only exists, but is sometimes very strong and impervious, may be collected from the history of a case reported by Mr. Cowper: In a married woman, twenty years of age, whose *hymen* was found altogether impervious, so as to detain the menses, and to be driven out by the pressure thereof, beyond the labia of the pudendum, not unlike a prolapsus of the uterus. On dividing it, at least a gallon of grumous blood came forth. It seems the husband, being denied a passage that way, had found another through the *meatus urinarius*; which was found very open, and its sides extruded like the anus of a cock.

Upon a rupture of the *hymen*, its parts shrinking up, are supposed to form those little fleshy knots, called *carunculae myrtiformes*.

HYMEN is also used by botanists for a fine delicate skin, where-with flowers are inclosed while in the bud, and which bursts as the flower blows or opens.

The term *hymen*, in this sense, is particularly used in speaking of roses.

HYMN*, a song or ode in honour of God; or a poem proper to be sung, composed in honour of some deity. See SONG, and ODE.

* The word is Greek, ὕμνος, *hymn*, formed of the verb ὕμνω, *celebro*, I celebrate.

Isidore, on this word, remarks, that *hymn* is properly a song of joy, full of the praises of God; by which, according to him, it is distinguished from *threnna*, which is a mourning song, full of lamentation.

The *hymns* or odes of the antients, generally consisted of three stanzas or couplets: the first called *strophe*; second, *antistrophe*; and the last, *epode*.

S. Hilary, bishop of Poitiers, is said to have been the first that composed *hymns* to be sung in churches: he was followed by S. Ambrose. Most of those in the Roman Breviary were composed by Prudentius. They have been translated into French verse by Messieurs de Port Royal. The *Te Deum* is also commonly called a *hymn*, though it be not in verse; so also is the Gloria in excelsis.

In the Greek Liturgy, there are four kinds of *hymns*; but then the word is not taken in the sense of a praise offered in verse, but simply of laud or praise.—The angelic *hymn*, or Gloria in excelsis, makes the first kind; the trisagion the second; the cherubic *hymn* the third; and the *hymn* of victory and triumph, called *mnikes*, the last. See TRISAGION, &c.

HYOIDES*, ῥοειδαι, in anatomy.—The *Os HYOIDES*, called also *bicorne*, is a bone situate at the root of the tongue, making as it were the basis, or foundation thereof.

* It is thus called, from its imperfect resemblance of the Greek upilon Υ ; the word being formed of υ and $\omega\iota\delta\alpha\iota$, form; for which reason it is also called *yploides*, and *hyploides*.

It generally consists, in adults, of three little bones; and in children of five or six. The middle bone of the three, which is the shortest and broadest, is called the *basis*, and the two side bones *cornua*, or horns; whence also the appellations, *bicorne* and *ceratoides*.

The basis of the *hyoides* is about a thumb's breadth long on the outer side, which is convex; the inner being concave.

H Y P

It is half a finger broad, and has a small protuberance in the middle. The *cornua* are an inch and half long, and broader at bottom than at the extremes, which are about two inches asunder.

It has two cartilaginous processes, called *cornicula*, fastened about the juncture of its *cornua* with the basis. They are tied to the processus *styloides* by long slender ligaments; though sometimes between them and the *styloides* there is found a small muscle, beside the *styloceratothyroideus*.

The basis of this bone lies, as it were, on the head of the larynx; and its horns are fastened by ligaments to the upper processes of the cartilago *scutiformis*, and *styloides*.

It is moved by five pair of muscles, viz. the *sternothyroideum*, the *coracohyoideum*, the *mylohyoideum*, *geniohyoideum*, and *stylohyoideum*. See each under its proper article.

HYOTHYROIDÆ*, in anatomy, a pair of muscles of the larynx; which arising from the anterior part of the os *hyoides*, are inserted into the cartilago *thyroides*.—They serve as antagonists to the *sternothyroides*; and lift up the thyroid cartilage.

* The word is compounded of *hypo*, under, and *thyroides*. See THYROIDES, &c.

HYPÆTHROS*, or **HYPÆTHRION**, ὑπαίθριον, in the antient architecture, a kind of temple, open at the top, and thereby exposed to the air.

* The word is formed of *ὑπο*, sub, under, and *αἶθρα*, air.

The *hypæthron*, according to Vitruvius, is an open building, or portico, such as antiently were certain temples that had no roof or covering.—Of this we have an instance in the temple of Jupiter Olympius, built by Cossutius, a Roman architect at Athens.

Of *hypæthrons*, some were decastyle, others pycnostyle: But they had all rows of columns withinside, forming a kind of peristyle; which was essential to this sort of temple. See PERISTYLE.

HYPALLAGE*, *Immutatio*; a grammatical figure, whereby, of different expressions which give the same idea, we make choice of that which is least natural and obvious; or, when there is a mutual permutation or change of cases, moods, regimens, &c.

* The word is Greek, ὑπαλλαγή, formed of ὑπαλλάττω, I change; composed of *ὑπο* and *αλλάττω*, I change; of *αλλο*, alter, another.

As in this instance, *Dare classibus aurois*, instead of *Dare classes aurois*.

HYPAPANTE*, or **HYPANTE**, a name which the Greeks give to the feast of the Purification of the holy virgin; or the presentation of Jesus in the temple.

* The words are Greek, ὑπαάντη, and ὑπαμάντη, which properly signify *humble*, and *lowly meeting*; being compounded of *ὑπο*, under, beneath, and *αἶνω*, or *αἰνῶμαι*, I meet, of *αἶν*, contra, against.—The denominations are taken from the meeting of old Simeon and Anna the prophetess in the temple, at the time the child Christ Jesus was brought thither.

HYPER, a Greek word used in the composition of divers terms derived from that language.

The Greek preposition ὑπέρ, *hyper*, literally signifies *above*, *beyond*; and, in composition, it expresses some excess, or something beyond the signification of the simple word it is joined with.—Hence,

HYPERBATON*, or **HYPERBASIS**, in grammar and rhetoric, is a transposition; or, a figurative construction, inverting the natural and proper order of the terms of a discourse. See TRANSPOSITION.

* The word is Greek, ὑπερβατον, or ὑπερβασις, derived of ὑπερβαύω, *transgressor*, I go beyond; formed of ὑπέρ, *ultra*, beyond, and *βαύω*, *eo*, I go.

The *hyperbaton*, Longinus observes, is no other than a transposal of sentiments, or words, out of the natural order and method of discourse; and always implies great violence, or strength of passion, which naturally hurries a man out of himself, and distracts him variously.—Thucydides is very liberal in *hyperbatons*.

Quintilian calls the *hyperbaton*, *verbi transgressio*.—It is of use to enliven and animate the discourse: It is very proper to express a violent passion, and represent an agitation of mind in the liveliest manner.

HYPERBOLA, in geometry, one of the curve lines, formed by the section of a cone. See CONIC SECTION.

The *hyperbola* arises when the plane that cuts the cone is not parallel to one of its sides, as it is in the *parabola*; but diverges from it outwards, not inward, as in the *ellipse*.

Thus: If the cone ABC (See *Tab. Conics*, fig. 27.) be so cut, as that the axis of the section DQ continued, concur with the side of the cone AC, continued to E; the curve arising from this section is an *hyperbola*.

Some authors define the *hyperbola* to be a section of the cone, by a plane parallel to its axis. But this definition is faulty: for though it be true that such a section really describes a *hyperbola*; yet it is likewise true, that a thousand others may

HYP

HYP

be described where the plane is not parallel to the axis, and which of confluence are not included in the definition. Authors sometimes call the plane terminated by this curve, an *hyperbola*; and in respect thereof, call the curve itself the *hyperbolic line*.

A *hyperbola* may be defined, with respect to its properties, to be a curve line, wherein the square of the semi-ordinate is to the rectangle of the absciss into a right line compounded of the same absciss, and a given right line called the *transverse axis*, as another given right line, called the *parameter* of the axis, is to the transverse axis: or it is a curve line, wherein $ay^2 = abx + bxx$, that is, $b : a :: y^2 : ax + x^2$.

In the *hyperbola*, a mean proportional between the transverse axis and parameter, is called the *conjugate axis*: And if the transverse axis AB (Tab. Conics, fig. 27. n. 2.) be joined directly to the axis AX, and be bisected in C; the point C is called the *centre* of the *hyperbola*.

If a right line DE pass through the vertex A, (fig. 20.) parallel to the ordinates MM, it is a tangent to the *hyperbola* sin A.

If a right line DE be drawn through the vertex A of an *hyperbola* parallel to the ordinates MM, and be equal to the conjugate axis, viz. the parts DA and AE equal to the semi-axis; and right lines CF and CG be drawn from the centre C through D and E; those lines are called *asymptotes* of the *hyperbola*.

The square of the right line CI or AI, is called the *power* of the *hyperbola*.

Properties of the HYPERBOLA.—In the *hyperbola*, the squares of the semi-ordinates are to each other, as rectangles of the absciss into a certain right line composed of the absciss and transverse axis.—Hence, as the absciss x increase, the rectangles $ax + x^2$, and consequently the squares of the semi-ordinates y^2 , and therefore the semi-ordinates themselves, increase. The *hyperbola*, therefore, continually recedes from its axis.

2°. The square of the conjugate axis, is to the square of the transverse, as the parameter to the transverse axis.—And hence, since $b : a :: PM^2 : AP \cdot PB$, the square of the conjugate axis, is to the square of the transverse; as the square of the semi-ordinate is to the rectangle of the absciss into a line composed of the absciss and transverse axis.

3°. To describe an *Hyperbola*, in a continued motion; the transverse axis, and the distance from the vertex being given. In the two foci F and f, (fig. 28.) fix two nails or pins; and to one of them, in F, tie a thread FMC, fastening the other end C to the ruler Cf, which exceeds the same by the transverse axis AB. The other end of the ruler being perforated, put it on the pin f; and fixing a style to the thread, move the ruler. Thus will the style trace out an *hyperbola*.—Again, with the same data, any number of points in an *hyperbola*, are easily found, which may be connected into an *hyperbola*. Thus, from the focus f, with any interval greater than AB, describe an arch; and making $fb = AB$; with the remaining interval bm , from the point F, draw another arch intersecting the former in m : for, as $f m - m = AB$; m is a point in the *hyperbola*. And so of the rest.

4°. If in an *hyperbola*, the semi-ordinate PM, (fig. 20.) be produced till it meet the asymptote in R; the difference of the squares of PM and PR is equal to the square of the conjugate semi-axis DA.—Hence, as the semi-ordinate PM increases, the right line PR decreases, and consequently MR; and therefore the *hyperbola* itself approaches nearer to the asymptote; but it can never absolutely meet it, because, as $PR^2 - PM^2 = DA^2$; it is impossible $PR^2 - PM^2$ should ever become 0.

5°. In an *hyperbola*, the rectangle of MR and Mr, is equal to the difference of the squares PR^2 and PM^2 .—And hence, the same rectangle is equal to the square of the conjugate semi-axis DA; and consequently all rectangles formed in the same manner are equal.

6°. If qm be parallel to the asymptote CF, the rectangle of qm into Cq is equal to the power of the *hyperbola*.—And hence, 1°. If we make $CI = AI = a$, $Cq = x$, and $qm = y$, we shall have $a^2 = xy$; which is the equation expressing the nature of the *hyperbola* between its asymptotes. 2°. The asymptotes therefore being given in position, and the side of the power of CI or AI; if in one of the asymptotes CG, you take any number of absciss; so many semi-ordinates will be found, and by them any number of points in an *hyperbola* will be determined by finding third proportionals to the absciss, and the side of the power CI.—3°. If the absciss be not computed from the centre C, but from some other point L; and CL be supposed $= b$; we shall have $Cq = b + x$; and consequently $a^2 = by + xy$.

7°. In the *hyperbola*, as the transverse axis is to the parameter; so is the aggregate of the transverse semi-axis and absciss, to the subnormal: and as the aggregate of the transverse semi-axis and absciss is to the absciss; so is the aggregate of the entire transverse axis and absciss to the subtangent. See SUBNORMAL and SUBTANGENT. 8°. If within the asymptotes of an *hyperbola*, from a point

thereof, (fig. 29.) be drawn two right lines Hm and mK, and other two LN and NO, parallel to the same; Hm. $mK = LN$. NO. And the same will hold, if you draw LN o parallel to the right line thus drawn Hm k, viz. in this case likewise Hm. $mK = LN$. No.—Consequently, all rectangles formed after this manner of right lines drawn parallel either to the same line Hk, or to two, Hm and mK, are equal to each other.

9°. If a right line Hk be drawn in any manner between the asymptotes of an *hyperbola*; the segments HE and mK intercepted on each side between the *hyperbola* and asymptotes are equal.—And hence, if E m = o, the right line Hk is a tangent to the *hyperbola*: Consequently the tangent FD intercepted between the asymptotes, is bisected in the point of contact V. Lastly, the rectangle of the segments Hm and mK, parallel to the tangent FD, is equal to the square of half the tangent DV.

10°. The square of the semi-ordinate in an *hyperbola*, is to the rectangle of the absciss, and aggregate of the transverse diameter AB, (fig. 30.) and absciss AP, as the square of the conjugate semi-diameter AD, is to the square of the transverse semi-diameter CA.—Hence, if you suppose AP x , and $2r^2 = AB = a$, you will have $y^2 r^2 = ax + x^2$; and consequently $y^2 = (a^2 x + a^2 x^2) : \frac{1}{4} a^2 = \frac{4}{a} x + \frac{4}{a^2} x^2$. Suppose $4 \cdot a^2 = ab$; then will $y^2 = bx + bx^2 : a$.

So that the same equation defines the nature of the *hyperbola* in respect of its diameter, as expresses it in respect of its axis; and the parameter is a third proportional to the conjugate diameters DE and AB.

11°. If from the vertex A, and any point of the parabola N, you draw AF and TN parallel to the asymptote CR; the rectangle of TN into TC, will be equal to the rectangle of FA into FC.—Hence, if TC $= x$, TN $= y$; the equation expressing the nature of a *hyperbola* within asymptotes, in respect of its diameter, will be $xy = ab$.

12°. An asymptote being taken for a diameter; divided into equal parts, and through all the divisions, which form so many absciss continually increasing equally, ordinates to the curve being drawn parallel to the other asymptote; the absciss will represent an infinite series of natural numbers; and the corresponding *hyperbolic* or asymptotic spaces, will represent the series of logarithms of the same numbers.

Hence different *hyperbola's* will furnish different series of logarithms to the same series of natural numbers; so that to determine any particular series of logarithms, choice must be made of some particular *hyperbola*.—Now, the most simple of all the *hyperbola's* is the equilateral one, i.e. that whose asymptotes make a right angle between them. This, M. de Lagni alleges in favour of the binary arithmetic, as being the result of such equilateral *hyperbola*. See BINARY Arithmetic.

For the Locus of an HYPERBOLA. See the article LOCUS. For the Quadrature of an HYPERBOLA. See QUADRATURE. Ambigenal HYPERBOLA, is that which has one of its infinite legs inscribed, and the other circumscribed.

Equilateral HYPERBOLA, is that wherein the conjugate axis AB (fig. 20.) and DE are equal.

Properties of the Equilateral HYPERBOLA.—Since the parameter is a third proportional to the conjugate axis, it is also equal to the axis.

Wherefore, if in the equation $y^2 = bx + bx^2 : a$, you suppose $b = a$; the equation $y^2 = ax + x^2$ will express the nature of the equilateral *hyperbola*.

And hence the squares of the ordinates y^2 and z^2 , are to each other as $ax + x^2$ and $az + z^2$: That is, as the rectangles of the absciss into right lines composed of the absciss and parameter.

If you suppose HC $= x$, CA $= r$, then will AP $= x - r$, and PB $= r + x$. Consequently $y^2 = x^2 - r^2$. And since AE $= CA$; the angle ACE will be half right; and consequently the angle of the asymptotes FCG a right angle.

Infinite HYPERBOLA's, or HYPERBOLA's of the higher kinds, are those defined by the equation $a y^n + b x^n = a^2 x^n (a + x)^n$. Hence, in infinite *hyperbola's* $a y^n + b x^n : a^2 v^n + b x^n = (a + x)^n : b x^n (a + x)^n$: That is, $y^n + \frac{b}{a^2} x^n : v^n + \frac{b}{a^2} x^n = (a + x)^n : x^n (a + x)^n$.

As the *hyperbola* of the first kind or order has two asymptotes, that of the second kind or order has three, that of the third, four, &c.

In respect of these, the *hyperbola* of the first kind, is called the Apollonian or conical *hyperbola*.

Apollonian HYPERBOLA, is the common *hyperbola*, or the *hyperbola* of the first kind: Thus called in contradistinction to the *hyperbola's* of the higher kinds.

HYPERBOLE*, in rhetoric, a figure, whereby the truth, and reality of things is excessively either enlarged or diminished. See EXAGGERATION.

* The word is Greek, υπερβαλον, *superlatio*, formed of the verb υπερβαλλω, *exsuperare*, to exceed, surpass by far.

The character of an *hyperbole* is to exaggerate or extenuate the idea of the thing spoke of, beyond the bounds of truth, or even probability.—As, He ran swifter than the wind; he went slower than a tortoise, &c.

Hyperbole's, says Seneca, lye without deceiving; they lead the mind to truth by fictions, they convey the sentiment intended, tho' by exprefing it in terms which render it incredible.—The *hyperbole* premises too much, in order to make you conceive enough.

Aristotle observes, that *hyperbole's* are the favourite figures of young authors, who love excess and exaggeration; but that philosophers should not use them without a great deal of reserve.

The pitch to which an *hyperbole* may be carried, is a point of great delicacy: To carry it too far, is to destroy it: It is of the nature of a bow-string, which, by immoderate tension, slackens; and frequently has an effect quite contrary to that intended. *Longinus*.

Those *hyperbole's* are best, which are latent, and are not taken for *hyperbole's*. For this reason, they should scarce ever be used but in a passion, and in the middle of some important incident: such is the *hyperbole* of Herodotus, speaking of the Lacedemonians, who fought at Thermopylae, 'They defended themselves, for some time, with the arms that were left them, and at last with their hands and teeth; till the Barbarians, continually shooting, buried them, as it were, with their arrows.' Now, what likelihood is there that naked men should defend themselves with their hands and teeth against armed men; and that so many persons should be buried under their enemies arrows? Yet does there appear some probability in the thing, by reason it is not fought for the sake of the figure; but the *hyperbole* seems to arise out of the subject itself. *Id*.

Of the like kind is that passage of a comic poet mentioned by *Longinus*: 'He had lands in the country no larger than a Lacedemonian epistle.'

There are certain manners of tempering the harshness of *hyperbole's*, and giving them an air of probability. Virgil says, that to see the fleets of Anthony and Augustus at the battle of Actium, one would have taken them for the Cyclades floating on the water: and Florus, speaking of the expedition wherewith the Romans built a number of vessels in the first Punic war, says, 'It seemed, not that the ships were built by workmen, but that the trees were transformed into ships by the gods.' They do not say that the ships were floating islands; nor that the trees were metamorphosed into ships; but only that one might have taken them to be so. This precaution serves as a kind of passport to the *hyperbole*, if we may be allowed the phrase, and makes it go down even in prose: for what is excused before it is said, is always heard favourably, how incredible soever it be. *Bouhours*.

HYPERBOLIC, or HYPERBOLICAL, something relating either to an *hyperbole*, or an *hyperbola*. See *HYPERBOLA*, and *HYPERBOLIC*.

Thus we say, an *hyperbolic* expression; an *hyperbolic* image, &c.

HYPERBOLIC Conoid. See the article *CONOID*.

HYPERBOLIC Cylindroid, is a solid figure, whose generation is given by Sir Christopher Wren, in the *Philosophical Transactions*.

Two opposite *hyperbola's* being joined by the transverse axis, and through the centre a right line being drawn at right angles to that axis; and above that, as an axis, the *hyperbola's* being supposed to revolve, by such revolution, a body will be generated, which is called the *hyperbolic cylindroid*, whose bases, and all sections parallel to them, will be circles. In a subsequent *Transfation*, the same author applies the new figure to the grinding of *hyperbolic* glasses; affirming, that they must be formed this way, or not at all.

HYPERBOLIC Log of a curve, is that which approaches infinitely nearer to some asymptote.

Sir Isaac Newton reduces all curves, both of the first and of the higher kinds, into those with *hyperbolic* legs, and those with parabolic ones. See *CURVE*.

HYPERBOLIC Line is used by some authors for what we call the *hyperbola* itself.

In this sense, the plane surface terminated by the curve line is called the *hyperbola*; and the curve line that terminates it, the *hyperbolic line*.

HYPERBOLIC Mirror. See the article *MIRROR*.

HYPERBOLIC Solid. See the article *CUBATURE*.

HYPERBOLIFORM Figures, are such curves as approach, in their properties, to the nature of the *hyperbola*; called also *hyperboloids*.

HYPERBOLOIDES, are *hyperbola's* of the higher kind, whose nature is expressed by this equation: $a y^m x^n = b x^m (a+x^n)$: especially if $m > 1$, or $n > 1$. e. g. $a y^3 = b x^2 (a+x)$.

HYPERBOREAN, ὑπερβορεος, in the antient geography.—The antients denominated those people, and places *hyperborean*, which were to the northward of the Scythians. They had but very little acquaintance with these

hyperborean regions; and all they tell us of them is very precarious, and much of it false.

Diodorus Siculus says, the *hyperboreans* were thus called by reason they dwelt beyond the wind *Boreas*; ὑπερ, signifying above or beyond, and βορεας, *Boreas*, the north wind. This etymology is very natural and plausible; notwithstanding all that Rudbecks has said against it, who would have the word to be generally Gothic, and to signify *nobility*.

Herodotus doubts, whether or no there were any such thing as *hyperborean* nations: Strabo, who profess'd that he believed there were, does not take *hyperborean* to signify beyond *Boreas* or the north, as Herodotus understood it: The preposition ὑπερ, in this case, he supposes only to help form a superlative; so that *hyperborean*, on his principle, means no more than *most northern*: by which it appears the antients scarce knew themselves what the name meant by it.

HYPERCATALECTIC *, in the Greek and Latin poetry, is applied to verses which have one or two syllables too much; or beyond the regular measure. See *VERSE*.

* The word is Greek, ὑπερκαταλεκτικος; composed of ὑπερ, over, beyond, and καταλεγειν, I put to the number I add; so that *hypercatalectic* denotes as much as *super-added*.

The Greek and Latin verses are distinguished, with respect to their measure, into four kinds: *acatalectic* verses, where nothing is wanting at the end; *catalectic*, which want a syllable at the end; *brachycatalectic*, which want a whole foot at the end; and, lastly, *hypercatalectic*, which have one or two syllables too many.—These last are also called *hyper-meters*.

HYPERCATHARSIS *, ὑπερκαθαρσις, in medicine, *super-purgation*; a too violent, and excessive purgation.

* The word is compounded of the Greek, ὑπερ, supra, and καθαρσις, I purge.

HYPERCRISIS *, ὑπερκρισις, in medicine, any immoderate critical excretion.

* The word is compounded of ὑπερ, supra, and κρισις, crisis, judgment.

Thus, when a fever terminates in a looseness, the humours sometimes flow off faster than the strength can bear, and are therefore to be checked.—This is a *hypercrisis*.

HYPERCRITIC *, an over-rigid censor, or critic; one who will let nothing pass, but animadvert severely on the slightest fault.

* The word is compounded of ὑπερ, super, over, above, beyond, and κριτικος, of κρισις, judex; of κρισις, judex, I judge.

HYPERDULIA *, in the Romish theology, is the worship rendered to the holy virgin. See *VIRGIN*.

* The word is Greek, ὑπερδουλια, composed of ὑπερ, above, and δουλια, worship, service.

The worship offered to saints is called *dulia*; and that to the mother of God, *hyperdulia*; as being superior to the former.

HYPERMETER *, in the antient poetry, the same with *hypercatalectic*. See *HYPERCATALECTIC*.

* The word is composed of ὑπερ, super, and μετρον, measure.

HYPERSARCOSIS *, ὑπερσαρκωσις, in medicine and chirurgery, an excess of flesh; or rather, a fleshy excrescence, such as those generally arising on the lips of wounds, &c.

HYPERTHYRON *, in the antient architecture, a sort of table used after the manner of a frieze, over the jambs of Doric doors and gates, and the lintels of windows. It lies immediately under the corona; and is by our workmen usually called the *king-piece*.

* The word is formed of ὑπερ, super, over, and θυρον, janua, gate.

HYPHEN, ῥηφην, an accent or character in grammar, which implies, that two words are to be joined, or connected into one compound word.—As, male-fanus, male-administration, &c.

Hyphens serve also to connect the syllables of such words as are divided by the end of the line.

HYPNOTICK *, ὑπνωτικος, in medicine, a remedy which promotes or induces sleep; called also *soporific*, and *opiate*.

* The word comes from the Greek, ὑπνω, somnus, sleep.

HYPPO, ὑπο, a Greek particle, retained in the composition of divers words borrowed from that language; literally denoting under, beneath,—In which sense it stands opposed to ὑπερ, super, above.

HYPOBOLE *, in rhetoric, a figure whereby we answer beforehand, to what we apprehend the adversary will object.

* The word comes from the Greek ὑπο, and βαλλω, jacio, I cast.

HYPOCATHARSIS *, ὑποκαθαρσις, in medicine, a too faint, or feeble purgation.

* The word is compounded of ὑπο, sub, under, and καθαρσις, I purge.

HYPOCAUSTUM *, ὑποκαυστον, among the Greeks and Romans, was a subterraneous place, wherein was a furnace that served to heat the baths.—Vitruvius calls it *caldarium*.

* The word is Greek, formed of the preposition *ὑπο*, *sub*, under, and the verb *καίω*, *incendo*, I burn.

The ancients had properly two sorts of *hypocausta*; the one called by Cicero *vaporarium*, and by others *laconicum* or *sudatio*; which was a large sweating bath, in which were three brazen vessels called *caldarium*, *tepidarium*, and *frigidarium*, according to the water contained therein.

The other *hypocaustum*, was a sort of *fornax* or oven to heat their winter parlours, or *vernacula hybernæ*.

The latter *hypocaustum* was called *abeus* and *fornax*; and the man that tended the fire, *fornicator*.

HYPOCAUSTUM, among the moderns, is that part or place where the fire is kept that warms a stove, or hot-house. See **STOVE**.

HYPPOCHONDRIA*, *ὑποχονδρία*, in anatomy, a space on each side the epigastric region, or upper part of the lower belly. See **ABDOMEN**, and **EPIGASTRIC**.

* The word is composed of the preposition *ὑπο*, *sub*, under, and *χονδρῖον*, cartilage; *g. d. cartilagin subiacens*, or under the cartilages of the ribs, &c.

The *hypochondria* compose the upper part of the epigastrum. They are situate on each side, between the cartilago enfiformis, the cartilages of the ribs, and the tip of the breast; and are divided, with respect to their situation, into *right* and *left*.

In the *right hypochondrium* the liver is found; and in the *left* the spleen, and a great part of the stomach.

Hippocrates sometimes uses the word *hypochondrium* for the whole lower venter or belly.

The *hypochondria* are subject to divers disorders.

HYPPOCHONDRIAC Affection, or Passion, a popular disease, otherwise called the *spleen vapours*, &c.

The *hypochondriac* is a very comprehensive disease: it is variously denominated, according to the various symptoms it is attended with, and the various parts where it is supposed to be seated, or in which it arises.

When conceived as situate in the *hypochondriac* regions, or arising from some disorder of the parts contained therein, *viz.* the spleen, liver, &c. it is properly called the *hypochondriac disease*, *spleen*, &c.

When conceived as owing to some disorder of the womb, it is called the *hysterical affection*, &c.

And lastly, when the flatulent rumblings in the intestines, belchings, &c. are considered, it is called the *vapour*.

The *hypochondriac* is a very common and very obstinate disease: Few men of a sedentary life, and fewer women, are free from it: Its symptoms are very numerous: The most usual, are a pain in the stomach, windiness, vomitings, a swelling or distension of the *hypochondrium*, or upper part of the belly, noises and rumblings in the lower venter, wandering pains, a constriction of the breast, difficulty of breathing, palpitation of the heart, faintings, vigilæ, inquietudes, swimming of the head, fear, suspicions, melancholy, deliriums, &c. Not that all these accidents befall every person seized with this disease; but sometimes some of them, and at other times others, according to the constitution, &c. of the patient.

In effect, the *hypochondriacal* is a very vague, indeterminate sort of disorder. Dr. Sydenham observes, that its symptoms are or emulate those of most other diseases; and that whatever part it is in, it produces somewhat like the common diseases of that part.—Thus, in the head, it produces a sort of apoplexy; fits like the epilepsy, called *hysterical fits*; intolerable head-ach, &c. In persons affected with the chlorosis, it produces a palpitation of the heart; sometimes, though rarely, it seizes the lungs, and causes a continual dry cough: It also imitates the colic, and iliac passion, and sometimes the stone, jaundice, &c. In the intestines it produces a diarrhoea; in the stomach, nausea: sometimes it seizes the external parts, and particularly the back, which it renders chilly and painful; and the legs and thighs, which it swells so as to resemble the dropsy, seizing the teeth it resembles the scurvy; (indeed, Etmüller makes the scurvy itself to be only a great degree of this disease). Lastly, which is the most unhappy circumstance of all, the patient is sometimes more affected in mind than in body.

The feat of this disease is commonly supposed to be in the animal spirits, and the nervous system. Its cause is referred to an acid salt abounding in the mass of blood; to which the ill disposition of the stomach, and the other parts contained in the epigastrum, may greatly contribute. Purcell assigns crudities and indigestions as the prime cause. According to Sydenham, vehement motions of the body, or more usually violent perturbations of the mind, as grief, anger, fear, &c. are its procaccious causes.

For the cure, the principal indication is to purify and strengthen the blood, which is to be effected, after proper evacuations, by chalybeats, bitters, strengtheners, and volatile spirits. The cortex has also notable virtues in this disease; as has also a milk diet. Riding is admirable.

VOL. I.

HYPPOCHONDRIACAL Medicines, are remedies proper in the *hypochondriacal* disease.

Such are all those which tend to purify the blood, humours, and spirits; as chervil, baum, agrimony, and the other cephalic and cardiac herbs: such also are those which purge melancholy or atrillitis, according to the old authors, and those which dispel wind and vapours; and all medicines good for disorders of the nerves, particularly vervain, both male and female; but above all, frequent, gentle, anodyne purges are excellent.

HYPPOCHONDRIACAL Regions. See **HYPPOCHONDRIA**.

HYPOCHYMA*, or **HYPOCHYSIS**, in medicine, a disease of the eyes more usually called a *cataract*. See **CATARACT**.

* The word is Greek, *ὑποχυμα*, which literally denotes shedding, effusion, or pouring out; the disease having formerly been supposed to arise from an effusion of some viscid humour upon the pupil.

HYPOCHYSIS, in medicine. See **HYPOCHYMA**.

HYPOCISTIS*, *ὑποκίστις*, in medicine, a juice, used in the composition of theriaca, &c.

* The word is Greek, formed of *ὑπο*, under, and *κίστις*, *cistus*.

The *hypocistis* is the juice of a shoot or excrecence of the same name, sprouting out from the foot of a kind of cistus, which is called *ledon* or *ladanifera*; common enough in the hot countries.

The shoot grows about a foot high; and one, two, or three inches thick; and is somewhat bigger at top than at bottom; and is soft, succulent, of a yellowish colour, and surrounded from space to space with a sort of rings, or brownish knots.

When gathered, they pound it in a mortar, and express the juice: that done, they evaporate it on the fire till it come to the consistence of a hard blackish extract, much like Spanish liquorice. Then they make it up into little masses for carriage. It is of a tart astringent taste, and used to stop fluxes of the belly, vomitings, and hæmorrhages; though anciently much more than at present. It is also an ingredient in some unguents.

It is sometimes used as a substitute to acacia.—Dr. Quincy says, it is the more powerful astringent of the two.

HYPOCRAS. See the article **HYPOCRAS**.

HYPODROME. See the article **HYPODROME**.

HYPOGÆUM*, in the ancient architecture, is a name common to all the parts of a building that are under ground; as the cellar, butteries, and the like places.

* The word is Greek, *ὑπογαίον*, formed of *ὑπο*, under, and *γαία*, *terra*, earth.

HYPOGÆUM, *ὑπογαίον*, in astrology, is a name given to the celestial houses which are below the horizon; and especially the *inimæ celi*, or bottom of heaven.

HYPGASTRIC Region. See **HYPGASTRIUM**.

HYPGASTRIC Artery, is an artery arising from the iliac interna, and distributed to the bladder, the rectum, and the genital parts, particularly in women.

HYPGASTRIC Vein, arises in the same parts, and discharges itself into the iliac interna.

HYPGASTRIUM*, in anatomy, the lower part of the abdomen, or lower venter; commencing from two or three inches below the navel, and extending to the os pubis.

* The word is Greek, formed of *ὑπο*, *sub*, under, and *γαστήρ*, *venter*, belly.

HYPOGLOTTIS*, or **HYPOGLOSSIS**, in anatomy, is a name given to two glands of the tongue.

* The word is Greek, composed of *ὑπο*, *sub*, under, and *γλῶττις*, *lingua*, tongue.

There are four large glands of the tongue; two of them called *hypoglossides*, situated under it, near the venæ ranulares; one on each side of the tongue. They serve to filtrate a kind of ferous matter, of the nature of saliva, which they discharge into the mouth by little ducts near the gums.

HYPOGLOTTIS, or **HYPOGLOSSIS**, in medicine, denotes an inflammation or ulceration under the tongue; called also *ranula*.

HYPOMOCHLION*, in mechanics the fulcrum of a lever; or the point which sustains its pressure, when employed either in raising or lowering bodies.

* The word is Greek, *ὑπομοχλίων*, formed of *ὑπο*, *sub*, under, and *μοχλῖον*, *avellia*, lever.

The *hypomochlion* is frequently a roller set under the lever; or under stones, pieces of timber, &c. that they may be the more easily lifted up, or removed.

HYPOPYON*, in medicine, a disease of the eyes.—It consists in a collection of pus, under or behind the cornea; which sometimes covers the whole pupil, and obstructs the light.

* The word is Greek, *ὑποπύον*; formed of *ὑπο*, *sub*, under, and *πύον*, pus.

Some will have this disorder the same with *unguis*; but the more accurate make a difference.

The *hypopyon* arises from a rupture of the vessels in the uvea, occasioned either by some external violence, or the acrimony of the blood therein.

It is very difficult of cure.—The suppuration is to be prevented by proper cataplasms; or, if these will not take effect, is to be promoted.

HYPORCHEMA, in the Greek poetry, a poem composed in divers kinds of verses, and of different lengths; but always very short, and full of Pyrrhic feet.

HYPOSPATHISMUS*, in the ancient chirurgery, an operation practised, by making three incisions in the forehead, to the very bone, about two inches long; in order to cut or divide all the vessels between those incisions. The design of the operation was to prevent defluxions on the eyes.

* The word is Greek, *ὑποσπάθισμος*, formed of *ὑπο*, under, and *σπάθη*, spatula; by reason after incisions were made, they thrust a spatula all along between the pericranium and the flesh.

HYPOSTASIS*, a Greek term, literally signifying *substance*, or *subsistence*; It is used in theology for *person*.

* The word *ὑπόστασις* is compounded of *ὑπο*, sub, under, and *ἵστημι*, *sto*, *existo*, I stand, I exist; *g. d. substantia*.

Thus we hold, that there is but one nature or essence in God, but three *hypostases*, or persons.

The term *hypostasis* is of a very ancient standing in the church. S. Cyril repeats it divers times, as also the phrase *Union according to hypostasis*. The first time it occurs in all christian antiquity, is in a letter of that father to Nestorius,

where he uses it instead of *προσωπον*, the word we commonly render *person*, which did not seem expressive enough.

The philosophers, says S. Cyril, have allowed three *hypostases*: They have extended the divinity to three *hypostases*: They have even sometimes used the word *trinity*:

and nothing was wanting but to have admitted the consubstantiality of the three *hypostases*, to shew the unity of the divine nature, exclusive of all triplicity in respect of distinction of nature, and not to hold it necessary to conceive any

respective inferiority of *hypostases*.

This term has occasioned great dissensions in the ancient church; first among the Greeks, and afterwards also among the Latins.

In the council of Nice, *hypostasis* was defined to denote the same with *essence*, or *substance*; so that it was hereby to say that Jesus Christ was of a different *hypostasis* from the Father; but custom altered its meaning.

In the necessity they were under of expressing themselves strongly against the Sabellians, the Greeks made choice of the word *hypostasis*, and the Latins of *persona*; which change proved the occasion of endless disagreement. The phrase *τρεῖς ὑποστάσεις* used by the Greeks, scandalized the Latins, whose usual way of rendering *ὑπόστασις* in their language, was by *substantia*: The barrenness of the Latin tongue in theological phrases, allowed them but one word for the two Greek ones, *ὑπόστασις* and *ὑπόστασις*; and thus disabled them from distinguishing *essence* from *hypostasis*.—For which reason they chose rather to use the term *tres personæ*, than *tres hypostases*.

—An end was put to these logomachias, in a synod held at Alexandria about the year 362. at which S. Athanasius assisted; from which time the Latins made no great scruple of saying *tres hypostases*, nor the Greeks of three *persons*.—Among the Greeks the custom obtained to say *μία ὕψοστασις*, one *essence*, three *substances*; and among the Latins, not *una essentia*, *tres substantiæ*, but with the same meaning, *una essentia*, or *substantia tres personæ*. Some later Latin writers, to avoid the ambiguity of the words *substance* and *person*, use *subsistence*, and say, one *essence*, three *subsistences*. Those who took the word *hypostasis* in its antient signification, could not bear to hear of three *hypostases*, which, according to them, were so many divine essences or substances. And yet they who used the word in the new sense against the Sabellians, all along declared, that they meant by it three individuals, or three subjects which subsist alike, and not three different essences or substances: so that in their sense, they admitted three *hypostases* in one and the same essence.—Others, by *essence*, understood a common and indefinite nature, as humanity is to all men in the general; and by *hypostasis*, a single nature, peculiar to each individual, as each man in particular is a modification of the whole human nature or essence.—But this last signification, which some attribute to S. Basil, if applied to the Deity, would imply tritheism: for if the three persons in the Trinity be three *hypostases*, just as Peter, James, and John are, there are manifestly three Gods.

HYPOSTASIS, in medicine, the sediment of the urine, or that thick heavy part of the urine, which subsides and settles at bottom.

HYPOSTATICAL, in theology, is a term used in speaking of the mystery of the incarnation.

Hypostatical Union, is the union of the human nature with the divine.

The Word was united *hypostatically* to the human nature in the person of Jesus Christ.

HYPOSTATICAL Principles, among the chemists, and particularly the Paracelsists, are the three chemical elements, *salt*,

sulphur, and *mercury*; called also the *tria prima*. See **PRINCIPLE**, and **ELEMENT**.

HYPOTHECA*, in the civil law, an obligation, whereby the effects of a debtor are made over to his creditor, to secure his debt.

* The word comes from the Greek, *ὑπόθεκα*, a thing subject to some obligation; of the verb *ὑποτίθημι*, *suppono*, I am subjected; of *ὑπο*, under, and *τίθημι*, *pono*, I put.

As the *hypotheca* is an engagement procured on purpose for the security of the creditor, various means have been made use of to secure to him the benefit of the convention. The use of the pawn or pledge is the most ancient; which is almost the same thing with the *hypotheca*; all the difference consisting in this, that the pledge is put into the creditor's hands; whereas, in a simple *hypotheca* the thing remained in the possession of the debtor. It was found more easy and commodious to engage an estate by a civil covenant, than by an actual delivery: accordingly, the expedient was first practised among the Greeks; and from them the Romans borrowed both the name and the thing: only the Greeks, the better to prevent frauds used to fix some visible mark on the thing, that the public might know it was *hypothecate*, or mortgaged by the proprietor: But the Romans, looking on such advertisements as injurious to the debtor, forbade the use of them.

The Roman lawyers distinguished four kinds of *hypotheca's*: The *conventional*, which was with the will and consent of both parties: The *legal*, which was appointed by law, and for that reason called *tacit*: The *praetor's pledge*, when by the flight or non-appearing of the debtor, the creditor was put in possession of his effects: And the *judiciary*, when the creditor was put in possession by virtue of a sentence of the court.

The *conventional hypotheca* is sub-divided into *general* and *special*. The *hypotheca* is *general*, when all the debtor's effects, both present and future, are engaged to the creditor. It is *special*, when limited to one or more particular things. For the *tacit hypotheca*, the civilians reckon no less than twenty six different species thereof.

HYPOTHENAR*, in anatomy, the second muscle of the little finger.

* The word is compounded of *ὑπο*, sub, and *ἰθηναρ*, the hollow of the hand.

The *hypothenar* arises from the little bone of the carpi, situate over the others, and is inserted externally into the first bone of the little finger, which it serves to withdraw from the rest.

The sixth and last muscle of the toes is also called *hypothenar*, or abductor.

HYPOTHENUSE*, or rather **HYPOTENUSE**, in geometry, is the longest side of a right-angled triangle; or that side which subtends, or is opposite to, the right angle.

* The word is Greek, *ὑποθηνυσα*, *subtendens*, formed of *ὑπο*, sub, under, and *ἵστημι*, *subtendo*, I sub tend.

Thus in the triangle KML, (*Tab. Geometry, fig. 71.*) the side ML, opposite to the right angle K, is called the *hypotenuse*.

It is a celebrated problem in geometry, that in every rectilinear right-angled triangle, as KML; the square of the *hypotenuse* ML, is equal to the squares of both the other sides, KL and KM.—This is particularly called the *Pythagorean problem*, from its inventor Pythagoras, who is said to have sacrificed a whole hecatomb to the muses, in gratitude for their assisting him therein.

HYPOTHESIS*, in logic, is a proposition or principle which we suppose, or take for granted, in order to draw conclusions therefrom, for the proof of a point in question. See **POSITION**, and **PRINCIPLE**.

* The word is Greek, *ὑπόθεσις*, formed of *ὑπο*, sub, under, and *τίθημι*, *pono*, I put.

In disputation, they frequently make false *hypotheses*, in order to draw their antagonisms into absurdities; and even in geometry truths are often deducible from such false *hypotheses*.—Thus, if the sky should fall, we should catch larks: The consequence is good, though drawn from a false *hypothesis*.

Every conditional or hypothetical proposition, may be distinguished into *hypothesis* and *thesis*: The first rehearces the conditions under which any thing is affirmed or denied; and the latter is the thing itself affirmed or denied.

Thus, in the proposition, A triangle is half of a parallelogram, if the bases and altitudes of the two be equal: The latter part is the *hypothesis*, if the bases, &c. and the former the *thesis*, a triangle is half a parallelogram.

In strict logic, we are never to pass from the *hypothesis* to the *thesis*; that is, the principle supposed must be proved to be true, before we require the consequence to be allowed.

HYPOTHESIS, in physics, &c. denotes a kind of system laid down from our own imagination, whereby to account for some phenomenon or appearance of nature.

Thus

Thus we have *hypotheses* to account for the tides, for gravity, for magnetism, for the deluge, &c.

The real and scientific causes of natural things generally lie very deep: Observation and experiment, the proper means of arriving at them, are in most cases extremely slow; and the human mind is very impatient: Hence we are frequently driven to feign or invent something that may seem like the cause, and which is calculated to answer the several phenomena; so that it may possibly be the true cause.

Philosophers are divided as to the use of such fictions or *hypotheses*, which are much less current now than they were formerly.—The latest and best writers are for excluding *hypotheses*, and standing wholly on observation and experiment.

Whatever is not deduced from phenomena, says Sir Isaac Newton, is an *hypothesis*; and *hypotheses*, whether metaphysical, or physical, or mechanical, or of occult qualities, have no place in experimental philosophy. *Phil. Nat. Prin. Math. in Calc.*

The Cartesians take upon them to suppose what affections in the primary particles of matter they please; just what figures, what magnitudes, what motions, and what situations they find for their purpose.—They also feign certain unseen, unknown fluids, and endue them with the most arbitrary properties; give them a subtilty which enables them to pervade the pores of all bodies, and make them agitated with the most unaccountable motions. But is not this to set aside the real constitution of things, and to substitute dreams in their place? Truth is scarce attainable even by the surest observations; and will fanciful conjectures ever come at it? They who found their speculations on *hypotheses*, even though they argue from them regularly, according to the strictest laws of mechanics, may be said to compose an elegant and artful fable; but it is still only a fable. *Cotes in Prefat. ad Newton. Princip.*

HYPOTHESIS is more particularly applied, in astronomy, to the several systems of the heavens: or the divers manners wherein different astronomers have supposed the heavenly bodies to be ranged, moved, &c.

The principal *hypotheses* are the *Ptolemaic*, *Copernican*, and *Tychonic*.

The Copernican is now become so current, and is so well warranted by observation; that the retainers thereto, hold it injurious to call it an *hypothesis*.

HYPOTHETICAL Proposition, is a combination of two categorical propositions, the latter whereof follows from the former, which is distinguished by the particle *if*.

Such, *e. g.* are; If he be a man, he is an animal: If the Turk sleep, the cock crows: If you repent, you shall be forgiven.

HYPOTRACHELION*, in anatomy, denotes the lower part of the neck. See **NECK**.

* It is thus called from *ὑπο*, *sub*, under, and *τραχηλος*, *collum*, neck.

HYPOTRACHELION, in architecture, is used for a little frieze in the Tuscan and Doric capital, between the astragal and annulets; called also the *colerin*, and *gorgerin*.

The word is also applied by some authors in a more general sense, to the neck of any column; or that part of the capital thereof below the astragal.

HYPOTYPOSIS*, in rhetoric, a figure whereby a thing is so lively described or painted, that it does not seem to be read, or heard, but actually seen, or presented before the eyes.

* The word is Greek, *ὑποτύπωσις*, formed of the verb *ὑπὸ*, *per figuram demonstro*, I shew, represent, or make any thing be seen; of *ὑπο*, under, and *τύπος*, type, image, resemblance.

Such is that elegant one of Cicero, wherein he paints the barbarity of Verres: *Ipse inflammatus scelere & furore in furum venit. Ardebant oculi; toto ex ore crudelitas emanabat. Expellabant omnes quo tandem progressurus, aut quidnam acturus esset; cum repente hominem corripit, atque in foro medio nudari ac deligari, & virgas expedire jubet. Clamabat ille miser se civem esse Romanum, &c.*

The *hypotyposis* is frequently used by the poets, and particularly Virgil, who abounds in paintings.

HYPOZOMA, in anatomy, a name given to such membranes as separate two cavities.

In this sense, the mediastinum is a *hypozoma*.

HYPSILOGLOSSUS, in anatomy, the same with *basiglossus*.

HYPSILOIDES, in anatomy. See **HYOIDES**.

HYPISSTARII*, **HIPSISTARIANS**, a sect of heretics in the fourth century; thus called from the profession they made of worshipping the most high God.

* The word is Greek, *ὑψισταριοι*, formed from *ὑψιστος*, *hypsis*, highest.

The doctrine of the *Hypisstaris*, was an assemblage of Pa-

ganism, Judaism, and Christianity. They adored the most high God with the Christians; but they also revered fire and lamps with the Heathens; and observed the sabbath, and the distinction of clean and unclean things, with the Jews.

The *Hypisstaris* bore a near resemblance to the Eucrites, or Maffalians.

HYSSOP, **HYSSOPUS**, a medicinal herb, of a detergent cleansing quality, and chiefly used in diseases of the breast and lungs. It is a standing ingredient in pectoral apozems. There are also a syrup, and a simple distilled water from it, used in the shops.

It has also a faculty to comfort and strengthen; and is prevalent against melancholy and phlegm.—It is propagated only by slips.

Its tops and flowers reduced to powder, are by some reserved to strew upon the colder faller herbs.

HYSSOPIC Art, a name which Paracelsus gave to chymistry, considered as that art purifies metals, minerals, &c. in allusion to that text in the Psalms, 'Purge me with *hyssop*, and I shall be clean.'

HYSTERALGY*, in medicine, a pain in the matrix or womb, occasioned by some inflammation, or other disorder therein.

* The word is compounded of the Greek, *ὑστερα*, *matrix*, womb, and *αλγος*, *dolor*, pain.

HYSTERIC Affection, or *Passion*, a disease in women, called also *suffocation of the womb*, and vulgarly *fits of the mother*.

* The word is Greek, *ὑστερικος*, formed of *ὑστερα*, womb.

Hysteric affection is generally used by authors promiscuously with *hypochondriac affection*; the two diseases being supposed to be, in reality, the same.—They only differ indeed in point of relation and circumstance.

The *hysteric* is properly a species or branch of the *hypochondriac*, peculiar to women, and supposed to arise from some disorder of the womb.

One of the symptoms, or effects of *hypochondriac* diseases, is convulsions, or fits not unlike those of the epilepsy; these we call *hysteric fits*; and the disease that produces them, the *hysteric affection*. *Sydenham*.

It is also particularly denominated *hysteric suffocation*, from one of its principal symptoms, which is a contraction of the breast, and a difficulty of breathing.

Some women under this disorder, fancy a rope tied about their necks, ready to strangle them; and others, think a piece of something is got into their throats, which they cannot swallow, but which stops their breath: and some will even remain a good while as if really strangled, without any sense or motion.

The more common symptoms or accidents of this disease, are a swimming of the head, a dazzling of the eyes, inquietudes, pains of the abdomen, belches, nausea, vomitings, deliriums, and convulsions. It is not always attended with all these symptoms, but sometimes with more, and sometimes with fewer of them, and those more or less violent.

Dr. Purcell describes a *hysteric* paroxysm, as beginning with a sense of coldness creeping up the back, and afterwards spreading over the whole body; then ensues a head-ach, and sometimes a palpitation of the heart, with a fainting, from which the patient soon recovers. Sometimes, after the coldness, there succeeds a remarkable heat, which brings on the forementioned symptoms.—Baglivi adds, that *hysteric* women feel a sense of cold in the crown of the head; and this he takes to be the chief diagnostic of the disease.

The ordinary causes of this disorder are violent passions, rage, love, grief, ill news, sweet smells, &c. As for the popular notion of malignant vapours arising from the womb, and occasioning all these symptoms, the learned all discard it, and hold men as subject to the disease as women. The real cause they affirm is in the animal spirits, and the nervous system; and the affection does not differ from the *hypochondriac*.

For the cure; as many of the symptoms are convulsive, antispasmodics are indicated. During the paroxysm, fetid things, whether internally or externally applied, are of advantage; particularly castoreum, the smoke of burnt horn, or burnt feathers held to the nose. Volatile spirits also help to wake the patient out of the paroxysm; as also tickling in the soles of the feet. Where it is severer than ordinary, recourse must be had to puncture, scarification, vesicatories, and even to caustics.

HYSTERICs, or **HYSTERIC Medicines**, are remedies proper to remove *hysteric* affections; and to remedy disorders of the womb.

There are divers species of *hysterics*: some evacuate or cleanse the womb, by expelling any impurities lodged therein: others tend to stop immoderate fluxes thereof; and others strengthen the tone of the part.

According to Dr. Quincy, *hysteric* affections arise either from too titillating, or too uneasy sensations: The former proceed from that irritation of the nerve, which the make and secretion of those parts have naturally subjected them to, and which, in some sorts of constitutions, arise to that degree;

JAC

as to draw the whole system into disorder, and occasion a surprizing variety of symptoms; *e. g.* several sorts of convulsions, and species of madness; which therefore are by some termed *furæres uterini*.

These disorders are most effectually allayed by such things as are in a manner the reverse of cordials, and are both in smell and taste very offensive and disagreeable: they seem to answer this end by suffocating, as it were, the spirits, and damping their inordinate sallies, so that such stimulation ceases, and the fibres return to their natural tone and motions: for, as what is grateful to the senses, gives an inexpressible emotion to the fine nervous filaments; so does what is fetid and disagreeable quite destroy that emotion, and deaden it: and as the former kind consist chiefly of fine subtle volatile parts, by which, as before explained under *CEPHALICS*, they are fitter to enter the nerves; so these are generally of a clammy viscous contexture, and therefore the fitter to envelope and entangle that subtle juice; whereby its motion is much retarded.

JAL

HYSTEROLOGY*, *HYSTEROLOGIA*, in rhetoric, a vicious manner of speaking, wherein the natural order of things is inverted; called also by the Greeks *ὕστερος ἀπόλογος*; *q. d.* putting the first thing where the last should be.

* The word is Greek, *ὕστερος*, signifying a *discourse inverted*.

HYSTERON-PROTERON, *ὕστερος ἀπόλογος*. See *HYSTEROLOGY*.

HYSTEROTOMIA*, *ὑστεροτομία*, in anatomy, an anatomical dissection of the uterus, or womb. See *MATRIX*.

* The word is formed of the Greek, *ὕστερα*, *matrix*, womb, and *τομή*, *seco*, I cut, I dissect.

HYSTEROTOMOTOCY, *ὑστεροτομοτοκία* in chirurgery, an operation more usually called the *Cæsarian section*. See *CÆSARIAN*.

HYTH, or **HITH**, a port, wharf, or little haven, to embark or land wares at.—Such is *Queen-bith*, &c.

I.

I, The ninth letter of the English alphabet: It is both a vowel and a consonant; agreeable to which two different powers, it has two different forms.

The Hebrews called the *j* consonant *jod*, *י* from *י* hand and *space*; in regard it is supposed to represent the hand clenched, so as to leave the space underneath void. With them, it was pronounced as the consonant *y*, as it still is among the Germans, and some other people. The Greeks had no *j* consonant, and for that reason used their vowel *i* instead of it, as coming the nearest in sound. The French and English have two kinds of *j* consonants; the first has a snuffing kind of sound, and serves to modify that of the vowels, pretty much in the manner of *g*; as in *jew*, *just*, *jevial*: the latter is pronounced like the Hebrew *jod*; instances of which we have in some of our words, which are indifferently written with a *y* or an *i* before a vowel; as *voiage*, *voyage*, *loial*, *loyal*, &c. in which cases, the *i* is apparently a consonant, as being only a motion of the palate, which gives a modification to the following vowel.

The vowel *i*, according to Plato, is proper for expressing fine and delicate, but humble things: on which account that verse in Virgil.

Accipiant inimicum imbrems, rimisque fatiscunt;

which abounds in *i*'s is generally admired.

The vowel *i* was the only vowel which the Romans did not mark with a dash of the pen, to shew when it was long; instead of which, to denote it long, they used to make it bigger than ordinary, as in *Piſſo*, *Vltus*, &c.—According to Lippius, they often repeated it when it was to be long, as in *dii*. They sometimes also denoted the length of this letter by adding *e* to it, and turning it into a diphthong, as *divei* for *divi*, *omneis* for *omnis*, &c.

I, was antiently a numeral letter, and signified a hundred, according to the verse,

I. c. compar erit, & centum significabit.

I, in the ordinary way of numbering, signifies one; and when repeated, it signifies as many units as it is repeated times.

In abbreviatures and ciphers, *I* frequently represents the whole word *Jesus*, whereof it is the first letter.

JABAJAHITES, a sect among the musſulmen, who, according to Ricaut, teach, That God is not perfectly wise; that his knowledge does not extend to every thing; and that time and experience have furnished him with the knowledge of many things whereof he was before ignorant.—

Thus, say they, not being apprized from all eternity of every event that shall happen in the world, he is now obliged to govern it according to the chance, and occurrence of those events.

JACK, in a ship, is that flag which is hoisted up at the sprit-fail-top-mast head. See *Tab. Ship. fig. 1. n. 146*.

In falconry, *Jack* signifies the male of birds of sport. See *HAWK*, and *FALCON*.

JACK-Ketch, is a name given by the populace to the public hangman.

JACK in a Lantern. See the article *IGNIS FATUUS*.

JACOBS'S STAFF, a mathematical instrument for taking heights, and distances; the same with the *cross-staff*. See *CROSS-STAFF*.

JACOBINS, a name given in France to the religious who follow the rule of S. Dominic, on account of their principal convent, which is near the gate of S. James, in Latin *Jaco-*

bus, at Paris; and which, before they became possessed of it in the year 1218, was an hospital of pilgrims, dedicated to the said saint.

Others maintain, that they have been called *Jacobins* ever since they were established in Italy, in regard they pretended to imitate the lives of apostles.

They are also called *friars predicants*, or preaching friars, and make one of the four orders of mendicants.

JACOBITES, a sect of heretics, who were antiently a branch of the Eutyrians, and are still subsisting in the Levant.

They were so called from *Jacobus*, James, of Syria, who was one of the heads of the Monophysites, or sectaries, who owned but one nature in Jesus Christ.

The Monophysites were a sect of vast extent, comprehending the Armenians, Copts, and Abyssinians; but those among them who are properly *Jacobites*, were but few; and among those too, there is now a division, some being Romanised, and others perfectly averse to the Romish church: each of which parties have their several patriarchs, the one at Cærenit, and the other at Derzapharan.

As to their faith, all the Monophysites, both *Jacobites* and others, follow the doctrine of Dioscorus touching the unity of nature, and person in Jesus Christ.

JACOBITE, in England, is a term of reproach bestowed on such persons as disallow the late Revolution, and still assert the rights, and adhere to the interests, of the late abdicated king James and his line.

JACOBUS, a gold coin, worth 25 shillings; so called from king James the first of England, in whose reign it was struck. We usually distinguish two kinds of *Jacobus*, the *old* and the *new*; the former valued at 25 shillings; weighing six penny weight ten grains: the latter, called also *Coralus*, valued at 23 shillings; in weight five penny weight, twenty grains.

JADE, a greenish stone, bordering on olive colour, much esteemed for its hardness, which exceeds that of porphyry, agat, or jasper, and is only to be cut with diamond dust.

It is in mighty esteem among the Turks and Poles, who adorn all their fine works with it, and especially the handles of their fabres.

This stone applied to the reins, is said to be a preservative from the nephritic colic.—M. Bernier tells us, that the caravans of Tibet carry it to Cachemire, and that the Galibis prize it as highly as the diamond. The natives of South America value it on account of the virtues they attribute to it in the epilepsy, stone, and gravel.—In a treatise on it printed at Paris, it is called the *divine stone*. See *supplement*: article *JADE*.

JALAP, **JALAPIUM**, or **JALAPPA**, a root of a plant not much unlike our bryony, and therefore by some called *bryonia Peruviana*; as being brought to us chiefly from Peru and New-Spain, much used as a cathartic.

The mechoacan and this are reckoned of a species, and therefore as this is sometimes called *mechoacana nigra*, that goes as often by the name of *jalapium album*.

As *jalap* does not appear to have been known to the antients, it has its place in medicine only since those parts of America which produce it, have been traded to by the Europeans.

That which breaks blackest, most brittle, sound, and thinning withinſide, is the best; by reason the refinous parts, which give

give it those properties, are supposed to contain its medicinal virtues.

Some take great pains to extract its resin, which is to be done with any spirituous menstruum, but afterwards they want correctors for it: the most common is salt of tartar, or loaf sugar; but if correcting consists in separating its parts, as it certainly does, the drawing it from the root, and making it into a resin, should seem to be needless. — M. Boulduc, who has made several experiments on it, says, it is one of the best cathartics we have, taken as nature only has prepared it.

IAMBIC, a kind of verse, found in the Greek and Latin poets; consisting wholly, or at least in great part, of *iambus*'s, or feet so called.

Iambic verses may be considered, either with regard to the diversity, or the number of their feet: under each of which heads there are distinct kinds, which have different names. — 1^o. *Pure iambics*, are those which consist entirely of *iambus*'s; as the fourth piece of Catullus made in praise of a ship:

Phælus ille, quem videtis hospites.

The second kind are those called simply *iambics*. — These have no *iambus*'s but in the even feet, though there are sometimes *tribrachys*'s added to them, excepting to the last, which is always an *iambus*; and in the uneven feet they have spondee, anapaests, and even a dactyl in the first: Such is that of Medea in Ovid,

Servare potui, perdere an possim rogas?

The third kind are the *free iambic* verses, in which it is not absolutely necessary there should be any *iambus*, excepting in the last foot; of which kind are all those of Phædrus:

Amittit meritū proprium, qui alienum appetit.

In comedies, the ancient authors seldom confine themselves long, frequently less, as we may observe in Plautus and Terence: but the sixth is always indispensibly an *iambus*.

As to the varieties, occasioned by the number of syllables; — *Dimeter iambic*, is that which has but four feet:

Queruntur in sylvis aves.

Those which have six are called *trimeters*: These are the most beautiful, and are used principally for the theater; particularly in tragedy; wherein they are vastly preferable to the verses of ten or twelve feet, used in our modern drama; in regard they come nearer to the nature of prose, and favour less of art and affectation.

*Dii conjugales, tuque genialis tori
Lucina custos, &c.*

Those with eight, are called *tetrameters*, and are only used in comedies:

Pecuniam in loco negligere maximum interdum est lucrum. Terent.

Some add an *iambic* monometer, with two feet:

Virtus beat.

They are called *monometers*, *dimeters*, *trimeters*, and *tetrameters*; that is, of one, two, three, and four measures, because a measure consisted of two feet; the Greeks measuring their verses two feet by two feet, or by dipodys, or epitrites, joining the *iambus* and spondee together.

All the *iambics* hitherto mentioned are *perfect*; they have their just number of feet, without any thing either deficient or redundant. — The *imperfect iambics* are of three kinds; the *catalectic*, which want a syllable:

Musæ Jovem canebant.

The *brachycatalectic*, which want an entire foot:

Musæ Jovis gnate.

The *hypercatalectic*, which have either a foot or a syllable too much:

Musæ sorores sunt Minervæ,

Musæ sorores Palladis lugent.

Many of the hymns and anthems used in the Romish church, are *dimeter iambics*, that is, consisting of four feet.

IAMBUS *, **ΙΑΜΒΟΣ**, in the Greek and Latin prosody, a poetical foot, consisting of a short syllable followed by a long one; as in

— — — — —

— — — — —

Syllaba longa brevis subjecta vocatur iambus, as Horace expresses it; who also calls the *iambus* a swift, rapid foot, *pæcitus*.

* The word, according to some, took its rise from *Iambus*, the son of Pan and Echo, who invented this foot; or perhaps, who only used sharp biting expressions to Ceres, when afflicted for the death of Proserpine: Some rather derive it from the Greek, *ἰαμ*, venom, poison; or from *ἰαμίζω*, maledico, I rail, or revile; because the verses composed of *iambus*'s were at first only used in satire.

JAMES — S. JAMES of the Sward, *San Jago del Espada*, a military order in Spain, instituted in 1170, under the reign of Ferdinand II. king of Leon and Galicia.

Its end was, to put a stop to the incursions of the Moors; three knights obliging themselves by a vow to secure the roads.

An union was proposed and agreed to in 1170, between these

Vol. I.

and the canons of S. Eloy; and the order was confirmed by the pope in 1175.

The highest dignity in this order, is that of *grand master*, which has been united to the crown of Spain. — The knights are obliged to make proof of their descent from families that have been noble for four generations on both sides: they must also make it appear, that their fathers have never been Jews, Saracens, nor heretics; nor even to have been called in question by the Inquisition.

The novices are obliged to serve six months in the galleys, and to live a month in a monastery. — Heretofore they were truly religious, and took a vow of celibacy; but Alexander III. gave them a permission to marry. They now make no vows but of poverty, obedience, and chastity. — To which, since the year 1652, they have added that of defending the immaculate conception of the holy Virgin. — Their habit is a white cloke, with a cross on the breast. — This is esteemed the most considerable of all the military orders in Spain: the king carefully protects the office of grand master in his own family; on account of the rich revenues and offices, whereof it gives him the disposal. — The number of knights is much greater now than formerly, all the grandes chusing rather to be received into this, than into the order of the golden fleece; insomuch, that they put them in a fair way of attaining to command, and obtain many considerable privileges in all the provinces of Spain, but especially in Catalonia.

JANIZARIES *, an order of infantry in the Turkish armies; reputed the grand seignior's foot guards.

* Vossius derives the word from *genizari*, which, in the Turkish language, signifies *novi homines*, or *milites*; d'Hierlot tells us, that *jenitcheri* signifies a new band, or troop; and that the name was originally given by Amurath I. called the Conqueror, who chusing out one fifth part of the Christian prisoners, whom he had taken from the Greeks, and instructing them in the discipline of war, and the doctrines of their religion, sent them to Hagî Bektasche (a person whose pretended piety rendered him extremely revered among the Turks) to the end that he might confer his blessing on them, and at the same time give them some mark to distinguish them from the rest of the troops. — Bektasche, after putting them in his manner, cut off one of the sleeves of the far gown which he had on, and put it on the head of the leader of this new militia; from which time, viz. the year of Christ 1361, they have still retained the name *jenitcheri*, and the fur cap.

As, in the Turkish army, the European troops are distinguished from those of Asia, the *janizaries* are also distinguished into *janizaries of Constantinople*, and of *Damascus*.

Their pay is from two aspers to twelve per diem; for when they have a child, or do any signal piece of service, their pay is augmented.

Their dress consisted of a dolyman, or long gown, with short sleeves, which is given them annually by the grand seignior, on the first day of Ramazan. They wear no turban, but in lieu of that a kind of cap, which they call *semlak*, and a long hood of the same stuff hanging on their shoulders. On solemn days they are adorned with *semlaks*, which are black in a little case in the fore part of the helmet.

Their arms, in Europe, in a time of war, are a sabre, a carbine, or musquet, and a cartouch-box hanging on the left side. — At Constantinople, in a time of peace, they only carry a long staff in their hand. In Asia, where powder and firearms are more uncommon, they wear a bow and arrows, with a poniard, which they call *balanc*.

The *janizaries* were heretofore a body formidable even to their masters, the grand seigniors: Osman, they first stripped of his empire, and afterwards of his life; and sultan Ibrahim they deposed, and at last strangled in the castle of the Seven towers: but they are now much less considerable. Their number is, or ought to be, fixed to twenty thousand.

The *janizaries* are children of tribute, levied by the Turks among the Christians, and bred up to the military life. — They are taken at the age of twelve years, to the end, that forgetting their country and religion, they may know no other parent, but the sultan. However, generally speaking, they are not now-a-days raised by way of tribute; for the carach, or tax, which the Turks impose on the Christians, for allowing them the liberty of their religion, is now paid in money; excepting in some places, where money being scarce, the people are unable to pay in specie, as in Mengrelia, and other provinces near the Black sea.

The officer who commands the whole body of *janizaries*, is called the *janizar agagi*; in English, *aga* of the *janizaries*; he is one of the chief officers of the empire.

Though the *janizaries* are not prohibited marriage, yet they rarely marry, nor then, but with the consent of their officers; as imagining a married man to make a worse soldier than a bachelor.

The *janizaries* were at first called *foja*, that is, footmen, to distinguish them from the other Turks, the troops whereof consisted mostly of cavalry.

Vigener tells us, that the discipline observed among the *janizaries*,

J A P

nizaries, is extremely conformable, in a great many things, to that used in the Roman legions.

JANIZARIES, at Rome, are officers, or pensioners of the pope, called also *participantes*, by reason of certain rights or dues which they enjoy in the annates, bulls, or expeditions of the Roman chancery.

Most authors are mistaken in the nature of their office; the truth is, they are officers of the third bench, or college of the Roman chancery.—The first bench consists of writers, the second of abbreviators, and the third of *janizaries*; who are a kind of correctors and revisers of the pope's bulls.

JANSENISM, the doctrine of Cornelius Janfen, commonly called *Janfenius*, bishop of Ypres in Flanders, with relation to grace, and free-will.

Janfenism made no great noise in the world, till after the death of its author, in 1638; when Fromond and Catenus, his executors, published his book, entitled *Augustinus*. The whole doctrine was reduced by the bishops of France into five propositions, which follow: I. Some commands of God are impossible to righteous men, even though they endeavour, with all their powers, to accomplish them: the grace being wanting, by which they should be enabled to perform them. II. In the state of corrupted nature, a man never resists inward grace. III. To merit and demerit in the present state of corrupt nature, it is not requisite a man should have that liberty which excludes necessity: that which excludes constraint is sufficient. IV. The Semipelagians admitted the necessity of inward preventing grace to each act in particular, and even to the beginning of faith: but they were heretics, in regard they asserted that this grace was such, as that the will of man might either resist or obey it. V. It is Semipelagianism to say, that Jesus Christ died, or shed his blood for all men in general.

Janfenism consists in maintaining these doctrines, which may be done two ways: 1^o. By asserting, that these propositions are found, and orthodox. 2^o. In affirming, that they are evil and heretical in the sense wherein the church has condemned them; but that this sense is not that of *Janfenius*.

Janfenism has been condemned by the popes Urban VIII, Innocent X, Alexander VII, and Clement XI.

JANUARY*, the name of the first month of the year, according to the computation now used in the west.

* The word is derived from the Latin *Januarius*, a name given by the Romans, from *Janus*, one of their divinities, to whom they attributed two faces; because, on the one side, the first day of *January* looked towards the new year, and on the other towards the old one.—The word *Januarius* may also be derived from *janua*, gate; in regard this month being the first, is, as it were, the gate of the year.

January and *February* were introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March.

The Christians heretofore fasted on the first day of *January*, by way of opposition to the superstition of the Heathens, who, in honour of Janus, observed this day with feasting, dancing, masquerades, &c.

JAPAN Earth, or *Catechu*, a medicinal substance, of a dark purple colour; very austere upon the palate, seeming to melt, in the mouth, and leaving somewhat of a sweetish taste behind it.

It is famous for stopping fluxes of all kinds: and is the juice of a vegetable not an earth, as its name imports. See *CATECHU*.

JAPANNING, the art of varnishing, and drawing figures on wood, &c. after the same manner as the workmen do who are natives of Japan, a famous island not far from the coast of China.

The manner of *japanning* on wood, ordinarily practised among us, is said to be this:—They take a pint of spirit of wine well dephlegmated, and four ounces of gum lacca, (which last must be separated from the sticks and rubbish) then bruising it roughly in a mortar, they put it to steep in spring-water, tied up in a bag of coarse linnen, together with a little Castile soap, for the space of twelve hours. This done, they rub out all the tincture, and add to it the spirit and a little allum, and reserve it apart; they then add as much mastic and white amber, dissolved in a matras, with spirit of wine, by a two days digestion, frequently stirring it, that it do not stick to the glass; then they strain the whole, and press it out into another vessel.

This done, they take the wood to be *japanned*, and cover it with a layer of this varnish, till it be sufficiently drenched with it; then taking some of the colour the figures are to be of, they incorporate it with seven times as much of the varnish, and apply it with a pencil, going over each part three several times, each a quarter of an hour after the other: two hours after this they polish it with a peltle, or with Dutch reeds.

As to the colours used in this art, for a fair red they take Spanish vermilion, with a fourth part of Venice laque: Black, they make of ivory calcined between two crucibles; for blue, they use ultramarine, and only twice as much varnish as co-

I C E

lour.—The rest are applied as above directed, except the green, which is difficult to make fair and lively, and therefore is seldom used.—Thus far my author, on whose authority I desire this article may stand. *D. Ryft. tom. I.*—Parker will give much ampler instructions. See his treatise *Of Japanning*, Folio. Oxford, 1688, passim.

NIGHT JAPANNING, is performed by applying three or four layers with the colours first, then two of pure varnish uncoloured, made according to the former process. Before it be dry, they fit some aventurine, or gold wire reduced to powder, over it, and then cover it with as many layers of pure varnish, as render it like polished glass; and lastly, rub it over with tripoli, oil of olive, or a hatter's felt. See *VARNISH*.

JAR*, or *JARR*, an earthen pot or pitcher, with a big belly, and two handles.

* The word comes from the Spanish, *jerra*, or *jarro*, which signify the fame.

JAR is used for a sort of measure, or fixed quantity of divers things.—The *jar* of oil, is from eighteen to twenty six gallons: the *jar* of green ginger, is about an hundred pound weight.

JASPER*, *JASPIS*, a sort of precious stone, chiefly opake, but sometimes transparent in certain parts; and not much different from the agate, excepting in this, that it is more soft, and does not take so good a polish.

* The word is Hebrew, and has neither been changed by the Greeks, Latins, nor us: some Greek versions give it the name of *beryl*. Onkelos calls it *panther*, in regard of its being spotted like that animal.

In some of these stones, as also in the agates, nature has amused herself, in representing rivers, trees, animals, landscapes, &c. as if they were painted.—The *jasper*, found in the Pyreneans, is usually stained with various colours; though there are some that have but one colour, as red, or green; but these are the least valuable: The most beautiful is that bordering on the colour of lacca, or purple; next to that, the carnation; but what is now most valued, is the green spotted with red. See Supplement: article *JASPER*.

JATRALIPTIC, *IATPAEINTIKH*, that part of physic which cures by unguents and frictions; and the application of fomentations, plasters, &c.

It was one Prodicus, a disciple of Æsculapius, and native of Selymbria, who first instituted the *jatraliptic* art.

JAVELIN, a kind of spear, or half pike, used by the antients both on horseback, and on foot.

It was five foot and a half long, and the steel, wherewith it was headed, had three sides or faces, which all terminated in a point.

JAUNDICE*, a disease consisting in a suffusion of the bile, and a rejection thereof to the surface of the body, whereby the whole exterior habit is discoloured.

* The word is derived from the French, *jaunisse*, yellowness, of *jaunt*, yellow.

Of this there are three kinds; the first, properly called the *jaundice*, or *yellow jaundice*, is owing to the yellow bile, which, in this case, is too exalted, or too abundant in the mass of blood; or perhaps to an obstruction of the glands of the liver, which prevents the gall's being duly separated from the blood: or finally to a stoppage of the porous bilarius, or the like means, whereby the mixture of that fluid with the aliment in the intestines is prevented.

The second, called the *black jaundice*, is owing to the same bile's being mingled with acids.

The third, bordering on *green*, takes its rise also from a different mixture of bile with an acid:—This is usually called the *chlorosis*, or green sickness; and is a distemper pretty common in young women.

In the *yellow jaundice*, the albuginea, or white of the eye, and the skin, are chiefly yellow; and besides, they are troubled with an itching.—In the *black jaundice*, the natural colour is lost, by reason of an atrabiliary humour spread underneath the skin: it first appears brownish, and afterwards of a lead colour.

The *jaundice* often proves a forerunner of the dropsy.—A doctor of the faculty of Montpellier, calls the *yellow jaundice*, attended with periodical pains, a *rheumatism of the liver*; and another of the same place calls it, a *quartan ague of the liver*.

The acid spirit of sal ammoniac, is said to be an excellent remedy against the *jaundice*. See Supplement: article *ICTERUS*.

JAW, in anatomy. See the article *MAXILLA*.

ICADES, the name of an antient feast, celebrated every month by the Epicurean philosophers, in memory of their master Epicurus.

The day on which it was held, was the twentieth day of the moon, or month; which was that whereon Epicurus came into the world: And hence came the name *icades*, from *ικαδοι*, twenty.

They adorned their chambers on this day, and bore his image in state about their houses, making sacrifices, &c.

ICE, a brittle, transparent body, formed of some fluid frozen or fixed by cold.

Towards

ICH

Towards the poles there are found vast piles of *ice*, reaching two or three hundred feet above the surface of the water, and appearing like islands; about whose origin there are different opinions: some ascribe them to snow, which falling in great abundance in these cold climates, and melting in the sea, accumulates gradually, till those huge heaps are at length formed: But the more common opinion is, that this *ice* is formed from the fresh waters which flow from the neighbouring lands. Bartoli has written an Italian treatise expressly on *Ice and Coagulation*. And the *Acta Eruditorum* furnish us with an account of a French author on the same subject. See *COAGULATION* and *COLD*.

ICH-DIEN, the motto of the arms of the prince of Wales, signifying in High Dutch, *I serve*.

Sir Henry Spelman judges it to be Saxon, *ic dien*, *ic thien*; the Saxon *ic* with a transverse stroke *s*, being the same with *th*, and signifying, *I serve*, or *am a servant*; as the ministers of the Saxon kings were called *thiens*, or *thans*.

ICHOGRAPHY*, in perspective, the view of any thing cut off by a plane parallel to the horizon, just at the base, or bottom of it.

* The word is derived from the Greek, *ichos*, *vestigium*, foot-step, and *grapho*, *scribo*, I describe; as being a description of the footstep, or traces of a work.

Ichography, is the same with what is otherwise called the *plan*, *geometrical plan*, or *ground-plan* of any thing.

ICHOGRAPHY, in architecture, is a transverse section of a building, exhibiting the circumference of the whole edifice, and of the several rooms and apartments in the given story; together with the thickness of the walls, and partitions, the dimensions of the doors, windows, and chimneys; the projections of the columns, and peers; with every thing visible in such a section.

The drawing or designing of this is properly the work of the master-architect or surveyor, it being indeed the most difficult of any.

ICHOGRAPHY, in fortification, denotes the plan or representation of the length and breadth of a fortress, the distinct parts of which are marked out, either on the ground itself, or upon paper.

ICHOGLANS*, the grand seignior's pages, serving in the seraglio.

* The word, according to some authors, is composed of the two Turkish words, *ich*, or *itib*, which signifies *within*, and *eglan*, page. In which sense *ichoglan* is a page serving within the palace, or seraglio. Others derive it from the barbarous Greek, *ichoglan*, or *ichoglan*, which was formed from the Latin, *incola*. These two etymologies give nearly the same sense to *ichoglan*, taking *incola* for *domus incola*.

These are the children of Christians, and are bred up in an austerity scarce to be conceived. The sultan prefers them to officers more or less considerable, as they appear more or less capable and devoted to his service; but it is to be observed, they are incapable of offices till forty years of age, unless they have some particular dispensation from the grand seignior. They are educated with a great deal of care in the seraglio's of Pera, Adrianople and Constantinople. They are under the direction of a capit aga, who presides over their exercises, and treats them with a world of severity. They are divided into four odas, or chambers, where, according to their several talents, or inclinations, they are instructed either in the languages, religion, or exercises of the body.

ICHOR*, properly signifies a thin watry humour, like serum; but is sometimes also used for a thicker kind, flowing from ulcers; called also *Janies*.

* The word is originally Greek, *ichor*; where it signifies any humour, or humidity.

ICHTHYOCOLLA*, popularly called *isnglass*, a medicinal substance procured from a fish, common in the Danube; which has no bones except about the head.

* The word is Greek, *ichthycolla*, formed of *ichthys*, *piscis*, fish, and *colla*, *gluten*, glue.

After the bladder and other membranous parts of this fish are cut in small pieces, they boil them in water to a thick jelly; which is spread abroad and dried, then rolled up, and brought to us in the form we see it in the shops.

It is of a very glutinous quality, and consequently good in all disorders, which arise from too thin, and sharp a state of the fluids.

ICHTHYOPHAGI*, *Fish-eaters*, a name given to a people, or rather to several different people, who lived wholly on fishes.

* The word is Greek, *ichthophagi*, compounded of *ichthys*, *piscis* fish, and *phago*, *edere*, to eat.

The *Ichthyophagi* spoke of by Ptolemy are placed by Sanfon in the provinces of Nanquin and Yantong. Agatharchides calls all the inhabitants between Carmania and Gedrosia by the name *Ichthyophagi*.

IDE

From the accounts given us of the *Ichthyophagi* by Herodotus, Strabo, Solinus, Plutarch, &c. it appears, indeed, that they had cattle, but that they made no use of them, excepting as they say, to feed their fish withal. They made their houses of large fish-bones, the ribs of whales serving them for their beams. The jaws of these animals served them for doors, and the mortars wherein they pounded their fish, and baked it at the sun, were nothing else but their vertebrae.

ICONOCLASTES*, or **ICONOCLASTÆ**, breakers of images; a name which the church of Rome gives to all who reject the use of images in religious matters.

* The word is Greek, *εικονοκλαης*; formed from *εικων*, *imago*, and *κλαω* *rumpere*, to break.

In this sense, not only the reformed, but some of the eastern churches are called *Iconoclastes*, and are all esteemed by them heretics, as opposing the worship of the images of God and the saints, and breaking their figures and representations in churches.

ICONOGRAPHIA*, the description of images; or ancient statues of marble, and copper; also of busts and semi-busts, penates, paintings in fresco, mosaic works, and ancient pieces of miniature.

* The word is Greek, *εικονογραφια*, derived from *εικων*, *imago*, and *γραφω*, *scribo*, I describe.

ICONOLATRA*, or **ICONOLATER**, one who worships images; a name which the Iconoclastes give to those of the Romish communion, on account of their adoring images, and of rendering to them the worship only due to God.

* The word comes from the Greek, *εικων* and *λατρεω*, *colo*, I worship.

ICONOLOGIA*, the interpretation of ancient images, monuments, and emblems.

* The word is formed from the Greek, *εικων*, and *λογω*, I speak.

ICOSAHEDRON, a regular body, or solid, terminated by twenty equilateral and equal triangles.

The *icosahedron* may be considered as consisting of twenty triangular pyramids, whose vertices meet in the center of a sphere, imagined to circumscribe it; and therefore they all have their heights and bases equal; wherefore the solidity of one of those pyramids, multiplied by 20, the number of bases, gives the solid content of the *icosahedron*.

ICTERIC*, a term in physic, applied to such persons as have the jaundice, which the Latins call *icterus*, *aurigo*, or *morbus regius*. See *JAUNDICE*.

* The word is derived from the Greek *ictericus*, which signifies the same, and which some derive further from *ictus*, a kind of weasel with yellow eyes.

Icteric medicines are those remedies prescribed in cases of the jaundice.

IDEA*, **ΙΔΕΑ**, the image, or resemblance of a thing, which, though not seen, is conceived by the mind. See *IMAGE*.

* The word is Greek; Cicero renders it in Latin by *exemplar*, and *exemplum*, and Plato himself, in some places, by *παράδειγμα*. Cicero, in his *Topics*, also expresses it by *forma*, and *species*.

Plato has only given the *idea* of a perfect commonwealth: *Plato ideam tantum adumbravit, seu depinxit perfecti status reipublicæ*. Cic.

IDEA, in psychology, denotes the immediate object of the mind about which we are employed, when we perceive or think of any thing.

Thus, when we look at the sun, we do not see that luminary itself, but its image or appearance conveyed to the soul by the organ of sight; and this image we call *idea*.

The origin of *ideas* has been a long time disputed among philosophers. The Peripatetics maintain, that external objects emit species which resemble them all around; and that these species striking on our senses, are by them transmitted to the understanding; and that being material and sensible, they are rendered intelligible by the active intellect, and are at length received by the passive.

Others are of opinion, that our souls have of themselves the power of producing *ideas* of things we would think upon; and that they are excited to produce them by the impressions which objects make on the body; though these impressions are not images in any respect like the objects that occasioned them. And in this, say they, it is, that man is made after the image of God, and that he partakes of his power; for as God made all things out of nothing, and can reduce them to nothing when he pleases, so man can create as many *ideas* as he pleases, and annihilate them when he has done.

Others maintain, that the mind has no occasion for any thing besides itself to perceive objects; and that by considering itself and its own perfections, it is able to discover all things that are without.—Others with Descartes, hold that our *ideas* were created and born along with us.

Malebranche, and his followers assert, that God has in himself the *ideas* of all the beings he has created; that thus he sees all things, in considering his own perfections to which they correspond.

IDE

correspond; and that as he is intimately united to our souls by his presence, our mind sees and perceives things in him which represent created beings; and that it is thus we come by all our *ideas*. He adds, that though we see all sensible and material things in God, yet that we have not our sensations in him. When we perceive any sensible object, in our perception is included both a sensation and a pure *idea*. The sensation is a modification of the soul, and it is God who causes it in us: but for the *idea* joined with the sensation, it is in God, and it is in him that we see it.

The Cartesians distinguish three kinds of *ideas*.—The first *innate*; such they say is that we have of God, as of a being infinitely perfect.—The second *adventitious*; which the mind receives in proportion as bodily objects present themselves to our senses: Such is the *idea* of body, sound, figure, light, &c.—The third, according to these philosophers, are *fictitious*; which are those which the mind forms, by uniting and assembling the *ideas* which it already had: and these are called *complex*. But Mr. Locke seems to have put this matter out of dispute; having made it appear that all our *ideas* are owing to our senses; and that all innate, created, and fictitious *ideas*, are mere chimeras.

Our mind, he shews, has not absolutely any *ideas* besides those presented to it by the senses, and those which it forms by its own operations, on those others which the senses furnish. So that a man destitute of one of his senses, would never have any *idea* belonging to that sense; and supposing him destitute of all the senses, he would never have any *idea* at all; external objects having no other way of producing *ideas* in him, but by means of sensation. He would have no *idea*, not even of reflexion; because in wanting all sensation, he wants that which should excite in him the operations of his mind, which are the objects of his reflexion.

It is plain, therefore, there is no innate *idea*; no general truth, or first principle inherent in the soul, and created with it; no immediate object of the mind before it had perceived external objects by means of the senses, and reflected on that perception. Those *ideas* only seem to be innate, because we find we have them as soon as we come to the use of reason; but they are, in effect, what we formed from the *ideas* wherewith the mind was insensibly filled by the senses. Thus when the mind is employed about sensible objects, it comes by the *ideas* of bitter, sweet, yellow, hard, &c. which we call *sensation*; and when employed about its own operations, perceiving and reflecting on them as employed about the *ideas* before got by sensation, we get the *ideas* of perception, thinking, doubting, willing, &c. which we call *inward sensation* or *reflexion*: and these two, *viz.* external material things as the objects of sensation, and the operations of our own minds as the objects of reflexion, are the only originals, whence all our *ideas* have their rise.—When we have considered these, and their several modes and combinations, we shall find that they contain our whole stock of *ideas*; inasmuch that the understanding does not seem to have the least glimmering of any *ideas* that it did not receive from one of those sources.

And thus far the mind appears merely passive, as not having it in its power to chuse whether it will have these first beginnings or materials of knowledge, or not. For the objects of sense will obtrude their *ideas* upon the mind, and the operations of the mind will not let us be without some (however obscure) notion of them.

Ideas are divided into *simple* and *complex*.

Simple IDEAS, include all those which come into the mind by sensation; and though the qualities of bodies that affect our senses are in the things themselves so mixed and united, that there is no separation between them; yet the *ideas* they produce in the mind are simple and unmixed. Again, some of these *ideas* we acquire purely by means of one sense; as the *ideas* of colours only by the eye, of sounds by the ear, of heat by the touch, &c. Other *ideas* we gain by several senses; as of space, extension, figure, rest, motion, &c. for these have their effect both on the sight and the touch. There are other simple *ideas*, again, formed in the mind both by sensation and reflexion jointly; as those of pleasure, pain, power, existence, unity, succession, &c. And of some of these kinds of *ideas* are all, or at least the most considerable of those simple *ideas* which the mind hath, and out of which is made all its other knowledge.

The better to comprehend the nature of simple *ideas*, it will be convenient to distinguish between them as they are *ideas* of perceptions in our minds, and as they are modifications of the bodies that cause such perceptions in us, that we may not think, as is usually done, that they are exactly the images and resemblances of something inherent in the object: for most of those of sensation are in the mind no more the likeness of any thing existing without us, than the names that stand for them are the likeness of the *ideas*.

But here the qualities of bodies which produce those *ideas* in our minds are to be distinguished into *primary* and *secondary*. *Primary qualities* are such as are utterly inseparable from the body, in what state soever it be; and such as our senses con-

IDE

stantly find in every particle of matter; which are solidity, extension, figure, mobility, and the like. *Secondary qualities* are such as are, in reality, nothing in the objects themselves, but only powers to produce various sensations in us by means of their primary qualities; that is, by the figure, bulk, texture, &c. of their particles, as colour, sounds, taste, &c.

Now the *ideas* of primary qualities are in some sense resemblances of them, and their patterns do really exist in the bodies themselves; but the *ideas* produced in us by those secondary qualities, have no resemblance of them at all. There is nothing like our *ideas* existing in the bodies themselves that occasion them. They are in the bodies we denominate from them, only a power to produce those sensations in us: and what is sweet, warm, blue, &c. in the *idea*, is no more than the bulk, figure and motion of the particles of the bodies themselves which we call so.

The mind has several faculties of managing these simple *ideas*, which are worthy of notice; as, 1^o. That of discerning justly, and distinguishing rightly, between one and another; in which consists the accuracy of judgment.

2^o. That of comparing them one with another in respect of extent, degree, time, place, or any other circumstance of relation, or dependence one on another.

3^o. That of compounding or putting together the simple *ideas* received by sensation and reflexion, in order to make complex ones.

4^o. Children, by repeated sensations, having got some *ideas* fixed in their memories, by degrees learn the use of signs; and when they can speak articulately, they make use of words to signify their *ideas* to others.

Hence, the use of words being to stand as outward marks of our internal *ideas*, and those *ideas* being taken from particular things; if every particular *idea* that we take in, should have a particular name affixed to it, names would grow endless.—To prevent this inconvenience, the mind has another faculty, whereby it can make the particular *ideas* received from such objects, become general; which is done, by considering them as they are in the mind such appearances, separate from all other existences, and circumstances of existence, as time, place, and other concomitant *ideas*: And this is called *abstraction*; whereby *ideas* taken from particular things, become general representatives of all of that kind, and their names, general names, applicable to whatever exists conformable to such abstract *ideas*. Thus, the same colour being observed to-day in chalk or snow, which we observed yesterday in paper or milk, we consider that appearance alone, make it a representative of all the same kind, and give it the name of *whiteness*; by which found we always signify the same quality, wheresoever to be met with or imagined.

From the powers of combining, comparing, and separating, or abstracting simple *ideas*, acquired by sensation and reflexion, all our complex *ideas* are formed; and, as before, in the perception of *ideas*, the understanding was passive, so here it is active, exerting the power it hath in the several acts and faculties above mentioned, in order to frame compound *ideas*.

Complex IDEAS, though their number be infinite, and their variety endless, yet may they all be reduced to these three heads, *viz.* *modes*, *substances*, and *relations*.—*Modes* are such complex *ideas*, as however compounded, are not supposed to exist by themselves, but are considered as dependencies on, or affections of substances; such are the *ideas* signified by the words *triangle*, *gratitude*, *murder*, &c.

These are of two kinds: 1^o. Such as are only variations, or different combinations of the same simple *idea*, without the mixture of any other, as a dozen, a score, &c. which may be called *simple modes*. 2^o. There are others compounded of simple *ideas* of several sorts put together, to make one complex one, as beauty, theft, &c.

Substances have their *ideas* from such combinations of simple *ideas*, as are taken to represent distinct particular things subsisting by themselves; in which the supposed or confused *idea* of substance, such as it is, is always the first and chief.

Relations are a kind of complex *ideas*, arising from the consideration or comparison of one *idea* with another. Of these some only depend on the equality or excess of the same simple *idea* in several subjects, and these may be called *proportional relations*; such as equal, more, bigger, sweeter.—Another occasion of comparing things together, is owing to the circumstances of their origin and beginning; which, not being afterwards to be altered, make the relations depending thereon, as lasting as the subjects to which they belong. Thus it is with natural relations, as father, mother, uncle, cousin, &c. Thus also it is with relations by institution, as prince and people; general and army, &c. As to moral relations, they are the conformity or disagreement of mens free actions to laws and rules, whether human or divine.

Further, *ideas* may be divided into *clear*, or *distinct*, and *obscure*, or *confused*.

Simple IDEAS are *clear*, when they continue such as the objects represent them to us when our organs of sensation are in a good tone and order; when our memories retain them,

and can produce and present them to the mind whenever it has occasion to consider them; and when, with this, the mind sees that these simple *ideas* are severally different one from another.—The contrary to which is what we call *obscurity and confusion of ideas*.

Again, *ideas*, with respect to the objects whence they are taken, or which they are supposed to represent, come under a threefold distinction; being, either *real* or *fantastical*; *true* or *false*; *adequate* or *inadequate*.

By Real IDEAS, are meant such as have a foundation in nature, such as have a conformity with the real being or existence of things, or with their archetypes.

Fantastical IDEAS, are such as have no foundation in nature, nor any conformity with that being to which they are referred as their archetypes.

All our simple *ideas* are real; not that they are images or representations of what does exist, but as they are the certain effects of powers in things without us, ordained by our maker to produce in us such sensations. They are real *ideas* in us, in regard, that by them we distinguish the qualities that are really in the bodies themselves; their reality lies in the steady correspondence they have with the distinct constitutions of real beings, but whether with those constitutions as causes or patterns, it matters not, so long as they are constantly produced by them.

As to complex *ideas*, in regard they are arbitrary combinations of simple *ideas* put together, and united under one general name, in forming whereof the mind uses its own liberty, some are found *real*, and some *imaginary*. 1^o. Mixed modes and relations having no other reality than what they have in the minds of men, are real; nothing more being required to their reality, but a possibility of existing conformable to them. These *ideas* being themselves archetypes, cannot differ from their archetypes, and so they cannot be chimerical, unless any one jumbles inconsistent *ideas* in them: Indeed, those that have names assigned to them, ought to have a conformity to the ordinary signification of those names, to prevent their appearing fantastical. 2^o. Our complex *ideas* of substances being made in reference to things existing without us, whose representations they are thought, are no further real, than as they are combinations of simple *ideas* really united and co-existing in things without us. Those are fantastical, that are made up of several *ideas* that never were found united; as centaur, &c.

As to *true* and *false IDEAS*, it may be observed, that truth and falsehood in propriety of speech belong only to propositions; and that when *ideas* are termed *true* or *false*, there is some tacit proposition, which is the foundation of that denomination. Our *ideas* being nothing else but appearances or perceptions in the mind can no more be said to be true or false, than single names of things can be said to be so; for truth and falsehood lying always in some affirmation or negation, our *ideas* are not capable of them, till the mind passes some judgment of them.—In a metaphysical sense they may be said to be true, i. e. to be really such as they exist; though in things called *true*, even in that sense, there seems to be a secret reference to our *ideas*, looked upon as the standards of that truth; which amounts to a mental proposition. When the mind refers its *ideas* to any thing extraneous to it, they are then capable of being true or false; because in such a reference, the mind makes a tacit supposition of their conformity to that thing; which supposition, as it is true or false, so the *ideas* themselves come to be denominated.

Real ideas are divided into *adequate*, and *inadequate*.

Adequate IDEAS, are those which perfectly represent those archetypes which the mind supposes them taken from, and which it makes them stand for.

Inadequate IDEAS, are such as do but partially or incompletely represent those archetypes to which they are referred.

IDENTITATE Nominis, a writ which lies for him who upon a capias or exigent is arrested, and committed to prison for another man of the same name.

IDENTITY, Sameness; that by which a thing is itself, and not any thing else.—In which sense, *identity* differs from *similitude* as well as *diversity*.

Our idea of *identity* we owe to that power which the mind has of comparing the very being of things; whereby, considering any thing as existing at any certain time and place, and comparing it with itself as existing at any other time, &c. we accordingly pronounce it the same.

When we see any thing in any certain time and place, we are sure it is that very thing, and can be no other, how like soever it may be to something else in all other respects: In regard we conceive it impossible, that two things of the same kind should exist together in the same place, we conclude, that whatever exists any where at the same time, excludes all of the same kind, and is there itself alone. When therefore we demand, whether any thing be the same or no; it refers always to some thing that existed at such a time, in such a

place; which, it was certain, at that instant, was the same with itself, and no other.

We have ideas of three sorts of substances: of God; of finite intelligences; and of bodies.—God being eternal, unalterable, and every where, concerning his *identity* there can be no doubt. Finite spirits having had their determinate place and time of beginning to exist, the relation to that time and place will always determine to each its *identity* as long as it exists.—And the same will hold of every particle of matter to which no addition or from which no subtraction is made. These three exclude not one another out of the same place, yet each exclude those of the same kind, out of the same place.—The *identity* and diversity of modes and relations are determined after the same manner that those of substances are; only the actions of finite beings, as motion and thought, consisting in succession, cannot exist in different times and places as permanent beings: for no motion or thought considered as at different times, can be the same, each part thereof having a different beginning of existence. From whence it is plain, that existence itself is the *principium individuationis*, which determines a being to a particular time and place incommunicable to two beings of the same kind.

Thus, suppose an atom existing in a determined time and place, it is evident, that considered in any instant, it is the same with itself, and will be so, as long as its existence continues. The same may be said of two, or more, or any number of particles, whilst they continue together, the mass will be the same, however jumbled; but if one atom be taken away, it is then not the same mass.

But in vegetables, the *identity* depends not on the same mass, and is not applied to the same thing. The reason of this, is the difference between an inanimate body, and a crude mass of matter; this latter being only the cohesion of particles any how united, the other such a disposition or organization of parts, as is fit to receive and distribute nourishment, so as to continue and frame the wood, bark, leaves, &c. (of an oak, for instance) in which consists the vegetable life.

That, therefore, which hath such an organization of parts, partaking of one common life, continues to be the same plant, though that life be communicated to new particles of matter vitally united to the living plant.—The case is not so much different in brutes, but that any one may hence see what makes an animal, and continues it the same. The *identity* of the same man likewise consists in a participation of the same continued life, in succeeding particles of matter vitally united to the same organized body.

To understand *identity* aright, we must consider what idea the word stands for; it being one thing to be the same substance; another, the same man; and a third, the same person. An animal is a living organized body; and the same animal is the same continued life communicated to different particles of matter, as they happen successively to be united to that organized living body; and our notion of man is but of a particular sort of animal. Person stands for an intelligent being, that reasons and reflects, and can consider itself the same thing in different times and places; which it doth by that consciousness, that is inseparable from thinking. By this every one is to himself, what he calls *self*, without considering whether that self be continued in the same or in diverse substances. In this consists personal *identity*, or the sameness of a rational being; and so far as this consciousness extends backward to any past action, or thought, so far reaches the *identity* of that person. It is the self-same now it was then; and it is by the same self, with this present one, that now reflects on it, that that action was done. Self is that conscious thinking thing, whatever substance it matters not, which is conscious of pleasure and pain, capable of happiness or misery; and so is concerned for itself as far as that consciousness extends. That with which the consciousness of this present thinking thing can join itself, makes the *same* person, and is one self with it; and so attributes to itself, and owns all the actions of that thing as its own, as far as that consciousness reaches.

This personal *identity* is the object of reward and punishment, being that by which every one is concerned for himself. If the consciousness went along with the little finger, when that was cut off, it would be the same self, that was just before concerned for the whole body.—If the same Socrates, waking, and sleeping, did not partake of the same consciousness, he would not be the same person: Socrates waking could not be in justice accountable for what Socrates sleeping did; no more than one twin, for what his brother twin did, because their outdies were so like, that they could not be distinguished.

But suppose I wholly lose the memory of some parts of my life, beyond a possibility of retrieving them, so that I shall never be conscious of them again; am I not again the same person that did those actions, though I have forgot them? I answer, we must here take notice what the word *I* is applied to, which in this case is the man only: And the same man being presumed to be the same person, *I* is easily here supposed to stand also for the same person. But if it be possible

IDI

for the same man to have a distinct incommunicable consciousness at different times, it is past doubt the same man would at different times make different persons.—Which we see is the sense of mankind in the solemnest declaration of their opinions; human laws not punishing the madman for the former man's actions, nor the sober man for what the madman did; thereby making them two persons.

Thus we say in English, such an one is not himself, or is beside himself; in which phrases it is insinuated, that self is changed, and the self-same person is no longer in that man. But is not a man, drunk or sober, the same person? Why else is he punished for the same fact he commits when drunk, though he be never afterwards conscious of it? Just as much the same person, as a man that walks, and does other things in his sleep, is the same person, and is as answerable for any mischief he shall do in it. Human laws punish with a justice suitable to their way of knowledge; because, in these cases, they cannot distinguish certainly, what is real, and what is counterfeit; and so the ignorance in drunkenness or sleep is not admitted as a plea. For though punishment be annexed to personality, and personality to consciousness, and the drunkard is not conscious perhaps of what he did; yet human judicatures justly punish him, because the fact is proved against him, but want of consciousness cannot be proved for him. But in the great day, wherein the secrets of all hearts shall be laid open, it may be reasonable to think no one shall be made to answer for what he knows nothing of, but shall receive his doom, his own conscience accusing, or else excusing him.

To conclude this article, whatever substance begins to exist, it must, during its existence, be the same: whatever composition of substances begin to exist, during the union of those substances, the concrete must be the same. Whatever mode begins to exist, during its existence it is the same; and so if the composition be of distinct substances, and different modes, the same rule holds. Whence it appears, that the difficulty or obscurity that has been about this matter, rather arises from names ill used, than from any obscurity in the things themselves. For whatever makes the specific idea, to which the name is applied, if that idea be steadily kept to, the distinction of any thing into the same and diverse, will easily be conceived.

IDÉOT. See the article **IDROT.**

IDES*, **IDUS**, in the Roman calendar, a denomination given to eight days in each month; commencing, in the months of March, May, July and October, on the 15th day; and in the other months on the 13th day: and reckoned backward, so as in the four months above specified to terminate on the 8th day, and in the rest on the 6th.

* The origin of the word is contested: Some will have it formed from *idus*, to see; by reason the full moon was commonly seen on the day of the *ides*: others from *idus*, species, figure, on account of the image of the full moon then visible: Others from *idul*, or *exul idulis*, a name given by the Hetrurians to a victim offered on that day to Jupiter: Others from the Hetrurian word *idus*, i. e. *divido*; by reason the *ides* divided the moon into two nearly equal parts.

The *ides* came between the calends and the nones.

The 15th day, in March, May, July and October, and the 13th in the other months, being called the *ides* of those months; *idus Martii*, *Maii*, &c. The fourteenth day of the same four months, and the 12th of the other eight, were *pridie idus*, or the eve of the *ides* of March, &c. The 13th day in the four months, and the 11th in the eight, was called the third of the *ides* of such months, 3 *idus Martii*, &c. So, the 12th day in the four, and the 10th in the eight months, were the 4th of the *ides*, 4 *idus Martii*, &c. And thus of the rest, to the 8th and 6th days, which made the 8th of the *ides*, 8 *idus Martii*, &c.

This way of accounting is still in use in the Roman chancery, and in the calendar of the breviary.—The *ides* of May were consecrated to Mercury: the *ides* of March were always esteemed unhappy, after Cæsar's murder: the time after the *ides* of June was reckoned fortunate for those who entered into matrimony: the *ides* of August were consecrated to Diana, and were observed as a feast-day by the slaves. On the *ides* of September, auguries were taken for appointing the magistrates, who formerly entered into their offices on the *ides* of May, and afterwards on those of March.

IDIOM*, **IDIOMA**, is sometimes used for the peculiarities of a language; sometimes for a *dialect*; or the language of some particular province; differing, in some respects, from the language of the nation in general, whence it is derived.

* The word comes from the Greek, *ιδίωμα*, propriety; of *ιδίος*, proper, own.

IDIOPATHY*, a disease, or indisposition peculiar to some member, or part of the body; not caused by any other disease, or preceding affection; nor having any dependence on the rest of the body.

* The word is Greek, *ιδιοπάθεια*; derived from *ιδίος*, proper, particular, and *πάθος*, passion, affection.

In which sense it stands opposed to *sympathy*, which is when

IDO

the indisposition takes its rise from some prior disorder in some other part of the body.

Thus a cataract in the eye is an *idiopathy*: an epilepsy is either *idiopathic*, or *sympathic*; *idiopathic*, when it happens purely through some fault in the brain; *sympathic*, when it is preceded by some other disorder.

IDIOSYNCRASY*, in physic, a temperament peculiar to some body, in consequence whereof, whether in sickness or in health, it has a more than ordinary aversion, or inclination to certain things, or is more affected with them, than others usually are.

* The word is derived from the Greek, *ιδίος*, proper, own, with, and *συναίς*, *crasis*, mixture, temperament.

IDIOT*, or **IDÉOT**, in the English laws, denotes a natural fool, or fool from his birth.

* The word is originally Greek, *ιδίωτης*, which primarily imports a private person, or one who leads a private life, without any share or concern in the government of affairs.

A person who has understanding enough to measure a yard of cloth, number twenty rightly, and tell the days of the week, &c. is not an *idiot* in the eye of the law.

IDIOT, *Idiota* is also used by ancient writers for a person ignorant, or unlearned; answering to *illiteratus*, or *imperitus*. In this sense, Victor tells us, in his *Chronicon*, that in the consulship of Messala, the holy gospels, by command of the emperor Anastasius, were corrected and amended, as having been written by *idiot* evangelists: *Tanquam ab idiotis evangelistis composita*.

IDIOTA *inquirendo vel examinando*, a writ issued out to the sheriff of a county, where the king has notice that there is an idiot naturally born, so weak of understanding, that he cannot govern, or manage his inheritance; directing him to call before him the party suspected, and examine him, and enquire by a jury of twelve men whether he be an idiot. For the king by his prerogative, has the government of the lands and substance of such as are naturally defective in their own discretion.

IDIOTISM*, in grammar, a phrase, or manner of speaking peculiar to a language, and which cannot be rendered word for word into any other.

* The word is derived from the Greek, *ιδίος*, proper, peculiar. *Idiotism* is defined, by some authors, an inflexion of some verb, or a particular construction of some phrase or particle that is anomalous, and deviates from the ordinary rule of the language of the nation, but which is in use in some particular province of it.

Several authors have written of the *idiotisms* in the Greek and Latin languages; that is, of the particular turns in those tongues which vary the most from each other, and from the more popular among the modern tongues: but the examples of these *idiotisms* being borrowed from the best authors, *idiotisms*, in this sense, cannot properly be called an irregularity.

IDOL*, a statue or image of some false god, to whom divine honours are paid, altars and temples erected, and sacrifices offered.

* The word comes from the Greek, *εἰδωλον*, which signifies the same, of *εἶδος*, image, image, figure.

IDOLATRY*, the worship and adoration of false gods; or the giving those honours to creatures, or the works of man's hand, which are only due to God.

* The word comes from the Greek, *εἰδωλον λατρεία*, which signifies the same; composed of *εἶδος*, image, image, and *λατρεύω*, *servire*, to serve.

Several have written of the origin, and causes of *idolatry*; among the rest, Vossius, Selden, Godwyn, and Tension; but it is still a doubt who was the first author of it. It is generally allowed, however, that it had not its beginning till after the deluge, and many are of opinion that Belus, who is supposed to be the same with Nimrod, was the first man that was deified.

But whether they had not paid divine honours to the heavenly bodies before that time, cannot be determined; our acquaintance with those remote times being extremely slender.

All that can be said with certainty, is, That 426 years after the deluge, when God led Terah and his family out of Chaldaea, and Abraham passed over Mesopotamia, Canaan, the kingdom of the Philistines, and Egypt, it does not appear that *idolatry* had then got any footing in any of those countries; though some idly pretend that Abraham himself was an idolater.

The first mention we find made of it, is in Gen. xxxi. 19, where Rachel is said to have taken the idols of her father; for though the meaning of the Hebrew word *teraphim* *תְּרָפִים* be disputed, yet it is pretty evident they were idols. Laban calls them his gods, and Jacob calls them strange gods, and looks on them as abominations.

Cluverius, *Germ. Antig.* Lib. I. maintains Cain to have been the first idolater, and the false gods that he worshipped to have been the stars, to whom he supposed God had left the government of the lower world: but this is mere conjecture.

The

The principal causes that have been assigned for *idolatry*, are, the indelible idea which every man has of God, and the evidence which he gives of it to himself: an inviolable attachment to the senses, and an habit of judging and deciding by them, and them only: the pride and vanity of the human mind, which is not satisfied with simple truth, but mingles and adulterates it with fables: the ignorance of antiquity, or of the first times, and the first men, whereof we have but veary dark and confused knowledge by tradition, they having left no written monuments or books: the ignorance and change of languages: the style of the oriental writings, which is figurative and poetical, and personifies every thing; the superstition, scruples, and fears, inspired by religion: the flattery of writers: the false relations of travellers: the fictions of poets: the imaginations of painters and sculptors: a smattering of physics, that is, a slight acquaintance with natural bodies, and appearances, and their causes: the establishment of colonies, and the invention of arts, mistaken by barbarous people: the artifices of priests: the pride of certain men, who have affected to pass for gods, the love and gratitude bore by the people to certain of their great men and benefactors: and finally the scriptures themselves ill understood.

IDYLLION*, in poetry, a little poem, containing the description, or narration of some adventures.

* The word is derived from the Greek, a *ιδύλλιον*, diminutive of *ιδύς*, figure, representation; in regard this poetry consists in a lively natural image, or representation of things.

Theocritus is the oldest author who has written *idyllions*. The Italians imitate him, and have brought the *idyllion* into modern use.

The *idyllions* of Theocritus have a world of delicacy; they appear with a clownish, rustic kind of simplicity; but are full of the most exquisite beauties; they seem drawn from the breast of nature herself, and to have been dictated by the graces.

The *idyllion* is a kind of poetry, which paints the objects it describes; whereas the epic poem relates them, and the dramatic acts them.—The modern writers of *idyllions* do not keep up to that original simplicity observed by Theocritus; the people of our days would not bear an amorous fiction, resembling the clumsy gallantries of our peasants.—Boileau observes, that the shortest *idyllions* are usually the best.

JEALOUSY, *Waters of*. See the article **WATERS**.

JEAT. See the article **JET**.

JECTION, in physics, a trembling, palpitation, or disorderly and convulsive motion, of the whole body, of one side, or only of the heart, and pulse of a sick person; this shews that the brain, which is the origin of the nerves, is attacked, and threatened with convulsions.

JEUR. See the article **LIVER**.

JEUR Uterinum.—The placenta is by some thus called, from the supposed similitude of its figure, and office, with that of the liver. See **PLACENTA**.

JEER Captain. See the article **CAPTAIN**.

JEHAGH, in the eastern chronology. See **GEACH**.

JEJUNE Style. See the article **STYLE**.

JEJUNUM, the second of the small guts; thus called from the Latin *jejunus*, hungry; because always found empty. See **INTESTINES**.

JENNET, in horsemanship. See the article **HORSES**.

JEOPFAILE, or **JEOPAYLE**, a compound of three French words, *je* *ouy* *faillie*, I have failed; it is used in a legal sense, when the parties to any suit have, in pleading, proceeded so far, that they have joined issue, which shall be tried, or is tried by a jury, and this pleading or issue is badly joined, so that it will be error if they proceed.

In this case, one of the parties might, by their counsel, shew it to the court, as well after verdict given, as before the jury was charged, by saying, *This inquest you ought not to take: or, To judgment you ought not to go.*

But this occasioning great delays in suits; for the redress thereof several statutes were made, viz. 32 H. III. c. 30. by which it was enacted, 'That if the jury have once passed upon the issue, though afterwards there be found a *jeopfaile* in the pleading, yet shall judgment be given according to the verdict of the jury.' Other statutes have also been made relating to the same thing, in the time of king James I. and queen Elizabeth, and yet the fault not mended.

HERONYMITES, or **HERONYMITES**, a denomination given to divers orders, or congregations of religious; otherwise called *Hermits of S. Jerom*.

The first, called *Hermits of S. Jerom of Spain*, owe their origin to the third order of S. Francis, whereof the first *Heronymites* were members.—Gregory the eleventh confirmed this order, under the name of *S. Jerom*, whom they had chosen for their patron and their model, and gave them the constitutions of the convent of S. Mary of the Sepulchre, with the rule of S. Augustin; and for habit, a white tunic, with a scapulary, a little capuche, and a mantle, all of their natural colour, without dying, and of a mean price.

The *Heronymites* are in possession of the convent of S. Laurence, in the Elcurial, where the kings of Spain are buried.

—In Spain there is likewise an order of nuns of S. Jerom, founded by a lady towards the close of the 15th century. Sixtus put them under the jurisdiction of the *Heronymites*, and gave them the constitutions of the monastery of S. Martha of Cordova, which were afterwards changed by Leo X. for those of the order of S. Jerom.

Hermits of S. Jerom, of the Observance, or of Lamlarby, were founded by Lupus d'Olmedo in 1424, in the mountains of Cazalla, in the diocese of Sevil.

The third order of *Heronymites* was founded by Peter Gambacorti about the year 1377; but the vows they made were only simple till 1568, when Pius V. appointed them to be solemn. They have houses in Tirol, Italy, and Savaria.

The fourth congregation of *Heronymites* are the *Hermits of S. Jerom of Fiesan*, begun in 1705, when Charles de Montegraneli, of the family of the count of Montegraneli, retiring into solitude, first established it at Verona. It was approved by Innocent VII. under the rule and constitutions of S. Jerom. But Eugenius, in 1441, changed it to that of S. Augustin.—As the founder was of the third order of S. Francis, they preserved that habit; but, in 1468, Pius permitting such as pleased to change it, occasioned a division among them. This order was finally suppressed by Clement XI. in 1668.

JESIL BASCH, *Green-head*, a name of respect, which the Persians give to the Turks, because their emirs wear a green turban.

JESSANT*, in heraldry, is applied to a *barbez-de-lance*, or the like figure, seeming to spring, or shoot out of some other charge.—He bears sable three leopards heads; *essant*, flowers de lis, or.

* The word is formed from the obsolete French *jeffer*, to rise or spring out.

JESUATES, **JESUATE**, an order of religious, otherwise called *apostolical clerks*, or *hermits of Jesus*.

They were founded by John Gualtero, and approved of by Urban V. in 1367, at Avignon; where he first gave, to such as were present, the habit of white tunic.—They followed the rule of S. Augustin, and were named by Pius V. among the order of hermits.

They were called *Jesuates*, because their first founders had the name of Jesus continually in their mouths: to which they added the name of S. Jerom, by reason they chose that saint for their protector.

For two centuries the *Jesuates* were mere lay brothers; but in 1606 Paul V. gave them leave to enter into holy orders.—In most of their houses they were employed in pharmacy, others practiced distillation, and sold aqua vitae; which occasioned their being called *agua-vitæ-magistri*.

Being very rich in the state of Venice, that republic solicited their suppression, and obtained it in Clement IX. and their effects being employed towards supporting the expenses of the war in Candia.

JESUITS, an order of religious, founded by Ignatius Loyola, called also the *company of Jesus*.

This order has rendered itself very considerable by its missions into the Indies, and by its other employments relating to the study of the sciences, and the education of youth. The council of Trent calls them, *regular clerks of the company of Jesus*.

It was in the year 1538, that Ignatius having assembled ten of his companions at Rome, chosen mostly out of the university of Paris, proposed to them to make a new order. After this, he presented the plan of his institution to Paul III. who appointed three commissioners to examine it; upon whose report the pontiff confirmed the institution, under the name of the *company of Jesus*, by a bull in 1540.—By this bull, their number was restrained to sixty; but that restriction was taken away, two years afterwards, by another bull.—The order has since been confirmed by several succeeding popes, who have added many new rights and privileges to it.

The end principally proposed by this order, is to gain converts to the Romish church; with which view they disperse themselves in every country and nation, and with amazing industry and address pursue the end of their institution. No difficulty so great that they cannot surmount, no danger so imminent that they will not undergo, and as some say no crimes so shocking that have not been perpetrated by them for the service of their cause.

They have no particular habit; but change and accommodate it to times, and occasions. The order consists of five different classes; *professed fathers*, *spiritual coadjutors*, *approved scholars*, *lay-brothers*, called also *temporal coadjutors*, and *novices*.

The *professed fathers*, which make the body of the company, take the three solemn vows of religion publicly, and to these add a special vow of obedience to the head of the church; as to what regards missions among idolaters, heretics, &c.—The *spiritual coadjutors* also make public vows of chastity, poverty, and obedience; but omit the fourth relating to missions.—*Approved scholars* are those, who, after two years

years noviciate, have been admitted, and have made three vows of religion; not solemn, indeed, but yet declared.—These are in the way to become professed, or spiritual coadjutors, according as the general thinks fit. These degrees, especially that of professed, are never conferred till after two years noviciate, and seven years study, seven of regency, a third year of noviciate, and thirty three years of age. The vows of the scholars are absolute on their side, but only conditional on the side of the order; the general having it in his power to dispense with them.

The order is divided into *assistanes*, the *assistanes* into *provinces*, and the provinces into *houses*.—It is governed by a general, who is perpetual and absolute. He resides at Rome, and is elected by a general congregation of the order. He has with him five persons, who are, as it were, his ministers. They are called *assistanes*, and bear the name of the kingdom or country to which they belong, and by which they are appointed, viz. of Italy, France, Spain, Germany, and Portugal.—To these belongs the care of preparing the matters of their respective *assistanes*, and of putting them in a method to facilitate their dispatch. It is by these, that both inferiors and superiors go regularly before the general.—They are chosen by the congregation, and are not only the general's counsellors to assist him in his business, but are also to observe his conduct; and, if they find occasion, they may call a general congregation without his consent, who may depose him in form; or they have it in their power to depose him themselves, after having, by letter, obtained the suffrages of their provinces.

Each province has four kinds of *houses*, viz. *professed houses*, which can have no lands belonging to them; *colleges*, where the sciences are taught; *residences*, where are a number of workmen employed in such offices, as have any immediate relation to preaching, confession, missions, &c. and *houses of novices*. Among the colleges, there are some called simply *colleges*, and others called *seminaries*.—These last are set apart for the young Jesuits to go through their courses of philosophy and theology in; the others are for strangers.

Each province is governed by a *provincial*, and each house by a *superior*, who is called a *rector* in the colleges, and a *superior* in the other houses.—Ignatius regulated the discipline of these houses, and especially of the colleges, by what he had observed in the Sorbonne, while he studied at Paris.

The professed of this order renounce, by a solemn vow, all preferment, and especially prelacy; and cannot receive any, unless enjoined thereto by the pope, under pain of sin.—This the pope sometimes does; inasmuch that they have had eight cardinals of their order.

JET, *Gagates*, called also *black amber*, a light, smooth, pitchy, fissile stone, extremely black; formed of a bituminous juice in the earth, in the manner of coal.

It works like amber, and has most of its qualities: It abounds in Dauphine, but the best in the world is said to be produced in Yorkshire.—It readily catches fire, flashes, and yields a bituminous smell.

There is also a factitious *jet*, made of glass, in imitation of the mineral *jet*: This is now usually drawn out into long hollow threads, which are cut and fashioned at pleasure.—It is much used in embroideries, and in the trimmings of mourning, and may be made of any colour, though it is usually black, and white; and of late is denominated *bugles*. See supplement: article GAGATES.

JET D'EAU, a French word, signifying a fountain that casts up water to any considerable height in the air. See FOUNTAIN. Mariotte shews, that a *jet d'eau* will never raise water so high as its reservoir, but always falls short of it by a space, which is in a subduplicate ratio of that height.—The same author shews, that if a greater *jet* branch out into many smaller ones, or be distributed through several *jets*, the square of the diameter of the main pipe, must be proportioned to the sum of all the expences of its branches: and that if the reservoir be 52 foot high, and the adjutage half an inch in diameter, the pipe ought to be three inches in diameter.

JETSON. See the article FLOTSON.

JEWEL OFFICE, or **JEWEL-HOUSE**; an office which takes care of fashioning and weighing the king's plate; and delivering it out by warrants from the lord chamberlain. When his majesty makes any present of plate, &c. they have the charge of providing it; with some other things less material.

The principal officers are,—the *master of the jewel office*, whose salary is 450 *l.* per ann. a *yeoman, a groom, and a clerk*; all in the king's gift.

There are also in this office, in the gift of the lord chamberlain, the poet laureat at 100 *l.* per ann. salary: the king's historiographer, at 200 *l.* per ann. the history painter, and principal painter, at 200 *l.* per ann. the painter in enamel, and the surveyor and keeper of the pictures, at 200 *l.* per ann. each.

The *goldsmith and jeweller* are employed by the master, and are usually in his gift.

JEWS. See the article JUDAISM, ELECTION, &c.

JEWS-EAR, *Auriculae, Judae*, or *Fungus Sambucinus*, a kind of fungus, or spungy substance, that grows about the root of the elder tree.

It is chiefly used in decoction, which is found detergent, and vulnerary, and a good gargle in sore throats.

JEWISH Oeconomy, } See the articles { **OECONOMY**,
JEWISH Hours, } **Hour**, &c.

JEZIDES, or **JEZIDEANS**, a term used among the Mahometans, to signify *heretics*.

In which sense *Jezidean* stands opposed to *Musfulman*. Leunclavius tells us, that the name is derived from an emir, called *Jezid*, who killed the two sons of Ali, Hasan and Hussein, two grandsons of Mahomet on their mother's side, and persecuted the posterity of the prophet.—The Agareni-ans, whose emir or prince he was, looked on him as an impious and heretical person, and hence took occasion to call all whom they accounted heretics, *Jezideans*.

Some authors mention the *Jezides* as a particular people, speaking a language different both from the Turkish and Persian, though somewhat akin to the last.—They further tell us, that there are two kinds of *Jezides*; the one *black*, the other *white*. The white have no slit in the bosom of their shirt; but barely an opening for the head to pass through: a thing that they observe with a great deal of strictness, in memory of a circle of gold and light which they say fell from heaven upon the neck of their grand sheikh, or chief of their sect. —The black *Jezides* are faquires, or religious.

The Turks and *Jezides* bear a strong aversion to each other; and the greatest affront one can put upon a Turk, is to call him a *Jezidean*.—On the contrary, the *Jezides* love the Christians; being persuaded that *Jezid*, their chief, is Jesus Christ: or rather, because some of their traditions mention, that *Jezid* made an alliance with the Christians against the Musfulmen.

They drink wine, even to excess when they can get it, and eat swine's flesh.—They never undergo circumcision, excepting when they are forced to it by the Turks. Their ignorance is surprizing; they have no books. Indeed they pretend to believe in the gospel, and in the sacred books of the Jews; but they go without ever reading either one or other of them. They make vows, and go on pilgrimage; but have no mosques, temples, nor oratories, no feasts, nor ceremonies; all their religious worship consisting in singing hymns to Jesus Christ, the virgin, Moses, and Mahomet.—When they pray, they look towards the east, in imitation of the Christians; whereas the Musfulmen turn towards the south.—They believe the devil may possibly, one day, come into favour again with God; and that he is the executor of God's justice in the other world: For which reason, they make it a point of prudence not to speak ill of him, lest he should revenge himself of them.

The black *Jezides* are reputed saints; and it is forbidden to weep at their death; instead whereof, they make rejoicings: and yet, for the generality, they are no more than shepherds. They are not allowed to kill the animals they eat; that office belongs to the white *Jezides*.—The *Jezides* go in companies, like the Arabs. They often change their habitations, and live in black tents made of goats-hair, and encompassed with large rushes and thorns interwoven. They dispose their tents in a circle, placing their flocks in the middle.—They buy their wives: the stated price whereof is 200 crowns, be they better or worse. They are allowed divorce, provided it be to become faquires.—It is a crime among them to shave the beard, though ever so little.—They have some customs which intimate that they sprung originally out of some sect of Christians: for instance, in their feasts one of them presents a cup full of wine to another, bidding him take the cup of the blood of Jesus Christ; which last kisses the hand of him who presents it, and drinks.

IGNIS Fatuus, a common meteor, chiefly seen in dark nights, frequenting meadows, marshes, and other moist places:—known among the people by the appellations, *Will with a wisp*, and *Jack with a lantern*.

It seems to arise from a viscous exhalation, which being kindled in the air, reflects a sort of thin flame in the dark, without any sensible heat.

It is often found flying along rivers, hedges, &c. by reason it there meets with a stream of air to direct it.

IGNITION, in chymistry, the application of fire to metals, till such time as they become red-hot, without melting.

This happens in gold, and silver, but especially in iron: But lead and tin are too soft and fusible to bear ignition.

IGNORAMUS, q. d. *We do not know*; a word used by the grand jury, impannelled on the inquisition of causes criminal, and written upon the bill, when they dislike their evidence, as defective, or too weak to make good the presentment.

The effect of which is, that all farther enquiry upon that party for that fault is thereby stopped, and he is delivered without farther answer. See BILLA.

IGNORANCE, the privation, or want of knowledge.

Ignorance is chiefly owing to three causes; want of ideas; want of a discoverable connection between the ideas we have; and want of tracing and examining our ideas.

There are some things we are *ignorant* of for want of ideas: All the simple ideas we have, are confined to the observation of our senses, and the operations of our own minds, which we are conscious of in our selves. What other ideas it is possible other creatures may have, by the assistance of other senses or faculties, more or perfecter than we have, or different from ours, is not for us to determine: but to say there are no such, because we conceive nothing of them, is no better an argument, than if a blind man should be positive there was no such thing as light and colours; because he had no manner of idea of any such thing.—What faculties therefore other species of creatures have, to penetrate into the nature and inmost constitutions of things, we know not: This we know, and certainly find, that we want other views of them, besides those we have, to make discoveries of them more perfect. The intellectual and sensible world are in this perfectly alike, that the parts which we see of either of them, hold no proportion with that we see not; and whatsoever we can reach with our eyes, or our thoughts, of either of them, is but a point, almost nothing in comparison of the rest. Again, the want of ideas, which we yet seem capable of, is another great obstacle in our way, and keeps us in *ignorance* of things, which we conceive capable of being known. Bulk, figure and motion we have ideas of; yet not knowing what is the particular bulk, motion, and figure of the greatest part of the bodies of the universe, we are *ignorant* of the several powers, efficacies and ways of operation, whereby the effects we daily see are produced. These are hid from us in some things, by being too remote, and in others by being too minute. When we consider the vast extent of the known and visible parts of the world, and the reasons we have to think, that what lies within our ken, is but a small part of the immense universe; we shall then discover an huge abyss of *ignorance*: What are the particular fabricks of the great masses of matter, which make up the whole stupendous frame of corporeal beings, how far they are extended, and what is their motion, and how continued, and what influence they have upon one another, are contemplations, that at first glimpse our thoughts lose themselves in!—If we confine our thoughts to this little canton, this system of our sun, and the grosser masses of matter which visibly move about it; what several sorts of vegetables, animals, and intellectual corporeal beings, infinitely different from those of our little spot of earth, may probably be in the other planets; to the knowledge of which, even of their outward figures and parts, we can no way attain, whilst we are confined to this earth; there being no natural means, either by sensation or reflexion, to convey their certain ideas into our minds?—There are other bodies in the universe, no less concealed from us by their minuteness. These insensible corpuscles being the active parts of matter, and great instruments of nature, on which depend all their secondary qualities and operations; our want of precise distinct ideas of their primary qualities, keeps us in incurable *ignorance* of what we desire to know about them.

Did we know the mechanical affections of rhubarb or opium, we might as easily account for their operations of purging and causing sleep, as a watchmaker can for the motions of his watch.—The dissolving of silver in aqua fortis, or gold in aqua regia, and not *vice versa*, would be then perhaps no more difficult to know, than it is to a smith to understand, why the turning of one key will open a lock, and not the turning of another.—But whilst we are destitute of senses acute enough to discover the minute particles of bodies, and to give us ideas of their mechanical affections, we must be content to be *ignorant* of their properties and operations: nor can we be assured about them any farther, than some few trials we make are able to reach; but whether they will succeed again another time, we cannot be certain.—This hinders our certain knowledge of universal truths concerning natural bodies; and our reason carries us herein very little beyond particular matter of fact: and therefore it is matter of doubt, that how far soever human industry may advance useful and experimental philosophy in physical things, yet scientific will still be out of our reach: because we want perfect and adequate ideas of those very bodies which are nearest to us, and most at our command.

This, at first sight, shews us how disproportionate our knowledge is to the whole extent, even of material beings: to which, if we add the consideration of that infinite number of spirits that may be, and probably are, which are yet more remote from our knowledge, and whereof we have no cognizance at all; we shall find this cause of *ignorance* conceals from us, in an impenetrable obscurity, almost the whole intellectual world; a greater, certainly a more beautiful world, than the material: For abating some very few ideas of spirits, which we get from our own mind by reflexion, and

from thence the best we can collect of the Father of all spirits, the author of them, and us, and all things; we have no certain information so much as that, the essence of other spirits, but by revelation: much less how we can get ideas of their different natures, states, powers, and several constitutions, wherein they agree, or differ from one another, and from us: And therefore, in that concern to their different species and properties, we are almost all absolute *ignorance*.

Another cause of *ignorance*, is the want of discoverable connection between those ideas we have: when we want that, we are utterly incapable of universal and certain knowledge, and are, as in the former case, left only to observation and experiment.—Thus the mechanical effects of heat, shewing no affinity at all with the ideas they produce in it, we can have no distinct knowledge of such operations beyond our experience; and can read in no other way about them, than as the effects or appointments of an infinitely wise agent, which perfectly surpasses our comprehension.—The operation of our minds upon our bodies, is as another example: how any thought should produce a motion in the body, is a remote from the nature of our ideas, as how any body should produce any thought in the mind. That it may, if experience did not convince us, the consideration of the things themselves would never be able, in the least to discover to us.—In some of our ideas there are certain relations, habitudes, and connections, so visibly included in the nature of the ideas themselves, that we cannot conceive them separable from them by any power whatsoever: in these only we are capable of certain and universal knowledge.—Thus the idea of a right lined triangle necessarily carries with it an equality of its angles to two right ones; but the coherence and consistency of the parts of matter, the production of extension in us, of colours and sounds, &c. by impulse and action, being such wherein we can discover no natural connection with any ideas we have, we cannot but ascribe them to the arbitrary will and good pleasure of the wise architect.—Ideas as that we observe constantly to proceed regularly, we may conclude do act by a law set them; but yet, as we know not, whereby though causes work secretly, and effects constantly flow from them, yet their connections and habitudes being not discoverable in our ideas, we can have but an experimental knowledge of them.—Several effects come every day within the notice of our senses, of which we have far less sensitive knowledge; but the causes, manner, and certainty of their production, we must, for the first time, be content to be *ignorant* of. In those we are ignorant of, the particular experience informs us of several effects, and by analogy, we guess what effects the like bodies or operations will be like to produce. But as to perfect ideas of natural bodies, (not to mention spiritual beings) we are far removed from being capable of any such thing, that it may be reckoned sufficient to seek after it.

The third cause of *ignorance*, is our want of tracing these ideas we have, or may have; and finding out that intermediate ideas, which may shew us what holds of agreement or disagreement they may have one with another: And thus many are *ignorant* of mathematical truths for want of application, in enquiring, examining, and by due ways comparing those ideas.

ILI, in music, &c. See the article CROON.

ILIAC * Passion, a violent, and dangerous kind of colic; called also *colicula*, *nephritis*, *colica*, and *cholaspis*.

* It takes its name from the intestine, and grid of its being usually affected in talidampers or perhaps from the Greek verb *ili*, to wind, or twist; whence also it is the Latin calls it *colica*.

It consists in an expulsion of feculent matter by vomit, accompanied with a swelling and tension of the abdomen, an intense pain, and a total constipation of the bowels.

The immediate cause of the *iliac passion*, seems owing to an irregularity, or inversion of the peristaltic motion of the guts, *viz.* where it begins with the lower, and is continued upwards.

Other causes are, the hardness of the excrements, inflammation of the intestines, and their engagement in the stricture, as sometimes happens in hernias; or their twisting, and entering within one another.

Persons afflicted with the *iliac passion*, have sometimes been found to return suppositories and glisters as well as their stools by the mouth.

Some have been cured of it by swallowing a great quantity of quicksilver; or a musket ball. When the guts are twisted, or enter one within another; the weight of these bodies sometimes sets them to rights again. See Supplement: article ILIACA PASSIO.

ILIAC Vessels. See the articles ARTERY, and VEIN.

ILIACUS Externus, or *Pyiformis*; a muscle of the thigh, which arises from the internal concave part of the os sacrum, towards the bottom; and descending obliquely along the great sinus of the os ilium, from a round fleshy origin, joins the gluteus medius, and is inserted by a round tendon at the bottom of the great trochanter.

ILIACUS *Internus*, a muscle of the thigh, which arises fleshy from the internal concave part of the os ilium; and in its descent over the inferior part of it, joins with the psoas magnus; and is inserted with it, under the termination of the pectineus.

This, with the psoas magnus, moves the thigh forward in walking.

ILIAD *, *ΙΛΙΑΔ*, the name of an ancient epic poem, the first, and finest of those composed by Homer.

* The word is derived from the Greek *ίλιος*, of *ίλιον*, *Ilium*, Troy, a famous city in Asia, which the Greeks besieged for the space of ten years, and at last destroyed, on account of the rape of Helena, which makes the subject of the work.

The poet's design in the *Iliad*, was to shew the Greeks, who were divided into several little states, how much it was their interest to preserve an harmony, and good understanding among them.—In order to which, he sets before their eyes, the calamities that befel their ancestors from the wrath of Achilles, and his misunderstanding with Agamemnon; and the advantages that afterwards accrued to them from their union.

The *Iliad* is divided into twenty four books, which are marked with the letters of the alphabet.—Pliny gives us an account of an *Iliad* written on so very slender a paper, that the whole might be contained in a nut-shell.

For the conduct of the *Iliad*, see Father Bossu, Madam Dacier, and M. de la Motte.

The critics maintain the *Iliad* to be the first, and yet the best poem that ever appeared in the world: Aristotle's *Poetics* are almost taken wholly from it; the philosopher had nothing to do, but to form precepts from the poet's practice.—Some authors tell us, that Homer invented not only poetry, but all other arts and sciences; and that there are the visible marks of a perfect knowledge in every one of them, to be seen in the *Iliad*.

The ingenious Mr. Barns of Cambridge, has very strenuously attempted to prove Solomon to have been the author of the *Iliad*.

ILIUM *Intestinum*. See the article **INTESTINE**.

ILIUM *Os*. See the article **OFFA INNOMINATA**.

ILLEGITIMATE *Birth, or Delivery*. See **DELIVERY**, and **ABORTION**.

ILLEVIABLE, in law, a debt, or duty which cannot, or ought not to be levied. See **LEVY**.

The word *nihil* is usually set on a debt or due that is *illeivable*.

ILLUMINATION, in a general sense, denotes the act of a luminous body, or a body that emits light; sometimes also the passion of an opaque body that receives it.

ILLUMINATIVE *Lunar Month*. See **MONTH**.

ILLUMINED, *ILLUMINATI*, a church term, antiently applied to such persons as had received baptism.

This name was occasioned by a ceremony in the baptism of adults, which consisted in putting a lighted taper in the hand of the person baptized, as a symbol of the faith and grace he had received in the sacrament.

ILLUMINED, *ILLUMINATI*, is also the name of a sect of heretics, who sprang up in Spain about the year 1575, and were called by the Spaniards, *Alumbrados*.

Their leaders were Villalpando, a priest, originally of the isle of Tenerif, and a Carmelite, called *Catherine de Jesus*.—These had a great number of disciples and followers, most of whom were apprehended, and clapped up in the Inquisition at Cordova; some of them were put to death, and the rest abjured their errors.

Their principal doctrines were, That by means of a sublime manner of prayer, which they had attained to, they entered into so perfect a state, that they had no occasion for ordinances, sacraments, nor good works; and that they could give way, even to the vilest actions, without sin.

The sect of *illumined* was revived in France in the year 1634, and were soon after joined by the Guerinets, or disciples of Peter Guerin, who together made but one body, called also *illumined*: but they were so hotly pursued by Louis XIII. that they were soon destroyed.

The brothers of the *rossy cross*, are sometimes also called *illumined*. See **ROSSYCRUCIAN**.

ILLUSTRIOUS, *ILLUSTRIS*, was heretofore in the Roman empire a title of honour peculiar to people of a certain rank.

It was first given to the most distinguished among the knights, who had a right to bear the *latus clavus*: afterwards, those were entitled *illustrious*, who held the first rank among those called *honorati*; that is, the præfecti prætorii, præfecti urbis, treasurers, comites, &c.

There were, however, different degrees among the *illustres*: As in Spain they have *grandees* of the first and second class, so in Rome they had their *illustres*, whom they called *great majores*; and others less, called *illustres minores*.—For instance, the præfectus prætorii was a degree below the master of the offices, though they were both *illustres*.

The *novels* of Valentinian distinguish as far as five kinds of *illustres*; among whom, the *illustres administratores* bear the first rank.

IMAGE *, *IMAGO*, in optics, a natural, lively representation of an object, opposed to a smooth well polished surface, or mirror.

* The Latin word, *image*, comes originally from the Greek *μιμησις*, *imitari*, to imitate or mimic.

IMAGE, taken more largely, denotes the spectre, or appearance of any object, whether by reflexion, or refraction.

In all plane mirrors, the *image* is of the same magnitude as the object; and appears as far behind the mirror, as the object is before it.

In convex mirrors, the *image* appears less than the object; and farther distant from the centre of the convexity, than from the point of reflexion.

Mr. Molyneux gives the following rule for finding the diameter of an *image*, projected in the distinct base of a convex mirror: As the distance of the object from the mirror is to the distance from the *image* to the glass; so is the diameter of the object, to the diameter of the *image*.

IMAGE is also used for the trace, or mark which outward objects impress on the mind, by means of the organs of sense.

IMAGE also signifies an artificial representation performed by man; as in painting, sculpture, and the like.—In which sense, the word is now generally used in speaking of things holy, or imagined to be so.

The use and adoration of *images*, are things that have been a long time controverted in the world.—The Lutherans condemn the Calvinists for breaking the *images* in the churches of the Catholics, looking on it as a kind of sacrilege; and yet they condemn the Romanists (who are professed *image-worshippers*) as idolaters: Nor can these last keep pace with the Greeks, who go far beyond them in this point; which has occasioned abundance of disputes among them.

The Jews absolutely condemn all *images*; and do not so much as suffer any statues or figures in their houses, much less in their synagogues, or places of worship.

The Mahometans have a perfect aversion to *images*; which was what led them to destroy most of the beautiful monuments of antiquity, both sacred and profane, at Constantinople. The noble Romans preserved the *images* of their ancestors with a great deal of care and concern; and had them carried in procession at their funerals and triumphs. These were commonly made of wax, or wood; though sometimes of marble, or brass. They placed them in the vestibles of their houses; and they were to stay there, even if the houses happened to be sold, it being accounted impious to displace them.—Appius Claudius was the first who brought them into the temples, in the year of Rome 259; and he added inscriptions to them, shewing the origin of the persons represented, and their brave and virtuous achievements.

It was not, however, allowed for all, who had the *images* of their ancestors in their houses, to have them carried at their funerals; this was a thing only granted to such as had honourably discharged themselves of their offices; for those who failed in this respect, forfeited that privilege: and in case they had been guilty of any great crime, their *images* were broken in pieces.

IMAGE also signifies a lively description of any thing in a discourse.

Images in discourse, are defined by Longinus, to be, in general, any thoughts proper to produce expressions, and which present a kind of picture to the mind.

But, in the more limited sense, he says *images* are such discourses as come from us, when by a kind of enthusiasm, or an extraordinary emotion of the soul, we seem to see the things whereof we speak, and present them before the eyes of those who hear us.

Images in rhetoric, have a very different use from what they have among the poets: the end principally proposed in poetry is astonishment and surprize; whereas the thing chiefly aimed at in prose, is to paint things naturally, and to shew them clearly.—They have this, however, in common, that they both tend to move each in its kind.

These *images*, or *pictures*, are of vast use, to give weight, magnificence, and strength to a discourse. They warm and animate it; and when managed with art, according to Longinus, seem, as it were, to tame and subdue the hearer, and put him in the power of the speaker.

IMAGINARY *Root*, in algebra. See the article **ROOT**. **IMAGINATION**, a power or faculty of the soul, whereby it conceives, and forms ideas of things, by means of impressions made on the fibres of the brain, by sensation.

The organs of our senses, are composed of fibrillæ, or little fibres, which, at one end, terminate in the outward parts of the body and skin, and at the other in the middle of the brain.

These fibres may be moved two ways; either beginning at that end which terminates in the brain, or at that which terminates without.—Now the agitation of these fibres cannot be communicated to the brain, but the soul will be affected, and

I M A

and perceive something.—If then the agitation begins where objects make their first impression, viz. on the external surface of the fibres of our nerves, and is communicated thence to the brain; the soul in that case, judges that what the perceives is without; that is, the perceives an external object as present: But if only the interior fibres be moved by the course of the animal spirits, or in some other manner; the soul then imagines, and judges, that what the perceives is not without, but within the brain; that is, the perceives an object as absent: And herein lies the difference between sensation and imagination.

To give a more distinct idea of the faculty of *imagination*, according to the doctrine of Malebranche, it must be observed, that as often as there happens to be any alteration in that part of the brain where the nerves terminate, there also happens an alteration in the brain; that whenever there is any motion in that part, to change the order of its fibres, there also happens a new perception in the soul, and the finds something new, either by way of sensation or imagination; neither of which can be without an alteration of the fibres in that part of the brain.—So that the faculty of *imagining*, or *imagination*, only consists in the power which the soul has of forming images of objects, by producing a change in the fibres of that part of the brain, which may be called the principal part, because it corresponds to all the parts of our body, and is the place where the soul (if it may be so said) immediately resides.—It matters not which that part is, nor whether the opinion of Willis be true, who places the common sense in the two bodies, called *corpora striata*, and the *imagination* in the *corpus callosum*; or that of Fernelius, who places sensation in the pia mater, that encompasses the substance of the brain; or that of Descartes, who places it in the pineal gland: it suffices that there is some such part.

Since then the *imagination* only consists in a power which the soul has of forming images of objects, by impressing them on the fibres of the brain, it follows that the larger and more distinct the vestigia, or tracks of the animal spirits, which are the lines or strokes, as it were, of those images, are; the more strongly and distinctly the soul *imagines* those objects.—Now as the breadth, depth, and clearness of the strokes of a sculpture depend on the force wherewith the graver acts, and the obedience which the copper yields; so the depth and clearness of the tracks of the *imagination* depend on the force of the animal spirits, and the constitution of the fibres of the brain; and it is that variety which is found in those two things, to which we owe almost all that vast difference which we observe in peoples minds.—On the one side are abundance and scarcity, briskness and slowness, largeness and smallness of the animal spirits; and on the other hand delicacy or grossness, humidity or dryness, stiffness or flexibility of the fibres of the brain; and, lastly, a particular relation which the animal spirits may have with those fibres. From the various combinations of which things, will result a sufficiently great variety, to account for all the different characters which appear in the minds of men: and from the same principle flows that difference which is observed in the same person's mind, at different times, and under different circumstances, as in childhood, manhood, and old age, in sickness, health, &c.

It may here be observed, that the fibres of the brain are more agitated by the impression of objects, than by the course of the animal spirits; and for this reason the soul is more affected with objects, which it perceives by sensation, and which it looks on as present, and capable of giving it pleasure or pain, than by those perceived by *imagination*, which it judges to be distant.—And yet it sometimes happens, that in persons, whose animal spirits are extremely agitated by fasting, waking, drinking, a fever, or some violent passion, these spirits move the inward fibres of the brain as forcibly as outward objects do; so that those persons perceive things by sensation, which they should only perceive by *imagination*; for *imagination* and *sensation* only differ from each other, as the greater from the less. See Malebranche, *Recher. de la Verité* Lib. II. See also the articles MADNESS, DELIRIUM, PHRENZY, MELANCHOLY, &c.

IMAM, or **IMAN**, a minister in the Mahometan church, answering to a parish priest among us.

The word properly signifies what we call a prelate, *antistes*, one who precedes others; but the Mussulmen frequently apply it to a person who has the care and intendency of a mosque, who is always there the first, and reads prayers to the people, which they repeat after him.

IMAM is also applied by way of excellence to the four chiefs, or founders of the four principal sects in the Mahometan religion.

Thus Ali is the *imam* of the Persian, or of the sect of the Schiatoes: Abu-beker the *imam* of the Sunnites, which is the sect followed by the Turks. Saphi, or Saff-y, the *imam* of another sect, &c.

The Mahometans do not agree among themselves about this *imate*, or dignity of the *imam*. Some think it of divine

I M M

right, and attached to a single family, as the pontificate of Aaron.—Others hold, that it is, indeed, of divine right, but deny it to be so attached to any single family, as that it may not be transferred to another. They add, that the *imam* is to be clear of all gross sins, and that otherwise he may be deposed, and his dignity may be conferred on another. However this be, it is certain, that after an *imam* has once been owned as such, by the Mussulmen, he who denies that his authority comes immediately from God, is accounted impious; he who does not obey him is a rebel; and he who pretends to contradict what he says, is esteemed a fool, among the orthodox of that religion.

IMBARGO, or **EMBARGO**, a stop, or stay put upon ships, or merchandize, usually by public authority. See **EMBARGO**.

IMBECILLITY, a state of languor, or decay; wherein the body is not able to perform its usual exercises or functions.

IMBEZZLE, or **IMBEZZLE**, to waste, pilfer, or purloin.

As where a person intrusted with goods, wastes, consumes, and diminishes them, he is said to *imbezzle* them.

IMBIBE, is commonly used in the same sense as *absorb*; viz. where a dry porous body takes up another that is moist.

IMBRICATED, is used by some botanists to express the figure of the leaves of some plants, which are hollowed like an *imbres*, or gutter-tile, or are laid in close series over one another like the Tiles on a house.

IMITATION, in music, a kind of composition wherein one part is made to imitate another either throughout the whole piece, which is one of the kinds of canon, or only during some measures, which is a *simple imitation*.

Sometimes the movement, or the figure of the notes, alone, is *imitated*; and that, sometimes even by a contrary motion, which makes what they call a *retrograde imitation*.

Imitation differs from *figure*, in regard, in the former the repetition must be a second, a third, a sixth, seventh, or ninth, either above or below the first voice: whereas if the repetition were in unison, a fourth, fifth, or eighth, higher or lower, it would be a *figure*.

IMMACULATE, *without stain*.—A term much used among the Romanists, when speaking of the conception of the blessed virgin, they call it *immaculate*: intimating, that she was born without original sin.

When the cap is given to a doctor of the Sorbonne, he is obliged to swear that he will defend the *immaculate* conception. This was decreed by an act of the Sorbonne in the fourteenth century; in imitation of which, eighty other universities made the same order.

The military orders in Spain are all solemnly obliged to defend this prerogative of the virgin. See **CONCEPTION**.

There is also a *Congregation of the Immaculate Conception*; in most nunneries whereof is a society of secular maids, whose end is to honour the *immaculate conception*: of which they make a public protestation every year, and a private one every day.

IMMANENT, in logic.—The schoolmen distinguish two kinds of actions; the one *transient*, which pass from the agent to the patient; the other *immanent*, which continue in the agent.

IMMATERIAL, something devoid of matter, or that is pure spirit.

Thus God, angels, and the human soul, are *immaterial* beings.—Plato proves the *immateriality* of the soul from these five topics. 1^o. Its simplicity. 2^o. Its independency on the body, which is two-fold; in its *esse* and in its *operari*, in existing, and in acting or operating separately. 3^o. Its rule and authority over the body. 4^o. Its likeness and similitude to God, which discovers itself in the pleasure it enjoys in spiritual things, in its aiming at spiritual objects, &c. 5^o. Its spiritual manner of perceiving material objects. And lastly, its indivisibility, capacity, activity, and immortality. See **SOUL**.

IMMEDIATE, that which precedes, or follows some other thing, without any interposition.

IMMEDIATE, also signifies something that acts without means, or without medium. In which sense we say, *immediate* grace, an *immediate* cause, &c.

There have been great disputes among divines about *immediate* grace.—The question in debate is, Whether grace act on the heart and mind by an *immediate* efficacy, independent of all external circumstances; or, Whether a certain assemblage and improvement of circumstances, joined to the ministry of the word, may produce the conversion of souls? See **GRACE**.

IMMEDIATE Mode. } See the article { **MODE**.
IMMEDIATE Fire. } FIRE.

IMMEMORIAL, an epithet given to the time or duration of any thing whose beginning we know nothing of.

In a legal sense, a thing is said to be of time *immemorial*, or time out of mind, that was before the reign of our King Edward II.

IMMENSE, that whose amplitude, or extension no finite measure whatsoever, or how oft soever repeated, can equal.

IMMER-

IMMERSION, an act by which any thing is plunged into water, or some other fluid. See **FLUID**.

In the first ages of Christianity, baptism was performed by *immersion*; by three *immersions*.—The custom of *immersion* is said to be still preserved in Portugal, and among the Anabaptists in other parts.

IMMERSION, in pharmacy, is the preparation of some medicine, by letting it steep for some time in water, in order to take some ill quality or taste from it.

This is done in rhubarb, to moderate its force; in lime, to take away its salt; and in olives, which are preserved in brine.

IMMERSION, in astronomy, is when a star or planet comes so near the sun, that we cannot discern it; being as it were enveloped, and hid in the rays of that luminary.

IMMERSION also denotes the beginning of an eclipse of the moon; that is, the moment when the moon begins to be darkened, and to enter into the shadow of the earth.

The same term is also used with regard to an eclipse of the sun, when the disk of the moon begins to cover it.

In this sense, *immersion* stands opposed to *emergence*, which signifies the moment wherein the moon begins to come out of the shadow of the earth; or the sun begins to show the parts of his disk which were hid before.

IMMERSION is frequently applied to the satellites of Jupiter, and especially to the first satellite; the observation whereof is of so much use for discovering the longitude.

The *immersion* of that satellite, is the moment in which it appears to enter within the disk of Jupiter; and its *emergence* the moment wherein it appears to come out.

The *immersions* are observed from the time of the conjunction of Jupiter with the sun, to the time of his opposition: and the *emergences* from the time of his opposition to his conjunction.—The peculiar advantage of these observations, is, that during eleven months of the year, they may be made, at least, every other day.—The perfection of this theory, and the praxis thereon, we owe to M. Cassini.

Scruples of IMMERSION. See the article **SCRUPLE**.

IMMORTAL, that which will last to all eternity; as having in itself no principle of alteration, or corruption.

Thus, God, and the human soul, are *immortal*. Plato defines immortality, *αὐτοχρονία καὶ αἰδιότης*, animated essence and eternal mansion; and proves the immortality of the soul from two kinds of arguments; the one *artificial*, the other *artificial*.

The *artificial* arguments for the soul's immortality are testimonies and authorities, whereof he cites several, and adds in general, that all the great men and poets, who had any thing divine in them, have at all times asserted the immortality of the soul.

Artificial or proper arguments for the immortality are either *speculative* or *practical*: of the first kind are those drawn from 1°. The simple, uniform, spiritual and divine nature of the soul. 2°. From its infinite capacity. 3°. Its desiring and longing after immortality, and its inward horror of falling into nothing; proving it absurd that the soul should die, when life is its proper and adequate object. 4°. Its rational activity; proving that whatever has in itself a principle of rational and spontaneous motion, by which it tends towards some supreme good, is *immortal*. 5°. The various ideas which it has of spiritual things; particularly the idea it has of immortality. And 6°. Its immateriality.

His *practical* or moral arguments for the immortality of the soul, are drawn from, 1°. The justice of God, which can never suffer the wicked to escape unpunished, nor the good unrewarded after death. 2°. The dependance which religion has on this opinion, in regard, without this persuasion, there would be no religion in the world. 3°. The opinion which men have, that justice and every kind of virtue are to be cultivated, that they may at last live with God. 4°. The stings of conscience, and anxious solicitude we are under about a future state.

IMMUNITY, a privilege or exemption from some office, duty, or imposition.

Immunity is more particularly understood of the liberties granted to cities, and communities.

The princes heretofore granted all kinds of *immunities* to ecclesiastics, exempting them from all impositions; but the ecclesiastics of those days were not so rich as those of ours: they gave all they had to the poor.

There is still a privilege of *immunity* in some places, and especially in Italy, belonging to ecclesiastical things, and persons; who are exempted from certain dues, and are sheltered from the pursuits of justice. Though there are some crimes for which they cannot plead the privileges of their *immunity*, as premeditated murder, &c.

IMMUTABILITY, the condition of a thing that cannot change.

Immutability is one of the divine attributes.

There is a two-fold immutability in God; a *physical* and a

moral one.—The *physical immutability* consists in this, that the substance of God does not, nor cannot receive any alteration.—His *moral immutability* consists in his not being liable to any change in his thoughts, will, or designs; but that what he wills, he has willed from all eternity. See **GOD**.

IMPALED, in heraldry, is understood of a shield parted per pale, or divided into two halves by a line drawn palewise through the middle, from the top to the bottom.

When the coats of arms of a man and his wife, who is not an heiress, are born in the same escutcheon, they must be *impaled*, or marshalled in pale, i. e. the husband's on the right side, and the wife's on the left; and this the heralds call *baron and feme*, two coats *impaled*.

If a man have had two wives, he may *impale* his coat in the middle between theirs; and if he have had more than two, they are to be marshalled on each side of his in their proper order.

IMPALEMENT, in a penal sense. } See **EMPALEMENT**.

IMPALEMENT, in phytozoology.

IMPALPABLE, that, whose parts are so extremely minute, that they cannot be distinguished by the senses, particularly by that of feeling.

IMPANATION, a term used among divines to signify the opinion of the Lutherans with regard to the eucharist; who believe that the species of bread and wine remain, together with the body of our Saviour, after consecration.

IMPANATORÉS. See the article **ADSENARI**.

IMPANELLING, in law. See **EMPAANELLING**.

IMPARES Scamilli. See the article **SCAMILLI**.

IMPARLANCE, or **EMPARLANCE**. See **EMPARLANCE**.

IMPASSIBLE, that which is exempt from suffering; or which cannot undergo pain, or alteration.

The Stoics place the soul of their wife man in an *impassible*, imperturbable state. See **APATHY**.

IMPASTATION, the mixture of divers materials of different colours, and consistencies, baked or bound together with some cement, and hardened either by the air, or fire.

IMPASTATION is sometimes used for a sort of masons-work, made of stucco, or stone ground small, and wrought up again in manner of a paste.

Authors are of opinion that the obelisks, and the huge antique columns still remaining, were made, some by *impastation*, and others by fusion; but this is wholly erroneous: they are all cut out of quarries, yet open in Egypt, Arabia, &c.

IMPASTING, in painting. See **EMPASTING**.

IMPEACHMENT of Waste, a restraint from committing of waste upon lands, and tenements; or a demand of recompence for waste made by a tenant who has but a limited estate in the land granted.

He that hath a lease without *impeachment of waste*, hath by that a property or interest given him in the houses and trees, and may make waste in them without being called to an account for it.

IMPECCABILITY, the state of a person who cannot sin: or a grace, privilege, or principle which puts him out of a possibility of sinning.

The schoolmen distinguish several kinds and degrees of *impeccability*: That of God, belongs to him by nature: That of Jesus Christ, considered as man, belongs to him by the hypostatical union: That of the blessed, is a consequence of their condition: That of men, is the effect of a confirmation in grace, and is rather called *impeccance* than *impeccability*; accordingly divines distinguish between these two: this distinction is found necessary in the disputes against the Pelagians, in order to explain certain terms in the Greek and Latin fathers, which without this distinction are easily confounded.

IMPEDIT, in law. See the article **QUARE IMPEDIT**.

IMPENETRABILITY, a quality whereby a thing becomes unable to be pierced or penetrated; or a property of body whereby it so fills up a certain space, as that there is no room in them for any other body.

Dr. Harris defines *impenetrability*, the distinction of one extended substance from another, by means whereof the extension of one thing is different from that of another: so that two extended things cannot be in the same place, but must necessarily exclude each other.

IMPENITENCE, or **IMPENITENCY**, a hardness of heart, which makes a person persevere in vice, and prevents his repentance.

Final *impenitence*, is the sin against the holy Ghost, which is neither pardoned in this life, nor in that to come.

IMPERATIVE, in grammar, is one of the moods or manners of conjugating a verb, serving to express a commandment; as, *go, come*, &c. See **MOOD**.

In Hebrew and other oriental languages, the future tense has frequently an *imperative* signification.

IMPERFECT Plants, among botanists, are such as either really want flower, and seed, or are supposed to want them; no flower or seed having yet been discovered in the greater part of those plants included in this class by the botanical writers.

Mr. Ray distinguishes the plants called imperfect in his time according to the places of their growth, into,

I. *Aquatics*, or such as grow in the water : and that either, 1°. In the sea, and then they are called *marine plants* ; which are either of a hard and stony consistence, as the corals ; and corallines ; or of a more soft and herbaceous one. Of these last some are like herbs, and are of two kinds ; the greater, which are cauliferous, as the fucus ; the lesser, as the alga : the others have more of the muscus, or fungus appearance, as the spongia. 2°. *Fresh water plants*, and those have either no leaves, but are capillaceous, as the conserved ; or their leaves are either single or divided into three parts, as the lens palustris, and lenticula palustris trifida.

II. *Imperfect Plants*, which grow in dry ground ; these are divided into ; (1°.) Such as have their substance, either woody or fleshy ; and have scarce any thing common with the *perfect plants*, neither the green herbaceous colour nor the texture of herbs, nor flower, seed, nor leaf, properly speaking ; as all the fungi, which are either, 1°. Such as grow on trees, and therefore are called *arborescens*, as the fungus laricis, called *agaric*, and the fungus sambuci, which we call *Jews-ear*. 2°. Terrestrial, and those either cauliferous with heads either lamellated or porous underneath, or without stalks, as the pezize of Pliny, and fungus pulverulentus, crepitus lupi, or common puff-balls. 3°. Subterraneous, as the tuberæ terræ, or truffles. (2°.) Such as have a more soft and dry consistence, and this more like that of herbs ; of which some are both cauliferous and branched, as the musci, or mosses : others are without stalks, adhering like a crust to the surface of the earth, stones, trees, or wood ; as the lichen terrestris and arborescens. This was the opinion of Mr. Ray, as to the class of imperfect plants ; but their number has been, since his time, greatly diminished ; almost all of these named here, having been found lately to have real seeds. See Supplement : articles FUNGUS, CORALLIUM, and MUSCUS.

IMPERFECT Tense, in grammar, signifies an indefinite time between the present and the past ; as, *I taught, I heard*.

IMPERFECT Flowers, are those which want the petals ; hence also called *apetalous*, and *stameneous flowers*.

IMPERFECT Numbers, in arithmetic, are those whose aliquot parts taken together, do not make the just number itself, but either come short of it, in which case they are called *deficient numbers* ; or exceed it, and then they are called *abundant numbers*.

IMPERFECT Mixts. See the article MIXT.

IMPERIAL, something belonging to an emperor, or empire.

Thus we say, his *imperial majesty*, the *imperial crown*, *imperial arms*, &c.

IMPERIAL Crown. See the article CROWN.

IMPERIAL Chambers, is a sovereign court established for the affairs of the immediate states of the empire. See CHAMBER.

IMPERIAL Cities, in Germany, are those which own no other head but the emperor.

These are a kind of little commonwealths ; the chief magistrate whereof does homage to the emperor, and pays him the Roman month ; but in other respects, and in the administration of justice, the magistrate is sovereign.

The *Imperial cities* have a right of coining money, and of keeping forces and fortified places : their deputies assist at the *imperial diets*, where they are divided into two branches, that of the Rhine, and that of Suabia.—There were formerly twenty two in the former, and thirty seven in the latter ; but there are now only forty eight in all.

IMPERIAL Diet, is an assembly or convention of all the states of the empire.

It is usually held at Ratibon ; where the emperor, either in person, or by his commissioner, and the electors, secular and ecclesiastical, princes, prelates, princesses, counts, and deputies of *imperial cities*, assist.

The *diet* is divided into three *colleges*, which are those of the electors, the princes and the cities.—The electors alone form the first ; the second consists of princes, prelates, princesses, and counts, and the third of the deputies of *imperial cities*.

Each college has its *director*, who presides, in the consultations : the elector of Mentz, in the college of electors ; the archbishop of Saltzburg, in that of the princes ; and the deputy of the city of Cologne, in that of the cities.

In the *diet*, each principality has a voice ; but all the prelates (so they call the abbots and provosts of the empire) have but two voices, and all the counts but four.

Though the three colleges agree, yet the emperor has a negative voice : when he also consents, the resolutions pass into a law, which obliges all the states of the empire, both mediate, and immediate.

IMPERIAL Medals. See the article MEDAL.

IMPERII Recessus. See the article RECESSUS Imperii.

IMPERSONAL Verb, in grammar, is such an one, as is only used in the third person singular ; as, *oporet, licet, &c.*

IMPERVIOUS, a thing not to be pervaded, or passed through ; either by reason of the closeness of its pores, or the

particular configuration of its parts. See PORE, PENE-TRATION, &c.

IMPETIGO, in medicine, an extreme roughness, and foulness of the skin, attended with an itching and plentiful scurf.

In which sense it amounts to the same with *lichen, valatica*, and *mentagra*.

The *impetigo* is a species of dry, pruriginous itch, wherein scales, or scurf succeed apace ; arising from saline corrosive humours thrown out upon the exterior habit of the body, by which means the internal parts are usually relieved.

It is divided into *mitis*, mild, not accompanied with any malignity ; and *seva*, severe, which comes near to a leprosy.

IMPETRATION, the act of obtaining any thing by request or prayer.

IMPETRATION was more particularly used in our statutes for the pre-obtaining of benefices, and church-offices in England from the court of Rome, which did belong to the disposal of the king and other lay-patrons of the realm ; the penalty whereof is the same with that of provisors, 25 E. III. See PROVISOIR.

IMPETUS, in mechanics. See MOMENTUM, and MOTION.

Paracentric IMPETUS. See the article PARACENTRIC.

IMPING, in falconry, the inserting of a feather in the wing of a hawk, in the place of one that is broke.

IMPLANTATION, one of the six kinds of transpiration, used by some for the sympathetic cure of certain diseases.

Implantation is performed by placing plants, or at least the roots of plants, in a ground prepared for that purpose, and watered with what the patient has used to wash himself withal. By which means, it is pretended, the disease is translated into the plant.—If the plant happen to die before the cure be perfected, by reason of the ill qualities it imbibes, other plants, they say, must be placed instead of it, and the process be continued as in the first ; but this is all idle and absurd.

IMPLEAD, to sue, or prosecute by course of law. See PLEADING.

IMPLEMENTS*, is used for all things necessary for a trade, or the furniture of an household.

* The word is formed either from the Latin *implere*, to fill up ; or from the French, *employer*, to employ.

In this sense we frequently find it used in wills, and conveyances of moveables.

IMPLEX Action. See the article ACTION.

IMPLICITE*, something tacitly comprized, or understood ; that is, contained in a discourse, clause, or proposition, not in express terms, but only by induction and consequence.

* The word is derived from the Latin *in*, and *placere*, I fold.

IMPLICITE Faith. See the article FAITH.

IMPLICITE Condition. See the article CONDITION.

IMPLY a *contradiction*, a phrase used among philosophers, in speaking of the object of divine omnipotence.

God can do every thing that does not *imply a contradiction* proceeding from God : by which is not meant a relation of the action to the executive power of God ; for to say that God by this power could do whatever does not *imply a contradiction* proceeding from this power, would only be to say, that God can do what he can do.—In that proposition therefore is meant a relation to the other attributes and simple perfections of God : Thus, God can do whatever does not *imply a contradiction* to some other of his attributes. For instance, he cannot attest a false religion by his word or by miracle, because this is repugnant to his goodness and truth.

But because all things that *imply a contradiction*, cannot be said to have such a respect to the attributes of God ; therefore we may say more generally, that those things *imply a contradiction*, which involve a contrariety from the terms or object.—For there are two things requisite to the being of any thing ; the one on the side of the agent, *viz.* a power of acting ; the other on that of the patient or object, *viz.* a non-resistance.—For want of the first condition, there are a thousand things which we cannot do ; and for want of the second condition, there are many things that God cannot do : for that which, when it is affirmed, is yet denied, is impossible.

IMPORTATION, the act of *importing*, or bringing in merchandizes from foreign countries.

IMPOSITION of Hands, an ecclesiastical action, by which the evangelical mission, and the power of absolving, is conveyed.

Imposition of Hands was a Jewish ceremony, introduced, not by any divine authority, but by custom ; it being the practice among those people, whenever they prayed to God for any person, to lay their hands on his head.

Our Saviour observed the same custom, both when he conferred his blessing on children, and when he cured the sick ; adding prayer to the ceremony.—The apostles likewise *laid hands* on those whom they bestowed the holy Ghost on.

—The priests observed the same custom when any one was received into their body.—And the apostles themselves underwent the *imposition of hands* a-fresh, every time they entered upon any new design.—In the ancient church, *imposition of hands* was even practised on persons when they married; which custom the Abyssinians still observe. But this term, which, in its original signification, is general, is now restrained by custom, to that *imposition*, which is practised at ordination.—Spanheim has written a treatise *de Impositione Manuum*; and Tribenhorius and Braunius have done the same. See **ORDINATION**.

IMPOSITION, is also a kind of transplantation practised for the cure of certain diseases.

It is performed by taking some of the implanted spirit or excrement of the part affected, or of both together, and placing them in a tree, or a plant, between the bark and the wood, after which it is covered up with mud. Instead of this, some bore a hole in the tree with an auger; and shutting up the hole again with a tampion of the same wood, cover it over with mud.

If it be desired the effect should be lasting, a tree is chosen that will continue long, as an oak. If it be desired the effect should be speedy, they choose a tree that grows fast; in which last case, the matter serving as the medium of transplantation must be taken out of the tree as soon as the effect has followed, because the too great alteration of the spirit, might be some prejudice to the patient. But all this is idle and absurd, and the whole business of such cures deservedly laughed out of the world.

IMPOSITION of Tunnage, &c. See **DUTY, &c.**

IMPOSSIBLE, that which cannot be done.

A proposition is said to be *impossible*, when it contains two ideas which mutually destroy each other, and which can neither be conceived, nor united together in the mind.

Thus it is *impossible* that a circle should be a square; because we conceive clearly that squareness and roundness destroy each other by the contrariety of their figure.

There are two kinds of *impossibilities*, *physical* and *moral*.

Physical IMPOSSIBILITY, is that which cannot be done by the powers of nature.

A thing is *Morally IMPOSSIBLE*, when of its own nature it is possible, but yet is attended with such difficulties, as that, all things considered, it appears *impossible*.

Thus it is *morally impossible* that all men should be virtuous, or that a man should throw the same number with three dice an hundred times successively.

Any thing contrary to decency and good sense is also said to be *impossible*, among those who reason from moral topics; thus the lawyers say *Omne turpe impossibile*: Those conditions are *impossible*, which sense and decorum do not allow to be performed, though in themselves very possible to those who have no regard to good sense, &c.

IMPOST, in law, properly denotes the tribute or tax appointed by a sovereign to be paid for such merchandize as is brought into any haven in his dominions from foreign nations.

Impost is distinguished from *custom*, in that, custom more properly signifies the duties paid to the king for goods shipped off or exported.—But the two are frequently confounded together. See **CUSTOM**.

IMPOSTHUME, a collection of matter, or pus in any part of the body; either owing to an obstruction of the fluids in that part, which makes them change into such matter; or to a translocation of it from some other part where it was generated. See **ABSCCESS**.

IMPOSTS, in architecture, the capitals of pillars or pilasters which support arches. See also *Tab. Archit. fig. 36. lit. d. fig. 40.*

An *impost*, sometimes also called *chaprol*, is a sort of plinth or little cornice which crowns a pier, and supports the first stone whence an arch or vault commences.

Imposts conform to their proper orders.—The Tuscan, is a plinth only; the Doric has two faces crowned; the Ionic has a larnier over the two faces, and its mouldings may be carved; the Corinthian and Composite have a larnier, freeze, and other mouldings.

The projecture of the *impost* must not exceed the naked of the pilaster.—Sometimes the entablature of the order serves for the *impost* of the arch; and this looks very grand and stately.

The *impost* is a thing essential to an ordonnance; inasmuch as without it, in the place where the curve line of the arch meets with the perpendicular line of the pillar, there always seems a kind of elbow.

IMPOTENCE *, or **IMPOTENCY**, a want of strength, power, or means to perform any thing.

* The word is derived from the preposition *in*, taken privatively; and *potentia*, power.

Divines and philosophers distinguish two kinds of *impotency*; *natural* and *moral*.—The first is a want of some physical principle necessary to an action; or it is where a being is absolutely defective, or not free, and at liberty to act: the se-

cond only imports a great difficulty; as a strong habit to the contrary; a violent passion, inclination, or the like.—*Impotency*, is more particularly used for a natural inability to coition.

In this sense, *impotency* is defined an inability or insufficiency in the male to impregnate the female.

The Decretals idly distinguish three causes or rather species of *impotency*; viz. *frigidity*, *witchcraft*, and *impotentia coeundi*.

IMPRECATION *, a curse, or wish, that some evil may befall any one.

* The word is derived from the Latin *in*, and *precor*, I pray.

The antients had their goddesses called *Imprecations*, in Latin *Diræ*, i. e. *Deorum iræ*, who were supposed to be the executors of evil consciences.—They were called *Diræ* in heaven, *Furies* on earth, and *Eumenides* in hell.

The Romans owned but three of these *Imprecations*, and the Greeks only two.—They invoked them, with prayers and pieces of verses, to destroy their enemies.

IMPREGNATION *, the emission of the seed of the male in coition, by which the female conceives, or becomes with young.

* The word is derived from the Latin *impregnare*, of *pregnans*, a woman with child.

IMPREGNATION is also figuratively used in pharmacy, when a liquor imbibes the particles of some other body.

Thus a menstruum is said to be *impregnated* with a body dissolved in it, as much as its pores are able to receive.

IMPRESSED Species. See the article **SPECIES**.

IMPRESSION, in philosophy, is applied to the species of objects, which are supposed to make some mark or *impressions* on the senses, the mind, and the memory.

The Peripatetics tell us, that bodies emit species resembling them, which species are conveyed by the exterior senses to the common sensory: These *impressed* species, being material and sensible, they say, are rendered intelligible by the active intellect; and when thus spiritualized, are called *expressions* or *express species*, as being expreffed from the others.

IMPRESSION, is also frequently used in speaking of the editions of a book, or of the number of times it has been printed.

M. Arnaud assures us, there were above two hundred *impressions* of the Louvain Bible in one age; and it is affirmed, that Thomas a Kempis of the *Imitation of Christ*, has undergone more *impressions* than there have been months since it was first composed.

Impression, however, differs from *edition*: the former, properly speaking, takes in no more than what belongs to the printing, the letter, paper, margin, page, distances of words and lines, and the disposition of every thing that may have a good or bad effect on the eye: the latter, besides all this, takes in the care of the editor, who has revised the copy, corrected or augmented it, adding notes, tables, and other like things, which he judged might contribute towards making the book more useful, and correct.

Indeed, very frequently the word *edition* only refers to this latter part; as when, in speaking of the works of S. Augustin, we quote the edition of Erasmus, the Lovanists, Benedictines, &c. where we have no regard to the printing part, but only to the care and pains of the editors.

Privilege for IMPRESSION. See the article **PRIVILEGE**.

IMPREST, *Auditors of*. See the article **AUDITORS**.

IMPRISONMENT, the state of a person restrained of his liberty, and detained under the custody of another.

False IMPRISONMENT. See the articles **FALSE**, and **APPEAL**.

IMPROPER Fractions, are such as have their numerators equal to, or greater than, their denominators.

Such, e. g. are, $\frac{5}{3}$, $\frac{7}{4}$, &c.

These, properly speaking, are not *fractions*, but either whole, or mixed numbers; and are only put into the form of *fractions*, in order to be added, subtracted, multiplied, or divided, &c.

IMPROPER Motion. See the article **MOTION**.

IMPROPRIATION, is a term used where the profits of an ecclesiastical benefice are in the hands of a layman.

In which sense it stands distinguished from *appropriation*, which is, where the profits of a benefice are in the hands of a bishop, college, &c. though the two are now often used promiscuously.—There are said to be 3845 *impropriations* in England.

IMPROPRIETY, the quality of something that is not fit, or proper. See **PROPER**, and **PROPRIETY**.

Grammarians observe three kinds of faults in language; a *solecism*, *barbarism*, and *impropriety*: An *impropriety* is committed when a word is used that has not a proper signification. See **SOLECISM**, and **BARBARISM**.

IMPROVIDE, in law. See **QUIA IMPROVIDE**.

IMPULSIVE, a term in philosophy, applied to the action of a body which impels, or pushes another.

Thus the arm is said to give an *impulsive* motion to the stone that it throws. See **PROJECTILE**.

In this sense, *impulsive* stands contradistinguished from *attractive* and *repulsive*.

Sir Isaac Newton suggests that attraction itself may possibly be effected by an *impulsive* power.

IMPUTATION, a term much used among divines, sometimes in a good, and sometimes in an ill sense: in the latter it is used to signify the charging the sin to the account of one, which was committed by another.

Thus Adam's sin is *imputed* to all his posterity; all his descendants, by his fall, becoming as criminal in the sight of God, as if they had fallen themselves; and bearing the just punishment of his first crime. See **ORIGINAL SIN**.

Imputation, used in a good sense, signifies the charging of another's justice, or merit.

Thus the justice of Jesus Christ is *imputed* to us; his merits and the price of his sufferings being applied to us.

The *imputation* of the merits of Christ signifies no more, among the Reformed, than an extrinsic justice, which does not make us truly just, but only makes us appear so; which hides our sins, but does not efface them.

For this reason, those of the Romish communion decline the use of the word *imputation*, and assert, that the justifying grace, which applies to us the merits of Jesus Christ, not only covers our sins, but also effaces them; that this grace is intrinsic and inherent, renewing intirely the inward man, and rendering him pure, just, and without spot before God; and that this justice is given him on account of the justice of Jesus Christ, that is, by the merits of his death and passion.

—In a word, say they, though it is the obedience of Jesus Christ that has merited justifying grace for us, yet it is not the obedience of Jesus Christ that renders us formally just: And in like manner, it is not the disobedience of Adam that makes us formally sinners, but it is this disobedience that has merited for us, both that we should be sinners, and that we should undergo the punishment of sin.

Protestants say, that the sin of the first man is *imputed* to his descendants; they being looked on as culpable, and punished as such, because of the sin of Adam.—Catholics hold, that this is not enough; we are not only esteemed and punished as criminals, say they, but we are actually criminal ourselves by original sin.

Again, Protestants say, that the justice of Jesus Christ is *imputed* to us, and that our justification is only the *imputation* of Christ's justice; his sufferings standing instead of ours, and God accepting his death as a satisfaction in lieu of our own.—But Catholics teach, that the justice of Christ is not only *imputed*, but actually communicated to the faithful, by the operation of the Holy Ghost: so that they are not only reputed just, but also are made so.

INACCESSIBLE *Height*, or *distance*, is that which cannot be actually measured, by reason of some impediment in the way; as water, or the like. See **DISTANCE**, &c.

INACTION, *Cessation of Action*, a term much used in the mystical divinity; by which is understood a privation, or annihilation of all the faculties; whereby the door is, as it were, shut to all external objects, and a kind of extasy is procured, during which God speaks immediately to the heart. It is the state of *inaction* that is held the most proper for receiving the Holy Spirit; and in this fit of dozing, they say, it is that God communicates sublime, and ineffable sentiments and graces to the soul.

Some do not make it consist in this stupid kind of indolence or general suspension of all sensation; but by *inaction* only mean a cessation of desires, in which as the soul does not determine itself to any positive acts, neither does it abandon itself to useless meditations, or the vain speculations of reason; but demands in general every thing that may be agreeable to God, without prescribing any thing to him.

This latter is the doctrine of the antient mystics, and the former that of the modern ones, or the quietists.

In general, however, it may be said, that *inaction* is not the most likely way of pleasing God; it is our actions chiefly by which we are to gain his favour; he will have us to act; so that *inaction* cannot be agreeable to him.

INACTIVITY of *Matter*. See **VIS INERTIA**.

INADEQUATE *Idea*, or *Notion*, is a partial or incomplete representation of any thing to the mind. See **IDEA**.

INALIENABLE, that which cannot be validly alienated, or made over to another. See **ALIENATION**.

Thus the dominions of the king, the church, minors, &c. are *inalienable*, otherwise than with a reserve of the right of redemption for ever.

ENAMELLING, or **ENAMELLING**, See the article **ENAMELLING**.

INANIMATE*, denotes a body that has either lost its soul, or that is not of a nature capable of having any.

* The word is derived from the Latin preposition *in*, taken privatively, and *anima*, soul.

Thus, a dead man is an *inanimate* lump, and metals are *inanimate* bodies.

INANITION, a term in phisic, signifying emptiness; at the state of the stomach, when it is empty, and needs food.

There are flatulencies which proceed from repletion, and others from *inanition*, which last are the more dangerous.

INARTICULATE, an epithet applied to such sounds, syllables, or words, as are not pronounced distinctly. See **ARTICULATION**.

INAUGURATION*, the coronation of an emperor, or king; or the consecration of a prelate; so called, in imitation of the ceremonies used by the Romans, when they were received into the college of augurs.

* The word comes from the Latin *inaugurare*, which signifies to dedicate a temple, or to raise any one to the priesthood, having, in order to that, first taken auguries. See **AVGURS**, and **AUGURY**.

INCA, or **YNCA**, an appellation which the natives of Peru give to their kings, and princes of the blood.

The chronicle of Peru relates the origin of the *incas*: This country had been a long time the theatre of all sorts of wars, horrible crimes, and dissensions, till at length there appeared two brothers, the one of whom was called *Manguécapa*, of this person the Indians use to tell wonders; they say he built the city of Cusco, settled laws and policy, and taught them to adore the sun: and he and his descendants took the name of *inca*, which in the language of Peru, signifies king, or great lord. These *incas* grew so powerful, that they made themselves masters of the whole country, from Paiko to Chili, 1300 leagues long, and held it till the divisions between *inca* Guascar, and Atabalipa; which the Spaniards laying hold of, made themselves masters of Peru, and put an end to the empire of the *incas*.

They number only twelve of these *incas*.—It is said, the most considerable among the nobles of the country still bear the name of *inca*.

INCALESCENCE*, the growing hot of any thing, either by motion and friction, or as quick-lime does, by pouring water on it.

* The word is compounded of *in*, and *calere*, or *calefacere*, I grow warm.

INCAMERATION*, in the apostolical chancery, the union of some land, right, or revenue to the domain of the pope. See **CHAMBER**.

* The word is derived from the Latin *in*, and *camera*, chamber.

INCANTATION*, *Enchantment*; words and ceremonies used by magicians to raise devils; or rather to impose on the credulity of the people. See **MAGIC**, **FASCINATION**, **WITCHCRAFT**, &c.

* The word is derived from the Latin *in*, and *canto*, I sing. See **CHARM**, and **CARMEN**.

INCAPACITY, in matters of benefices among the canonists, is of two kinds: the one renders the provision of a benefice null in its original; the other is accessory, and annuls the provisions, which at first were valid.

Incapacities of the first kind, are the want of a dispensation for age in a minor, for legitimization in a bastard, for naturalization in a foreigner, &c.

Of the latter kind, are grievous offences and crimes; as being concerned in seeing a sentence of death executed, &c. which they decree, vacate the benefice to all intents, or render the holding it irregular.

INCARNATION, in theology, signifies the act whereby the Son of God assumed the human nature; or the mystery by which Jesus Christ, the eternal Word, was made man, in order to accomplish the work of our salvation.

The Indians own a kind of Trinity in the Godhead, and say, that the second person thereof has been incarnate nine times, and will be incarnate a tenth; and they give him a different name in each of these *incarnations*. See Kircher. *Chin. Illustr.*

The *æra* used among Christians, whence they number their years, is the time of the *incarnatio*, that is, of Christ's conception in the virgin's womb.

This *æra* was first established by Dionysius Exiguus, about the beginning of the sixth century, till which time the *æra* of Dioclesian had been in use.

Some time after this, it was considered, that the years of a man's life were not numbered from the time of his conception, but from that of his birth: which occasioned them to postpone the beginning of this *æra*, for the space of one year, retaining the cycle of Dionysius entire, in every thing else.

At Rome they reckon their years from the *incarnation*, or birth of Christ, that is, from the 25th of December, which custom has obtained from the year 1431.—In France, and several other countries, they also reckon from the *incarnation*; but then they differ from the other in the day of the *incarnation*, fixing it, after the primitive manner, not to

to the day of the birth, but conception of our Saviour.—Though the Florentines stick to the day of the birth, and begin their year from Christmas. See *Petav. de Doct. Temp.* Grandamicus *de Die Nat.*

INCARNATION*, in medicine, signifies the healing and filling up ulcers and wounds with new flesh.

* The word is formed from *in*, and *caro*, flesh.

The medicines which effect this, are commonly called *incarnatives*.

INCARNATIVE, in medicine and chirurgery, is applied to medicines, bandages, and sutures, which dispose a wound or ulcer to fill up with flesh. Whence they are also called *anaplerotics*, from *ana*, again; and *πληρώω*, to fill.

INCARNATIVE Medicine, is such a one as makes the flesh heal and unite.

INCARNATIVE Bandage, is a fillet with an eye or noose at one end of it, so as the other end may be put through it.—To make use of this bandage, they apply the middle of it to the side opposite to the wound; so that the aperture may be over the wound itself; and slipping the other end through it, they draw the lips of the wound close to each other, that they may grow together.

INCARNATIVE Suture, is such a one as, by rejoining the lips of a wound, and keeping them together, by means of a thread drawn through them with a needle, occasions them to grow up and heal.

INCARTATION, in chymistry, the refining of gold, by means of silver and aqua fortis.

This is the same with what is otherwise called *departing*. See **DEPART**.

INCENSE*, an aromatic, odoriferous resin; otherwise called *frankincense*.

* The word comes from the Latin *incensum*, q. d. *burnt*; as taking the effect for the thing itself.

Incense was formerly burnt in the temples of all religions, to do honour to the divinities that were there adored. Many of the primitive Christians were put to death, because they would not offer *incense* to idols. In the Romish church they still retain the use of *incense* in many of their ceremonies, particularly at solemn funerals, bestowing it on such persons as they would honour, as on prelates, &c. and sometimes also on the people.

INCEPTIVE, a word used by Dr. Wallis to express such moments, or first principles, which though of no magnitude themselves, are yet capable of producing such as are. See **INFINITE**, and **INDIVISIBLE**.

Thus a point has no magnitude itself, but is *inceptive* of a line which it produces by its motion. So a line, though it have no breadth, is yet *inceptive* of breadth; that is, it is capable, by its motion, of producing a surface which has breadth, &c.

INCEST, the crime of venereal commerce between persons who are related in a degree prohibited marriage by the laws of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the affection, so necessary in marriage, might be heightened by this double tie; and yet the rules of the church have formerly extended this prohibition even to the seventh degree, but time has now brought it down to the third or fourth degree.

The words *adultery* and *incest* are not indecent, though they signify very infamous things; because they represent them as covered with a veil of horror, which makes us look on them only as crimes: the words, therefore, rather signify the guilt of those actions, than the actions themselves.

Most nations look on *incest* with horror, Persia and Egypt alone excepted. In the history of the ancient kings of those countries we meet with instances of the brother's marrying the sister: the reason was, because they thought it too mean to join in alliance with their own subjects; and still more so, to have married into the families of any foreign princes.

As to the Persians, there was a still more abominable sort of *incest* practised by their magi: If we may trust Catullus, *carm.* 91.

*Nam magus ex matre & gnato signatur oportet,
Si vera est Persarum impia religio.*

Spiritual INCEST, is the like crime committed between two persons who have a spiritual alliance, by means of baptism, or confirmation.

Spiritual INCEST is also understood of a vicar, or other beneficiary, who enjoys both the mother and the daughter; that is, holds two benefices, the one whereof depends on the collation of the other.

Such a *spiritual incest* renders both the one and the other of those benefices void.

INCESTUOUS, the name of a sect or heresy, which arose in Italy about the year 1065.

The heresy of the *Incestuous* had its beginning at Ravenna; the learned of which place being consulted by the Florentines about the degrees of affinity which prohibit marriage, made

answer, that the seventh generation, mentioned in the canons, was to be taken on both sides together; so that four generations were to be reckoned on one side, and three on the other.

They proved this their opinion by a passage in Justinian's *Institutes*, where it is said, that a man may marry his brother's or sister's grand-daughter, though she be but in the fourth degree: Whence they concluded, that if my brother's grand-child be in the fourth degree with respect to me, she is in the fifth with respect to my son, in the sixth with respect to my grandson, and in the seventh with respect to my great grandson.

Peter Damian wrote against this opinion, and pope Alexander II. condemned it in a council held at Rome.

INCH, a known English measure, the twelfth part of a foot.

INCH of Candle, a manner of selling goods among merchants.

The method of it is thus.—Notice is usually given upon the Exchange in writing, and elsewhere, when the sale is to begin: against which time the goods are divided into several parcels, called *lots*, and papers printed of the quantity of each, and of the conditions of sale; as, that none should bid less than a certain sum more than another has bid before. During the time of bidding, a small piece, of about an *inch*, of wax-candle, is burning; and the last bidder, when the candle goes out, has the lot or parcel exposed to sale.

INCHASING, in sculpture. See the article **ENCHASING**.

INCHOATIVE, a term signifying the beginning of a thing, or action; the same with what is otherwise called *inceptive*. See **INCEPTIVE**.

INCHOATIVE Verbs, according to the strict rules of the Latin tongue, are used by the best authors indifferently with primitives, having almost all the tenses in common with them; nay, ordinarily they express our sentiments with more energy, and the actions themselves in a more perfect state.

INCIDE, *Cut*.—Those medicines are said to *incide*, which consist of pointed, and sharp particles; as acids, and moist salts; by the force or insinuation of which, the particles of other bodies, which before cohered, are divided from one another.

And thus some expectorating medicines are said to *incide*, or cut the phlegm, when they break it, so as to occasion its discharge. See **EXPECTORATION**.

INCIDENCE, in mechanics, expresses the direction in which one body strikes on another; or otherwise called *inclination*.

In the incursions of two moving bodies, their *incidence* is said to be *perpendicular* or *oblique*, as their directions or lines of motion make a straight line, or an oblique angle at the point of contact.

Angle of INCIDENCE, commonly denotes the angle comprehended between an *incident ray* or other body, and a perpendicular to the plane in point of *incidence*.

Thus, supposing AB (*Tab. Optics*, fig. 26.) an incident ray proceeding from the radiant point A, to B the point of *incidence*, and HB a perpendicular to DE in the point of *incidence*: the angle ABH, comprehended between AB and HB, is the *angle of incidence*—by others called the *angle of inclination*.

Angle of INCIDENCE, is also used by Dr. Barrow and some others for the complement of the above angle, or of the angle of inclination.

Thus, supposing AB an incident ray, and HB a perpendicular, as before; the angle ABD comprehended between it and the reflecting or refracting plane DE, is the *angle of incidence*; and the angle ABH, the angle of inclination.

Others, with Wolfius, make another distinction; which see under the articles **ANGLE**, **REFLEXION**, and **REFRACTION**. It is demonstrated by optical writers, 1^o. That the *angle of incidence*, ABH, fig. 26. is always equal to the angle of reflexion HBC, or the angle ABD to the angle CBE.

2^o. That the sines of the *angles of incidence* and *refraction*, are to each other reciprocally as the resistances of the mediums.

3^o. That from air to glass the sine of the *angle of incidence* is to the sine of the reflected angle as 300 to 193, or nearly as 14 to 9: on the contrary, that from glass to air, the sine of the *angle of incidence*, is to the sine of the refracted angle as 193 to 300, or as 9 to 14.

It is true, Sir Isaac Newton having shewn that the rays of light are not all equally refrangible, there can be no precise ratio fixed between the sines of the angles of refraction and *incidence*; but the proportion which comes nearest, is that above specified. See **LIGHT**, **COLOUR**, **REFRANGIBILITY**, &c.

INCIDENCE of Eclipse. See the article **ECLIPSE**.

Axis of INCIDENCE. See the article **AXIS of Incidence**.

Cathetus of INCIDENCE. See **CATHETUS of Incidence**; see also **REFLEXION**.

Line of INCIDENCE, in catoptrics, denotes a right line, as AB, *Tab. Optics*, fig. 26. whereby light is propagated from a radiant point A, to a point B, in the surface of a speculum.—This is also called an *incident ray*.

Line of INCIDENCE, in dioptrics, is a right line, as AB, fig. 56. whereby light is propagated unrefracted, in the same medium,

dium, from the radiant point to the surface of the refracting body HKLI.

Point of Incidence. See the article **POINT of Incidence**.

Scruples of Incidence. See the article **SCRUPLES**.

INCIDENT, in a moral sense, denotes an event; or a particular circumstance of some event.

INCIDENT, in a poem, is an episode or particular action, tacked to the principal action, or depending on it.

A good comedy is to be full of agreeable incidents, which divert the spectators, and form the intrigue. The poet ought always to make choice of such incidents, as are susceptible of ornament suitable to the nature of his poem. The variety of incidents well conducted make the beauty of an heroic poem, which ought always to take in a certain number of incidents to suspend the catastrophe, that would otherwise break out too soon.

INCIDENT Ray. See the articles **RAY**, **INCIDENCE**, and **INCLINATION**.

INCINERATION*, in chymistry, the reduction of vegetables into ashes, by burning them gently.

* The word is derived from the Latin preposition *in*, and *cinis*, ashes.

Thus fern is *incinerated* for the making of glass.

INCISION Crucial. See the article **CRUCIAL**.

Grafting by Double Incision. See **ENGRAFTING**.

INCISIVE, **INCISIVUS**, in anatomy, is applied to several teeth, a double muscle, and certain orifices situated near to those teeth.

INCISIVI Dentes, called also *incisores*, or *cutters*, and sometimes *risores*, because they threw themselves in laughing, are eight in number; four in each jaw, situate in the fore side, and in the middle of the others.—See *Tab. Anat. (Osteol.) fig. 2. lit. d.*

They are shorter and sharper than the others, and are inserted into their alveoli by a single root, or twang; for which reason they fall easily, especially those of the upper side.

They are called *incisivi*, because their office is to cut or incise the meat. See **TOOTH**.

INCISIVUS is also an appellation given to the first proper muscle of the upper lip; because it has its origin in the bone of the upper jaw, near the place of the *incisive* teeth; hence it passes, and is inserted into the upper lip, which it serves to draw up.

The maxillary bones, have four internal orifices, two whereof are called **INCISIVA**, as being directly under the *dentes incisivi*.

INCLINATION, in medicine and chymistry, the operation of pouring off a clear liquor from some fæces, or sediment, by only gently stooping the vessel.

This amounts to the same with what is otherwise called *decantation*.

INCLINATION, in physics, expresses the mutual approach, or tendency of two bodies, lines, or planes, towards one another; so that their directions make either a straight line at the point of contact, or an angle of a greater or lesser magnitude.

INCLINATION of a Right Line to a Plane, is the acute angle, which such right line makes with another right line drawn in the plane through the point where the inclined line intersects it, and through the point where it also cut by a perpendicular drawn from any point of the inclined lines.

INCLINATION of an Incident Ray, is the angle which it makes with a line drawn to the point of incidence, perpendicular to the reflecting or refracting surface.

This is otherwise called the *angle of inclination*: sometimes also the *angle of incidence*.

INCLINATION of a reflected Ray, is the angle which a ray after reflexion makes with the axis of inclination.

Thus, if AB, *Tab. Opt. fig. 26.* be the incident ray, HB a perpendicular to DE in the point B, and BC the reflected ray; CBH will be the *inclination of the reflected ray*; and ABC the *inclination of the incident ray*.

INCLINATION of the Axis of the Earth, is the angle which it makes with the plane of the ecliptic; or the angle between the planes of the equator and ecliptic.

INCLINATION of a Planet, is an arch or angle comprehended between the ecliptic, and the place of a planet in his orbit.

The greatest *inclination* of Saturn, according to Kepler, is $2^{\circ} 32'$; of Jupiter $1^{\circ} 20'$; of Mars $1^{\circ} 50'$; $30'$; of Venus $3^{\circ} 22'$; of Mercury $6^{\circ} 54'$. According to De la Hire, the greatest declination of Saturn is $2^{\circ} 33'$; of Jupiter $1^{\circ} 19'$; $20'$; of Mars $1^{\circ} 51'$; $0'$; of Venus $3^{\circ} 23'$; $5'$; of Mercury $6^{\circ} 52'$; $0'$.

INCLINATION of a Plane, in dialing, is the arch of a vertical circle, perpendicular both to the plane and the horizon, and intercepted between them.

To find this, take a quadrant and apply its side to the side of a square, and apply the other side of your square to your plane: if the plummet fall parallel to the side of the square, then the lower side of the square stands level; by which draw a horizontal line, whereon erect a perpendicular, and apply your square to that perpendicular; and if the plummet falls parallel to the side of the square, then that is also a level line, and your plane stands horizontally: If the the plummet falls not parallel to the side of the square, then turn your square, un-

Vol. I.

til it does; and draw an horizontal line, on which erect a perpendicular, to which apply your square, and observe what angle your plummet makes on the quadrant, with the side of the square; that is the angle of the *inclination of the Plane*.

INCLINATION of two Planes, is the acute angle made by two lines drawn one in each plane, through a common point of section, and perpendicular to the same common section.

Thus, in *Tab. Geometry, fig. 98.* the *inclination* of the plane KEGL to the plane ACDB is the angle HFI, or *fb*; made by the right lines HF and FI in the point F, perpendicular to the line of section EG.

Angle of INCLINATION, in optics, is the same with what is otherwise called the *angle of incidence*.

Thus, in *Tab. Optics, fig. 26.* supposing AB an incident ray, proceeding from the radiant A to the point of incidence B, on the surface of a mirror; the angle ABH comprehended between it and the perpendicular HB, is called indifferently by Mr. Molyneux, and others the *angle of inclination*, or of *incidence*.

Argument of INCLINATION. See **ARGUMENT**.

INCLINATION, in a moral sense. See **APPETITE**.

INCLINED Plane, in mechanics, is that which makes an oblique angle with the horizon.

It is demonstrated in mechanics, that a body, as B (*Tab. Mechanics, fig. 58.*) laid on an *inclined plane*, always loses part of its weight; and that the power or weight L, required to sustain it, is to the weight of D, as the height BA of the plane is to the length of it CA.—And hence also it follows, that the *inclination* of the plane may be so small, that the greatest weight may be sustained on it by the smallest power.

Hence it becomes a rule, that the force wherewith any heavy body would descend on an *inclined plane*, is to the force of the descent in the perpendicular, as the line of the angle of the *plane's inclination*, is to the radius. See **DESCENT**.

Suppose, therefore, a body or weight given, and it were required to find the power necessary to sustain it on an *inclined plane* D.—Call the weight W, and the power P: Then by the above rule, R : W :: S. incl. : P. that is, as radius is to the weight, so is the sine of the angle of the *plane's inclination* to the horizon, to the power sought: where, the three first being given, the fourth is known of course.

INCLINERS, in dialing. See **DIAL**, and **DEINCLINERS**.

INCOGNITO, a term borrowed from the Italian, used when a person is in any place where he would not be known; but it is more particularly applied to princes or great men, who enter towns, or walk the streets, without their ordinary train, or the usual marks of their distinction and quality.

The grandees in Italy make a common custom of walking the streets *incognito*; and always take it amiss, on such occasions, when people pay their compliments to them. It is not barely to prevent their being known, that they take these measures, but because they would not be treated with ceremony, nor receive the honours due to their rank.

When the horses in princes, cardinals, and ambassadors coaches have no tassels, which they call *fiochi*, and the curtains, which they call *bandinelle*, are drawn, they are reputed to be *incognito*; and no body that meets them is obliged to stop, or make his honours to them.

The cardinals also, when they would be *incognito*, leave off the red hat.

INCOMBUSTIBLE, that which cannot be burnt or consumed by fire.

Metals melt, stones calcine, and are yet *incombustible*.—Cloth made of lapis amianthus is *incombustible*; it is cleaned by fire, but not burnt. See the article **ASBESTOS**.

At Dole, in France, is said to be an *incombustible* taper: Gregory of Tours speaks of some wooden kettles in his time that bore the fire as long as those of iron.—Sylla undertook to burn down a tower of wood which defended Archelaus, one of Mithridates's lieutenants; but he could not attain his end, by reason of its being coated with alum.—It is alum water wherewith those people besmear themselves, who handle burning coals, melt Spanish wax on their tongues, &c. See **FIRE-EATER**, and **ALUM**.

INCOMMENSURABLE, a term in geometry, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both.

In the general, two quantities are said to be *incommensurable*, when no third quantity can be found that is an aliquot part of both: or, when those quantities are not to one another as unity to a rational number; or as one rational number to another.

The side of a square is *incommensurable* to the diagonal, as is demonstrated by Euclid; but it is commensurable in power; the square of the diagonal being equal to twice the square of the side.

Pappus, lib. 4. prop. 17. speaks also of *incommensurable* angles. Surfaces which cannot be measured by a common surface, are also said to be *incommensurable* in power.

IND

INCOMPATIBLE, that which cannot subsist with another without destroying it.

Thus cold and heat are *incompatible* in the same subject; the strongest overcoming and expelling the weakest.

INCOMPLEX Opposition. See the article **OPPOSITION**.

INCOMPOSITE Numbers, are the same with what Euclid calls *prime numbers*. See **PRIME**, and **NUMBER**.

INCONCINNOUS Discords. } See the article { **DISCORDS**.
INCONCINNOUS System. } **SYSTEM**.

INCORPORATION *, the mixing the particles of different bodies so together, as to make an uniform substance or composition of the whole, without leaving any possibility of discerning the ingredients or bodies mixed, in any of their particular qualities.

* The word is formed from *in*, and *corpus*, body.

INCORPOREAL, *Spiritual*; a thing or substance which has no body. See the articles **SPIRIT**, and **BODY**.

Thus the soul of man is *incorporeal*, and may subsist independent of the body. See **SOUL**.

Those ideas which are independent of bodies, can neither be corporeal themselves, nor be received within a corporeal subject. They discover to us the nature of the soul, which receives within itself what is *incorporeal*, and receives it in a corporeal manner too. Whence it is that we have *incorporeal* ideas even of bodies themselves. *Renelon*.

INCORRUPTIBLE, that which cannot be corrupted. See **CORRUPTION**.

Thus spiritual substances, as angels, human souls, &c. and thus also glass, gold, mercury, &c. may be called *incorruptible*.

INCORRUPTIBLES, INCORRUPTIBLES, the name of a sect which sprang out of the Eutychians.

Their distinguishing tenet was, That the body of Jesus Christ was *incorruptible*; by which they meant, that after and from the time wherein he was formed in the womb of his holy mother, he was not susceptible of any change, or alteration; not even of any natural, and innocent passions, as of hunger, thirst, &c. So that he eat without any occasion, before his death, as well as after his resurrection.—And hence it was that they took their name.

INCRASSATING, the act of condensing, or rendering fluids thicker, by the mixture of other less fluid particles; or by expelling the finer particles, and compingings, and bringing the grosser nearer together.

INCRUSTATION, the lining, or coating of a wall, either with glossy stones, rustics, marble, pottery, or stucco work; and that either equally, or in pannels and compartments.

INCRUSTED, or **INCRUSTATED Column**, is a column consisting of several pieces or slips of some precious marble, masticated or cemented around a mould of brick, or other matter; which is done, not only to save the precious stone, whether it be agat, jasper, or the like, but also for the sake of shewing pieces of it uncommon largeness, by the neatness and closeness of the *incrustation*, which renders the joints imperceptible, where the cement is of the same colour.

INCUBATION, the action of a hen, or other fowl, brooding on her eggs.

INCUBUS *, *Night-Mare*; a disease consisting in an oppression of the breast, so very violent, that the patient cannot speak, or even breathe.

* The word is derived from the Latin *incubare*, to lie down on any thing and press it: The Greeks called it *φωλον*, q. d. *sal-tator*, leaper, or something that raieth on a person.

In this disease the senses are not quite lost, but they are drowned and astonish'd, as is also the understanding and imagination; so that the patient seems to think some huge weight thrown on him, and ready to strangle him.

Children are very liable to this distemper; so are fat people, and men of much study and application of mind; by reason the stomach in all these finds some difficulty in digestion.

The *incubus* seems to be cousin-german to the epilepsy and apoplexy; for if it lasts long, it degenerates into one or other of those distempers. Others reckon it a kind of asthma, and call it *asthma nocturnum*; and say it proceeds from the same causes, and is helped by the same means, as the common asthma.

INCUMBENT, in law, a clerk resident in his benefice, with cure.

He is called *incumbent* of such church, because he ought to bend his whole study to discharge his cure. See **RECTOR**.

INCUMBRANT, in law. See **SQUARE Incumbravit**.

INCURVATION, the act of bending a bone, or other body, from its natural shape.

INCURVATION of the Rays of Light. See **LIGHT**, and **REFRACTION**.

INCUS, in anatomy, the second of the ossicles or little bones of the ear. See the article **EAR**.

INDE. See the article **INDIGO**.

INDEFESIBLE, or **INDEFRAZABLE**, in our law, signifies what cannot be defeated or made void:—As, a good and *indefesible* estate.

INDETERMINATE, *Indeterminate*; that which has no certain

IND

bounds, or to which the human mind cannot affix any.

Descartes uses the word in his philosophy, instead of *infinite*, both in numbers and quantities, to signify an *inconceivable* number, or number so great, that an unit cannot be added to it: and a quantity so great, as not to be capable of any addition.

Thus he says, the stars, visible and invisible, are in number *indefinite*, and not, as the ancients held, infinite; and that quantity may be divided into an *indefinite* number of parts, not an infinite number.

INDEFINITE is also used in the schools to signify a thing that has but one extreme; for instance, a line drawn from any point, and extended infinitely.

Thus what they call *eternity a parte ante*, or *eternity a parte post*, are *indefinite* durations.

INDEFINITE Proposition. See the article **PROPOSITION**.

INDEFINITE, in grammar, is understood of nouns, pronouns, verbs, participles, articles, &c. which are left in an uncertain indeterminate sense, and not fixed to any particular time, thing, or other circumstance.

INDELIBLE *, that which cannot be blotted out, or effaced.

* The word is formed from the Latin *delere*, to blot, with the preposition *in* taken negatively.

Thus baptism, and the order of the priesthood, are said to convey *indelible* characters.

INDEMNITY *, an act by which one promises to guarantee, or save harmless, some other person from any loss or damage, that might accrue to him on any particular account.

* The word is originally Latin, and is formed from the negatives *in*, and *dammum*, loss.

When a church is appropriated to an abbey or college, the archdeacon leaveth his induction-money for ever: in recompence whereof, he shall have yearly out of the church so appropriate, one or two shillings, more or less, for a pension, as was agreed at the time of the impropriation. And this pension is called an *indemnity*.

INDENTED, INDENTEE, in heraldry, is when the outline of a bordure, ordinary, &c. is notched, in form of the teeth of a saw.

INDENTED Verges. } See the article { **DENTED**.
INDENTED Medals. } **MEDALS**.
INDENTED Wheel. } **WHEEL**.

INDENTURE, in law, a writing which comprises some contract between two at least; being indented at top answerable to another part, which has the same contents.

It differs from a deed-poll; in that this last is a single deed, and is unindented.

INDEPENDANT Troop. See the article **TROOP**.

INDEPENDENTS, a sect of Puritans in England and Holland; so called, as denying not only any subordination among their clergy, but also all *dependency* on any other assembly.

They maintain, that every separate church, or particular congregation, has in itself radically and essentially every thing necessary for its own government; that it has all ecclesiastical power and jurisdiction; and is not at all subject to other churches or their deputies, nor to their assemblies or synods.

Though the *Independents* do not think it necessary to assemble synods; yet, if any be held, they look on their resolutions as weighty and prudential counsels, but not as decisions to be peremptorily obeyed.

They agree, that one or more churches may help another church with their advice and assistance, and even reprove it when it offends; provided they do not pretend to any superior authority or right to excommunicate, &c.

In matters of faith and doctrine, the *Independents* agree with the rest of the reformed; so that the difference is rather political, than religious.

During the civil wars in England, the *Independents* becoming the most powerful party, and getting to the head of affairs, most of the other sects, that were averse to the church of England, joined them: which occasioned them to be distinguished into two sects.

The first are in effect *Presbyterians*, only differing from them in matters of discipline.—The others, whom M. Spanheim calls *Pseudo-Independents*, are a confused assemblage of Anabaptists, Socinians, Antinomians, Familists, Libertines, &c.

F. Orleans speaks of the rise of the *Independents* in the following terms. 'Out of the same sect (the Presbyterians) had risen some time ago, on pretence of further reformation, a new sect, which was not only averse to the monarch, but the monarchy, both which it undertook to destroy; and in lieu thereof to form a republic.—They were called by the name of *Independents*, in regard that, professing to carry the gospel liberty still further than the other Puritans, they rejected not only bishops, but also synods, pretending each assembly ought to govern itself *independently* of all others; in which, said they, consists the liberty of the children of God. At first they were only distinguished among the Presbyterians, as the more zealous from the more indifferent, the more rigid from

from the more remote, by a greater aversion to all pomp and pre-eminence both in church and state, and by a more ardent desire to reduce the practice of the gospel to its primitive purity. It was their maxim of *independency* that first distinguished them, and rendered them suspected to the rest. But they had address and artifice enough to gain ground, and in effect they made abundance of proselytes out of all other parties and persuasions.

Independency is peculiar to Great Britain, the British colonies, and the United Provinces. One Morel in the 16th century endeavoured to introduce it into France; but it was condemned at the synod of Rochel, where Beza presided, and again at the synod of Rochel in 1644.

INDETERMINATE, in geometry, is understood of a quantity either of time, or place, which has no certain or definite bounds. See **INDEFINITE**.

INDETERMINATE Problem, is that, whereof there may be infinite different solutions.

For instance, if a number be required that may be a multiple of 4 and 5; where the answer may be 20, 40, 60, &c. to infinity; or, if it were required to find two numbers whose sum, together with their product, may be equal to a given number; or, to make a rhomboides, wherein the rectangle under the two sides may be equal to a given square.—Both of which problems admit of infinite solutions.

INDEX*, in anatomy, denotes the fore-finger.

* It is thus called from *indico*, I point or direct; because that finger is generally so used: whence also the extensor indicis is called *indicator*.

The Greeks call it *ἡ δακτύλος*, *licker*; this finger being used to be dipped in sauces, &c. in order to stir them; after which it is usually licked; or, as others will have it, because the nurses use it to take up the food wherewith they feed their infants; first licking it, to taste whether or no it be hot.

INDEX, in arithmetic, is the same with what is otherwise called the characteristic, or exponent of a logarithm. See **LOGARITHM**.

The *index* is that which shews of how many places the absolute number belonging to the logarithm consists, and of what nature it is, whether an integer or a fraction.

Thus, in this logarithm 2,521293, the number standing on the left hand of the point is called the *index*; and because it is 2, it shews you that the absolute number answering to it consists of three places: for it is always one more than the *index*, because the *index* of 1 is 0; of 10 is 1; and of 100 is 2, &c.—As in this example:

0 1 2 3 4 5 6 7 8 9

1 2 3 4 5 6 7 8 9 where the upper numbers are *indices* to the lower. And therefore in those small tables of Briggs's logarithms, where the *index* is omitted, it must be always supplied, before you can work by them.

If the absolute number be a fraction, the *index* of the logarithm has a negative sign, and is marked thus, 2,562293; which shews the corresponding number to be a decimal fraction of three places, *viz.* 1.365.

Mr. Townly has a peculiar way of noting these *indices*, when they express fractions, now much in use, *viz.* by taking, instead of the true *index*, its Arithmetical complement to 10: so that he would write the logarithm now mentioned thus: 8,562293.

How *indices* are to be added and subtracted, see under the article **LOGARITHM**.

INDEX of a Globe, is a little style fitted on to the north-pole, and turning round with it, pointing to certain divisions in the hour-circle.

It is sometimes also called *gnomon*. See **GLOBE**.

INDEX, or INDICE, is also the denomination of a congregation at Rome, whose business is to examine books, and to put such as they think fit to prohibit the reading and selling of, into an *index*.

Indices, or expurgatory indices, is the name by which the catalogues of prohibited books are called; among which, however, there is this difference, that some are condemned purely and absolutely, and others only *dones corrigantur*, till they be corrected.

Philip II. of Spain was the first who procured an *index* to be published of the books condemned by the inquisition of Spain. Pope Paul IV. took the hint, and in 1559 ordered the congregation of the holy office at Rome to print a second. Pius V. recommended the matter to the council of Trent, who made another. After this, the Duke of Alva procured another to be printed at Antwerp, in 1571.—Clement VIII. in 1596, published a very copious one, called by the name of the *Roman index*.—There were two others published in 1583, and 1612, by the cardinals Guirci and Sandoval, and several others by the inquisitors and masters of the sacred palace. The most considerable of all the *indices* is that of Sottomayor, which was made for all the states subject to the king of Spain, and comprehends all the others; coming down as low as the year 1667.

INDIA, or East INDIA Company, Coins, Silk, &c. See **COMPANY, COIN, SILK, &c.**

INDIAN Ink. } See the article **INK.**
INDIAN Ocean. } **OCEAN.**

INDIAN Wood, called also *Jamaica and Campeche Wood*, is taken out of the heart of a large tree growing plentifully in the isles of Jamaica, Campeche, &c. used in dying, its decoction being very red.

It has been observed, that putting some of this decoction into two bottles, and mixing a little powder of alum with the one, it will become of a very beautiful red, which will hold; the other in a day's time becoming yellow, though both bottles were stopp'd from the air alike; and that if a little of the same decoction be exposed to the air, it will become as black as ink in the same space of time.

INDICATION, a sign discovering, or pointing out something to be done.

INDICATION, in physic, signifies the pointing out or discovering what is fit to be done, and what means applied in any case, from a knowledge of the nature of the disease, and the virtues of medicines.

Indications are of four kinds: *preservative*, or *prophylactic*, which direct how to cut off the cause of an approaching disease; *curative*, which shew how to remove a disease actually formed; *palliative*, which direct how to lessen its effects, or take off some of its symptoms, before it can be wholly removed; and *vital*, which relate to the strength of the body. That part of physic which treats of *indications* is called *semeiotica*. See **SEMEIOTICA**.

INDICATIVE E, in grammar, the first mood or manner of conjugating verbs, shewing either the time present, past, or future.

I love, is the present tense; *I loved*, the past; and *I will love*, is the future of the *indicative* mood.

INDICATIVE Column. See the article **COLUMN**.

INDICATOR, in anatomy, a muscle of the index, or finger next following the thumb. See **INDEX**.

The *indicator* is the first proper muscle of the index; and is so called, because it serves to extend that finger to point at any thing withal.

It has its origin in the middle and hind part of the cubitus, and is inserted by a double tendon into the second phalanx of the index, and to the tendon of the great extensor, with which it acts in conjunction in stretching out the finger.

See *Tab. Anat. (Myl.) fig. 7. n. 10. 49.*

INDICTAMENTI, *Tenore mittendo*.

INDICTION, signifies the convoking of an ecclesiastical assembly; as a synod, or council, and even a diet.

INDICTION is also applied to the several sessions of the same councils.

Hence it is, that at the end of the sessions of the council of Trent, the decree by which the council appoints the day of the future session, is called the *indiction* of that session.

INDICTION, in chronology, a term used for a kind of epocha, or manner of accounting time among the Romans; containing a cycle or revolution of fifteen years, which, when expired, begins anew, and goes round again without intermission.

This method of computation has no dependance on the heavenly motions.—Petavius says, there is nothing in chronology less known than the Roman *indiction*; he means, than its origin and commencement.—It is the general opinion that it was instituted in the time of Constantine, but this is a mere guess.—There were *indictions* in the time of the emperor Constantius, as appears from the Theodosian Code.—The learned hold, that *indictions* were originally 10 (ctia) then certain annual taxes, the tariffs whereof were published every year: but why they were so called, why confined to a cycle of fifteen years, when, and on what occasion instituted, is not known!

We find three kinds of *indictions* mentioned in authors; the *indiction* of Constantinople, beginning on the first of September; the Imperial or Cæsarian *indiction*, on the 14th of September; and the Roman or papal *indiction*, which is that used in the pope's bulls, and which begins on the first of January.

The popes have dated their acts by the years of the *indiction*, ever since Charlemain made them sovereign; and of which time they dated them by the years of the emperors.

At the time of the reformation of the calendar, the year 1582 was reckoned the tenth year of the *indiction*, that beginning to reckon hence, and dividing the number of years elapsed between that time and this, the year 1749 will be the year of *indiction*, consequently so to present year of our Lord 1749.

The *indiction* may also be found by the year of the reign of our Lord, and dividing the same by 15, the remainder will be the year of the *indiction*: thus, the year 1749 divided by 15, the remainder is 15.

The word *indiction* comes from *indictio*, which signifies a summons, or citation.

blishment, order, or denunciation.—The time of the *indiction* among the Romans, was that wherein the people were summoned to pay a certain tribute; and it is for this reason that the Imperial *indiction* began towards the end of September, because the harvest being then got in, it was supposed the people could more easily pay their tax.

INDICTIVE, INDICTIVUS, an epithet given to certain feast-days appointed by the Roman magistrates, *viz.* the consular or praetor.

INDICTMENT*, in law, a bill, or declaration of complaint, drawn up in form of law, for the benefit of the commonwealth; exhibited as an accusation of one for some offence, criminal or penal, unto jurors, and by their verdict found to be true, and presented before a judge, or officer who has power to punish or certify the same offence.

* The word is derived from the French *inditer*, *indicare*, or according to M. Lambard, from *inducere*, I charge, I inform against.

INDICTMENT, in common law, signifies as much as *accusatio* among the civilians; though in some points it differs. See **ACCUSATION**.

It seems to be an accusation, because the jury who enquire of the offence, do not receive it, till the party that offereth the bill, appearing, subscribe his name, and proffer his oath for the truth of it.

It is always at the suit of the king, and differs from an *accusation* in this, that the pretenser is no way tied to the plea thereof upon any penalty, if it be not proved, except there appear a conspiracy.

INDICUM Folium. See the article **FOLIUM**.

INDICUS Cocculus. See the article **COCCULUS**.

INDICUS Cystus. See the article **COSTUS**.

INDIGESTION, a crudity, or want of due coction, either in a food, a humour of the body, or an excrement.

In the system of trituration, *indigestion*, which is a crudity, may be very naturally accounted for, from the relaxation of the fibres of the stomach.—A bilious *indigestion*, in the opinion of Haquet, a great advocate for trituration, is owing to too much force in the stomach, or too much vivacity in its oscillations, which spoil the digestion, by rendering the trituration imperfect. But this is hardly satisfactory, for it should seem that digestion would be the more perfect, in proportion as the force of the stomach is increased. See **DIGESTION**, and **TRITURATION**.

INDIGETES, a name which the antients gave to some of their gods.

There are various opinions about the origin, and signification of this word; some pretending it was given to all the gods in general; and others only to the semi-gods, or great men deified: others say, it was given to such gods as were originally of the country, or rather such as were the gods of the country that bore this name; and others again hold it was ascribed to such gods as were patrons, and protectors of particular cities.

Those of the first opinion maintain, that the gods were so called by antiphrasis, because they wanted nothing; the word coming from the verb *indiges*, I want.—If this were true the word *indigetes* would signify nearly the same thing in Latin with the Hebrew *שְׁחַדִּיָּה* *schaddia*, which the scripture frequently gives to God; as signifying that he is sufficient for himself, and needs nothing.

Those of the second opinion derive the word from *indigare*, to call, or invoke; it being these gods who were ordinarily invoked, and who it was supposed lent the readiest ear to the vows that were made them.—To this purpose they cite Macrobius, who uses the word *indigare* in that sense; telling us, the Vestals make their invocations thus, *Apollo Physician! Apollo Paean! Vestales ita Indigant, Apollo Medice! Apollo Paean!*—They add, that their books of prayers and forms of invocation were called *indigitamenta*.

Lastly, others hold *indigetes* to be derived from *inde genitus*, or in *loco degens*, or from *inde* and *ago*, for *dego*, I live, I inhabit; which last opinion seems the most probable.

In effect, it appears, 1°. That these *indigetes* were also called *Palæi*, *dii locales*, or *topical gods*, which is the same thing. 2°. The *indigetes* were ordinarily men deified, who indeed were, in effect, local gods, being esteemed the protectors of those places where they were deified; so that the second and third opinion are very consistent. 3°. Virgil joins *patrii* with *indigetes*, as being the same thing, *Georg. I. Dii patrii, indigetes*. 4°. The gods to whom the Romans gave the name *indigetes*, were Faunus, Vesta, Æneas, Romulus, all the gods of Italy; and at Athens Minerva, says Servius; and at Carthage, Dido.—It is true, we meet with Jupiter *indiges*, but that Jupiter *indiges* is Æneas, not the great Jupiter; as we may see in Livy, Lib. I. c. 3. in which last sense, Servius assures us, *indiges* comes from the Latin, *in diis ago*, I am among the gods.

INDIGNATORIUS, a muscle thus called, as being supposed to draw the eye from its inner corner outwards, which gives an appearance of scorn and anger.

But this is properly a compound motion of two muscles: for which see **EYE**.

INDIGO, a dyer's drug, of a deep blue colour, brought hither from the West Indies.

It is drawn from the leaves of a plant which the Spaniards call *anil*, and we *anile*, *nil*, *Indian woad*, *glæstum Indicum*, *blue weed*, and *indigo*.

The method of preparation is said to be this.—When the plant has arrived at a certain height, and its leaves are in a good condition, they cut them down, and throw them into a kind of vat, covering them with water. These they boil together for the space of twenty four hours; at the top there swims a scum, with all the different colours of the rainbow. Then the water is let off into another vessel, where they agitate and churn it, as it were, with five or six long poles, fitted together for that purpose. This they continue to do, till the water becomes of a deep green, and till the *grain*, as they call it, forms itself, which they discover by taking a little of it out into another vessel, and spitting in it; for if then they perceive a bluish dreg subsiding, they cease to beat. The water then precipitates of itself to the bottom of the vessel, when it is well settled, they pour off the water. After they take out the *indigo*, and put it into little linen bags, and let it drain; which done, they put it into shallow wooden boxes, and when it begins to dry, they cut it into slices, and let them harden in the sun.

There are several kinds of *indigo*; the best is that called *serapique*, from the name of a village where it is prepared. That is usually the best which is in flat pieces, of a moderate thickness and pretty hard; it should also be clean, light enough to swim in the water, inflammable, of a fine blue colour, marked a little on the inside with silver streaks, and appearing purplish when rubbed on the nail. *Indigo* is used among the painters, who grind and mix it with white to make a blue colour; for without that mixture it would paint blackish.

They also mix it with yellow, to make a green colour.—It is also used in dying, and by the laundresses, to give a bluish cast to their linen.

In the *Hortus Indus Malabaricus*, is an account of the plant whence *indigo* is drawn: the decoction of whole root is said to be excellent against nephritic colics; its leaves, applied to the abdomen, good to promote urine; and the *indigo* itself is said to be of good use in drying of tumors.

INDIRECT Modes, of syllogisms, in logic, are the five last modes of the first figure, expressed by the barbarous words *baralippton*, *celantii*, *dabitis*, *frisjonusum*. See **MODE**.

It is the conversion of the conclusion which renders the *modes indirecti*: for instance a syllogism in *darii*, and another in *dabitis*, would be perfectly alike, were it not for that conversion; the propositions having the same quantity, and the same quality, and the middle term being the subject in the major, and the attribute in the minor in both. It remains then, that to make a distinction, that which is the subject of the conclusion in *darii*, be the attribute in the conclusion of *dabitis*; and that which is the attribute in the first, the subject in the last. See **SYLLOGISM**.

DA- Every thing that promotes salvation is advantageous:

RI- There are afflictions which promote salvation;

I- Therefore there are afflictions which are advantageous.

DA- Every thing that promotes salvation is advantageous:

BI- There are afflictions which promote salvation;

TIS- Therefore some things promoting salvation are afflictions.

INDIRECT Confirmation. See **CONFIRMATION**.

INDIVIDUAL, INDIVIDUUM, in logic, a particular being of any species; or that which cannot be divided into two or more beings, equal, or alike.

The usual division in logic is made into genera, or genus, those genera into species, and those species into *individuals*. See **GENUS**, **SPECIES**, and **DIVISION**.

The schoolmen make a fourfold distinction of *individuals*: *viz.*

INDIVIDUUM Vagum, that, which though it signifies but one thing, yet may be any of that kind; as when we say a man, a certain person, or one said so and so; though but one person is meant, yet that person, for aught that appears to the contrary, may be any body.

INDIVIDUUM Determinatum, is when the thing is named and determined; as, Alexander, the river Nile, &c. this is also called *individuum signatum*.

INDIVIDUUM Demonstrativum, is when some demonstrative pronoun is used in the expression; as, this man, that woman.

INDIVIDUUM ex Hypothese, or by supposition; when an universal name or term is restrained, by the supposition, to a particular thing: as when we say, the son of such an one, and it be known that he had but one son.

INDIVISIBLES, in geometry, those indefinitely small elements, or principles, into which any body or figure may be ultimately resolved.

A line is said to consist of points, a surface or parallel lines, and a solid of parallel and similar surfaces; and because each of these elements is supposed *indivisible*, if in any figure a line

be drawn through the elements perpendicularly, the number of points in that line will be the same as the number of the elements.

Whence it appears, that a parallelogram, prism, or cylinder, is resolvable into elements, or *indivisibles*, all equal to each other, parallel, and like to the base: And a triangle into lines parallel to the base, but decreasing in arithmetical proportion: so also are the circles, which constitute the parabolic conoid, and those which constitute the plane of a circle, or the surface of an isosceles cone.

A cylinder may be resolved into cylindrical curve surfaces, having all the same height, and continually decreasing inwards, as the circles of the base do; on which they insit.

This way of considering magnitudes is called the method of *indivisibles*, which is only the antient method of exhaustions, a little disguised and contracted.

It is found of good use in shortening mathematical demonstrations; of which we may give an instance in that famous proposition of Archimedes, That a sphere is two thirds of a cylinder subtending it.

Suppose a cylinder, an hemisphere, and an inverted cone (*Tab. Geometry, fig. 99.*) to have the same base and altitude, and to be cut by infinite planes all parallel to the base, of which *dg* is one; it is plain, the square of *db* will every where be equal to the square of *kc* (the radius of the sphere) the square *bc* = *eb* square; and consequently, since circles are to one another as the squares of the radii, all the circles of the hemisphere will be equal to all those of the cylinder, deducting thence all those of the cone: wherefore the cylinder, deducting the cone, is equal to the hemisphere; but it is known, that the cone is one third of the cylinder, and consequently the sphere must be two thirds of it.

INDIVISO.—*Pro* INDIVISO. See the article *PRO*.

INDOCTORUM Parliamentum. See *PARLIAMENTUM*.

INDORSEMENT, any thing written on the back of a deed or instrument. See *ENDORSEMENT*.

A condition written on the back of an obligation is commonly called an *indorsement*; from *in*, and *dorsum*, back.

INDORSEMENT of a Bill of Exchange. See *ENDORSEMENT*.

INDUCIARUM Petitio. See the article *PETITIO*.

INDUCTION, in logic, a consequence drawn from several propositions, or principles first laid down.

Thus, the conclusion of a syllogism, is an *induction* made from the premises. See *SYLLOGISM*.

INDUCTION is also used for a kind of syllogism itself, being a medium between an enthymeme and a gradation, in regard it wants a proposition (which, however, is understood) as in the enthymeme, and abounds in assumptions (which yet are collateral, or of the same degree) which is the case in a gradation.

For instance; every terrestrial animal lives, every aerial animal lives, every aquatic animal lives, and every reptile animal also lives; therefore every animal lives.

Here, it may be observed, are various assumptions, from the more general species of the animal kind collected into one; which this proposition is supposed to precede, e.g. that every animal is either terrestrial, aerial, aquatic, or reptile.

Suidas reckons three kinds of *induction*; that just mentioned, which concludes or gathers some general proposition from an enumeration of all the particulars of a kind, he calls the *dialectic induction*.

The second proceeds by interrogation, and concludes probably, or with a verisimilitude. This is what the Greeks called *anagoge*, and was that which Socrates ordinarily made use of, as Cicero in his *Topics*, and Quintilian have observed.

The third kind of *induction* is properly rhetorical; being a conclusion drawn from some example, or authority.

This is a very imperfect *induction*, all its force lying in a proposition which is concealed, and which will hardly bear being expressed. — Thus, he that says, Codrus died bravely for his country, therefore I must die bravely for my country, proves nothing unless this proposition be carried in mind, that I must do the same with Codrus. Again, Archimedes, and the other mathematicians say, the sun is much bigger than the earth; therefore, it must be owned the sun is much bigger than the earth. Where this proposition is understood, viz. whatever Archimedes, and the other mathematicians say, is true.

INDUCTION, in the English laws is usually taken for the giving possession to an incumbent of his church, by leading him into it, and delivering him the keys, by the commissary, or bishop's deputy, and by his ringing one of the bells.

When a clerk is instituted into a benefice, he is to exhibit his mandate from the bishop to the archdeacon, or other person to whom it is directed, and hath a right thereby to be inducted into his living; and if he be refused *induction*, he hath a remedy both in the ecclesiastical court, and also an action of the case in common law, against the archdeacon.

If the inductor, or person to be inducted, be kept out of the church or house by laymen, the writ *de vi laica* lies for the clerk, which is directed out of the chancery to the sheriff of the county, to remove the force, &c. — If another clergyman, presented by the same patron, keep possession, a spoliation is grantable out of the spiritual court, whereby the tithes, &c. shall be sequestered, till the right be determined.

The archdeacon rarely inducts a clerk in person, but usually issues out a warrant to the clerks and lettered persons within the archdeaconry, empowering any of them to do it in his stead.

The usual form and manner of *induction*, is, for the inductor to take the clerk by the hand, and then to lay it on the key of the church, which must be then in the door, and to say, 'By virtue of this instrument, I induct you into the real, actual and corporal possession of the rectory or vicarage of —, with all its fruits, profits, members, and appurtenances.' This done, he opens the door, and puts the clerk in possession of the church, and shuts the door upon him; who, after he hath tolled a bell (if there be any) comes out, and desires the inductor to indorse a certificate of his *induction* on the archdeacon's warrant, and that all present will signify it under their hands. If the church key cannot be had, it is sufficient that the clerk lays hold of the ring of the door, and within the time limited read the Common Prayer, and thirty-nine articles of the church, in the church-porch. Within two months after this, the clerk must read the thirty-nine articles, and all the service of the day, both at morning and evening-prayers, and declare his assent and consent; he must also then read the bishop's English certificate, in which is the declaration of his conformity; and of all this he must have two or three good witnesses, who must sign that they heard him do it, and be ready to attest it, *viva voce*, if required; and within three months after *induction*, he must also take the abjuration-oath at the quarter-sessions, or in some one of the courts at Westminster-Hall.

INDULGENCE, in the Romish theology, the remission of a punishment due to a sin, granted by the church, and supposed to save the sinner from purgatory.

The Romanists found their *indulgences* on the infinite treasure of the merits of Jesus Christ, the holy virgin, and all the saints; which they suppose the church has a right of distributing, by virtue of the communion of saints.

The Roman jubilee carries with it a plenary, or full *indulgence*, for all the crimes committed therein.

The pope also grants bulls of plenary *indulgence* to several churches, monasteries, and even to private persons; and it is a frequent thing to have general *indulgences* for the time of the principal feasts of a year. — Their casuists say, that a plenary *indulgence* does not always prove effectual, for want of complying with the conditions whereon it was granted.

For the extirpation of hereticks it has been a common practice with the popes to grant *indulgences*. Thus Clement XII.

'That we may stir up and encourage the faithful to exterminate this ungracious crew of forlorn wretches, [the Calvinists, when in arms against Lewis XIV.] we fully grant and indulge the full remission of all sins, whatever they may be, (relying upon that power of binding and loosing, which our Lord conferred upon his chief apostle) to all those that shall lift themselves in this sacred militia, if they shall happen to fall in battle.' See *ABSOLUTION*.

INDULGENCE, or *INDULTO*, signifies also a special favour or privilege, conferred either on a community, or a particular person, by the pope's bulls; in virtue whereof the party is licensed to do or to obtain something contrary to the intention and disposition of the common laws.

There are two kinds of *indulto*; the one *active*, which consists in a power of nominating and presenting freely, and without reserve to benefices that are otherwise limited, and restrained by the laws of the apostolical chancery; such are those ordinarily granted to secular princes, cardinals, bishops, &c.

*Passive indulto*s; consist in a power of receiving benefices and expectative graces; of which kind are those of a parliament, of graduates, and mandataries.

The *indulto* of kings, is the power given them of presenting to consistorial benefices, either by treaty, by favour, or special privilege.

The *indulto* of cardinals, is a licence for holding regular as well as secular benefices, and for disposing of benefices in commendam, or continuing them, &c.

Indulto of parliament, is a right of privilege granted to the chancellor, presidents, counsellors, and other officers in the parliaments of France, to obtain a benefice of the collator, upon the king's nomination directed to him. — This is a kind of advowson, or patronage belonging to the French king; the *indulto* being a mandate or grace, by which he is permitted to name to any collator he pleases, a counsellor, or other officer of parliament, on whom the collator shall be obliged to bestow a benefice: so that the right of the *indulto* relies

INF

radically in the king, the officers being only the objects thereof.

INDURATING, a term applied to such things as give a harder or firmer consistence to others, either by the greater solidity of their particles, or by dissipating the thinner parts of any matter, so as to leave the remainder harder.

Thus a tumor is *indurated*, either by the addition of earthy and solid particles, as in the scirrhi and knotty swellings; or by transpiring the thinner parts through the skin, whereby the remainder grows more fixed, as in an oedema.

INDUSTRY, *Fruits of*. See the article **FRUITS**.

INEQUALITY of natural days. See **EQUATION**.

INEQUALITY Optical. See the article **OPTICAL**.

INERTIE *Vis*. See the article *Vis Inertiae*.

INESCATION *, a kind of transplantation, practised for the cure of certain diseases by a suppos'd sympathetic power. See **TRANSPLANTATION**, and **SYMPATHETIC**.

* The word is derived from the privative preposition *in*, and *escia*, food.

It consists in impregnating a proper medium or vehicle, with some of the nuxia, or vital spirit of the patient, and giving it to some animal to eat. It is pretended, the animal unites and assimilates that nuxia with itself, correcting it, and imbibing its vicious quality; and by that means restoring health to the person whereto the nuxia belonged. If the animal happens to die before the cure be effected, a second animal must be pitched on, and the experiment repeated. — Some tell us, that the blood of the patient well putrefied or fermented, does the business better than any other part; but all this is idle and absurd, and now deservedly laugh'd out of the world.

INESCUTCHEON, in heraldry, a small *escutcheon* born in a larger one, as part of some other coat. See **ESCUTCHEON**.

He beareth ermin, and *inescutcheon* gules.

This is also sometimes called an *escutcheon of pretence*.

He who marries an heiress, bears her coat of arms on an *inescutcheon*, or *escutcheon of pretence*, in the middle of his own coat.

IN ESSE is applied to things which are actually existing. Authors make a difference between a thing *in esse*, and a thing *in posse*: a thing that is not, but may be, they say is *in posse*, or *potentia*; but a thing apparent and visible, they say is *in esse*, that is, it has a real being *eo instanti*, whereas the other is casual, and at best but a possibility.

INFALLIBLE *, that which cannot deceive, or be deceived.

* The word comes from the Latin preposition *in*, taken privatively, and *fallo*, I deceive.

Upon this term stands one of the principal heads of controversy between the Reformed and the Catholics: the latter of whom maintain, that the church, assembled in general council, is *infallible*; which the former deny. See **CHURCH**.

The principal reasons alledged for the *infallibility*, are drawn from the obscurity of the scriptures, the insufficiency of private judgment, and the necessity there is of some *infallible* judge for the decision of controversies.

The *infallibility* of the pope is a doctrine of a late standing, and is not entirely acquiesced in, even in their own communion. — Du Pin, a doctor of the Sorbonne, has written against it; and the late behaviour of the cardinal de Noailles, and the protesting bishops, seconded by a considerable part of the clergy of France, shew to how low an ebb the pope's *infallibility* is reduced in that country.

INFAMOUS *, in the ordinary use of the word, signifies something notoriously contrary to virtue, or honour.

* The word is derived from the Latin *in*, and *fama*, fame, report.

Aulus Gellius uses the word *infames materias*, for what we ordinarily call *paradoxes*, i. e. discourses remote from the common opinion; propositions that appear opposite to truth; &c. as the elogy of Therites, the praise of a quartern ague, &c.

INFAMOUS, in law denotes a person, or thing which is of no repute or esteem in the world.

There are two kinds of *infamy*; some persons being *infamous* by right, *de jure*, as those who have been noted by the laws, or stigmatized by public judgment.

Others are *infamous* in fact, *de facto*, as those who exercise some scandalous profession, as a catchpole, a merry andrew, a hangman, an informer, &c.

Heretofore, there were crowns of *infamy* given by way of punishment to criminals: they were made of wool.

INFANT, in a law sense, a person under the age of one and twenty years.

An *infant* eight years of age, or upwards, may commit homicide, and be hanged for it, if it appear by any other act

INF

that he had knowledge of good and evil; for here *malitia supplebit aetatem*; yet Coke on Littleton, sect 405. says, 'An infant shall not be punished till the age of fourteen'; which, according to him, is the age of discretion.

INFANTE, and **INFANTA**, are titles of honour given to the children of some princes, particularly those of the houses of Spain and Portugal.

It is usually said that the appellation *infante* was introduced into Spain, on occasion of the marriage of Eleanor of England with king Ferdinand of Castile, and that their son Sancho was the first that bore it. — But this is contradicted by Pelagius bishop of Oviedo, who lived in the year 1100, and who informs us, that the titles *infante* and *infanta*, were used in Spain ever since the reign of king Eremond II.

INFANTRY, the body of foot-soldiers, in an army or other corps.

The *infantry* stand contradistinguished from the *cavalry*, or horse.

INFATUATE *, to prepossess any one in favour of some person or thing that does not deserve it, so far as that he cannot easily be disabused.

* The word *infatuate* comes from the Latin *fatuus*, fool; of *fari*, to speak out, which is borrowed from the Greek *φαω*, whence *φαω*, which signifies the fame with *φαω* in Latin, or *prophet* in English; and the reason is, because their prophets or priests used to be seized with a kind of madness or folly, when they began to make their predictions, or deliver oracles.

The Romans called those persons *infatuati*, *infatuati*, who fancied they had seen visions, or imagined the god Faunus, whom they called *Fatuus*, had appeared to them.

INFECTION *, the catching a disease, by some effluvia, or fine particles, which fly off from disordered bodies, and mixing with the juices of others, occasion the same disorders, as were in the bodies they came from.

* The word comes from the Latin verb *infectere*, which properly signifies to dye of some other colour; *infectere*, i. e. *facere ut aliquid intus fit*, to occasion something to be imbibed. See **CONTAGION**.

INFERIOR, **INFERIOUR**, stands opposed to *superior*. See **SUPERIOR**.

INFERIOR Maxilla.	} See the article	{	MAXILLA.
INFERIOR Ocean.			OCEAN.
INFERIOR Planet.			PLANET.
Obliquus INFERIOR.	} See the article	{	OBLIQUUS.
Serratus INFERIOR.			SERRATUS.
Subscapularis INFERIOR.			SUBSCAPULARIS.
INFERIORIS Labii Depressor.	} See	{	DEPRESSOR.
INFERIORIS Labii Elevator.			ELEVATOR.

INFIDEL, a term applied to such persons as are not baptized, and that do not believe the truths of the Christian religion.

It is baptism that makes the specific difference between an heretic, and an *infidel*.

INFINITE, that which has neither beginning nor end: in which sense God alone is *infinite*.

INFINITE is also used to signify that which has had a beginning, but will have no end; as angels, and human souls.

This makes what the schoolmen call *infinitum à parte post*; as, on the contrary, by *infinitum à parte ante*, they mean that which has an end, but had no beginning. See **INDEFINITE**, and **FINITE**.

INFINITE, in mathematics, is applied to quantities which are either greater or smaller than any assignable ones. In which sense it differs not much from what we otherwise call *indefinite*, or *indeterminate*. Thus, an

INFINITE, or **INFINITELY** great line in geometry, denotes only an indefinite, or indeterminate line; to which no certain bounds, or limits are prescribed.

INFINITE Series. See the article **SERIES**.

ARITHMETIC of INFINITES. See the article **ARITHMETIC**.

CHARACTERS in ARITHMETIC of INFINITES. See **CHARACTER**.

INFINITE Proposition, in logic. See **PROPOSITION**.

INFINITE Distress, in law. See the article **DISTRESS**.

INFINITELY small quantity, called also an *infinitesimal*, is that which is so very minute, as to be incomparable to any finite quantity; or it is that which is less than any assignable quantity.

An *infinite* quantity cannot be either augmented, or lessened, by adding or taking from it any finite quantity. Neither can a finite quantity be either augmented, or lessened, by adding to, or taking from it an *infinitely small* quantity.

If there be four proportionals, and the first be *infinitely* greater than the second; the third will be *infinitely* greater than the fourth.

If a finite quantity be divided by an *infinitely small* one, the quotient will be an *infinitely* great one. And if a finite quantity be multiplied by an *infinitely small* one, the product will be an *infinitely small* one: if by an *infinitely* great one, the product will be a finite quantity.

INF

If an *Infinitely* small quantity be multiplied into an *infinitely* great one, the product will be a finite quantity.

INFINITELY Infinite Fractions, or all the powers of all the fractions whose numerator is one, are together equal to an unit. See the demonstration hereof given by Dr. Wood, in Hooke, *Phil. Coll.* N^o. 3. p. 45. *seq.*

Hence it is deduced, 1^o. That there are not only *infinite* progressions, or progressions in *infinitum*; but also *infinitely* farther than one kind of infinity. 2^o. That the *infinitely* infinite progressions are notwithstanding computable, and to be brought into one sum; and that not only finite, but so small as to be less than any assignable number. 3^o. That of *infinite* quantities, some are equal, others unequal. 4^o. That one *infinite* quantity may be equal to two, three, or more other quantities, whether *infinite* or finite.

INFINITE Series. See the article **SERIES**.

INFINITIVE, in grammar, the name of one of the moods, which serve for the conjugating of verbs.

The *infinitive* does not denote any precise time, nor does it determine the number, or persons, but expresses things in a loose indefinite manner; as, *to teach*, &c.

In most languages, both ancient and modern, the *infinitive* is distinguished by a termination peculiar to it; as *verbum* in the Greek, *scribere* in the Latin, *ecrive* in the French, *scrivere* in the Italian, &c. but the English is defective in this point; so that to denote the *infinitive*, we are obliged to have recourse to the article to; excepting sometimes when two or more *infinitives* follow each other.

The practice of using a number of *infinitives* successively, is a great, but a common fault in language; as, *he offered to go to teach to write English*.—Indeed, where the *infinitives* have no dependance on each other, they may be used elegantly enough; as, *to mourn, to sigh, to sink, to swoon, to die*.

INFINITY, the quality which denominates a thing *infinite*.

The idea signified by the name *infinity* is best examined, by considering to what things *infinity* is by the mind attributed, and how the idea itself is framed: finite and infinite are looked upon as the modes of quantity, and are attributed primarily to things that have parts, and are capable of increase or diminution, by the addition or subtraction of any the least part. Such are the ideas of space, duration and number.—When we apply this idea to the supreme being, we do it primarily in respect of his duration and ubiquity; and more figuratively, when to his wisdom, power, goodness, and other attributes, which are properly inexhaustible and incomprehensible: for when we call them *infinite*, we have no other idea of this *infinity*, but what carries with it some reflection on the number or the extent of the acts or objects of God's power and wisdom, which can never be supposed so great, or so many, that these attributes will not always surmount and exceed, though we multiply them in our thoughts with the *infinity* of endless number. We do not pretend to say, how these attributes are in God, who is infinitely beyond the reach of our narrow capacities; but this is our way of conceiving them, and these are our ideas of their *infinity*.

We come by the idea of *infinity* thus: Every one that has any idea of any stated length of space, as a foot, yard, &c. finds that he can repeat that idea, and join it to another, to a third, and so on, without ever coming to an end of his additions. From this power of enlarging his idea of space, he takes the idea of infinite space, or immensity. By the same power of repeating the idea of any length or duration we have in our minds, with all the endless addition of number, we also come by the idea of eternity.

If our idea of *infinity* be got, by repeating without end our own ideas, it may be asked, Why do we not attribute it to other ideas, as well as those of space and duration; since they may be as easily and as often repeated in our minds as the other? yet nobody ever thinks of infinite sweetness, or whiteness, though he can repeat the idea of sweet or white, as frequently as those of yard or day? To this it is answered, that those ideas which have parts, and are capable of increase by the addition of any parts, afford us by their repetition an idea of *infinity*; because with the endless repetition there is connected an enlargement, of which there is no end: but it is not so in other ideas; for, if to the perfectest idea I have of white, I add another of equal whiteness, it enlarges not my idea at all. Those ideas, which consist not of parts, cannot be augmented to what proportion men please, or be stretched beyond what they have received by their senses; but space, duration, and number, being capable of increase by repetition, leave in the mind an idea of an endless room for more; and so those ideas alone lead the mind towards the thought of *infinity*.

We are carefully to distinguish between the idea of the *infinity* of space, and the idea of a space *infinite*.—The first is nothing but a supposed endless progression of the mind over any repeated idea of space: but to have actually in the mind the idea of a space *infinite*, is to suppose the mind already passed over all those repeated ideas of space, which an end-

INF

less repetition can never totally represent to it; which carries in it a plain contradiction. See **SPACE**.

This will be plainer, if we consider *infinity* in numbers: The *infinity* of numbers, to the end of whose addition every one perceives there is no approach, easily appears to any one that reflects on it: but how clear soever this idea of the *infinity* of numbers be, there is nothing yet more evident, than the absurdity of the idea of an actual infinite number.

INFIRMARY, a place where the sick and weak belonging to any society, or community are disposed, either for nursing or cure. See **HOSPITAL**.

INFLAMMATION*, in physic, a tumor attended with a preternatural heat, and redness; frequently arising from some obstruction; by means whereof the blood flowing into some part faster than it can run off again, swells up, and causes a tension, with an unusual soreness, redness, and heat.

* The word comes from the Latin *in*, and *flamma* flame.

The immediate cause of *inflammations* is an excess, or overflowing of blood in the part affected: other causes, more remote, may be the density and coagulation of the blood, or the relaxation and contusion of the fibres.

Physicians have given particular names to the *inflammations* of several parts: that of the eyes is called *ophthalmia*, that of the lungs *peripneumonia*, and that of the liver *hepatitis*.

INFLATION*, *blowing up*; the act of stretching or filling any flaccid, or distensible body, with a flatulent or windy substance.

* The word is formed from the Latin *in*, and *flatui*; of *flat*, I blow.

INFLECTION, in optics, is defined, by Dr. Hook, a multiplicate refraction of the rays of light, caused by the unequal density and fluctuating motion of the constituent parts of the medium; whereby the progress of the rays is hindered from going on in a right line, and *inflected*, or deflected by a curve.

This property was first taken notice of by Dr. Hooke; who shews that it differs both from *reflection* and *refraction*; in that those are both made at the superficies of the body, but this in the middle of it within.

Sir Isaac Newton discovered also by plain experiment this *inflection* of the rays of light; and M. de la Hire assures us, he found, that the beams of the stars being observed, in a deep valley, to pass near the brow of a hill, are always more refracted, than if there were no such hill, or the observations were made on the top thereof; as if the rays of light were bent down into a curve, by passing near the surface of the mountain.

Sir Isaac Newton, in his *Optics*, makes several experiments and observations on the *inflection* of the rays of light; which see under **LIGHT**, and **RAYS**.

INFLECTION, in grammar, the variation of nouns and verbs, in their several cases, tenses, and declensions.

Inflection is a general name, under which are comprehended both conjugation and declension. See **CONJUGATION** and **DECLENSION**.

Point of INFLECTION, of a curve, in geometry, is the point, or place where the curve begins to bend, or turn a contrary way. See **POINT**.

If a curve line, as AFK (*Tab. Geometry*, fig. 100.) be partly concave, and partly convex towards any right line, as AB, or towards a fixed point; the point F, which divides the concave, from the convex part, and consequently is at the beginning of the one, and end of the other, is called the *point of inflection*, as long as the curve, being continued beyond F, keeps its course the same: when it returns back again towards that part or side, from whence it took its original, it is called the *point of retrogression*. See the article **RETROGRESSION**.

To conceive this, it is to be considered, that whatever quantity goes on continually increasing or decreasing, it cannot change from a positive to a negative expression, or from a negative to a positive one, without first becoming equal to an infinite, or nothing. It becomes equal to nothing, if it continually decrease; and equal to an infinite, if it continually increase.

Now, if through the point F be drawn the ordinate EF, and the tangent FL, and from any point, as M, on the same side, as AF, be drawn the ordinate MP, and the tangent MT; then, in curves which have a *point of inflection*, the absciss AP continually increases, and the part AT of the diameter, intercepted between the vertex of the diameter and the tangent MT, increases also, till the point P fall into E; after which it again begins to diminish: whence the line AT must become a maximum AL, when the point P falls into the point E.

In those curves which have a *point of retrogression*, the part AT increases continually, and the absciss increases, till the point T falls in L; after which it again diminishes: whence AP must become a maximum, when the point T falls in L.

If $AE = x$, $EF = y$, then will $AL = \frac{y^2}{x} - x$, whose

fluxion, which is $\frac{y^2 x - y^2 \dot{x}}{x^2}$ supposing x constant, being

divided by x , the fluxion of AL must become nothing; i. e.

$-\frac{y^2}{x^2} = 0$; so that multiplying by x^2 , and dividing by $-y$,

$\dot{x} = 0$; which is a general form for finding F , the point of inflection, or retrogression, in those curves whose ordinates are parallel to one another. For the nature of the curve AFK being given, the value of y may be found in x ; and taking the fluxion of this value, and supposing x invariable, the value of \dot{y} will be found in x ; which being put equal to nothing, or infinity, serves in either of these suppositions to find such a value of $A E$, as that the ordinate EF shall intersect the curve AFK in F , the point of inflection, or retrogression.

INFLUENCE, a quality supposed to flow from the bodies of the stars, either with their heat, or light, to which astrologers vainly attribute all the events which happen on the earth.

Alchemists, also, who to this ascribe the philosophers' stone, tell us, that every thing in nature is produced by the influence of the stars, which, in their passage through the atmosphere, imbibe many of its moist parts, the grossest whereof they deposit in the sands and earths where they fall; that these filtrating through the pores of the earth, descend even to the centre, whence they are driven, by the central fire, back again to the surface; and in their ascent, by a natural kind of sublimation, as they find earths duly disposed, they form natural bodies, as metals, minerals, and vegetables, &c.—Thus, chymistry consisting in an artificial imitation of these natural operations, and in applying active principles to passive principles, it is pretended it can form natural bodies, make gold, &c. See **TRANSMUTATION**, and **PHILOSOPHERS' STONE**.

INFLUENT, a term used where a liquor or juice, by the contrivance of nature, and the laws of circulation, falls into any current, or receptacle.

Thus, with respect to the common receptacle, the chyle is its *influent* juice; and so is the bile to the gall-bladder; the venal blood to the heart in its diastole; and the like.

INFORCED. **INFORCEMENT**. } See the article { **REINFORCED**.
 } **REINFORCEMENT**.

IN FORMA PAUPERIS, in law. See **FORMA Pauperis**.

INFORMATION, in law, for the king, is much the same with what is called *declaration* for a common person: It is not always done directly by the king, or his attorney, or the clerk of the crown office; but sometimes by another, who sues as well for the king as himself, on a breach of some penal law or statute, wherein a penalty is given to the party that will sue for the same. See **DECLARATION**.

INFORMATUS non sum, or *Non sum INFORMATUS*; a formal answer made of course by an attorney, who is commanded by the court to say any thing he thinks good in behalf of his client; who having nothing material to urge, makes answer he is not informed: on which judgment passes for the other party.

INFORMIS, *unformed*; that which has not the form, or perfection it should have.

Stellæ INFORMES, in astronomy, are such stars as have not yet been reduced into any constellation; otherwise called *spærades*.

Of this kind there was a great number left by the ancient astronomers; but Hevelius, and some others of the moderns, have provided for the greater part of them, by making new constellations.

INFRACTION*, a rupture, or violation of a treaty, law, ordinance, or the like.

* The word is formed from the preposition *in*, and the supine of *frango*, I break.

INFRALAPSARIÏ, the name of a sect of Predestinarians, who maintain, that God has created a certain number of men only to be damned, without allowing them the means necessary to save themselves, if they would.

This doctrine they maintain in different manners, the sect itself being divided into two branches: Some hold, that God, independently of every thing, and antecedently to all knowledge or foresight of the fall of the first man, resolved to signalize both his mercy and his justice: his mercy, by creating a certain number of men, to make them happy to all eternity; and his justice, by creating likewise a number of other men, to be miserable to all eternity.

Others hold, that God did not take this resolution, but in consequence of original sin, and of the knowledge which he had from all eternity; that Adam would commit it: for say they, man, by this sin, having forfeited all pretences to his

original justice, deserves nothing now but punishment. All mankind is become a mass of corruption, which God may abandon to eternal destruction, without any impeachment of his justice. However, to shew his mercy too, as well as his justice, he has resolved to select some out of this mass, to sanctify them, and to make them happy.

Those who maintain the doctrine in the first manner, are more properly called *supralapsariï*, as believing that God formed the resolution of damning a number of men, *supra* lapsum, before Adam's fall, and independently of it.

Those of the second opinion are called *infralapsariï*, as holding, that God made that resolution, *infra* lapsum, after his knowledge of the fall, and in consequence thereof.

INFRASPINATUS, a muscle which arises from the inferior parts of the basis, spine, and under-coats of the scapula, and which filling the lower intercapulum, passes on between the spine and teres minor in a triangular form, and growing tendinous at the cone, is inserted into the head of the humerus, and draws directly backwards.—See *Tab. Anat. (Myl.) fig. 7. n. 33*.

INFULA, a name antiently given to one of the pontifical ornaments worn on the head. Festus tells us, that the *infula* were filaments or fringes of wool, wherewith the antients used to adorn their priests, their victims, and even their temples. Several authors confound the *infula* with the mitre, tiara, or cap wore by the priests; but there is a great deal of difference: The *infula* was properly a fillet or headband of white wool, covering that part of the head where the hair grows, as far as the temples; whence, on each side, hung down two fringes, called *vittæ*, to bind it withal; and this has given occasion to some authors to confound the *infule* with *vittæ*.

The *infula* was the same thing to priests that the diadem was to kings; viz. the badge of their dignity and authority. The difference in shape between the diadem and the *infula* consisted in this, that the diadem was flat and broad, and the *infula* was rounded and twisted.

INFUNDIBULIFORM Flowers. See **FLOWERS**.

INFUNDIBULUM, a Latin word, signifying a funnel; whence divers parts in the human body, having a resemblance thereto in shape, are called by the same name.

Such, e. g. are, the *infundibulum cerebri*, and *infundibulum renum*. See **BRAIN** and **KIDNEYS**.—See also *Tab. Anat. (Osteol.) fig. 5. lit. c*.

Hence also certain parts of plants are called *infundibuliformes*.

The word *infundibulum* is also used by the metallurgick writers to signify a vessel of a conic shape, used to pour a melted metal out of the crucible into: a modern translator of Cramer's Art of Essaying, not knowing this, has ordered the pouring some melted silver into a funnel.

INFUSION, an operation in pharmacy, whereby the virtues of plants, roots, and the like, are drawn out, by letting them steep in some convenient fluid menstruum, without boiling them therein.

Infusum is used in bodies of a lax texture, whose parts are so light, as not to admit of a greater motion, without hazard of flying away in vapour.

Its chief use is to communicate the virtues of bodies to liquors, either in order to regulate their force, or correct their ill qualities.

Some *infusions* are made in common water, others in wine, vinegar, milk, spirit of wine, &c.

INFUSION is also used to signify the action of conveying a liquor into the body by the veins. See **INJECTION**.

Some physicians have found out a new method of purging, by *infusing* a cathartic into the veins, which operates pretty much after the manner of a clyster.

INGEMINATED Flowers, are those where one flower stands on, or naturally grows out of, another.

INGENDRING. See the article **ENGENDRING**.

INGENITE, *Inborn*; signifies any disease, or habit, which comes into the world with a person: nearly the same with *hereditary*. See **HEREDITARY**.

INGENUOUS, **INGENUUS**, among the Romans, a title applicable to a person born free, or of free parents. See **FREE**.

Isidore says, they are called *ingenui*, *qui libertatem habent in genere, non in factis*; those who are born free, not those who acquire their freedom.

A person was accounted *ingenuus*, if only the mother were free, and the father a slave.

These could give their votes, and enjoy offices, from which the *liberti*, or freedmen, &c. were debarred.

INGENUUS is sometimes also used to signify a native of a country, in contradistinction to a foreigner. See **NATIVE**.

ENGINEER, or **ENGINEER**. See the article **ENGINEER**.

INGLUVIES, *Craw*, or *Crop*; a part in granivorous fowls which serves for the immediate reception of the food; where it remains some time for maceration, before it be transmitted to the stomach.

This *ingluvies* is furnished with glands, which, the patrons of fermentation maintain, convey a menstruum thither, that impregnates the aliment, and serves instead of mastication.

INGOT,

INGOT*, a mass, or lump of gold, or silver, from the mines, melted down and cast in a sort of mould, but not coined, or wrought.

* The word seems formed from the French *lingot*, which signifies the same.

INGOT is also a name given to the moulds, or cavities wherein they cast melted metals, or regulus, of femimetal.

INGRAFTING, or **ENGRAFTING**. See **ENGRAFTING**.

INGRAILED. See the article **ENGRAILED**.

INGRAVING, or **ENGRAVING**. See **ENGRAVING**.

INGREDIENTS, all the simples which go into the composition of any medicine, ointment, fauce, or the like.

INGRESS, in astronomy, the sun's entering the first scruple of one of the four cardinal signs, especially Aries.

INGRESSU, in law, a writ of entry, whereby a person seeks entry into lands or tenements.—It lies in various cases, and has various forms. See **ENTRY**.

INGROSSATOR *Magni Rotuli*, is the same as clerk of the pipe. See **CLERK of the Pipe**.

INGROSSE, in common law, is one who buys up corn growing, or any provisions by wholesale, before the market, to sell again.

It also signifies a clerk, who writes records, or instruments of law on skins of parchment.

INGUEN*, that part of the body, reaching from the head of the thigh to above the secret parts; commonly also called the groin, and by anatomists *pubes*.

* The word is pure Latin, and is derived, according to some, from *unguent*, ointment, because these parts are frequently anointed: Others derive it from *ango*, because pains happen frequently there; and others again from *ingenare*, because the genital parts are here.

INGUINALIS, an appellation given to any subdivisions made of the *inguen*; or any thing therein contained, or applied thereto by way of medicine, or the like.

INHARMONICAL Relation, in music. See **RELATION Inharmonical**.

INHERENCE, in philosophy, is applied to the juncture or connexion of an accident with its substance.

Thus quantity has a necessary *inherence* in a natural body.

INHERITANCE, *Hereditas*, a perpetuity in lands and tenements, to a man and his heirs.

Inheritance is not understood where a man hath inheritance of lands and tenements by descent, or heritage; but every fee-simple or fee-tail, that a man hath by his purchase, may be said to be an *inheritance*, for that his heirs may inherit it after him.

INHIBITION, a writ to inhibit, or forbid a judge from farther proceeding in a cause depending before him.

Sometimes *prohibition* and *inhibition* are put together, as of the same import; but *inhibition* is most commonly a writ issuing out of a higher court Christian to a lower; and *prohibition* out of the king's court to an inferior court. See **PROHIBITION**.

INHUMATION. See the article **INTERRING**.

INJECTION, in pharmacy, any liquid medicine made to be injected or thrown into the body, or any of its parts, by a syringe, clyster-pipe, or other instrument.

INJECTION is also used for the operation of filling the vessels with coloured wax, or any other proper matter, to shew their figures and ramifications.

INITIALIA, a name antiently given to the mysteries of Ceres. See **CEREAIA**.

INITIANS Punctum. See article **PUNCTUM**.

INITIATED*, a term properly used in speaking of the religion of the antient heathens; where it signifies, being admitted to the participation of the sacred mysteries.

* The word comes from the Latin *initiatu*, of *initiare*, *initiare*; which properly signifies to begin sacrificing, or to receive or admit a person to the beginning of the mysteries, or of ceremonies of less importance.

The antients never discovered the deeper mysteries of their religion, nor even permitted some of their temples to be open to any but those who had been *initiated*.

Casaubon, upon Athenæus, observes, that all the mysteries were not communicated at once to the persons who presented themselves for the priesthood, but that at first they purified them, then admitted them to the less considerable matters, to dispose them for the more important; and at last they drew the veil quite, and laid open all the most sacred and solemn parts of religion. See **MYSTERY**.

INJUNCTION, a writ grounded upon an interlocutory order or decree out of the court of Chancery or Exchequer, sometimes to give possession to the plaintiff, for want of the defendant's appearance; sometimes to the king's ordinary court, and sometimes to the court Christian, to stop proceedings in a cause, upon suggestion made, that the rigour of the law, if it take place, is against equity and conscience in that case.

INJURY*, *Injuria*, in a general sense, signifies any thing contrary to justice and equity; that is, any wrong or damage

done to a man's person, reputation, or goods.

* The word is derived from the Latin preposition *in*, which here has a negative power, and *jus*, law, right; *injuria dicitur omni quod non jure fit*. The antients made a goddess of *Injury*, and called her *Ate*. Homer makes her the daughter of Jupiter, and says, she did mischief to every body, even to her father; that she was very nimble and tender-footed, and walked altogether on men's heads, without ever touching the ground.

Civilians define *injuria*, a private offence, committed designedly, and with an evil intention, to any man's prejudice.—The author of the *Rhetorics* to Herennius says, *Injuria est quæ aut pulsatione, aut convicio, aut turpitudine, corpus, aures, aut vitam alicujus violatur*.

By the Roman law, the action for an *injuria* was annual; that is, no reparation could be required after the expiration of a year. By the law of the twelve tables, where the *injuria* was the breaking of a limb, the injured person might demand talionem, that is, that he might break the same limb of the criminal.

For the breaking of a bone there were also considerable pecuniary punishments assigned: For other *injuries* only twenty asses were decreed, which the poverty of those times thought a sufficient penalty; but the prætors afterwards finding this too slender a satisfaction, in lieu thereof, appointed the injured person to set a rate on the *injuria*, which they afterwards increased or lessened as they thought good.

INK, a liquor wherewith to write on paper or parchment. The common writing *ink* is a composition of vitriol, galls, gum arabic, and water.

Printing *ink* is made of nut-oil, or linseed-oil, turpentine, and lamp-black. See **PRINTING**.

Indian, or Chinese *ink*, is an admirable composition, in vain attempted to be imitated in Europe. It is not fluid, like our writing *inks*; but solid, like our mineral colours, though much lighter. They make it of all figures, but the most usual is rectangular, about a quarter of an inch thick. Some of the sticks are gilt with figures of dragons, birds, flowers, &c. In order to do this, they have little wooden moulds, so curiously wrought, that we could hardly equal them in metals.

To use this *ink*, there must be a little hollow marble, or other stone, with water in it, on which the stick of *ink* must be ground, till the water becomes of a sufficient blackness. It makes a very black shining *ink*; and though it be apt to sink when the paper is thin, yet it never runs or spreads: so that the letters are always smooth and evenly terminated, how big soever they be. It is of great use in designing, because it may be weakened or diminished to any degree one pleases; and there are abundance of things which cannot be represented to the life without it.

The Chinese make it with smoke-black of different kinds, but the best is said to be made of the smoke of fat pork, burnt at a lamp. They mix a kind of oil with it, to make it more smooth, and add some odorous ingredients to take away the rankness of the smell.—After they have mixed it into a paste of a proper consistence, they put it into a mould to figure it.

Sympathetic Ink. See the article **SYMPATHETIC**.

INLAND, implies any thing situate in the main land, or heart of a country, far from the sea-coasts.

Hence *inland bills*, in traffic, are such bills as are payable in the same land wherein they are drawn. See **BILL**.

INLAYING. See **VENEERING**, **MOSAIC**, and **MARQUETRY**.

INMATES, such persons as are admitted, for their money, to live in the same house or cottage with another man, in different rooms, but going in at the same door: being usually supposed to be poor, and not able to maintain a whole house themselves.—These are enquireable in a court-leet.

INNATE *Air*. } See the article { **AIR**.

INNATE *Heat*. } See the article { **HEAT**.

INNATE Ideas, or *Principles*, are certain primary notes or characters, by many supposed to be stamped on the mind of man when it first receives its being, and which it brings into the world with it.

But the doctrine of *innate ideas* is abundantly confuted by Mr. Locke. See **IDEA**.

INNER Barristers. See the article **BARRISTER**.

INNINGS, lands recovered from the sea, by drizzling, and banking.

INNOCENTS Day, the name of a feast celebrated in commemoration of the infants murdered by Herod.

Heretofore it was the custom to have dances in the churches on this day, wherein were persons who represented bishops, by way of derision, as some suggest, of the episcopal dignity. Though others, with more probability, suppose it done in honour to the innocence of childhood. See **EPISCOPUS Puerorum**.

By a canon of the council of Cognac, held in 1260, these were expressly forbid.

INNOMINATI, *Gli INNOMINATI*, *Anonymi*, persons who have no names; a title by which the academists of Parma distinguish themselves.

Most cities in Italy have an academy, and each has its proper name; thus those at Parma entitle themselves *Gli innominati*, as if it was their characters to have no name at all. **INNOMINATUM**, in general, signifies any thing without a name.

Many parts of the body are left under this indistinct term; as the *innominata glandula oculi*, now called *caruncula oculi*; *innominata tunica oculi*, &c. See **EYE**.

Os INNOMINATUM, is that otherwise called *Os coxae*, or *coxendix*: being composed of three bones; viz. the ilium, the pubis and ischium, only connected by cartilages.—See *Tab. Anat. (Osteol.) fig. 3. n. 16, 17, 18, 19.*

INNS, of municipal, or common law professors, **INNS**.—Our colleges of municipal, or common law professors, and students, are still called *inns*; the old English word for houses of noblemen, bishops, and others of extraordinary note; being of the same signification with the French word *hotel*.

INNS of Courts, are so called, as some think, because the students there are to serve, and attend the courts of judicature; or else because antiently these colleges received none but the sons of noblemen, and better sort of gentlemen, who were here to be qualified to serve the king in his court, as Fortescue affirms.

—Of these we have four principal ones; viz. the two *Temples*, heretofore the dwelling of the knights-templars, purchased by some professors of the common law about 300 years ago; and *Lincoln's-Inn* and *Gray's-Inn*, antiently belonging to the earls of Lincoln and Gray.

These societies are no corporations, nor have any judicial power over their members, but they have certain orders among themselves, which have, by consent, the force of laws: for lighter offences persons are only excommunicated, or put out of commons; for greater, they lose their chambers, and are expelled the colleges; and when once expelled out of one society, they are never received by any of the others.

The whole company of gentlemen in each society may be divided into four parts; benchers, utter-barristers, inner-barristers, and students. See **BENCHER**, and **BARRISTER**.

INNS of Chancery, were probably so called, because antiently inhabited by such clerks as chiefly studied the forming of writs, which regularly belonged to the curators, who are officers of Chancery.

The first of these is *Thornes-Inn*, begun in the reign of Edward III. and since purchased by the society of *Lincoln's-Inn*; beside this we have *New-Inn*, *Symonds-Inn*, *Clements-Inn*; *Cliffords-Inn*, antiently the house of the lord Clifford; *Staple-Inn*, belonging to the merchants of the staple; *Lions-Inn*, antiently a common inn with the sign of the lion; *Furnivals-Inn*, and *Bernards-Inn*.

These were heretofore preparatory colleges for younger students; and many were entered here, before they were admitted into the *inns* of court. Now they are mostly taken up by attorneys, solicitors, &c.

They belong all to some of the *inns* of court, who send yearly some of their barristers to read to them.

INNUENDO, is a word frequently used in writs, declarations, and pleadings, to ascertain a person or thing which was named, but left doubtful, before: as, He (*innuendo* the plaintiff) did so and so; mention being before made of another person.

INOCULATION, in agriculture and gardening, a kind of grafting; or an artificial operation, by which the bud of one fruit-tree is set into the stock or branch of another, so as sometimes to make different sorts of fruit grow in the same tree. See **ENGRAFTING**.

There are various ways of performing this: The antient method was, by making a shallow incision in the bark, where the knot of a shoot or eye, *oculus* (whence the operation takes its name) begins to bud forth, into this a promising shoot of another kind was inserted, and the incision closed up with fat earth or clay.

The method of *inoculation* among our gardens, as delivered by Mr. Lawrence, is as follows: They cut off a vigorous shoot from the tree that is to be propagated, a month before or after Midsummer; then chuse out a smooth place in the stock (which should not be above three or four years growth) making a perpendicular slit in the bark, a little above an inch long, and another at right angles to it, at the lower end, to give way to the opening of the bark. This done, the bark is gently loosened from the wood on both sides with a penknife, beginning at the bottom.

They then prepare the bud, cutting it off from the aforesaid vigorous shoot, and taking with it as much of the wood above as below it, and as near as may be to the length of the slit in the stock. When the bud is thus cut off, they take out the woody part of the bud, and put the bud itself in, between the bark and the wood of the stock, at the cross-slit before opened, leading it upwards by the stalk, where the leaf grew, till it exactly closes. They then bind it about with woollen yarn, the better to make all parts of it close exactly, that the bud may imbodify it self with the stock which it will do in about three weeks time.

This operation is said to be best performed in a cloudy day, or in the evening; and it is observed, that the quicker it is done, the better it always succeeds.

This practice has the advantage of engrafting in many respects, both as it is more secure, it seldom failing of having effect, especially if two or three buds are put into the same stock; and as its success is more readily discovered. Indeed when large stocks are to be practised on, *inoculation* is not proper, and they are then obliged to have recourse to grafting.

This one rule is observed to hold universally; viz. That no success is to be expected in *inoculation*, if the sap does not run well; that is, if the bark will not part readily from the wood of the stock. See *supplement*: article **INOCULATION**.

INOCULATION, in a physical sense, is used for the transplantation of distempers from one subject to another; particularly for the ingraftment of the small-pox; which is a new practice among us, and of ancient use in the eastern countries.

The method of performing the operation is as follows: After the body is rightly disposed and prepared, by proper diet and evacuations, two small incisions are made, one in the muscular part of the arm, about the place where an issue is usually cut, and the other in the leg of the opposite side; then being provided of a small quantity, as a drop or less of well concocted variolous matter, chosen from the distinct or best sort of pustules, before the turn of the distemper, and imbibed by two small doffils of lint; these are immediately put into the incisions, whilst the matter remains warm, and are kept on by a proper bandage: in a day or two the bandages are opened, the lint thrown away, and only a colewort-leaf or the like applied over the incisions. This dressing is continued daily.

The incisions usually grow sore, inflame and enlarge of themselves, and discharge matter more plentifully as the distemper rises. The eruptions generally appear within eight or ten days after the operation; during which time the patient is not confined, or obliged to observe a very strict regimen.

The practice seems to be beneficial, because the most proper age, the most favourable season of the year, the most regular method of preparation, and all possible precautions, may here be used, according to the wishes of the patient, his parents, and the physician; advantages impossible to be had when the distemper is caught in the natural way.

It has been almost constantly observed, that the best sort of small-pox is hereby occasioned; that the eruptions are few, the symptoms light, the danger next to none, and the recovery easy; and that the patient is equally secured from this distemper for the future, as he would be by having gone through it in the natural manner.

INORDINATE Proportion, is where three magnitudes being in one rank, and three others proportional to them in another; you compare them in a different order.

E. gr. If there be in one rank these three numbers, 2, 3, 9; and in another rank, these other three, 8, 24, 36, which are proportional to the precedent, in a different order; so that 2 be to 3 as 24 to 36, and 3 to 9 as 8 to 24: Then casting away the mean terms in each rank, you conclude the first 2 in the first rank to be the last, 9; as 8, and the first of the other rank, to the last, 36.

INOSULATION. See **ANASTOMASIS**, and **ARTERY**. **IN PACE**, a Latin term, used among monks, to signify a prison, where such of them are shut up as have committed any grievous fault.

Formerly, there used to be a great deal of ceremony at the putting a religious in *pace*, but now it is not much regarded. Such as are shut up in perpetual imprisonment, are also said to be in *pace*.

Sometimes, also, the words *requiescat in pace* are used by way of allusion to a custom in the Romish church, of praying that the soul of the deceased may rest in peace.

The same words are also frequently seen at the bottom of epitaphs, in lieu of those used by the ancient Romans, *S. T. T. L. i. e. Sit tibi terra levis*, Light lie the earth; or, *Sit humus cineri non onerosa tuo*.

IN PALE. See the article **PALE**.

INPROMPTU, or **IMPROMPTU**, a Latin word frequently used among the French, and sometimes in English, to signify a piece made off-hand, or extempore; without any previous meditation; by the mere force, and vivacity of imagination.

Many authors pique themselves on their *inpromptu's*, which yet were in truth done at leisure, and in cold blood.

INQUEST, or **ENQUEST**. See **ENQUEST**, and **ARREST**. **INQUIRENDO**, an authority given to a person, or persons, to inquire into something for the king's advantage.

INQUIRENDO Idiota. } See the article } **IDIOTA.**
Ad INQUIRENDUM. } See the article } **AD.**

INQUISITION, in the civil and canon law, a manner of proceeding for the discovery of some crime by the sole office of the judge, in the way of search, examination, or even torture.

INQUISITION is also used in common law, for a like process in the king's behalf, for discovery of lands, profits, and the like. In which sense it is also confounded with office. See **OFFICE**. **INQUI.**

INQUISITION, or the *Holy Office*, denotes an ecclesiastical jurisdiction established in Spain, Portugal, and Italy, for the trial and examination of such persons as are suspected to entertain any religious opinions, contrary to those professed in the church of Rome.

It is called *Inquisition*, because the judges of their office take cognizance of crimes on common report, without any legal evidence, except what they themselves fish out.

Some people fancy they see the original of the *Inquisition* in a constitution made by pope Lucius, at the council of Verona, in 1184, where he orders the bishops to get information, either by themselves, or by their commissaries, of all such persons as were suspected of heresy; and distinguishes the several degrees, of suspected, convicted, penitent, and relapsed, &c. However this be, it is generally allowed, that pope Innocent III. laid the first foundation of the *Holy Office*; and that the Vaudois and Albigenses were what gave the occasion to it. That pontiff sent several priests, with S. Dominic at their head, to Tholouse, in order to blow up a spirit of zeal and persecution amongst the prelates and princes. These missionaries were to give an account to the pope of the number of heretics in those parts, and of the behaviour of the princes and persons in authority to them; and thence they acquired the name of *Inquisitors*: but these original inquisitors had not any court, or any authority; they were only a kind of spiritual spies, who were to make report of their discoveries to the pope.

The emperor Frederic II. at the beginning of the 13th century, extended their power very considerably; He committed the taking cognizance of the crime of heresy to a set of ecclesiastical judges; and as fire was the punishment decreed for the obstinate, the inquisitors determined indirectly with regard both to the persons and the crimes: by which means the laity was cut off from its own jurisdiction, and abandoned to the zeal and devout madness of the ecclesiastics.

After the death of Frederic, who had long before repented the power he had given the churchmen, as having seen some of the fruits of it; pope Innocent IV. erected a perpetual tribunal of inquisitors, and deprived the bishops and secular judges of the little power the emperor Frederic had left them. And this jurisdiction, which depended immediately on himself, he took care to introduce into most of the states of Europe. But the inquisitors were so fiery hot, and made such horrible butchery among the reputed heretics, that they raised an universal detestation, even in some catholic countries themselves. Hence it was that their reign proved very short both in France and Germany; nor was even Spain entirely subject to them till the time of Ferdinand and Isabella, in 1448, when their power was increased, under pretence of clearing the country of Judaism and Mahometanism.

The power of the *Inquisition* is very much limited in some countries, particularly at Venice, where it is received under such modifications, as prove a great check on its authority. Indeed at Venice it seems rather a political than a religious contrivance, and serves rather for the security of the state, than for that of the church. There are appeals from the subaltern *Inquisitions* in Italy, to the congregation of the holy office residing at Rome.

It is the constant practice of the *Inquisition*, to affect, in all their procedures, to inspire as much terror and amazement as possible; every thing is done with the profoundest silence and secrecy, and with the greatest rigour and pretended impartiality. When a person is seized, all the world abandons him, not the nearest friend dares to speak a word in his defence; that alone would be enough to render them suspected of heresy, and would bring them within the claws of the *Inquisition*. The criminals are seized, examined, tried, tortured, and, unless they recant, are even condemned and executed, without ever seeing or knowing their accusers; whence the revengful have a fair occasion of wreaking their malice on their enemies. When the *Inquisition* has done with them, and condemned them to death, they are turned over to the secular arm, with a word of prayer and pious intreaty, that their lives may not be touched. Time is no manner of security in point of heresy: nor does the grave itself shelter the accused from the pursuits of the *Inquisition*; even the deceased have their trials, and they proceed in all their form and solemnity against the dead carcasses. The executions are always deferred till the number of the condemned is very great, that the multitude of sufferers may strike the deeper horror, and make the scene more terrible and shocking. See *ACT of Faith*.

The *Inquisition* of Rome is a congregation of twelve cardinals, and some other officers, where the pope presides in person. This is accounted the highest tribunal in Rome; it began in the time of pope Paul IV. on occasion of the spreading of Lutheranism.

The *Inquisition* is very severe in the Indies. It is true, there must there be the oaths of seven witnesses to condemn a man; but the depositions of slaves or children are taken. The person is tortured till he condemns himself, for his accusers are never brought to confront him. Persons are accused for the slenderest expression against the church, or even for a disrespectful word of the *Inquisition*.

The standard of the *Inquisition* is a piece of red damask, or which is painted a cross, with an olive-branch on one side, and a sword on the other: with those words of the psalm, *Exurge, Domine, & judica causam meam*.

INQUISITORS, among us, are sheriffs, coroners *super visum corporis*, or the like, who have authority to enquire into certain cases ex officio.

IN QUO, *Medium in quo*. See the article *MEDIUM*.

INROLEMENT, in law, the registering, recording, or entering of any lawful act, or instrument, in the records of Chancery; as a recognizance acknowledged, or a statute, or a fine levied.

Inrolements are also made in the rolls of the Exchequer, King's-bench, or Common-pleas; in the huffings at Guildhall, London; and by the clerk of the peace in any county.

Clerk of the INROLEMENTS. See the article *CLERK*.

INSANUM Parliamentum. See *PARLIAMENTUM*.

INSCONCED, in the military art, denotes that a part of an army have fortified themselves with a *seance*, or small fort, in order to defend some pass, &c. See *SCONCE*.

INSCRIBED, in geometry.—A figure is said to be *inscribed* in another, when all the angles of the figure *inscribed* touch either the angles, sides, or planes of the other.

INSCRIBED Hyperbola, is such a one as lies entirely within the angle of its asymptotes; as the conical *hyperbola* doth. See *HYPERBOLA*; see also *CIRCUMSCRIBING*.

INSCRIPTION, a title, or writing, affixed to any thing, to give some further knowledge thereof.

Antiquaries are very curious, in examining ancient *inscriptions* found on stones, and other monuments of antiquity. Sanctionation, cotemporary, as it is said, with Gideon, drew most of the memoirs, whereof his history is composed, from *inscriptions*, which he found in temples, and on columns, both among the Heathens and the Hebrews.

It appears, indeed, that the ancients engraved upon pillars the principles of sciences, as well as the history of the world. Those mentioned by Herodotus shew, that this was the first way of instructing people, and transmitting histories and sciences to posterity. This is confirmed by Plato, in his *Hippias*, where-in he says, that Pisistratus engraved, on stone-pillars, precepts useful for husbandmen. Pliny assures us, that the first public monuments were made plates of lead; and that the treaties of confederacy, concluded between the Romans and the Jews, were written upon plates of brass; that, says he, the Jews might have something to put them in mind of the peace and confederacy concluded with the Romans. The Greeks and Romans were great dealers in *inscriptions*, and were extremely fond of being mentioned in them; and hence it is that we find so many, in those countries of ancient learning, that large volumes have been composed of them; as the collection of Gruter, &c.

Since Gruter's collection, Th. Reinefius has compiled another huge volume of *inscriptions*. M. Fabretti published another volume at Rome in 1699, wherein he has corrected abundance of errors which had escaped Gruter, Reinefius, and other antiquaries, &c. and added a great number of *inscriptions* omitted by them.—Since all these, Grævius has published a complete collection of *inscriptions*, in three volumes in folio. In France is an academy of *inscriptions* and medals, consisting of ten honorary and ten pensionary members, ten associates, and as many novices, who are to meet twice a week, and to employ themselves in the examination of medals and ancient monuments, and other parts of Greek and Roman literature, and to compose a history of the kings of France from medals.—Such was the academy at the time of its institution, or rather restoration, in the beginning of this century; but as they are not now wholly employed about medals and *inscriptions*, they have changed their name for one of a greater latitude, and are called the *Academy des Belles Lettres*.

Notes or Abbreviations used in INSCRIPTIONS. See *CHARACTER*.

INSCRUTABLE, *Unsearchable*, in theology, is usually understood of the secrets of providence, and the judgments of God, which cannot be found out, or into which human reason cannot penetrate.

INSECTS, *INSECTA*, in natural history, a smaller sort of animals, commonly supposed to be exanguinous; and distinguished by certain incisions, cuttings, or indentings in their bodies.

* The word is originally Latin, formed of *in*, and *seco*, I cut; the reason of which is, that in some of this tribe, as ants, the body seems to be cut or divided into two; or because the bodies of many, as worms, caterpillars, &c. are composed of divers circles, or rings, which form a sort of inclosure.

Insects, according to Mr. Ray, in his *Methodus Insectorum*, are either, First, *Apollapodous*, such as do not change their form: or, Secondly, *Metamorphous*, such as do really change their form.

Insects, which do not change their form are either, 1^o. *Arachnida*, without feet; or, 2^o. *Prædator*, with feet; and of these there are some kinds that cast their skins, and others that do not.

INSECTS

INSECTS without feet, are either *terrestrial*, i. e. land-insects, or *aquatic*.

Terrestrial INSECTS, are either, First, Such as are produced on the land; as the *lumbri* terrestres, which are either of the larger sort, and called *dew-worms*; or of a smaller size: And of these there are some red, and others green, with yellow tails; which last are commonly called *gill tails*.—Or, Secondly, Such as are found in the bowels of animals; of which some are found in the intestines of men; as, 1^o. The *lumbri* teretes. 2^o. *Lumbri* lati, which are also called *tenia*. 3^o. *Cucurbitini*, which some will have to be only the fragments of the *tenia*. 4^o. *Ascarides*, which are chiefly found in the rectum.—Others are found in the intestines of beasts, which are of two sorts, the *oblongi* and *pellucidi*, of the thickness of an horse-hair, and therefore called *vermiculi* *seiformes*: And the *brevi*, and *crassiores*, which are often found in horses, and are called the *botti*. To the genus of *terrestrial* insects, many natural historians also refer snails, whether with or without shells.

Aquatic INSECTS without feet, not changing their form; are, either, First, of the greater sort, which have a peculiar way of moving, by first fixing their head to the ground, and then drawing up their tail towards it, &c. Of these, some are *teretes*, round and smooth, of which there are three sorts, as, the medicinal *hirundines*, or leeches, the common black horse leeches, and the ash-colored sea-leeches: but there is also a sort of this kind, which is smaller and flatter, found sticking to stones in the bottom of little brooks.—Or, Secondly, of the lesser sort, which have a different way of crawling or moving from the former.—These are also either round or flat: of the round sort, there is one that is black, with two small horns on its head, found sticking to wet stones on the watery tops of hills; and another which is red, of about a finger's length, with a forceps at the tail, found at the bottom of fish-ponds, and stagnant waters. The flat sort are very small and thin, and are called *flukes*, being sometimes found in waters, and sometimes in the branches of the porous bilarius in sheep.

INSECTS not changing forms, and having feet, are either, First, *hexapoda*, with six feet. Secondly, *octapoda*, with eight feet. Thirdly, *decateissarapoda*, with fourteen feet. Or, fourthly, *polyapoda*, with more numerous feet.

Those that have but six feet, are either *terrestrial* or *aquatic*. the *terrestrial* are either, first, of a larger kind; as, 1^o. The yellowish insect, found in rotten or decaying oaks. 2^o. The black one, on the ground, called by Mouffet, *vermivorous*. 3^o. The black one, living under ground, with a forceps at the tail. 4^o. A white sort, with square black spots on its back. 5^o. The *farinarius*, bred in meal, of a whitish colour.—Or, secondly, a smaller sort; some of which are found about the bodies of animals; as, 1^o. The *cimex*, bug, or wall-louse, of a stinking smell. 2^o. *Ricinus*, the tick. 3^o. *Pediculus*, the common louse. 4^o. *Pediculus ferus* seu *inguinalis*, the crab-louse. Of some of which there are various kinds.—Others are not found on the bodies of animals; as, 1^o. One that in bigness and figure resembles a louse, but is very nimble and swift, and is found in books and rotten wood. 2^o. Another with a very long body, and a forcipal tail. 3^o. The black insect, found often in the flowers of the chelidonium. 4^o. A subterraneous sort, a little whitish. 5^o. One that skips like a grasshopper, but is much less.

The *aquatic*, are, First, The *pediculus marinus grandis*, which adheres to fishes. Secondly, The *squilla fluviatilis*, with a pyramidal tail, and two hairs or bristles at the end. Insects not changing form, and having eight feet, are either those with a tail, as the scorpion; or without; as, first, The spider: of which some spin no web, have but two eyes, and very long legs, as the *opilio*, or shepherd: Others spin a web, and of these they count three sorts: 1^o. The *aranea Colostrensis* *abdomine tumido, subrotundo, & elato*. 2^o. The spider with the thorax, or middle part of his body, as big as the abdomen. 3^o. The spider with the long abdomen, found among reeds, rushes, grass, &c. Secondly, The *ricini octopodes*, which are some more flat and compressed; as, the rambling ticks that run over the bodies of animals, but do not fasten; and some more round and thick, which do adhere to the skin. Thirdly, The *gyron*, or mites.

Insects not changing form, and with fourteen feet, and therefore called *tetratetravivipara*, are the *aselli*; of which there are three sorts; as, 1^o. The *sea-asellus*; the longest and largest of all, living amongst the rocks. 2^o. *Asellus lividus*, which rolls itself up into a ball. The common wood-lice, fows, or chefs bugs. 3^o. *Asellus spinosus*, with a forked tail: not rolling itself up.

To this species may also be added, 1^o. The *asellus marinus figure brevis*, rolling itself up. 2^o. *Asellus aquarium dulcium*, with long legs and two bristles on its tail. 3^o. *Pulex aquaticus*, both in fresh and salt water. And 4^o. The *Pediculus aquaticus*, which fastens upon fish.

Insects not changing form, with twenty-four feet, have the eight fore-feet lesser, and the sixteen hinder ones larger: there

are two kinds of them observed, both with long bodies; one larger, and of an obscure colour, among the rocks by the sea-side; the other of a silver colour, found in houses.

There is also a kind with thirty feet, of an oblong shape, chestnut colour, and full flattish body, usually lying under logs, and trunks of trees: This is very agile and swift.

Insects not changing form with yet more numerous feet called *polycheta*, are some on land, and either roundish in body, with all their legs rising out of the middle of the belly, (nearly) as the *julus*; or more flat and compressed, with their legs, not rising, as before, from a point in the middle of their body, but growing along on the sides; as, the *scelopendra*.

Others are aquatic, of which Mr. Ray makes three differences; 1^o. The *egripis* lugs, used for baits in catching fish, with thirty-eight legs, and a smooth roundish body. 2^o. The *scelopendra marina corpore plano*. 3^o. *Animalculum bi. n. g.*, or rather *bicaudatum*, lying in the clefts of stones under the salt water.

INSECTS which undergo a change of their form, are called *metamorphoses*, though improperly; since, as Swammerdam shews, there is no real transformation, but only an explication of the parts of the animal, latent before in miniature, like the plant in the seed; and an increase of all the parts by proper degrees. In these the first species of transmutation or change is instantaneous, there being no sensible rest or stop between the old and the new form.—The insects of this order do not lose their motion at the time they shift the pellicula, at least not to appearance.—This is when the vermiculus, leaving the former shape of the nymph, with which it appeared in the egg, and subsisted without food, now beginning to feed, has its members or parts visibly increased and stretched out, and takes the form of a new nymph, which is not without motion; and from thence becomes a flying insect.

Insects of this sort are, 1^o. The *libella*, or *perle*, which are produced from an insect of six feet, one kind of which Mouffet takes for the *pulex marinus*, or, as before he calls it, *locusta aquatica*.—Out of the crustaceous skin, or hull, of this insect, the libella breaks by a fissure, which begins between the eyes, and is continued to the roots of the wings, and is there joined to the lateral fissures. 2^o. The *cimex* *lybustres*, whose characteristic marks (according to Willughby) are, First, A long proboscis, not spiral, but straight. Secondly, Their upper wings to the middle are thick, and like leather; thence to the ends thin and membranous. Thirdly, There is the figure of S. Andrew's cross on their back. 3^o. The *locusta*, which Willughby refers to the *apuleia* *apuleia*. 4^o. The *gryllis* *campestris*. 5^o. The *gryllis* *domestici*, or crickets. 6^o. The *gryllis* *talpa*, mole-cricket. 7^o. The grass hopper. 8^o. The *blatta*, according to Swammerdam. 9^o. The *tipula* *aquatica*, which run very swiftly on the surface of the water, and have a sting in their mouths like the cimices, or ticks. 10^o. The *scorpius aquaticus*, with a sting also in its mouth. 11^o. The *musca* *aquatica*, called by Aldrovandus, *apei* *amphibia*. 12^o. The *hemerobius*, or *ephemera*, or *diaria* of Swammerdam. and 13. The *forficula*, or *auricularia*.

The second species of transmutation includes such insects as undergo a double metamorphosis, or change of shape. 1^o. Into a *chrysalis* or something analogous to it. 2^o. Into a flying insect.

These kinds of insects, a while before they change, lie quite still, without feeding, or changing place; and in respect of their wings are, First, *Ketecephala*, or *vaginipennia*, as the *scarabei*, beetles. Secondly, *Androidea*, whose wings are open and expanded: and the wings of these are either farinaceous, as in the *papiliones*, &c. or membranous, as in the *apei*, *muscae*, &c. and these are either *diurna*, with two wings, or *nocturna*, with four wings.

The *scarabei* may be divided, 1^o. In respect of their horns, into the *nasicornis*, *bucrota*, and *cervi* *volans*, or *taurus*. 2^o. In respect of their antennae, which are of many kinds; whereof the most eminent are those called *capricorni*. 3^o. With regard to their motion, as the *salutaries*. 4^o. With regard to their colour, as *cantharides*, green, &c.

To the beetle-kind may also be referred the *cicindela*, or glow-worm; the *staphylinus*, called, by Willughby, *apuleia* *apuleia*, the *proscarabeus*, or oil-beetle, so called from its emitting from its joints a kind of oil, on its being pressed or squeezed: The *anelytra* with farinaceous or mealy wings, are called *papiliones*, butterflies; and these are either diurnal, or nocturnal: The specific distinction of the diurnal is, that they always settle with their wings erect, are produced from an angulus aurelia, and have their antennae knobbed; of these there are a vast number of species observed in England.—The nocturnal butterflies, or *phalene*, are vastly numerous, and cannot very clearly be methodized. But for memory and distinction sake they may be divided into,

1^o. The *geometrigena*, which come from an *eruca* (called *geometra*, from the manner of its walk, which is anafinuous, by curling up its back like the handle of a cup) with eight or ten feet. 2^o. Such as come from *erucæ* with fourteen feet:

of this kind, which is very numerous, there hath been distinguished the *phalena fasciata*, whose wings are in patches or areas of different colours; *phalena lineata*, whose wings are marked with transverse lines; *phalena punctata*, whose wings are marked with one or more points; and, these excepted, all the others are distinguished into greater, lesser, and those of a middle size, between both.—Some of the larger kinds may be distinguished also by their inner wings running out beyond the upper, when they fit or rest: and another sort, by the appearance of the figure of the eyes upon the wings: And a third, by their long tails, and narrow sharp wings; which by some are called *phalena prædatrixes*, or *accipitrinae*.

The *anthytra*, with membranous wings, are *bees*, *flies*, *wasps*, *bomblyli*, *crabrones*, &c. And to this kind the *culex vulgaris*, or *gnat*, according to Swammerdam, is referred; as also the *formica*, or ant.

Hither also must be referred such water insects as are covered by a theca, according to the observations of Willughby. These are either, first, An immovable theca, or case, which is fixed to the stones; and this case is either of a round figure, or one more compressed and flat. Secondly, A moveable portable theca; and these are commonly called *phryganæ*: And their theca is either, 1^o. Straight, and that either composed of straws, and little festucae, lying parallel one to another; of which there are two kinds; a *greater*, where the festucae are two inches long; and a *lesser*, which are very common, and are called *straw-worms*. Or else the festucae lie transversely, and are shorter, having also sometimes pieces of shells, or stones, intermixed with them: Others, whose cases are straight also, have no festucae, but always either sand or gravel; and of these some have the theca round, and are called *ced-bait*; others are flat and compressed. 2^o. The crooked, or horned, which run tapering; of these Mr. Ray reckons four kinds; a greater and less black fly, and a greater and less *ash-coloured* one. These all produce flies, with large wings like butterflies.

The third species of transmutation, is a simple change from a vermiform to a flying insect; but with a sensible *metamorphosis*, rest, or stop, between one form and the other. This exchange Swammerdam thus describes: 'The vermicle excluded from the egg gets nourishment by little and little from without, and under that first skin, or covering, has its members increased by degrees; not slipping it, or putting it off as other vermicles do when they change into nymphae, but assuming the figure of a nympha in it: for a time it is quite motionless, till the superfluous moisture is evaporated, and then in a few days, it recovers its motion again, and casting off this skin, which is as it were double, it becomes a fly.' Of this kind are our *slab-flies*, and all that come from the *nymphae veriformes*, the *vespa ichneumonæ*, &c. Reaumur and others have, since the time of Mr. Ray, greatly improved the History of Insects. See Supplement: article PAPILIO, ERUCA, MUSCÆ, &c.

GENERATION OF INSECTS.—The world is now generally convinced, that insects are not bred of corruption, but ex ovo; though the contrary was believed by the antients, because of the vast numbers that were sometimes hatched as it were at once, and because they could not discern the particular manner of their propagation. See GENERATION. Malpighi, Swammerdam, and Redi, have abundantly disproved the doctrine of equivocal generation, as well as the chimerical transformation of the caterpillar into the butterfly, and other the like metamorphoses; and have shewn, that all the members of the butterfly were originally inclosed under the skin or nympha of the caterpillar, as the parts of a plant are in the seed.

Insects take particular care to deposit their eggs, or feed in such places where they may have a sufficient incubation, and where the young, when hatched, may have the benefit of proper food till they become able to shift for themselves.—

Those whose food is in the water, lay their eggs in the water; those to whom flesh is a proper food, in flesh; and those to whom the fruits, or leaves of vegetables are food, are accordingly deposited, some in this fruit, some in that tree, and some in one plant, and some in another, but constantly the same kind in the same tree, or plant.—As for others, that require a more constant and greater degree of warmth, they are provided by the parent animal with some place in or about the body of other animals; some in the feathers of birds, some in the hair of beasts, some in the scales of fishes, some in the nose, some in the flesh, nay some in the bowels, and in most recesses of man, and other creatures.—And as for others, to whom none of those methods are proper, the parents make them nests by perforation in the earth, in wood, in combs, and the like, carrying in and sealing up provisions that serve both for the production of their young, and for their food, when produced.

In flies, butterflies, &c. it is observed there is a kind of gluten, by which the female fastens her eggs to the bearing buds of trees, &c. so that the rains cannot wash them off.—These eggs will not be hurt by the greatest frost.

Andry, *De la Generation de Vers dans le Corps de l'Homme*,

takes notice, that the antients were mistaken in denying that insects did breathe, on the account of their wanting lungs: for modern observations convince us, that insects have a greater number of lungs than other animals.

The antients thought also that insects had no blood, because many of them had no red liquor like our blood: but it is not the colour, but the use of that liquor that is to be regarded.

They believed also that insects had no hearts; whereas our microscopes do now discover, that when insects have several lungs, they have also several hearts; and in particular, it is found, that silk-worms have a continued chain of hearts, reaching from the head almost to the very extremity of the tail.—It is this number of hearts and lungs, that occasions those insects to give signs of life long after they are divided into several parts.

Andry observes also, that it is wrong to call insects imperfect animals, since they want no parts either necessary or convenient for their use, to render them complete in their kind.

—There are some who affirm, that the earth-worms, and those round tailed worms, which are found in the intestines of men and horses, &c. also snails and horse-leeches, are hermaphrodites; but that such worms as become flies, and silk-worms, are not so; being of no sex, but only peculiar cases of real animals, which we see in time come out with wings.

The moderns have proceeded much farther in the knowledge of insects than the antients, as having the advantages of the microscope, which distinguishes their minute parts, whereof they have published draughts and descriptions.—Dr. Hooke has published a Micrographia in folio; and Fran. Redy, a physician at Florence, has published several figures with new and curious experiments of his own.—Sig. Malpighi, Bartholin, and the *Philosophical Transactions* of London, Paris, and Leipzig, have a great number of fine observations and experiments on insects.—Swammerdam has written a general history of insects in Dutch, and assures us, there were before that above 400 writers on this subject; among others he speaks well of Wotton, Gelfner, Aldrovandus, Mouffet, Harvey, Fabricius ab Aquapendente, Goedart, &c. Hoeffnagel, painter to the emperor Rudolphus, has given very good designs of above 300 species, Goedart has described above 400, and Mr. Albin has given us a new history of the English insects, with beautiful figures; and, since that, the late Mr. Wilks, and many others have given histories and figures of many kinds. But the work of the above mentioned Monsieur de Reaumur is, by far, the most valuable treatise of the kind.

INSEMINATION, one of the four kinds of transmutation in use for the sympathetic cure of certain diseases.

It is performed by mixing the medium impregnated with the mummy taken from the patient, with some fat earth, wherein has been sown the seed of a plant appropriate to that disease; but care must be taken from time to time, to sprinkle it with the water wherein the part affected has been washed. It is supposed the diseases will decline, in proportion as the plant grows.—By *mumia* is here meant part of the vital spirit of the patient, as the writers on that subject express themselves. But all this idle stuff is now laughed out of the world.

INSEPARABLE Modes. See the article MODES.

INSERTED Column. See the article COLUMN.

INSERTION, a term frequently used in anatomy, to signify the implication of one part within another.

Thus we say, the *insertion* of a muscle.

The *insertion* of the bones, muscles, and nerves, in the members of an animal, is exceeding artful: The vena cava has its *insertion* in the right ventricle of the heart.

INSERTION is also used in agriculture for the inclosing a graft within the cleft of a tree. See ENGRAFTING.

INSESSUS, or **INSESSIO**, in medicine, a kind of half-bath, usually prepared with a decoction of several herbs proper for the lower parts, wherein the patient sits down to the navel.

It has several uses, as the easing of pain, softening the parts, dissolving of stultent matter, and frequently promoting the menses.

INSINUATION, denotes a cunning, and covert way of creeping into any person's favour.

INSINUATION of a Will, among civilians, is the first production of it, or the leaving it with the register, in order to its probate. See WILL.

INSIPID, *tasteless*, that which has nothing in it pungent enough to affect the palate, tongue, &c. and to occasion that sensation we call *tasting*.

INSITION, **INSITIO**, in botany, denotes the same with engrafting; viz. the act of inserting and uniting a cyon, bud, or the like, into the substance of the stock. See ENGRAFTING.

INSOLATION *, in pharmacy, a method of preparing certain fruits, drugs, &c. by exposing them to the heat of the sun's rays; either to dry, to mature, or to sharpen them: as is done in vinegar, figs, &c.

* The word comes from the Latin verb, *insolare*, which is used by Pliny and Columella, and signifies to expose to the sun.

INSOLVENT, a term applied to such persons as have not wherewithal to pay their just debts.

A person dying, and not leaving estate sufficient to discharge these, is said to die *insolvent*.

INSPECTOR, a person to whom the care, and conduct of any work is committed.

INSPECTORS, in the Roman law, were such persons as examined the quality and value of lands and effects, in order to the adjusting or proportioning taxes and impositions to every man's estate.

The Jews also have an officer in their synagogue, whom they call *inspector*, *חזן* *hazan*. His business consists principally in inspecting or overlooking the prayers and lessons, in preparing and shewing them to the reader, and in standing by him to take care he reads right, and, if he makes mistakes, he is to correct him.

INSPICIENDO VENTRE. See the article **VENTRE**.

INSPIRATION, among divines, &c. implies the conveying of certain extraordinary and supernatural notices, or motions into the soul.

Thus the prophets are said to have spoken by divine *inspiration*; and the finner is converted, when he ceases to resist the *inspiration* of grace.

Some authors reduce the *inspiration* of the sacred writers to a particular care of providence, which prevented any thing they had said from failing, or coming to nought; maintaining, that they never were really *inspired*, either with knowledge or expression.

According to M. Simon, *inspiration* is no more than a direction of the holy Spirit, which never permitted the sacred writers to be mistaken.

It is a common opinion, that the *inspiration* of the holy Spirit regards only the matter, not the style, or words; and this seems to fall in with M. Simon's doctrine of direction.

Among the heathens, the priests and priestesses were said to be divinely *inspired* when they gave oracles.

The poets, also, laid claim to it; and to this end, they always invoked Apollo and the muses at the beginning of any great work.

INSPIRATION, in physic, is understood of that action of the breast, by which the air is admitted into the lungs.

In which sense, *inspiration* is a branch of respiration, and stands opposed to *expiration*.

This admission of the air depends immediately on its spring, or elasticity, at the time when the cavity of the breast is enlarged by the elevation of the thorax and abdomen, and particularly by the motion of the diaphragm downwards: so that the air does not enter the lungs, because they are dilated; but those dilate, because the air enters within them. Nor is it the dilatation of the breast which draws in the air, as is commonly thought; though this is a condition absolutely necessary to *inspiration*; but there is an actual intrusion of the air into the lungs.

INSPISSATING, in pharmacy, an operation whereby a liquor is brought to a thicker consistence, by evaporating the thinner parts.

Thus, juices, as that of liquorice, are *inspissated*.

INSTALLMENT*, a settling, or installing any person in a dignity.

* The word is derived from the Latin *in*, and *stallum*, a term used for a seat in church, in the choir, or a seat or bench in a court of justice, &c. Though Vossius is of opinion the word is of German origin.

INSTALLMENT is chiefly used for the induction of a dean, prebendary, or other ecclesiastical dignitary, into the possession of his stall, or proper seat in the cathedral church to which he belongs.

This is sometimes also called *inflation*.

INSTALLMENT is likewise used for the ceremony, whereby the knights of the Garter are placed in their rank, in the chapel of St. George at Windsor, and on many other like occasions.

INSTANT, such a part of duration, wherein we perceive no succession; or it is that which takes up the time of only one idea in our minds.

It is a maxim in mechanics, that no natural effect can be produced in an *instant*.—Hence may appear the reason why a burthen seems lighter to a person, the faster he carries it; and why, the faster a person slides, or scates on the ice, the less liable is the ice to break.

The schoolmen distinguish three kinds of *instants*; a *temporary*, a *natural*, and a *rational instant*.

Temporary INSTANT, is a part of time immediately preceding another: thus the last *instant* of a day, precedes immediately and really the first *instant* of the following day.

Natural INSTANT, is what we otherwise call a *priority of nature*, which obtains in things that are subordinated in acting; as, first and second causes; or causes and their effects. For the nature of things requires, that if there be a second cause, there must be a first; and that there must be a cause, if there be an effect.

Rational INSTANT, is not any real *instant*, but a point which the understanding conceives to have been before some other *instant*, founded on the nature of the things which occasion

it to be conceived. For instance, as God has made several things voluntarily, which he could otherwise have let alone; there is a reasonable foundation to conceive God, such as he is in himself, before he had made any of those voluntary determinations; but as there was no real *instant* when God had not formed any determination, this *instant* is called a *rational instant*, by way of opposition to an *instant* of time.

INSTANTANEOUS ACTION. See the article **ACTION**.

INSTANTING. See the article **REINSTATING**.

INSTAURATION*, the re-establishment, or relevation of a religion, a church, or the like, to its former state.

* The word is by some derived from the old Latin, *instaurum*, which signified the stock of things necessary for the tilling, and managing of grounds; as, cattle, tools, harness, &c. The word *instaurum* is only of the middle age; but *instauratio* is of much greater antiquity, and by some is derived from *instar*, like; as importing a thing's being brought to its former likeness or appearance.

INSTINCT, a natural disposition or sagacity wherewith animals are endued; and by virtue whereof they are enabled to provide for themselves, and know what is good for them, and are determined to preserve and propagate their species.

Instinct bears some analogy to reason, and supplies the defects of it in brutes.

INSTITUTES, INSTITUTA, in the civil law, a book, containing the elements, or principles of the Roman law; and which constitutes the last part of the corpus juris civilis.

The *Institutes* are a compendium or summary of the whole body of civil law, in four books, compiled by Tribonianus, Theophilus and Dorotheus, by order of the emperor Justinian, for the use of young students; who having the first elements of the whole profession in this little treatise, might the sooner gain a competent knowledge of it, without being discouraged by the bulk of the other books.

INSTITUTES likewise denote a system of laws, or rules in any science.

INSTITUTION, in a general sense, the act of ordaining, founding or establishing any thing.

Thus we say, Moses *instituted* the ceremonies of the old law; Jesus Christ *instituted* the sacraments of the new.

INSTITUTION, in canon and common law, is the act of the bishop, or of one commissioned by him, whereby a clerk is invested with the spiritualities of a rectory, or vicarage. See **PRESENTATION**.

The clerk kneels down before the bishop, whilst he pronounces these words of *institution*; (*Instituto te rectorem ecclesie de A. B. cum cura animarum, & accipe curam tuam & meam*) and the clerk holds the written instrument, with the episcopal seal annexed, in his hand, during the ceremony.

Before the clerk is *instituted*, he must subscribe the thirty-nine articles of religion, in the presence of the ordinary, or his substitute; and this subscription must be without reserve, exception, or qualification, else his *institution* is, ipso facto, void and null, and the church is still vacant.—At the same time the ordinary requires the clerk to subscribe the other two articles mentioned in the 26th canon about the king's supremacy, and the lawfulness and use of the liturgy. The clerk must also before *institution* subscribe to that part of the declaration enjoined by the act of uniformity, 14 Car. II. c. 24. viz. *I will conform to the Liturgy of England, as by law established*.—Before *institution*, he must also take the oaths mentioned in the first statute of William and Mary, c. 8. instead of the former oaths of allegiance and supremacy, required by stat. 1 Eliz. And then he must take the oath against simony, enjoined by the 40th canon, and the oath of canonical obedience. And he is to have certificates given him of his subscribing the declaration contained in the act of uniformity, in English, in a distinct instrument, under the hand and seal of the bishop; and of his other subscriptions and oaths in Latin.

The clerk ought by all means to have witnesses of his *institution*, his taking the oaths, making subscriptions, &c. and therefore he should desire some present to write their names on the back of his instruments; and make memorandums who they are, and where they live.

The church, by *institution*, is full against all persons, but the king; and the clerk by it may enter upon the glebe, and take the tithes; but he cannot let or grant them, nor sue for them, if they be refused to be paid, till he be inducted.

After *institution*, the clerk is to receive a written mandate from the ordinary to the archdeacon, or other proper person, in order to his induction; without which he has not a full right to his temporalities; unless the benefice be a donative. See **INDUCTION**.

INSTITUTIONS, in literary matters, denote a system of the elements, or rules of any art or science.

Thus physical, or medicinal *institutions*, are such as teach the necessary praeconita to the practice of medicine, or the cure of distempers.

INSTRUCTIVE Column. See the article **COLUMN**.

INSTRUMENT, denotes a thing which is subservient to a cause for producing its effect. See **EFFECT**.

INSTRUMENTS of Sacrifice, in the antique architecture, are ornaments, as vases, patens, candlesticks, knives, &c. wherewith the

the victims were killed, &c. Instances of which we see in a Corinthian freeze in the remains of a temple behind the capitol at Rome, &c.

INSTRUMENT, is also used in law, to signify some public act, or authentic deed, by means whereof any truth is made apparent, or any right or title established, in a court of justice. See **ACT**, and **DEED**.

Wind INSTRUMENTS. See the article **WIND**.

INSTRUMENTAL Arithmetic. See **ARITHMETIC**.

INSTRUMENTAL Cause. See the article **CAUSE**.

INSTRUMENTUM Synodale. See **SYNODALE**.

INSULATE, or **INSULATED**, a term applied to a column, or other edifice which stands alone, or free and detached from any contiguous wall, &c. like an island in the sea; whence the denomination is apparently derived.

INSULT, a military term used for the attack of any post with open force; without the apparatus of trenches, saps, or any regular approaches.

INSUPER, a word used by the auditors of the Exchequer. In their accounts they say, so much remains *insuper* to such an account; that is, so much remains due on his account.

INSURANCE, security given in consideration of a sum of money paid in hand, to make good ships, merchandizes, houses, &c. to the value of that for which the premium is received, in case of loss by storm, pirates, fire, or the like. See **ASSURANCE**.

INTACTÆ, right lines to which curves do continually approach, and yet can never meet with them; more usually called *asymptotes*. See **ASYMPTOTE**.

INTAGLIO'S, precious stones, having the heads of great men, inscriptions, and the like, engraven on them; such as we frequently see set in rings, seals, &c.

IN-TAKER, a name anciently given to certain banditti, or free-booters, who inhabited part of the north of England, and made frequent incursions into the very middle of Scotland, plundering the inhabitants wherever they came.

Those who made the expeditions were called *out-parters*; and those who were left behind to receive the booty, *in-takers*.

INTEGERS, in arithmetick, denote whole numbers, in contradistinction to fractions.

Integers may be defined to be numbers which refer to unity, as a whole to a part.

INTEGRAL, or **INTEGRANT**, is applied by the schoolmen, to those parts which are necessary to the integrity of a whole.

In which sense they stand contradistinguished from *essential* parts.

Thus the arms, legs, &c. are *integral* parts; body and soul *essential* parts of a man.

INTEGRAL Calculus, in the new analysis, is the counterpart to the differential calculus.

This last has been completely explained by the Marquis de l'Hospital, but the other still remains imperfect, having been yet but little cultivated.

The *integral calculus* of Leibnitz, and other foreigners, answers to what the English call *inverse method of fluxions*. See **FLUXIONS**, and **CALCULUS**.

INTEGRITY of the action. See the article **ACTION**.

INTEGNUM. — *Resstitutio in integrum*. See **RESTITUTION**.

INTEGUMENTS*, in anatomy, denote the common coverings which invest the body; as the cuticula, cutis, and even the panniculus carnosus, and tunica reticularis, if there be really any such part.

* The word is Latin, formed of *in*, and *tegumentum*; of *tego*, I cover.

INTEGUMENT, is also extended to the particular membranes which invest certain parts of the body; as, the coats or tunics of the eye.

INTELLECT, a term used among philosophers, to signify that faculty of the soul usually called the *Understanding*. See **UNDERSTANDING**.

The Peripatetics make two kinds of intellect, *active*, and *passive*.

Active Intellect, they say, is that which receives the impressed species emitted by objects to the exterior senses, and conveys them to the common sensorium.

These impressed species being material and sensible, are supposed to be rendered intelligible by the *active intellect*, and fit to be received into the *passive intellect*.

The species, so spiritualized, are called *expressed species*, as being expressed from those others impressed; and it is by these, according to them, that the *passive intellect* comes to know material things.

INTELLECTUAL Thinking. See **THINKING**.

INTELLIGIBLE, any thing capable of being understood or conceived by the mind.

Philosophers have invented certain beings which are purely *intelligible*, and only subsist in the understanding; such are the *entia rationis*, universal ideas, and other chimeras.

The *intelligible*, or intellectual world, is the idea of the

world in the divine mind, frequently spoken of by Malebranche.

INTENDANT, one who has the conduct, inspection, and management of any thing.

This is a title frequent among the French: they have *intendants of the marine*, who are officers in the sea-port, whose business is to take care the ordinances and regulations relating to sea-affairs be observed: *intendants of the finances*, who have the direction of the revenues: *intendants of provinces*, who are appointed by the king to take care of the administration of justice, policy, and finance: in the provinces: *intendants of buildings*, of bridges, &c.

INTENDMENT of Law, the sense, intention, or true meaning of the law.

The judges ought to judge according to the common *intendment* of the law. *Coke*.

INTENSIONE, in law, a writ which lies against him who enters after the death of the tenant in dower, or tenant for life, and holds out him in the reversion or remainder.

INTENT, in the civil law, signifies to begin, or commence an action, or process.

INTENTION, or **INTENSION**, in medicine, that judgment, or method of cure, which a physician forms to himself from a due examination of the symptoms.

INTENTION, in physics, the increase of the power, or energy of any quality, as heat, cold, &c.

By which it stands opposed to *remission*, which signifies its decrease or diminution. See **REMISSION**.

INTENTION, in metaphysics, denotes an exertion of the intellectual faculties with more than ordinary vigour; when the mind with earnestness fixes its view on any idea, considers it on all sides, and will not be called off by any sollicitation.

The schoolmen also speak of terms of *first* and *second intention*.

A *Term of first INTENTION*, is that which signifies a thing; the primary design of man, in establishing words, being to express things, or the ideas they have of things.

A *term of second INTENTION*, is that which does not signify a thing, but another term, or sign.

Thus, a tree, a man, &c. are terms of *first intention*; and the terms in rhetoric, grammar, &c. as figures kind, &c. are terms of *second intention*.

INTENTIONAL Qualities. See **QUALITIES**.

INTERCALARY Day*, denotes the odd day inserted in the leap year. See **BISSEXTILE**.

* The word is derived from the Latin *intercalari*, of *calo*, to *calare*, which antiently signified to call with a loud voice; an *intercalary* day among the Romans, signifying a day inserted between two other days; which, for that reason, was proclaimed by the priests with a loud voice.

INTERCESSOR*, a person who prays, expostulates, or intercedes in behalf of another.

* The word comes from the Latin *inter*, and *cedo*, I go between.

In the Roman law, *intercessor* was the name of an officer, whom the governors of provinces appointed principally to raise taxes, and other dues.

INTERCESSOR is also a term heretofore applied to such bishops, as, during the vacancy of a see, administered the bishoprick, till a successor to the deceased bishop had been elected. See **BISHOP**.

The third council of Carthage calls these *interventors*.

INTERCOLUMNATION, or **INTERCOLUMNATION**, in architecture signifies the space between two columns.

Vitruvius calls it *intercolumnium*; which according to that author, is of five kinds; viz. *picnostyle*, *stysyle*, *eustyle*, *distyle*, and *areostyle*: which see explained under their proper heads. **PICNOSTYLE**, &c.

For a medium, some authors have laid down the following proportions: in the Tuscan order, the *intercolumnation* is to be four diameters of the body of the column below; in the Doric three; in the Ionic two; in the Corinthian two, one quarter; and in Composite one and a half.

INTERCOMMONING, is when the commons of two manors lie together, and the inhabitants of both have, time out of mind, caused their cattle to feed promiscuously in each.

INTERCOSTAL, in anatomy, signifies any thing between the costæ, or ribs.

INTERCOSTAL Nerves, are two nerves so called, because in descending they pass near the roots of the ribs.—They are formed in the brain, by three branches of nerves, two whereof come from the sixth pair, and the third from the fifth.—The *intercostal* nerves have a great communication with those of the eighth pair, and send several branches to the breast and lower belly.

INTERCOSTAL Arteries, are two; the *upper*, which comes from the subclavian, and distributes itself within the four spaces of the upper ribs; and the *lower*, which comes from the lower trunk of the great artery, and diffuses itself within the spaces between the eight lower ribs and the neighbouring muscle.

INTERCOSTAL Vein, is a vein which arises from the four spaces between the upper ribs, and terminates in the subclavian.

vide.—See *Tab. Anat. (Angeol.) fig. 1. n. 31. fig. 6. lit. f.*

INTERCOSTAL Muscles, are either *external* or *internal*; and are forty-four in number, one of each sort being between every two ribs.

They arise from the lower edges of each superior rib, and are inserted into the upper edges of each inferior rib.—Their fibres cross one another; those of the external run obliquely from the back-part forwards; but those of the internal from the fore-part backwards; they are thin and fleshy.—See *Tab. Anat. (Myol.) fig. 1. n. 43. fig. 2. n. 27.*

INTERDICT, a censure inflicted by a pope, or bishop, suspending the priests from their functions, and depriving the people of the use of sacraments, divine service, and Christian burial.

In common law, *interdict* is also used in the same sense as in the canon law; where it is defined to be, *confutatio ecclesiastica prohibens administrationem divinarum.*

INTERDICT is most properly understood of a general excommunication of a country or city, as appears by the Decretals. See **EXCOMMUNICATION**.

There is a *local* and a *personal interdict*; where these two are joined, the *interdict* is said to be *mixed*.

This punishment, as well as general excommunications, were but little known till the time of pope Gregory VII.

In excommunicating a prince, all his adherents, that is, his subjects who retain their allegiance, are excommunicated, and the whole country is put under an *interdict*.—In the reign of king John, the kingdom of England lay under a papal *interdict* for above six years together: it began *A. D.* 1208.

In imitation of the popes, the bishops also soon began to *interdict*; and it became a common thing for a city or town to be excommunicated for the sake of a single person whom they undertook to shelter. But this severity was found to have such ill effects, that they have been obliged to moderate it.

An *interdict* is denounced, and taken off again, with the same formalities as an excommunication.

INTERDICTS, in the Roman law, certain formulæ of words, by which the prætor, when the possession of any thing was contested between many, ordered or forbid something to be done with it, till the right or property should be legally determined.

Which formulæ were called *interdicts*, because they related to the possession of the thing in the interim, or till the right was ascertained.

They had three kinds of *interdicts*, *prohibitory*, *restitutory*, and *exhibitory*.

Prohibitory INTERDICTS, were those by which the judges forbade any one to vex another in the possession of any thing legally belonging to him.

Restitutory, were those by which the judges appointed any one, who had been expelled out of his estate, to be repossessed, before his right was legally ascertained; and this was the same with what they called the *reintegrant*.

Exhibitory, were those by which any thing in dispute was ordered to be exhibited; as a testament, &c.

There was also a second division of *interdicts*; viz. into *adipiscendæ*, *retinendæ*, and *recuperandæ*. The first tending to the acquiring a new possession, as the *interdict quorum bonorum*, &c. the second to the keeping an old one till it was further determined, as the *uti possidetis*, &c. the last to the recovering one lost, as *unde vi*, &c.

INTERDICTION of Water and Fire, a sentence antiently pronounced against such, as for some crime were to be banished.

They were not directly adjudged to banishment; but by giving order that nobody should receive them, but deny them *fire and water*, they were condemned, as it were, to a civil death: and this they called *legitimum exilium*. Livy.

INTEREST, a sum of money, reckoned for the loan and forbearance of some other sum, lent for, or due at, a certain time, according to some certain rate.

In respect hereof, the sum lent or forborn is called the *principal*, because it is the sum that procreates the *interest*, or from which the *interest* is reckoned.

Interest is either *simple* or *compound*.

Simple INTEREST, is that counted from the principal only.

This is easily computed by the golden rule, either *simple* or *compound*, thus: Let that which is the principal or cause of the *interest* be put in the first place, that which betokened time in the second place, and the remaining in the third: under this conditional part place the two other terms, each under its like, and there will be a blank to supply under one of those above, either under the first, second, or third.

1. Months. 1.
100 . 12 . 6
50 . 3

Here the blank will be under the third place: multiply the three last for a dividend, and the two first for a divisor, the quotient of these gives the sixth; that is, $6 \times 50 \times 3 = 900$, and $100 \times 12 = 1200$. Now $1200 \div 900 = 1\frac{1}{3}$ required.

If the demand had been, In how many months would 50 l.

have gained 15 s. or, if 100 l. in twelve months gain 6 l. what shall the principal be that in three months would gain 15 s? In these cases the blank would have been under the first or second term: Then, by another rule, multiply the first, second, and last for a dividend, and the third and fourth for a divisor; and the quotient is the answer.

1. Months. 4.
100 . 12 . 6

$3 \cdot 75 = 15$ s. Then by the rule $100 \times 12 \times 75 = 900.00$ and $6 \times 3 = 18$ 900. (50 l. required.

This rule shews *simple interest*, and all that belongs to it, with ease, and was thus found: Put P for the principal, T for the time, and G for the gain in the conditions, and $p \ t \ g$ answering, it will be, $P : G :: t : \frac{G \ p}{P}$ And T :

$G \ p :: \frac{G \ p \ t}{T \ P} = g$, which is the first rule; that is, multiply the three last for a dividend, and the two first for a divisor. And because $\frac{G \ p \ t}{T \ P} = g$, therefore $G \ t \ p = T \ P \ g$.

and consequently $t = \frac{T \ P \ g}{G \ p}$ and $p = \frac{T \ P \ g}{G \ t}$, which is the second rule.

Compound INTEREST, is that which is counted both from the principal, and the *simple interest* forborn; called also *interest upon interest*.

Compound interest arises from the principal and its *interest* put together, as that *interest* becomes due.—To find this, it is necessary to find the new principal, which is still created by the increase of the growing money, at the several times when the payments of *interest* were due.

If R be the amount of one pound for one year; then R^2 will be the amount for two years, R^3 for three years, &c.

As one pound is to its amount for any given time; so is any proposed principal sum to its amount for the same time.

Punitory INTEREST. See the article **PUNITORY**.

INTERFERING, in the manage. See **CUTTING**.

INTERJECTION, in grammar, an expression used to denote some sudden motion, or passion of the mind; as *oh!* *eh!* &c.

As the greatest part of the expressions used on these occasions are taken from nature alone, the real *interjections* in most languages are monosyllables. And as all nations agree in those natural passions, so do they agree in the signs and indications of them, as of love, mirth, &c.

Some deny the *interjections* to be words, or any part of speech, and make them mere natural signs of the motions or passions of the mind, expressed by these inarticulate sounds, several whereof brutes have in common with us. But as these are passions, and must be represented in discourse, the *interjection* has a good foundation in nature, and is a necessary part of speech.

The Greeks confound their *interjections* with *adverbs*; and the Hebrews confound them with their *adverbs* and *prepositions*, calling them all by the general name *particle*.

INTERIM, a term borrowed from the Latin, signifying in the mean time; it was first brought into popular use by Charles V. in order to compose the disturbances of Germany.

The *interim* of that prince was a kind of ordinance or regulation to be observed in the empire, with regard to the articles of religion then controverted, till such such time as they should be determined by a council; and therefore was called *interim*. It was said to have been drawn up by two Catholics and a Protestant: but as it retained most of the doctrines and ceremonies of the Romanists, excepting that of marriage, which was allowed to priests, and communion, which was administered to the laity under both kinds; most of the Protestants rejected it—those who admitted it were nick-named *Interimists*, or *Adiaphorists*. Indeed the *interim* equally diffused the generality of both parties, the Protestants and Catholics.

Besides this, there were two other *interims* made; the one called the *interim* of Leipzig; the other by the divines of Franconia, who refusing to accept the two former, made another for themselves.

INTERIOR. See **INTERNAL**, and **INTERNUS**.

Angle of INTERIOR Figure. See the article **ANGLE**.

INTERIOR Polygon. } See the article } **POLYGON**.

INTERIOR Talus. } See the article } **TALUS**.

INTERLINEATION, something inserted between two lines.

INTERLOCUTORY Order, that which decides not the cause, but only settles some intervening matter relating to the cause.

As, where an order is made in Chancery, for the plaintiff to have an injunction, to quit possession till the hearing of the cause: This order not being final, is called *interlocutory*.

INTERLOPING, the intercepting or disturbing the traffic of a company; or the taking up a new trade or employment,

INT

INT

pleasing, to the prejudice of those who were brought up

INTERLOPERS, are properly those, who without due authority hinder the trade of a company, or corporation lawfully established, by dealing in the same way.

INTERLUCAUTION, in husbandry, the thinning of a wood, or letting in light between, by lopping, or cutting away boughs.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play; to amuse the spectators while the actors take breath, and shift their dress; or to give time for changing the scenes, and decorations.

In the ancient tragedy, the chorus sung the *interludes*, to shew the intervals between the acts.

Interludes, among us, usually consist of songs, dances, feats of activity, concerts of music, &c.

Aristotle and Horace give it for a rule, that the *interludes* should consist of songs built on the principal parts of the drama: But since the chorus has been laid down, dancers, buffoons, &c. ordinarily furnish the *interludes*.

INTERMEDIATE, something betwixt two.—It is usually understood of the space of time elapsed from any certain point to any other.

INTERMEWING, in falconry, is a hawk's *merwing*, from the first change of her coat till the turn white.

INTERMITTENT, a thing which ceases its action for some time; which time is called the *interval*.

Thus fevers which go off, and soon return again, are called *intermittents*, in opposition to those which are always continued.

So a pulse which after so many strokes stops, or loses one in its due time, is called an *intermitting pulse*. See **PULSE**.

With regard to this it has been observed, that as often as the stomach is much inflated with wind, the nerves or plexus cardiacus at its orifice must suffer a contraction, which being continued to the heart, will occasion a twitching; and this, as it is more or less violent, will produce either only a simple *intermission* of pulse, or a real palpitation of the heart.

INTERNAL ANGLES, are all angles made by the sides of any right-lined figure within.

The sum of all the *internal angles* of any right-lined figure, is equal to twice as many right angles as the figure hath sides, except 4.

In a triangle, as KLM, (Tab. Geometry fig. 19.) the angles L and M, are particularly called *internal* and *opposite*, in respect of the external angle LKM, which is equal to them both.

INTERNAL ANGLE is also applied to the two angles formed between two parallels by a line intersecting those parallels, on each side the intersecting line.

Such are the angles z and y , and x and s , (Tab. Geometry, fig. 36.) formed between the parallels OP and QR, on each side the intersecting line ST.

The two *internal angles* are always equal to two right angles.

INTERNAL AND OPPOSITE ANGLE is also applied to the two angles s and y , (Tab. Geometry, fig. 36.) formed by a line cutting two parallels.

These are respectively equal to A and u, called the *external* and *opposite angles*.

INTERNODIUM, in botany, the space that is between two knots, or joints, of the stalk of a plant; *e. gr.* of the stalk of straw of wheat, or other corn.

INTEROSSEI Manus, the muscles which move the fingers; thus called from their situation, as being contained, *inter ossa*, between the spaces of the bones of the metacarpus.

Some reckon six of them, and others eight.—One half lie between the spaces these bones leave towards the palm of the hand; these are called the *internal interossei*, arising from the upper part of the bones of the metacarpus next the carpus; and being inserted on the internal sides of the first bones of the fingers with the lumbricales, serve as adductores digitorum, to bring the fingers to the thumb.

The other half, called *interossei externi*, are contained in the

spaces that the bones of the metacarpus leave on the back of the hand: these rise from the upper part of the bones of the metacarpus next the carpus, and are inserted on the external sides of the first bones of the fingers: These serve as abductores digitorum, to draw the fingers from the thumb. See Tab. Anat. (Mysl.) fig. 6. n. 23. fig. 7. n. 9, 50.

INTEROSSEI Pedis, the muscles which move the toes; in number, use, origin, and insertion, they answer exactly to those of the hand.

INTERPLEAD, or **ENTERPLEAD**. See **ENTERPLEAD**.

INTERPOLATION, a term used by critics in speaking of ancient writings and manuscripts, in which some spurious additions, or alterations have been since made.

To establish, or ascertain an *interpolation*, P. Ruinart gives us the five following rules. 1. That the piece supposed to be interpolated appear to have all the antiquity it pretends to:

2. That there be good proofs that it has been interpolated.

3. That the supposed interpolations agree to the time of the interpolator.

4. That the interpolations do not touch the foundation of the work, and that they be not too frequent, nor entirely disfigure the piece.

5. That the restitution made, agree perfectly to the rest of the work.

INTERPOSED Attic. See the article **ATTIC**.

INTERPOSITION, the situation of a body between two others, so as to hide them, or prevent their action. The eclipse of the sun is occasioned by an *interposition* of the moon between the sun and us; and that of the moon by the *interposition* of the earth between the sun and moon.

INTERPRETER*, a person who explains the thoughts, words, or writings of some other; which before were unintelligible.

* The word *interpreter*, according to Isidore, is composed of the preposition *inter*, and *partes*, as signifying a person in the middle betwixt two parties, to make them mutually understand each other's thoughts: Others derive it from *inter*, and *pres*, *i. e.* *adjuvator*; *q. d.* a person who serves as security between two others, who do not understand one another.

There have been great debates about *interpreting* scripture: The Romanists contend, that it belongs absolutely to the church; adding, that, where she is silent, reason may be consulted; but where she speaks, reason is to be disregarded. The Protestants generally allow reason to be the sovereign judge, or *interpreter*; though some among them have a strong regard to synods, and others to the authority of the primitive fathers. Lastly, others have recourse to the spirit within every person to *interpret* for them. Which is what Bochart calls *arbitrium tuum interpretatio*.

INTERREGNUM, the time during which a throne is vacant, or a kingdom without a head. See **INTERREX**.

In hereditary kingdoms, as England, there are properly no *interregnums*. In elective kingdoms, the *interregnums* are extremely liable to factions, and disorders. In Germany, the emperors have lost the greatest part of their dominions during the *interregnums*.

INTERREX, a magistrate who governs during an *interregnum*, or in the interval between the death of a monarch, and the election or inauguration of his successor.

This magistrate was established in old Rome, and was almost as ancient as the city itself: After the death of Romulus there was an *interregnum* of a year, during which the senators were each *interrex* in their turn, five days apiece.

After the establishment of consuls and a commonwealth, though there were no kings, yet the name and function of *interrex* was still preserved: For, when the magistrates were absent, or when there was any irregularity in their election, or they had abdicated, so that the comitia could not be held; provided they were unwilling to create a dictator, they made an *interrex*, whose office and authority was to last five days; after which they made another. To the *interrex* was delegated all the regal and consular authority, and he performed all their functions. He assembled the senate, held comitia, or courts, took care the election of magistrates was according to the rules. Indeed, at first it was not the custom of the *interrex* to hold comitia; at least we have no instance of it in the ancient Roman history.

The patricians alone had the right of electing an *interrex*.—This office fell with the republic; when the emperors made themselves masters of every thing.

INTERMENT, **INTERMENT**; or **ENTERMENT**, the act of *interring*; *i. e.* burying, or laying a deceased person in the ground.

The kings of England are *interred* at Westminster; those of France at Dennis, &c.—The excommunicated are not to be *interred* in holy, *i. e.* in consecrated, ground. The ancients did not *inter* their dead: they burnt them, as the Indians do at this day.

The custom of burning the dead ceased among the Romans under the empire of the Antonines; long before the Christians were allowed to *interr* in churches, which was even prohibited kings and emperors.

The Abyssinians, in lieu of *interring* their dead, shut them up in the bodies of trees, dug hollow for this purpose. Gardeners also *INTER*, or earth up, sallery, endive, and lettuce, to blanch, or whiten, and make them the tenderer.

To *interr* wild flocks in ditches, is what Columella calls, *deponere fœmina scrobibus*.—There are some trees, as willows, olives, &c. which grow very well, by *interring* their truncheons, i. e. cutting a truncheon, or piece off at both ends, and planting it in the ground: which is what the Latins call, *inburnare taleas, taleis serere*.

INTERROGATE, a judiciary act, performed by a judge, or commissioner deputed to examine, or question a party; who first gives his oath, that he will answer truly to every thing he is *interrogated*.

INTERROGATION, a figure of rhetoric, in which the passion of the speaker introduces a thing by way of question, to make its truth more conspicuous.

The *interrogation* is a kind of apostrophe which the speaker makes to himself; and it must be owned, that this figure generally adds an uncommon briskness, action, and force to discourse.

INTERROGATION, in grammar, is a point which serves to distinguish such parts of a discourse, where the author speaks as if he were asking questions. Its form is this?

INTERRUPTION, in matters of proportion, denotes the same with *disjunction*.

It is noted thus (::) and signifies the breaking off of the ratio in the middle of four disjunct or discrete proportionals: as A : B :: C : D; that is, as A is to B, so is C to D. See **RATIO, PROPORTION, &c.**

INTERRUPTION is also a figure in rhetoric, wherein a person breaks off his discourse suddenly; to shew some passion.

INTERSECTION, in mathematics, the cutting of one line, or plane, by another; or the point or line wherein two lines, or two planes, cut each other.

The mutual *intersection* of two planes is a right line. The centre of a circle is in the *intersection* of two diameters. The central point of a regular or irregular figure of four sides, is the point of *intersection* of the two diagonals.

The equinoxes happen when the sun is in the *intersections* of the equator and ecliptic.

INTERSOILING, in husbandry, the laying one kind of soil, or mould, upon another; as clay on sand, sand on earth, &c.

INTERSPERSUM *Vacuum*. See the article **VACUUM**.

INTERSPINALES Colli, the name of five pair of small muscles discovered by Mr. Cowper; and by him so called, from their position along the spine.

They arise from each double process of the spine of the neck, and run from the upper one to the next below, into which they are inserted.

They serve to draw together the vertebrae of the neck; and are more especially proper to this part, as having both their origin and insertion in it.

INTERSTELLAR, a word used by some authors to express those parts of the universe which are without, and beyond, the limits of our solar system.

In the *interstellar* regions are supposed to be several other systems of planets moving round the fixed stars, as the centres of their respective motions: And if it be true, as it is not improbable, that each fixed star is thus a sun to some habitable orbs, that move round it, the *interstellar* world will be infinitely the greatest part of the universe.

INTERTIES, or **INTERDUCES**, in architecture, those small pieces of timber which lie horizontally betwixt the summers, or betwixt them and the fell, or rafter.

INTERTRANSVERSALES Colli, certain muscles between the *transverse* processes of the vertebrae of the neck; serving for divers motions of the head: of the same size and figure with the *interspinales*, and observed by the same author. See *Philosoph. Transact.* n. 251. p. 131.

INTERVAL *, the distance or space between two extremes, either in time, or place.

* The word comes from the Latin *intervallum*, which, according to Isidore, signifies the space *inter solum et murum*, between the ditch and the wall: Others note, that the stakes or piles, driven into the ground in the ancient Roman balwarks, were called *valla*, and the interstices or vacancy between them *inter-valla*.

Angle of **INTERVAL**. } See the article } **ANGLE**.
Lucid **INTERVALS**. } **LUCID**.

INTERVAL, in music, the difference between two sounds, in respect of acute and grave; or that imaginary space terminated by two sounds differing in acuteness or gravity.

When two or more sounds are compared in this relation, they are either equal or unequal in the degree of tune: Such as are equal are called *unisons*, with regard to each other, as having one tune; the other, being at a distance from each other, con-

stitute what we call an *interval* in music; which is properly the distance in tune between two sounds.

Intervals are distinguished into *simple* and *compound*.

Simple INTERVAL, is that without parts, or division: such are the octave, and all that are within it; as the second, third, fourth, fifth, sixth, and seventh, with their varieties.

Compound INTERVAL, consists of several lesser *intervals*: such are all those greater than the octave; as the ninth, tenth, eleventh, twelfth, &c. with their varieties.

But this distinction, it is to be observed, regards practice only, because there is really no such thing as a least *interval*. Besides, by a *simple interval* is not meant here the least practised, but such as though it were equal to two or more lesser which are in use, yet when we would make a sound move so far up or down, we always pass immediately from one of its terms to the other.—What is meant then by a *compound interval*, will be very plain: It is such, whose terms are in practice taken either in immediate succession, or such where the found is made to rise and fall from the one to the other, by touching some intermediate degree; so that the whole becomes a composition of all the *intervals* from one extreme to the other.

What we here call a *simple interval*, the ancients called a *diastem*, and the *compound* they called a *system*.

Each of these has its differences; even of the *simple* there are some greater, and others less: but they are always discord; but of the *compound* or *systems*, some are concord, others discord. Unisons, it is plain, cannot possibly have any variety; for where there is no difference, as in unisonance, which flows from a relation of equality, it is plain there can be no distinction: Unisons therefore must all be concords. But an *interval* depending on a difference of tune, or a relation of inequality, admits of variety; and so the terms of every *interval*, according to their particular relation or difference, make either concord or discord. Some indeed have restrained the word *concord* to *intervals*, making it include a difference in tune: but this is precarious; for as the word *concord* signifies an agreement of sounds; it is certainly applicable to unisons in the first degree. *Intervals*, it is plain, may differ in magnitude, and there may be an infinite variety, according to the possible degrees of tune; for there is no difference so great or so little, but a greater or a less may possibly be conceived. It is true, with regard to practice, there are limits, which are the greatest and least *intervals* our ears are judges of, and which may be actually produced by voice or instrument.

The degrees of tune are proportional to the numbers of vibrations of the sonorous body in a given time, or the velocity of their courses and recourses.—Now these differences in tune constitute, as has been already said, the *intervals* in music; these therefore must be greater or less, as the differences are; and it is the quantity of these, which is the subject of the mathematical part of music.

Those *intervals* are measured, not in the simple differences or in arithmetical ratio's of the numbers expressing the lengths or vibrations, but in their geometric ratio's; so that the same *interval* depends on the same geometrical ratio, and *vice versa*. It is however to be observed, that in comparing the equality of *intervals*, the ratio's expressing them must be all of one species; otherwise this absurdity will follow, that the same two sounds may make different *intervals*.—To describe the particular methods of measuring the inequality of *intervals*, would be too tedious: this one rule may be observed; that, to determine in general which of two or more *intervals* are the greatest, take all the ratio's as proper fractions, and the least fraction will be the greatest *interval*.

The ancients were extremely divided about the manner of measuring *intervals*.—Pythagoras and his followers measured them by the ratio's of numbers. They supposed the differences of gravity and acuteness, to depend on the different velocities of the motion which causes found; and therefore concluded, that they could only be accurately measured by the ratio's of those velocities. Which ratio's are said to have been first investigated by Pythagoras, on occasion of his passing by a smith's shop, and observing a concordance betwixt the sounds of hammers striking on the anvil.

Aristoxenus opposed this. He thought reason and mathematics had nothing to do in the case, and that sense was the only judge in the dispute; the other being too subtle to be of any use. He therefore determined the octave, fifth and fourth, which are the most simple concords, by the ear; and by the difference of the fourth and fifth, he found out the tone; which, once settled as an *interval*, the ear could judge of, he pretended to measure every *interval* by various additions, and subtractions made of these mentioned one with another: But this method is very inaccurate.

Ptolemy keeps a middle course betwixt the two: He finds fault with the one for despising reason, and with the other for excluding sense; and shews how these two may mutually assist each other in this matter.

Concinnous INTERVALS. } See the article } CONCINNOUS.
 Diminished INTERVAL. } DIMINISHED.
 Harmonical INTERVAL. } HARMONICAL.

INTER TWISTED Suture. See the article SUTURE.

INTESTATE, a person who dies without making a will.
 An heir *ab-intestate*, is a person who inherits an estate by some other right, than that of will or testament.

Hitherto, those who died *intestate*, were held infamous, and accursed; in regard, by the canons of several councils, every person was enjoined to bequeath a part of his estate (and Matthew Paris says it was at least to be a tenth part) to the church, for the safety of his soul; which, a person who neglected to make a will, and to leave this legacy to the church, was judged to have abandoned.—Several councils took on them to command the priests to solicit dying persons to be charitable to the church; and this they did earnestly, that absolution and the viaticum were denied to those whom they could not prevail on; so that they made no difference between these *intestates* and self-murderers; and they were alike denied christian burial.—Du Cange adds, that all who died without absolution, without receiving the viaticum, and without leaving alms to the church, (even though they died suddenly) had their effects seized and confiscated to the use of the church, the bishop, &c.

In the English law there are two kinds of *intestates*: the one *de facto*, which are those who make no will at all; the other *de jure*, called also *quasi intestati*, which are those who make a will; but such a one as is null and void, either from the executors refusing to act, or from some other cause: in which case they are judged to die as *intestates*, *quasi intestati*.

INTESTINE Motion, that change of place which is found between the component particles whereof any body or mass consists.

The Cartesians suppose a continual *intestine motion* essential to fluidity.

It is certain, where the attracting corpuscles of any fluid are elastic, they must necessarily produce an *intestine motion*; that is, a visible motion or change of place among the minute parts of such fluid; and this greater or less, according to the degrees of their elasticity, and attractive forces. For two elastic particles after meeting, will fly from one another (abstracting the resistance of the medium) with the same degree of velocity with which they met: But when in flying back from one another, they approach other particles, their velocity will be increased.

INTESTINE War. See the article WAR.

INTESTINES, INTESTINA, in anatomy, the *guts*, or *bowels*; those hollow, membranous, cylindrical parts, extended from the right orifice of the stomach to the anus; by which the chyle is conveyed to the lacteals, and the excrements are voided.

The *intestines* seem to be nothing but a continuation of the stomach; as, consisting of the same number of coats, and fabricated in the same manner; they are protended with various circunvolutions and inflexions to the anus, through which they discharge the excrementitious part of their contents out of the body.

They are, when separated from the mesentery, to which they are all along connected, of a very great length; ordinarily about six times as long as the persons height whose they were. And though they seem to be but one continued channel or fistula, yet because in several parts their magnitude, figure, and thickness are different, they are in general divided into the *thick* and *small*; and these again are each of them subdivided into three; the three small are called *duodenum*, *jejunum*, and *ileum*; and the thick, *cæcum*, *colon*, and *rectum*.

They have all of them, in common, a kind of vermicular motion, which, beginning at the stomach, is propagated downwards, and is called the *peristaltic motion*. To facilitate that, they are generally lubricated with a great deal of fat, especially the thick ones, whose surface being somewhat more uneven, and the contents less fluid than those of the small, they need somewhat more to make them slide easy.—See *Tab. Anat.* (Blanch.) fig. 3. lit. m. fig. 6. lit. a. b. c. fig. 7. d. e. see also PERISTALTIC.

INTESTINA tenuia, the Small Guts.—The first is called *duodenum*, and reaches from the right orifice of the stomach, as far as the vertebrae of the back on the left side, where, at the first angle made by the *intestines* it ends, which is about twelve inches, from which measure it seems to have taken its name. This measure, however, is far from being very exact, as being much too largely computed. Into this gut the gall-duct and pancreatic-duct empty themselves, and their several liquors here mix with the chyle.

The next *intestine* is the *jejunum*, so called, because it is generally found more empty than the rest; which may be occasioned partly by the fluidity of the chyle, which is greater in this *intestine* than in any of those that follow it; and partly by its capacity, being somewhat larger than that of the *duodenum*, and therefore it gives a freer passage; and perhaps

also the irritation of this gut through the acrimony of the bile, which is discharged into the *intestines* a little before the beginning of this gut, may contribute something towards accelerating the passage of the contents. However, it may seem sufficient, that through the great number of lacteals, with which this gut abounds more than any other, the descent of the contents, which are here deprived of their most fluid parts, should in the rest be more sluggish, by reason of their great confidence.—This *intestine* is allowed to possess almost the whole umbilical region, and its length is generally computed to be about twelve or thirteen hands breadth.

The *ileum*, which is the third *intestine*, is situated below the navel, and fills the ilia with its numerous folds and convolutions.—It is much the longest of all the *intestines*, being esteemed to be one and twenty hands long: But these estimates are somewhat arbitrary, because it is not exactly settled among anatomists, where the jejunum ends, or the *ileum* begins; neither is it easy or necessary to do it.—In both this and the preceding *intestine*, the inner tunic is much corrugated, the loose folds of which have been thought to do, in some measure, the office of valves, and have therefore by authors been called *valvulae conniventes*; which are framed, as in the stomach, only by the inner coat being larger than the outward.

INTESTINA crassa, the Thick Guts.—The first is called the *cæcum*, which has a lateral inflexion into the upper end of the colon, and is not perforated at its other extremity, but hangs to it like the finger of a glove, and is about three or four inches long. The true use of this part is not yet determined, and some late anatomists have thought that the name likewise is mistaken, not allowing this to be the *cæcum* of the ancients, which they imagined to be that thick globous part of the colon, which is immediately appended to the ileum, and therefore they have given this part the name of *appendicula vermiformis*. This *cæcum*, or appendix, is proportionably bigger in infants than in adults, and in many other animals even smaller than in men; and is, at the unperforated extremity, slightly connected to the right kidney.

The next of the thick *intestines* is the *colon*, which is much the largest, and most capacious of them all. It begins with the *cæcum*, and is with that connected to the right kidney.

Thence with a winding course it proceeds towards the liver, where it is sometimes tied to the gall-bladder, and by that is tinged with yellow. From the liver it runs across under the bottom of the stomach, where it is by very fine thin membranes fastened to the spleen, and marches over the left kidney, where its cavity is sometimes very much straightened, and descending so to the bottom of the os ileum, and from thence returning to the upper part of the os sacrum, and there making the figure of a circumflex, it enters in the rectum.—At the entrance of the ileum into this gut there is placed a valve, formed out of the production of the inward coat of the ileum, which, like the finger of a glove, when its extremity is cut off, hangs loose in the cavity of the colon, by which means it stops the return of the excrements, though sometimes, as in inversions of the peristaltic motion, it proves not sufficient for that use. It has a great many cellular, or, as it were, distinct cavities, framed by a coarctation of the gut by two ligaments, or bundles of membranous fleshy fibres, about half a finger broad, each running on either side the gut opposite to each other, the whole length of it; and as it were girding it in at certain distances, thereby making it resemble a glass incorporator used in mixing oil and vinegar.—The last of the *intestines* is the *rectum*, which reaches from the os sacrum to the anus, and is plain, without cells. It is fast tied to the ossa sacrum and coccygis, by means of the perritoneum, and in men to the neck of the bladder of urine; in women to the vagina uteri, to which it is so strongly connected by a membranous substance, that the substance of the vagina and *intestine* are hardly distinguishable from one another. The length of this gut is ordinarily about a hand's breadth and an half, and its capacity about the thickness of three fingers; its lower end, the anus, is furnished with three muscles, viz. the *sphincter ani*, and two *levatori ani*, which see.

There are also in the *intestines* a great number of glands, which, in the *intestina tenuia*, are gathered together in heaps, as it were, like bunches of grapes. In these *intestines* they are very small, and were it not for their coacervations, would be scarce visible. But in the *intestina crassa* they are much larger, not gathered like the others, but dispersed; and, though very numerous, they come under the denomination of *solitary glands*. These glands discharge a liquor into the *intestines*, whether ordinarily for any thing more than the lubrication of the *intestines*, and diluting their contents, is not certain; though through these seems the greatest part of the discharge to be made, which, either upon extraordinary fluxes, or upon the administration of cathartics, we have frequent occasions to observe.

The *intestines*, in general, are furnished with blood from the mesenteric arteries, which is returned by the mesenteric veins: But the duodenum receives a branch of an artery from the cæliac, which is called *duodena*; to which answers a vein of the

same name, that likewise returns the blood to the porta; the rectum receives others, which are called *hemorrhoids*; the internal from the inferior mesenteric, and the external from the hypogastric, with veins corresponding of the same name, that also go to the porta. These vessels spread the *intestines* with abundance of ramifications, and are frequently diversified in several subjects of the same species; much less are they to be depended upon for an uniform appearance in animals of different kinds. The nerves of the *intestines* come some of them from those of the stomach, and some from the great mesenteric plexus, which distributes branches to all the *intestines*. The remaining vessels of the *intestines* are the lymphæducts, and venæ lacteæ.

INTIRE Tenancy. See the article ENTIRE TENANCY.
INTRANSITIVE Verbs, in grammar, such whose action does not (*transire*) pass on an object, or subject. See **VERBS Neuter.**

INTRIGUE*, or **INTREAGUE,** an assemblage of events, or circumstances occurring in an affair, and perplexing the persons concerned in it.

* The word is French, *intrigue* formed from the Latin *intricare*; which, according to Nonius, comes from *tricare*, entanglements; and that from the Greek *τριχης*, hairs: *quod pullos gallinacos involvant & impediunt capilli*. Which conjecture is adopted by Tripaud, who will have the word *intrigue* to be primarily and properly understood of chickens, which have their feet entangled in hair: and to be derived from the Greek *τριχης*, and *βηξ*, hair.

INTRIGUE, is more particularly used to signify the plot of a play, or romance; or that point wherein the principal characters are the most embarrassed, through the artifice and opposition of certain persons, of the unfortunate falling out of certain accidents, and circumstances.

In a tragedy, comedy, or epic poem, there are always two designs; the first and principal is that of the hero of the piece; the second contains the designs of all those who oppose him. These opposite causes produce opposite effects, to wit, the efforts of the hero for the execution of his design, and the efforts of those who thwart it. As those causes and designs are the beginning of the action, so those efforts are the middle, and there form a knot or difficulty, which we call an *intrigue*, that makes the greatest part of the poem. It lasts as long as the mind of the reader or hearer is suspended about the event of those opposite efforts; the solution or catastrophe commences when the knot begins to unravel, and the difficulties and doubts begin to clear up.

The *intrigue*, or plot of the *Iliad* is twofold; the first comprehends the three days fighting in Achilles's absence, and consists, on the one side, in the resistance of Agamemnon and the Greeks, and on the other, in the inexorable temper of Achilles. The death of Patroclus unravels this *intrigue*, and makes the beginning of a second. Achilles resolves to be revenged, but Hector opposes his design; and this forms the second *intrigue*, which is the last day's battle.

In the *Æneid* there are also two *intrigues*: the first is taken up in the voyage and landing of Æneas in Italy; the second in his establishment there. The opposition he met with from Juno, in both those undertakings, forms the *intrigue*.

As to the choice of the *intrigue*, and the manner of unravelling it, it is certain they ought both to spring naturally from the ground and subject of the poem.—Bosfu gives us three manners of forming the *intrigue* of a poem; the first, is that already mentioned; the second, is taken from the fable and design of the poet; in the third, the *intrigue* is so laid, as that the solution follows from it of course.

INTRINSIC, a term applied to the inner, real, and genuine values, properties, &c. of any thing; in opposition to their *extrinsic*, apparent, or popular values, &c. See **EXTRINSIC.**

INTRONATI, the name of an academy at Sienna in Italy.

The members of this academy contented themselves, at their first institution, with establishing the following six short laws: 1^o. To pray. 2^o. To study. 3^o. To be merry. 4^o. To offend no body. 5^o. Not to credit too lightly. 6^o. To let the world talk.

INTRUSION*, in the canon law, signifies the enjoyment of a benefice, or exercise of an office, without a good title to it. See **ENTRUSION.**

* The word is derived from the Latin verb *intrudere*, to thrust in, or enter by force.

Intrusion disqualifies the party from ever holding the benefice.
INVALID, a person wounded, maimed, or disabled for action by age.

At Chelsea and Greenwich are magnificent hospitals, or rather colleges, built for the reception and accommodation of *invalids*, or soldiers and seamen, worn out and disabled in the service.

At Paris is a college of the same kind, called *les Invalides*, which is accounted one of the finest buildings in that city.

INVECTED, in heraldry, denotes a thing fluted, or furrowed.

Invected is the just reverse of *engrailed*, in which the points are turned outward to the field: whereas in *invected* they are turned inward to the ordinary.

INVENTION, denotes the act of finding any thing new; or even the thing thus found.

Thus we say, the *invention* of gun-powder, of printing, &c.

The alcove is a modern *invention* owing to the Moors.

The Dorick, Ionic, and Corinthian orders are of Greek *invention*; the Tuscan and Composite of Latin *invention*.

Janfon ab Almelooven has written an *Onomasticon of inventions*, wherein are shewn, in an alphabetical order, the names of the inventors, and the time, place, &c. where they were made.—Pancirollus has a treatise of old *inventions* that are lost, and new ones that have been made; Polydore Virgil has also published eight books of the *inventors of things*, *De Inventoribus Rerum*.

INVENTION is also used for the discovery of a thing hidden.

The Romish church celebrates a feast on the fourth of May, under the title of, *invention of the holy cross*.

INVENTION is also used for subtilty of mind, or somewhat peculiar in a man's genius, which leads him to the discovery of things new.

In which sense we say, a man of *invention*: Wolfius has made some essays towards an art of *invention*.

INVENTION, in rhetoric, signifies the finding out, and chusing of certain arguments which the orator is to use for the proving his point, or moving his hearers passions.

Invention, according to Cicero, is the principal part of oratory: He wrote four books *De Inventionibus*, whereof we have but two remaining.

This *invention* of the orators cannot, according to lord Bacon, be properly called *invention*: to *invent*, is to discover things not yet known, not to recollect those that are; whereas the use and office of this rhetorical *invention*, is only out of the stock of knowledge laid up in the mind, to select such articles as make for the purpose.

The same author divides this faculty of *invention* into two parts, the one *topical*, the other *promptuary*; the first points out the way in which we are to pursue the argument, the latter only lays up and disposes things, for which we have frequent occasion, in the mind.

INVENTION, in poetry, is applied to whatever the poet adds to the history of the subject he has chosen; as well as to the new turn he gives it.

INVENTION, in painting, is the choice which the painter makes of the objects that are to enter the composition of his piece.

M. Felibien gives the general name *invention* to every thing that depends on the genius of the painter, as the ordonnance, the disposition of the subject, and even the subject itself, when it is new.

In another place that author distinguishes *invention* into two kinds; to wit, that which arises immediately from the mind of the painter, and that which he borrows from some other. The first is, when he absolutely invents the subject himself; and the second, when he borrows it from history, fable, &c.

De Piles observes, that *invention* is different from *disposition*, and that it is those two things together that form *composition*: for after having made a good choice of objects proper for the subject, they may be ill-disposed; and then, though the *invention* be never so good, the disposition or ordonnance will be faulty, and the piece will displease.

Of all the parts of painting, *invention*, doubtless, is that which gives the painter the fairest occasions of shewing his genius, his imagination, and his good sense.

INVENTORY, in law, a catalogue, or repertory orderly made, of all a dead man's goods, and chattels, prized by four or more credible men, which every executor or administrator is obliged to exhibit to the ordinary at such time as he shall appoint.

The use of the *inventory* is borrowed from the civil law; for whereas by the law of the ancient Romans the heir was obliged to answer all the testator's debts; by which means, inheritance sometimes became rather prejudicial than profitable: To obviate this inconvenience, Justinian ordained, that if the heir would first exhibit a true *inventory* of all the testator's effects, he should be no farther charged than to the value of the *inventory*.

INVENTORY, in trade, is a list or particular valuation of goods, &c. See **VALUE, APPRAISEMENT, &c.**

INVERSE, is applied to a manner of working the rule of three, or proportion, which seems to go backwards, or contrarily to the order of the common and direct rule.

In the rule of three direct, the first term is to the second, as the third is to the fourth; that is, if the second be greater than

than the third, or less than the first, in any proportion, the fourth is less than the third in the same proportion. — But in the *inverse* rule, the fourth term is as much greater than the third, as the second is less than the first.

In the *inverse* rule, therefore, the proportion is not, as the first is to the second, so is the third to the fourth; but as the fourth is to the first, so is the second to the third.

For instance, in the direct rule we say, If three yards of tapestry cost twenty pounds, how much will six cost? The answer is, forty. In the *inverse* rule we say, If twenty workmen make ten yards in four days, in how many days will forty do it? The answer to this is, in two days.

INVERSE Method of Fluxions. See the article FLUXIONS.

INVERSE Planting. See the article PLANTING.

INVERSE Proportion. See the article PROPORTION.

INVERSION, the act whereby any thing is inverted, or turned backwards.

Problems, in geometry, and arithmetic, are often proved by *inversion*, that is, by a contrary rule or operation.

INVERSION, in grammar, is where the words of a phrase are arranged in a manner not to natural as they might be.

For an instance: 'Of all vices, the most abominable, and that which least becomes a man, is impurity.'—Here is an *inversion*: the natural order being this Impurity is the most abominable of all vices, and that which least becomes a man. An *inversion* is not always disagreeable, but sometimes has a good effect.

INVERTED Crescent. } See the article CRESCENT.

INVERTED Point. } POINT.

INVERTED Volt. } VOLT.

INVESTIGATION, properly denotes the searching, or finding any thing out by the tracks, or prints of the feet.

Hence mathematicians, schoolmen, and grammarians, came to use the term in their respective researches.

INVESTIGATION of a Theme, is the art, method, or manner of finding the themes of verbs, that is, the primitive tense, mood, and person, of any verb, far removed from its source. To understand a Greek author, it is absolutely necessary to be well acquainted with the method of *investigating* a theme: This theme in the Greek tongue, is the present tense of the indicative mood.

Clenard was the first who introduced this term into grammar; he gives the title *investigatio thematici*, to that part where he teaches the manner of finding whence any person or tense of a verb proceeds, and of reducing it to its primitive word, or finding its indicative.

INVESTING, the act of conferring on any one the right or property of a fee, dignity or office; or of ratifying and confirming what has been obtained elsewhere.

The emperor pretends to a right of *investing* several princes both in Germany and Italy: There was formerly a particular ceremony for the *investing* of bishops.

After the election of a knight of the garter, he is *invested* by the sovereign with the two principal ensigns of the order, the garter and George.—Before his installation, he is also *invested* with the habit of the order.

INVESTING, in the military art, signifies the opening a siege, and the incamping of an army round the place, to block up its avenues, and prevent all ingress and egress.

It is the cavalry that always begins to *invest* a place.

INVESTING, in common law, signifies the putting in possession. A tenant is *invested* by giving him a verge or rod into his hands, and administering an oath.

Others define it thus, *investire est in fœm jus aliquem introducere*, to give livery of feisin or possession. See LIVERY, and SEISIN.

INVESTITURE, is used both for the right, and the act, of investing a tenant or vassal; that is, of receiving the faith and homage, by which a vassal becomes seized and possessed of a fee by his lord.

Investiture was antiently performed by rehearsing a formula of words; afterwards, by the delivery of such things as had the nearest resemblance to what was transferred. Thus, land passed by the delivery of a turf; and to shew the trees were transferred at the same time, a bough was cut, and delivered along with it.

In after-times the things by which *investitures* were made, were not so strictly observed. — Many were invested by the delivery of a staff, a glove, a knife, a piece of a cloke, of a strap, and a girdle; or by pricking the thumb, by giving the keys, a spit, a blow, a ring, a turf, a bough, a straw, &c. The *investiture* of a kingdom or lordship was performed by a standard, a banner, a cap, a sword, a bow, arrows, spurs, &c. The symbols were sometimes preserved in the repositories of the houses, and were annexed to the titles.

INVESTITURES were also used with regard to spiritual benefices. These were frequently performed by delivering the crozier and pastoral ring.

The kings of England and France, the emperors of Germany, &c. had formerly this right: so that on the death of a prelate, his clergy sent the crozier, &c. to their sovereign,

to be used at the ceremony of *investing* his successor. The first who disputed this privilege with them, was Gregory VI. Gregory VII. did it to some purpose; he excommunicated the emperor Henry IV. and forbade all ecclesiastics, under pain of excommunication, to receive *investiture* at the hands of secular princes. Paschal II. however, was obliged to confirm Henry V. in the right of giving *investitures*; but repenting what he had done, he excommunicated him, and reduced him to a necessity of begging absolution. At length that emperor was obliged, by pope Gelafius II. solemnly to renounce all *investitures* and elections.

INVOCATION, an act whereby we adore God, and call on him for his assistance.

The Romanists also practise *invocation* of saints; begging them to intercede with God in their behalf. This is one of the grand articles of dispute between the Romanists and the Reformed.

INVOCATION, in poetry, an address at the beginning of a poem, wherein the poet calls for the assistance of some god, particularly of his muse, or the deity of poetry. See MUSES.

This part is absolutely necessary in an epic poem, in regard the poet relates things which he could not be supposed to know, unless some deity inspired him. Besides, this serves his readers as an example of piety and devotion, which ought to be the foundation of his whole work. To these it may be added, that the gods themselves are to have a part in the action, and it is not decent he should set them to work, without first asking them leave.

Indeed, in the course of an epic poem, there are usually several *invocations*; particularly where any thing extraordinary or miraculous comes to be related, as that when Virgil describes the metamorphosis of Æneas's fleet into sea-nymphs: but the first *invocation* is always the most considerable.

In the *invocation*, Boffa considers two things; the first is, what the poet requests, the second, to what deity he addresses his request. — As to the first, Homer has joined the *invocation* so closely to the proposition, that he seems to *invoke* his muse for the whole work. — But Virgil, on the contrary, only requests his muse to furnish him with a part of his subject, and even mentions what particular part it is he desires. — After proposing his matter in all its extent, he begs the muse to acquaint him with the cause of it. See PROPOSITION.

As to the deity *invoked*, the same author observes, that it must always be, either the divinity that presides over poetry in general, or that which presides over the particular subject of the work. — Ovid's *invocation*, in his *Metamorphoses*, is of this latter kind, and so is that of Lucretius: those of Homer and Virgil are of the former kind; they only invoke the muses; and thus they distinguish between the divinities who preside over poetry, and those who preside over the actions of the poem, and have parts in it.

By the way, it may be observed, that the deities *invoked* are not looked on, even by the poets themselves, as divine personages from whom they expect any real assistance. — Under the name of *muses*, they wish for the genius of poetry, and for all the qualities necessary for the execution of their design. — These are mere allegories, or manners of expressing themselves poetically; just as when they make gods of sleep, of rest, fame, and other natural and moral things. And thus the muses come to be of all ages, countries, and religions; there are Pagan, Christian, Greek, Latin, and English muses.

INVOICE, or **INVOYCE**, a list or account of commodities, with their value, customs, provision, charges, &c. sent by a merchant to his factor, or correspondent in another country. See the article BOOK.

INVOLUNTARY Motion. See the article MOTION.

INVOLUTION, in algebra, the raising any quantity from its root to any height, or power assigned. See POWER.

Thus, if $a+b$ were to be squared, or raised to its second power, they say, *involve* $a+b$; that is, multiply it into itself, and it will produce $a^2 + 2ab + b^2$.

And if it be *involved* again, or if that square be multiplied by the root, the cube or third power will be produced, viz. $aaa + 3aab + 3bba + bbb$. See EVOLUTION.

INWARD flanking Angle. See the article ANGLE.

JOACHIMITES, the name of a sect, the followers of one Joachim, abbot of Flora, in Calabria, who was esteemed a prophet while he lived, and left, at his death, several books of prophecies, besides other works; which were condemned together with himself in 1215, by the council of Lateran; and by the council of Arles, in 1260.

The *Joachimites* were particularly fond of certain ternaries. The Father, said they, operated from the beginning till the coming of the Son; the Son from that time to theirs, viz. the year 1260, and the holy Spirit then took it up, and was to operate in his turn. — Hence, they divided every thing that related to men, time, doctrine, and manner of living, into three classes or states, according to the three persons in the Trinity; every one of which states either had already, or was hereafter to succeed in its turn: and hence they called their divisions *ternaries*.

The first ternary was that of *men*: This comprehended three states or orders of men; the first state was that of married people, which had lasted, according to them, the whole period of the Father; that is, the time of the Old Testament: The second was that of clerks, which lasted during the time of the Son: The third was that of monks, wherein was to be an uncommon effusion of grace, by the holy Spirit. —The second ternary was that of *doctrine*, which they divided also into three: The Old Testament, which they attributed to the Father; the New, which they attributed to the Son; and the everlasting gospel which they attributed to the holy Spirit. —In the ternary of *time*, they gave all the time elapsed from the beginning of the world till the coming of Christ, to the Father; in which time, said they, the spirit of the law of Moses prevailed. They gave to the Son the 1260 years from Jesus Christ to their time; during which the spirit of grace prevailed. —Lastly, the third, which was, to come, and which they called the time of the *greatest grace*, was for the holy Spirit. —Another ternary consisted in the manner of living: In the first time, under the Father, men lived according to the flesh; in the second under the reign of the Son, men lived according to the flesh and the spirit; in the third, which was to last to the end of the world, they were to live according to the Spirit only. The *Jacobinites* maintained, that in the last times all sacraments and signs were to cease; and the truth was to appear openly, and without any veil.

JOBBER, a person who undertakes *jobs*, or small pieces of work.

In some statutes, *jobber* is used for a person who buys and sells cattle for others. See **BROKER**.

JOBBENT Nails. See the article **NAILS**.

JOHIS, a sect of heathen religious in the East Indies, who never marry, nor hold any thing in private property; but live on alms, and practise strange severities on themselves.

They are subject to a general, who sends them from one country to another to preach. They are properly a kind of penitent pilgrims, and are supposed to be a branch of the ancient Gynnoprophits.

They frequent principally such places as are consecrated by the devotion of the people, and pretend to live several days together without eating or drinking. After having gone through a course of discipline for a certain time, they look on themselves as impeccable, and privileged to do any thing; upon which they give a loose to their passions, and run into all manner of debauchery.

JOHN.—*Christians of S. JOHN*. } See **CHRISTIANS**.
Hermits of S. JOHN Baptist. } **HERMITS**.
Prefter JOHN. } **PREFTER**.

JOINDER, or **JOYNDER**, in law, is the coupling or joining two persons in one action, or suit against another.

JOINERY. } See the article **JOINERY**.

JOINING of Issue. } **ISSUE**.

JOINT, the juncture, articulation, or assemblage of two, or more things. See **ARTICULATION**.

JOINTS, in architecture, denote the separations between the stones, which are filled with mortar, plaster, or cement.

JOINT, in carpentry, &c. is applied to several manners of assembling, or fitting pieces of wood together.—Thus we say, a *dove-tail joint*, &c. See **MORTISE**, **DOVE-TAIL**, &c.

JOINT-Battery. } See the article **BATTERY**.

JOINT-Rule. } **Carpenters' JOINT RULE**.

JOINTENANTS, or **JOINT-TENANTS**, in law, those who come to, and hold lands and tenements by one title, *pro indiviso*, or without partition.

These are distinguished from *sole*, or several tenants, from *coparceners*, and from *tenants in common*.—Antiently they were called *participes*, and not *hæredes*. See **SOLE Tenant**.

Jointenants must jointly plead, and be jointly impleaded and sued by others; which is common to them and coparceners.

—But *joint-tenants* have a peculiar quality of survivorship, which coparceners have not; so that if there be two or three *joint-tenants*, and one hath issue, and dies, he, or those *joint-tenants* that survive, shall have the whole by survivorship.

JOINTURE, a covenant whereby the husband, or some friend in his behalf makes over to his wife, on condition of marriage, certain lands and tenements for term of her life, or otherwise, in lieu of dower. See **DOWER**.

JOISTS, or **JOYSTS**, in architecture, those pieces of timber, framed into the girders and summers, on which the boards of floors are laid.

Joists are from six to eight inches square, and ought seldom to lie at a greater distance from each other than ten inches, never than twelve; nor ought they ever to bear at a greater length than ten foot, or to lie less into the wall than eight inches.

Sometimes the carpenters furr their *joists*, as they call it, that is, they lay two rows of *joists*, one over the other.

JONCTURE, or **JOINTURE**, the same with *joint*, which see.

IONIC, in architecture, the name of one of the five orders of columns.—See *Tab. Architectæ*. fig. 32.

The first idea of the *Ionic* was given by the people of Ionia; who, according to Vitruvius, formed it on the model of a young woman, dressed in her hair, and of an easy, elegant shape: whereas the *Doric* had been formed on the model of a strong, robust man.

The *Ionic* column is the third in order, and is distinguished from the Composite, in that it has none of the leaves of acanthus in its capital; and from the Tuscan, *Doric*, and Corinthian, by the volutes, or rams-horns, which adorn its capital; and from the Tuscan and *Doric* too, by the channels or fluting in its shaft.

This column is a medium between the massive and the delicate orders, the simple and the rich. Its height is eighteen modules, or nine diameters of the column taken at the bottom. —When it was first invented, its height was but sixteen modules; but the artists rendered it still more beautiful than the *Doric*, augmented its height, by adding a base to it, which was unknown in the *Doric*.

M. le Clerc makes its entablature to be four modules and ten minutes, and its pedestal fix entire modules; so that the whole order makes twenty-eight modules ten minutes.

It is said, the temple of Diana at Ephesus, the most celebrated edifice of all antiquity was of this order.—At present, it is properly used in churches and religious houses, and in courts of justice, and other places of tranquillity and devotion.

This order has one advantage above any of the rest; and it consists in this, that the fore and hind parts of its capital are different from the sides. But this is attended with an inconvenience, when the ordonnance is to turn from the front of the building to the side; to obviate which, the capital may be made angular, as is done in the temple of Fortuna Virilis. Scamozzi, and some other modern Architects, have introduced the upper part of the composite capital in lieu of the *Ionic*, imitating that of the temple of Concord, whose four sides are alike: to render it more beautiful, the volute may be made a little oval and inclining.

IONIC Base. } See the article **BASE**.
IONIC Corniche. } **CORNICHE**.
IONIC Frieze. } **FRIEZE**.
IONIC Pedestal. } **PEDESTAL**.

IONIC Dialect in grammar, a manner of speaking peculiar to the people of Ionia.

At first it was the same with the antient Attic; but passing into Asia, it did not arrive at that delicacy and perfection to which the Athenians attained. Instead of that, it rather degenerated, in Asia Minor; being corrupted with the admixture of foreign idioms.

In this dialect it was that Herodotus, Hippocrates, and Galen wrote.

IONIC Transmigration, was heretofore a celebrated epocha, which took its rise from the retreat of the Athenian colonies; who, upon the death of Codrus, put themselves under the command of his son Neleus, and established the twelve cities of Ionia in Asia.

These colonies, according to Eratosthenes, were established fifty years after the return of the Heraclidæ; and, according to Martham, seventy seven years after the taking of Troy.

IONIC Sect, was the first of the antient sects of philosophers.

The founder of this sect was Thales, who being a native of Miletus in Ionia, occasioned his followers to assume the appellation of *Ionic*.

It was the distinguishing tenet of this sect, that water was the principle of all natural things.

This is what Pindar alludes to in the beginning of his first Olympic ode.

IOVIALE Arcanum. } See the article **ARCANUM**.

IOVIALE Bezoardicum. } **BEZOARDICUM**.

JOURNAL, a day-book, register, or account of what passes daily. See **DIARY**.

JOURNAL, in merchants accounts, is a book into which every particular article is posted out of the waste-book, and made debtor.—This is to be very clearly worded, and fairly engrossed.

JOURNAL, in sea-affairs, is a register kept by the pilot and others, wherein notice is taken of every thing that happens to the ship from day to day, and from hour to hour, with regard to the winds, the rhumbs, the rake, foundings, &c. in order to enable him to adjust the reckoning, and determine the place where the ship is.

JOURNAL, is now become a common name for news-papers, which detail the daily transactions of Europe.

JOURNAL is also used for the title of several books which come out at stated times, and give abstracts, accounts, &c. of the new books that are published, and the new improvements daily made in arts, and sciences.

The first *journal* of this kind was the *Journal des Savans*, printed at Paris: The design was set on foot for the ease of such as are too busy, or too lazy, to read the entire books themselves. It seems an excellent way of satisfying a man's curiosity, and of becoming learned upon easy terms: And so useful

ful has it been found, that it has been executed in most other countries, though under a great variety of titles.

Of this kind are the *Philosophical Transactions* of London; the *Acta Eruditorum* of Leipzig; the *Novelles de la Republique des Lettres* of Mr. Bayle, &c. the *Bibliothèque Universelle, Choïse, & Ancienne & Moderne*, of M. le Clerc; the *Memoires de Trevoux*, &c.

In 1692, Juncker printed in Latin, *An Historical Treatise of the Journals of the Learned, published in the several parts of Europe*; and Wolfius, Struvius, Morhoff, Fabricius, &c. have done something of the same kind.

The *Memoirs of the Royal Academy of Sciences*; those of the *Academy des Belles Lettres*; the *Miscellanea Naturæ Curiosum*; the experiments of the academy del Cimento; the *Acta Philo-Sophicorum Naturæ & Artis*, which appeared from March 1686 to April 1687, and which are a history of the academy of Bresle; and the *Miscellanea Berolinensia*, or memoirs of the academy of Berlin, are not so properly *Journals*, though they are frequently ranked in the number.

Juncker and Wolfius give the honour of the first invention of *Journals* to Photius. His *Bibliotheca*, however, is not altogether of the same nature with the modern *Journals*; nor was his design the same. It consists of Abridgments, and extracts of books which he had read during his embassy in Persia.

M. Salo first began the *Journal des Savants* at Paris in 1665, under the name of the Sieur de Hedouville; but his death soon after interrupted the work. The abbot Gallois then took it up, and he in the year 1674 gave way to the abbot de la Roque, who continued it nine years, and was succeeded by M. Coufin, who carried it on till the year 1702; when the abbot Bignon instituted a new society, and committed the care of continuing the *Journal* to them, who improved and published it under a new form.—This society is still continued, and M. de Voyer has the inspection of the *Journal*; which is no longer the work of any single author, but of a great number.

The other French *Journals* are the *Memoirs and Conferences of Arts and Sciences*, by M. Dennis, during the years 1672, 1673, and 1674: *New Discoveries in all the Parts of Physic*, by M. de Blegny. The *Journal of Physic*, begun in 1684; and some others, discontinued almost as soon as begun.

The *Novelles de la Republique des Lettres*, news from the republic of letters, were begun by M. Bayle in 1684, and carried on by him till the year 1687, when M. Bayle being disabled by sickness, his friends, M. Bernard and M. de la Roque, took them up, and continued them till 1699. After an interruption of nine years, M. Bernard resumed the work, and continued it to the year 1710. The *History of the Works of the Learned*, by M. Bagnage, was begun in the year 1686, and ended in 1710. The *Universal Historical Library*, by M. le Clerc, was continued to the year 1693, and continued twenty five volumes. The *Bibliothèque Choïse* of the same author, began in 1703. The *Memoirs for a History of Sciences and Arts*, usually called *Memoirs des Trevoux*, from the place where they are printed, began in 1701. The *Essays of Literature*, reached but to a twelfth volume in 1702, 1703, and 1704: These only take notice of ancient authors. The *Journal Littéraire*, by father Hugo, begun and ended in 1705.—At Hamburg, they have made two attempts for a French *Journal*, but the design failed: An *Ephemerides Savantes* has also been undertaken, but that soon disappeared. A *Journal des Savants*, by M. Datis, appeared in 1694, and was dropt the year following. That of M. Chauvin begun at Berlin in 1696, held out three years; and an essay of the same kind was made at Geneva. To these may be added, the *Journal Littéraire* begun at the Hague in 1715; and that of Verdun, and the *Memoirs Littéraires de la Grande Bretagne*, by M. de la Roche, whereof there have been fifteen tomes, and which is confined to English books alone.

The English *Journals* are, the *History of the Works of the Learned*, begun at London in 1699. *Censura Temporum*, in 1708. About the same time there appeared two new ones; the one under the title of, *Memoirs of Literature*, containing little more than an English translation of some articles in the foreign *Journals*, by M. de la Roche; the other a collection of loose tracts, entitled, *Bibliotheca curiosa*, or a *Miscellany*.

The Italian *Journals* are, that of abbot Nazari, which lasted from 1668 to 1681, and was printed at Rome. That of Venice began in 1671, and ended at the same time with the other: The authors were, Peter Moretti and Francis Milleti. The *Journal* of Parma, by Roberti and father Bacchini, was dropped in 1690, and resumed again in 1692. The *Journal* of Ferrara, by the abbot de la Torre, begun and ended in 1691. *La Galleria di Minerva*, begun in 1696, is the work of a society of men of letters. Signior Apollolo Zeno, secretary to that society, begun another *Journal* in 1710, under the protection of the grand duke: it is printed at Venice, and several persons of distinction have a hand in it. The *Fatti Bruditi della Bibliotheca Volante*, were published at Parma.

The principal among the Latin *Journals* is that of Leipzig, kept under the title of *Acta Eruditorum*, begun in 1682. P. P. Manzani begun another at Parma. The *Nova Literaria*

Maris Baltici, lasted from 1698 to 1708. The *Nova Literaria Germanica*, collected at Hamburg, begun in 1703. The *Acta Literaria ex Manuscriptis*, and the *Bibliotheca curiosa*, begun in 1705, and ended in 1707, are the work of Struvius. Mess. Kufter and Sike, in 1697, begun a *Bibliotheca Novorum librorum*, and continued it for two years. The Swiss *Journal*, called *Nova Literaria Helvetica*, was begun in 1702, by M. Scheuchzer; and the *Acta Medica Hofnensis*, published by T. Bartholin, make five volumes from the year 1671, to 1679.

There are two Low-Dutch *Journals*; the one under the title of *Boekzaal van Europe*: it was began at Rotterdam in 1692; by Peter Rabbus; and continued from 1702 to 1708, by Mess. Sewel and Gavern; the other is done by a physician, called Ruiter, who began in 1710.

The German *Journals* of best note are, the *Monatlichen Unterredungen*, which held from 1689, to 1698. The *Bibliotheca curiosa* begun in 1704, and ended in 1707, both by M. Tentzel. The *Journal* of Hanover begun in 1700, and continued for two years by M. Ecard, under the direction of M. Leibnitz, and afterwards carried on by others. The *Theological Journal*, published by M. Loefcher, under the title of *Altri & Neues*, that is, old and new. A third at Leipzig and Francfort, the authors Mess. Walterer, Krause, and Groschuffius; and a fourth at Hall, by M. Turk.

JOURNEY, Sabbath Days. See the article **SABBATH**.

JOURNEY-MAN*, antiently signified a person who wrought with another by the day; though now, by the statute, it extends to those likewise who covenant to work with another in their occupation or trade by the year.

* The word is formed from the French *journee*, a day's work.

JOY. See the articles **PLEASURE**, and **PAIN**.

JOYNNERS Prefr. See the article **PRESS**.

JOYNERY, the art of working in wood, and of fitting or joining various parts or members of it together.

The French call it *menuiserie*, from *minutaria* small work; by which it is distinguished from carpentry, which is conversant in the larger and less curious work.

Column of JOYNNERY. See the article **COLUMN**.

IPECACUANHA, a little wrinkled root, about the thickness of a moderate quill, brought hither from several parts of the West-Indies; much used as an emetic, and against diarrheas and dysenteries.

There are four kinds of *Ipecacuanha*; viz. a brown, a black, a grey, and a white one;—the grey is most esteemed in physic; though the brown is that the most used, as being easiest had:—This latter is firm, twisted, difficult to break, of a sharp bitter taste, and grows plentifully not far from Carthagena.—The root of the grey *ipecacuanha* is longer than any of the other sorts: It is also more violent in its operation. It comes from Peru, by the way of Porto-bello: The Spaniards call it *hexagilla*.—The white *ipecacuanha* differs from the others, not only in colour, but in figure too, being less twisted, or rugged, than them; and more resembling the root of white dittany. This grows in Brazil and Martinico.

The *ipecacuanha* is purgative, and astringent; it is also an excellent vomitive; and is found one of the best and surest remedies hitherto discovered for a dysentery.

There are divers false species of *ipecacuanha*, or roots, which, on account of their external appearance, bear the denomination of *ipecacuanha*, and are sometimes sold for it.—Dr. Douglas mentions two: the one white, resembling the true white, only larger in size, straighter and softer to the touch.—The other brown, of a deeper colour than the true brown, and sometimes mixed with red: whence it has also been called red *ipecacuanha*.—These are both produced in Maryland and Virginia, where they are used as vomitives by the lower sort. Sir Hans Sloane has discovered, that the latter is no other than the root of a poisonous apocynum, described by him in his *Natural History of Jamaica*. See *Philosop. Transact.* N^o. 410. p. 156, 169q.

IRASCIBLE, a term in the old philosophy, applied to an appetite, or a part of the soul where anger, and the other passions which animate us against things difficult, or odious, were supposed to reside.

Of the eleven kinds of passions attributed to the soul, philosophers ascribe five to the *irascible* appetite; viz. wrath, boldness, fear, hope, and despair: the six others are charged on the concupiscible appetite; viz. pleasure, pain, desire, aversion, love and hatred.

Plato divided the soul into three parts; the reasonable, *irascible*, and concupiscible parts. The two last, according to that philosopher, are the corporeal and mortal parts of the soul, which give rise to our passions.

Plato fixes the seat of the *irascible* appetite in the heart; and of the concupiscible, in the liver; as the two sources of blood and spirits, which alone affect the mind.

IRENARCHIA*, a military officer in the Greek empire; whose business was to provide for the peace, security, and tranquillity of the provinces.

* The word is Greek, *ἱρεναρχία*, composed of *ἱρεν*, peace, and *αρχία*, prince, from *αρχω*, command, office.

I R O

In Justinian's code it is mentioned, that the *irenarchæ* are sent into the provinces to maintain the public peace, by punishing crimes, and putting the laws in execution.

Besides this, there was another *irenarcha* in the cities, to whom belonged the preserving of peace, and quelling sedition among the citizens. This officer was sometimes also called *præfectus urbis*.

The emperors Theodosius and Honorius suppressed the office of *irenarchæ*, on account of their abusing their trust, and distressing and persecuting the people, instead of maintaining peace among them.

IRIS*, *Rainbow*. See the article RAINBOW.

* The word is Greek, *ἶρις*, supposed by some to be derived from *ἰσθω*, I speak, I tell; as being a meteor that is supposed to foretell rain.

IRIS, in anatomy, a striped variegated circle round the pupil of the eye, formed of a duplicate of the uvea.

The *iris*, in different subjects, is of several very different colours: In its middle is a perforation through which appears a little black speck, called the *fight*, *pupil*, or *apple of the eye*, round which the *iris* forms a ring.

IRIS is also applied to those changeable colours which sometimes appear in the glasses of telescopes, microscopes, &c. so called from their similitude to a rainbow.

The same appellation is also given to that coloured spectrum, which a triangular prismatic glass will project on a wall, when placed at a due angle in the sun-beams.

IRISH Terms. See the article TERMS.

IRON, a hard, fusible, and malleable metal, of great use in the affairs of life.

Iron consists of an earth, salt, and sulphur, but all impure, ill mixed, and digested; which renders it extremely liable to rust.

It is the hardest, driest, and the most difficult to melt, of all metals. It may be softened by heating it often in the fire, hammering it, and letting it cool of itself; and it is hardened by extinguishing it in water.

It may be rendered white, by cooling it in sal armoniac and quicklime. The strongest temper of *iron* is said to be that which it takes in the juice of earth worms.

A red hot *iron* applied to a roll of sulphur, dissolves and falls into a fine dust.

Iron has a great conformity with copper; and the two are not easily separated, when folded together: whence arises that uncommon friendship which the poets feign between Mars and Venus.

It has a great conformity also with the loadstone. Rohault observes that it is itself an imperfect loadstone; and that if it be a long time exposed in a certain situation, it becomes a real loadstone; and mentions the *iron* in the keeple of Notre Dame at Chartres as an instance.

There are several kinds of *iron*, which have properties very different from one another:—as,

English Iron, which is coarse, hard, and brittle, fit for fire-bars, and such uses.

Swedish Iron, which is a fine, tough sort, will best endure the hammer, is softest to file, and in all respects the best to work upon.

Spanish Iron, which would be as good as the Swedish, were it not subject to red-fer, that is, to crack betwixt hot and cold.

German Iron, commonly called among us *Dort square*, because it is brought hither from Dort, and is wrought into bars of three quarters of an inch square; this is a coarse *iron*, and only fit for ordinary uses.

There is another sort used for making of wire, which is the softest, and toughest of all: This is not peculiar to any country, but is indifferently made wherever *iron* is made, though of the worst sort; for it is the first *iron* that runs from the mine-stone, when it is melting, and is reserved purely for the making of wire.

Generally speaking, the best *iron* is that which is softest and toughest, and which, when it breaks, is of an even greyish colour, without any glittering specks, or any flaws or divisions like those seen in broken antimony.

To give *iron* a blue colour, with a grind-stone they rub off the black scurf, then heat it in the fire; and as it grows hot, it will change colour by degrees; become first of a gold colour, and then of a beautiful blue. Sometimes the workmen rub a mixture of indigo and salad oil on it, while it is heating, and let it cool of itself.

Square and flat bars of *iron* are sometimes twisted, for ornament: the manner of doing which is this: After the bar is square, or flat forged, they give it a flame heat, or if the work be small, only a blood-red heat; in which state it is easy to twist it about as much or as little as they please, with the tongs, vice, or the like.

The several heats which smiths give their *iron* in working are, 1^o. A sparkling or welding heat, which is used when they double up their *iron*, or weld two pieces of *iron* together, end

I R R

to end. 2^o. A flame or white heat, which is used when the *iron* has not its form and size, but must be forged into both. 3^o. A blood-red heat, which is used when the *iron* has already its form and size, but wants a little hammering to smooth and fit it for the file.—If the *iron* be made too hot, it will red-fer, i. e. break or crackle under the hammer while it is working between hot and cold.

We have a great number of *iron works* in most parts of England; those in the forest of Dean, in Gloucestershire, are in most repute.

The ore is there found in great abundance, differing much in colour, weight, and goodness. The best, called *bray-ore*, is of a bluish colour, very ponderous, and full of little shining specks, like grains of silver; this affords the greatest quantity of *iron*, but being melted alone, it produces a metal very short and brittle, and therefore not so fit for common use. For the remedying whereof, the workmen make use of another sort of material, termed *cinder*, which is nothing but the refuse of the ore, after the metal has been extracted; and which being mingled with the other, in a due quantity, gives it that excellent temper of toughness, which causes this *iron* to be preferred before any brought from foreign parts.

After they have provided the ore, their first work is to calcine it, which is done in kilns, much after the fashion of our ordinary lime-kilns: these they fill up to the top with coal and ore, stratum super stratum, that is, one layer upon another: and so putting fire to the bottom, they let it burn till the coal be wasted, and then renew the kilns with fresh ore and coal, in the same manner as before.—This is done without fusion of the metal, and serves to consume the more drossy part of the ore, and to make it brittle; supplying the beating, and washing which are used in other metals.

From hence they carry it to their furnaces, which are built of brick or stone, and are about twenty four foot square on the outside, and near thirty foot in height within, not above eight or ten foot over where widest, which is about the middle: the top and bottom having a narrow compass, much like the shape of an egg. Behind the furnace are fixed two huge pair of bellows, the noles of which meet at a little hole near the bottom: these are compressed together by certain buttons, placed on the axis of a very large wheel, which is turned about by water, in the manner of an over-shot mill. As soon as these buttons are slid off, the bellows are raised again by the counterpoise of weights, whereby they are made to play alternately, the one giving its blast while the other is rising.

At first they fill the furnace with ore and cinder, intermixed with fuel, which in these works is always of charcoal, laying them hollow at the bottom, that they may more easily take fire; but after they are once kindled, the materials run together into a hard cake or lump, which is sustained by the fashion of the furnace: and through this the metal, as it melts, trickles down into the receivers set at the bottom, where there is a passage open, by which the men take away the scum and dross, and let out the metal as they see occasion. Before the mouth of the furnace there lies a great bed of sand, wherein they make furrows of the shape into which they would have their *iron* cast. As soon as the receivers are full, they let in the metal, which is made so very fluid by the violence of the fire, that it not only runs to a considerable distance, but stands afterwards boiling for a good while.

When the furnaces are once at work, they keep them constantly employed for many months together, never suffering the fire to slacken night or day, but still supplying the wasting of the fuel, and other materials, with fresh poured in at the top: charcoal is used altogether in this work, sea-coal will scarcely do.

From these furnaces the workmen bring their *sows* and *pigs* of *iron*, as they call them, to their forges, where they are wrought into bars.

For the refining of Iron. }
For the conversion of Iron into Steel. } See { REFINING.
Harping Iron. } { STEEL.
 { HARPING.

IRON-MOULDS, yellow lumps of earth or stone, found in chalk-pits, about the Chiltern in Oxfordshire and elsewhere; being in reality a kind of Pyrites or indigested *iron* ore.

IRON-SICK, is applied to a ship or boat, when her bolts, nails, or spikes are so eaten with rust, that they make hollows in the planks, whereby the ship leaks.

IRONY*, a figure in speech, wherein we plainly intend something very different from what our words express: as when we seem to praise a person at a time when we evidently railly, and discommend him.

* The word is derived from the Greek, *ἰρωνία*, dissimulation.

Hence Quintilian calls this figure *diversilequium*, *dissimulation*, and *illusion*.

Thus we say, John's a very honest fellow; meaning he is a rank knave: A fine historian indeed! meaning, a liar.—The *irony* discovers itself rather in the tone of the speaker than in the words.

IRRADIATION, signifies an emanation, or shooting out of rays, or subtle effluvia from any body. See EMANATION, RAY, EFFLUVIA, and QUALITY.

IRRATIONAL

IRRATIONAL Numbers, the same as *furd numbers*. See **SURD**, and **NUMBER**.

IRRATIONAL Quantities. } See { **RATIONAL Quantities**.
IRRATIONAL Soul. } See { **SOUL**.

IRREGULAR, something that deviates from the common forms or rules.

Thus we say, an *irregular fortification*, an *irregular building*, an *irregular figure*, &c. See **BUILDING**, **FORTIFICATION**, **FIGURE**, **BASTION**, and **PLACE**.

IRREGULARS, in grammar, are such inflexions of words as vary from the general rule, or pattern.

IRREGULAR, among casuists, is applied to a person who is unqualified for entering into orders, as being a bastard, maimed, &c. or to an ecclesiastic, who is interdicted, suspended, or censured, and by that means rendered incapable of holding a benefice, or discharging any of the sacred functions.

IRREGULAR Bodies, are solids not terminated by equal and similar surfaces.

IRREGULAR, in the art of building, is applied not only to the parts of an edifice which deviate from the proportions established by antique monuments, and confirmed by architects; as when a Doric column is made nine modules high, or a Corinthian eleven; but also to the places and figures of buildings, where the angles and sides are made unequal, as in most of the ancient castles; where, without any necessity or confinement from the situation, they affected such irregularity.

A column is also said to be *irregular*, not only when it deviates from the proportions of any of the five orders, but when its ornaments, whether in the shaft or the capital, are absurd and ill chosen.

IRREGULARITIES in the Moon's motion. See **MOON**.

IRREPLEVIABLE Returnum. See **RETURNUM**.

IRREPLEVABLE, or **IRREPLEVISABLE**, in common law, signifies what may not be replevied, or set at large upon sureties.

IRRORATION, sometimes denotes a kind of transplantation, used for the cure of certain diseases, by sympathy.

It consists in sprinkling every day either trees, or other proper plants, with the urine or sweat of the patient, or with the water wherein his body, or at least the part affected, has been washed; till such time as the disease is removed.—As soon as the sprinkling has been made, they throw fresh earth about the roots, in order to prevent the virtue of the mummy, that is, of the vital spirit of the liquid, from evaporating into the air. This is all an idle and foolish practice, now deservedly laughed out of the world.

ISCHIADIC*, ΙΣΚΙΑΔΙΚΟΣ, an epithet given by physicians to two veins of the foot, which terminate in the crural.

* The word is derived from the Greek, ΙΣΧΙΑ, or ΙΣΧΙΟΝ, *coxa*, the hip.

The first, called the *great ischiadic*, is formed by ten little branches, proceeding from the toes, which uniting together, pass by the muscles of the calf of the leg.

The *lesser ischiadic* is formed by several ramifications, proceeding from the skin and muscles, which encompass the articulation of the thigh.—They are also called *sciatic veins*.

ISCHIAS, **ISCHIADICA**, or **ISCHIATICA**. See the article **SCIATICA**.

ISCHIUM*, or **ISCHION**, in anatomy, the name of one of the bones of the hip; called also *coxa*, and *coxendix*.

* The word is derived from the Greek, ΙΣΧΥΣ, *robur*, strength.

In the *ischium* is a deep cavity, called *cavile*, or *acetabulum*, which receives the head of the thigh-bone. This cavity is encompassed with a cartilaginous circle, which serves to strengthen the thigh.

The *ischium* is one of the ossa innominata of authors.—See *Tab. Anat. (Osteol.) fig. 3. lit. S. n. 19. fig. 12. lit. c.*

ISCHURIA*, in physics, a disease consisting in an entire suppression of urine.

* The word is Greek, ΙΣΧΥΡΙΑ, formed from ΙΣΧΥΣ, I stop, and ὕρσις, urine.

It is occasioned by any thing which may obstruct the passages of the reins, ureters, or the neck of the bladder, as sand, stone, mucus, &c.—It may also arise from an obstruction of the nerves, which pass to the reins or bladder, as we see it does, in a palsy of the parts below the diaphragm.—The too great distention of the bladder may also produce the same effect; for the fibres being much lengthened, and consequently condensed, the spirits necessary for their contraction cannot get admittance; whence it is that persons, who have retained their urine a long time, find a great deal of difficulty in discharging it.

ISELASTICS, **ISELASTICA**, a kind of games, or combats, **VOL I.**

celebrated in the cities of Greece and Asia, in the time of the Roman emperors.

The victors at these games had very considerable privileges conferred on them; after the example of *Agamemnon*, and the Athenians, who did the like to the conquerors at the *Olympic*, *Pythian*, and *Isthmian* games. They were crowned on the spot, immediately after their victory; and persons who followed them; were furnished with provisions at the public cost; were carried home in triumph, and made to enter their cities through a breach in the walls; whence their appellation, from *ισθμίου*, to enter.

ISTA, ΙΣΤΙΑ, feasts and sacrifices antiently celebrated in honour of the goddess *Iris*.

The *ysa* were full of the most abominable impieties; and for that reason, those who were initiated into them were obliged to take an oath of secrecy. They held for many days festively, but grew so scandalous, that the senate abolished them at Rome, under the consulate of *Piso* and *Calpurnius*.—Two hundred years after this, they were re-established by the emperor *Commodus*, who himself assisted at them, appearing among the priests of that goddess with his head shaved, and carrying the *Anubis*.

ISIACI, priests of the goddess *Iris*.—*Dioconides* tells us that they bore a branch of sea-wormwood in their hands instead of olive. They sung the praises of the goddess twice a-day, viz. at the rising of the sun, when they opened her temple; after which they begged alms the rest of the day, and, returning at night, repeated their orisons, and shut up the temple.

Such was the life and office of the *ysa*; they never covered their feet with any thing, but the thin bark of the plant papyrus, which occasioned *Prudentius* and others to say they went bare-footed. They wore no garments but linen, because his was the first who taught mankind the culture of this commodity. See *Diodorus Siculus*, and *Plutarch's Isis and Osiris*.

ISING-GLASS, a name given to *Muscovy* tale, and to *terthycolla*; which see.

ISLAND, or **ISLE**, a tract of dry land, encompassed with water; either with the sea, or with a river, from which *island* stands contradistinguished from *continent*, or *terra firma*.

Some conclude, from *Gen. 1. 9.* and from *Ecc. xliii. 23.* that *islands* are as ancient as the world, and that there were some at the beginning, whatever becomes of the proof, it is by no means probable, that the large *islands*, far remote from the continent, are new, or that they either arose out of the sea, or were torn from the main land. Nor is it less certain, that there have been new *islands* formed by the calling up of vast heaps of clay, mud, sand, &c. as that, for instance, of *Tsongming*, in the province of *Nanquin* in *China*; or by the violence of the sea, which has torn off large promontories from the continent, as the antients imagined *Sicily*, and even *Great Britain* to have been formed. It is also certain, that some have emerged above the waves, as *Saba* and *Aden*, formerly, and three other *isls* near it lately; the last in 1707, which rose from the bottom of the sea after an earthquake, that was supposed to have loosened it from its hold.

Several naturalists are of opinion, that *islands* were formed at the deluge; others think they have been rent and separated from the continent by violent storms, inundations, and earthquakes. These last have observed, that the East-Indies, which abound in *islands* more than any other part of the world, are likewise more annoyed with earthquakes, tempests, lightnings, vulcanos, &c. than any other part.

Varenus thinks most of these opinions true in some instances, and believes that there have been *islands* produced each of these ways. *S. Helena*, *Ascension*, and other steep rocky *islands* he supposes to have become so, by the seas overflowing their neighboring champaigns. By the heaping up huge quantities of sand, and other terrestrial matters, he thinks the *islands* of *Zealand*, *Japan*, &c. were formed: *Sumatra* and *Ceylon*, and most of the East-Indian *islands*, he rather thinks were rent off from the main land; and concludes, that the *islands* of the Archipelago were formed in the same way; imagining it probable, that *Deucalion's flood* might contribute towards it.

The antients had a notion, that *Delos*, and some few other *islands*, rose from the bottom of the sea; which, how fabulous soever it might appear, agrees very well with some later observations. *Seneca* takes notice, that the *island Therasia* rose thus out of the *Ægean* sea in his time, of which the mariners were eye-witnesses.

They had also an opinion, that there are some *islands* which swim in the sea. *Thales*, indeed, thought the whole earth, which we inhabit, floated, thus, in the ocean; but his opinion is easily refuted, the channel of the sea being found continuous to the shore: but floating *islands* are no ways improbable, especially if the earth whereof they consist be light and sulphureous.—*Seneca* says, that near the *Cutiae* he saw such an *island*, and mentions several others of the same kind; and it was even a common opinion among the antients, that all the *Cyclades* had done the same.

Gryphander has written a Latin treatise expressly on *islands, de Insulis*.

FORTUNATE ISLANDS.

ISLAND Crystal.

Refraction in ISLAND Crystal.

ISLES, in architecture, the sides, or wings of a building.

See **WING**.

ISOCRONAL, or **ISOCRONOUS**, is applied to such vibrations of a pendulum, as are performed in equal times.

Of which kind are all the vibrations, or swings of the same pendulum, whether the arcs it describes be longer or shorter; for when it describes a shorter arc, it moves so much the slower; and when a long one, proportionably faster.

ISOCRONAL Line, is that wherein a heavy body is supposed to descend without any acceleration.

Leibnitz, in the *Act. Erud. Lipf.* for April 1689, has a discourse on the *linea isochrona*, in which he shews, that a heavy body, with a degree of velocity acquired by its descent from any height, may descend from the same point by an infinite number of *isochronal* curves, which are all of the same species, differing from one another only in the magnitude of their parameters; such as are all the quadratocubical parabolics, and consequently similar to one another. He shews also, how to find a line, in which a heavy body descending, shall recede uniformly from a given point, or approach uniformly to it.

ISOMERIA, in algebra, a method of freeing an equation from fractions, by reducing all the fractions to one common denominator, and then multiplying each member of the equation by that common denominator.

This amounts to the same with what is otherwise called *conversion of equations*. See **CONVERSION of equations**.

ISOPEIMETRICAL Figures, are such as have equal perimeters, or circumferences.

It is demonstrated in geometry, that among *isoperimetrical* figures, that is always the greatest which contains the most sides, or angles.—From whence it follows, that the circle is the most capacious of all figures which have the same circumference with it.

That of two *isoperimetrical* triangles, which have the same base, and one of them two sides equal, and the other unequal; that is the greater whose sides are equal.

That of *isoperimetrical* figures whose sides are equal in number, that is the greatest which is equilateral, and equiangular.

Hence flows the solution of that popular problem, To make the hedging or walling which will fence in one acre, or any other determinate number of acres, a , fence in any other greater number of acres whatever.

For, call x one side of a parallelogram, whose area is the number of acres a ; then will $\frac{a}{x}$ be the other side, and $2 \cdot \frac{a}{x}$

$+ 2x$, will be the circumference of the parallelogram: which must be equal to four times the square root of b , that is $2 \cdot \frac{a}{x} + 2x = 4\sqrt{b}$, whence the value of x will easily be had;

and infinite numbers of squares and parallelograms may be made, which shall have the same perimeter, yet different areas.—*E. gr.* If one side of a square be 10, and one side of a parallelogram be 19, and the other 1, such square and parallelogram will be *isoperimetrical*, viz. each 40; yet the area of the square will be 100, and of the parallelogram only 19.

ISOSCELES Triangle, is a triangle which hath two equal sides.

In an *isosceles* triangle, FDE (*Tab. Geometry, fig. 69.*) the angles y and u , opposite to the equal sides, are equal; and a line drawn from the top or vertex, F, cutting the base into two equal parts, is perpendicular to the base.

ISSUANT, **ISSUING**, in heraldry, is understood of a lion, or other animal, in a coat of arms, that seems just coming out from under a chief, fesse, a house, a wood, or the like, and only shews half his body.

It is not very easy to distinguish the lion *issuant* from the lion *naissant*: some say the *issuant* is that which comes out from the bottom of the chief, shewing his head, neck, the tip of his fore-legs and his tail, against the chief of the coat; whereas the *naissant* has its rise about the middle of the field, and shews all his fore-part, with the tip of his tail, as if he were rising out of the earth.

ISSUE, in common law, has divers applications; being sometimes taken for the children begotten between a man and his wife—sometimes, for profits growing from amerements or fines—sometimes, for profits of lands and tenements—but more frequently, for the point of matter depending in suit, whereupon the parties join, and put their cause to the trial of the jury.

In all these occasions, *issue* has but one signification, which is, an effect of a cause precedings; as, the children are the effect of the marriage between the parents: The profits growing to the king or lord, from the punishment of any man's offence, is the effect of his transgression: The point referred

to the trial of twelve men, is the effect of pleading, or process.

Issue in this last signification, is either *general*, or *special*.

General Issue seems to be that whereby it is referred to the jury to bring in their verdict, whether or no the defendant hath done any such thing as the plaintiff lays to his charge.

For example, if it be an offence against any statute, and the defendant plead Not guilty; this being put to the jury, is called the *general issue*.—So if a man complain of a private wrong, which the defendant denies, and pleads no wrong, nor default; and this be referred to the jury, it is likewise the *general issue*.

Special Issue, is that wherein special matters being alledged by the defendant in his defence, both parties join on this point, and so go to a demurrer, if it be *questio juris*; or else to a trial by the jury, if it be *questio facti*: As in assault and battery, where the defendant pleads that the plaintiff struck first.

ISSUES, in physic, small artificial apertures in a fleshy part of the body, to drain off superfluous moisture, or give vent to any noxious humour.

They are usually made in the arms, legs, or back, either by caustics or incision. Caution is used to place them about the middle of a muscle, that the necessary motion of the part may not incommode them, or pain the patient.—

There is an easy way of making an *issue*, which succeeds best in children; it is done after this manner: Having applied a small piece of blistering plaster, about the bigness of a small pea, to the part where you would have an *issue*, and letting it lie on for a few hours, it will cause a blister; the skin being raised, apply a pea as usual, and compress it tight with a bandage, till by degrees it sinks in, and forms an *issue*. *Issues* are very useful in many distempers, several of which, when obstinate, cannot be cured without them; as an hydrocephalus, ophthalmia, old ulcers, &c.

ISTHRIA, **ΙΣΘΜΙΑ**, or **ISTHMIAN Games**, **Ludi ISTHMI**, were solemn sports, held in honour of Neptune: being the third in rank of those so much celebrated in antient Greece.

Plutarch, in the life of Theseus, tells us, they were instituted by that hero in imitation of Hercules, who had before instituted the Olympic games; but Archias refers their institution to Melicerta, or Palemon, whom the Latins call *Perumnus*.—Others say, they were instituted by Nisus, son of Neptune; and others, by Sisypus, brother of Athamas, king of Corinth, about 1350 years before Christ: however this be, it was in the *isthmus* of Corinth they were celebrated, and hence arose their name.

Archias and others say, the conqueror's prize at these games was a crown of parsley.—Plutarch and Strabo say, it was at first a crown of pine; and that this was afterwards changed for one of parsley, but that at length the pine was resumed; and to this was added a reward of 100 silver drachmæ.

These games were held every three years, or, according to Pliny, every five, and were esteemed so sacred, that after the destruction of Corinth, the Sicyonians were charged with the keeping them up. They were so celebrated, and the concurrence at them was so great, that only the prime persons of the most remarkable cities could have place in them.—The Athenians had only as much room allotted them as the sail of a ship, which they sent yearly to Delos, could cover.

ISTHMUS, **ΙΣΘΜΟΣ**, a narrow neck, or slip of ground, which joins two continents; or joins a peninsula to the terra firma, and separates two seas.

The most celebrated *Isthmus*'s are those of Panama or Darien, which joins North and South America; that of Suez, which connects Asia and Africa; that of Corinth, or Peloponnesus, in the Morea; that of Crim-Tartary, otherwise called *Taurica chersonesus*; that of the peninsula Romania and Erißo, or the *isthmus* of the Thracian chersonesus, twelve furlongs broad; being that which Xerxes undertook to cut through.

The antients had several designs of cutting the *isthmus* of Corinth, which is a rocky hillock, about ten miles over; but they were all vain, the invention of sluices being not then known.—There have been attempts, too, for cutting the *isthmus* of Suez, to make a communication between the Red-sea and the Mediterranean.

ISTHMUS, is also applied by anatomists to several parts of the human body, particularly that narrow part of the throat, situated betwixt the two tonsils.

Also, to the ridge that separates the two nostrils. See **NOSE**.

ITALIAN, the language spoke in Italy.

This tongue is derived principally from the Latin, and of all the Languages formed from the Latin, there is none which carries with it more visible marks of its original than the *Italian*.

It is accounted one of the most perfect among the modern tongues, containing words and phrases to represent all ideas, to express all sentiments, to deliver one's self on all subjects, to name all the instruments, and parts of arts, &c.—It is complained indeed, that it has too many diminutives and superlatives, or rather augmentatives; but without any great

reason: for if those words convey nothing further to the mind than the just ideas of things, they are no more faulty than our pleonasm and hyperbole's.

The character of the Italian tongue, it must be owned, is very different from that of our own, which is the reason perhaps why we are so apt to find fault with it: for though the *Italian* be proper for all kinds of writing, for all styles, and for all subjects; yet there are many of their celebrated authors that do not succeed when translated into English, and which an Englishman cannot read, with pleasure, even in their original.—The language corresponds to the genius of the people; they are slow, and thoughtful, and accordingly, their language runs heavily, though smoothly, and many of their words are lengthened out to a great degree.—They have a great taste for music; and, to gratify their passion this way, have altered abundance of their primitive words; leaving out consonants, taking in vowels, softening and lengthening out their terminations, for the sake of the cadence.

Hence the language is rendered extremely musical, and succeeds better than any other in opera's, and some parts of poetry; but it fails in strength and nerves: hence also a great part of its words, borrowed from the Latin, become so far disguised that they are not easily known again.

The multitude of sovereign states into which Italy is divided, has given rise to a great number of different dialects in that language; which, however, are all good in the place where they are used.—The Tuscan is usually preferred to the other dialects, and the Roman pronunciation to that of the other cities; whence the *Italian* proverb, *Lingua Toscana in Bocca Romana*.

The *Italian* is generally pretty well understood throughout Europe, and is frequently spoken in Germany, Poland, and Hungary.—At Constantinople, in Greece, and in the ports of the Levant, the *Italian* is used as commonly as the language of the country; indeed in those places it is not spoke so pure as in Tuscany, but is corrupted with many of the proper words and idioms of the place, whence it takes a new name, and is called *Frank Italian*.

ITALIC, or ITALIAN Hours, are the twenty-four hours of the natural day, accounted from the sun-setting of one day, to the same again the next day.

This way of reckoning was used by the Jews of old, and is used by the Italians to this day.

ITALIC Character, in printing. See LETTER.

ITALIC Sect, is the name of a party of ancient philosophers, founded by Pythagoras; so called, because that philosopher taught in Italy; spreading his doctrine among the people of Tarentum, Metapontus, Heraclea, Naples, &c.

ITCH, a disease of the skin, wherein it is corrupted by the oozing out of certain sharp saline humours, which gather into pustules, and occasion a pruritus, or itching. There are two kinds of *itch*, a humid and a dry kind. The latter has been usually supposed to be owing to an atrabiliary humour, and the former to a saline pituita; they are both contagious.

Dr. Bononio has given a much more rational account of the cause of this distemper, than any author before him: he carefully examined several globules of the matter picked out of the pustules of itchy persons with a microscope, and found them to be minute living creatures, in shape resembling a tortoise, of brisk motion, with six feet, a sharp head, and two little horns at the end of the snout.—Hence he makes no scruple to impute this contagious disease to the continual biting of these animalcules in the skin; by means of which some portion of the serum oozing out through the small apertures of the cutis, little watry bladders are made, within which the insects continuing to gnaw, the infected are forced to scratch, and by scratching increase the mischief; breaking not only the little pustules, but the skin too, and some little blood-vessels, and so making scabs, crusty sores, &c.

Hence we perceive how the *itch* comes to be catching; since these creatures, by simple contact, may very easily pass from one body to another; their motion being wonderfully swift, and they crawling on the surface of the body, as well as under the cuticula.

Hence also we learn the reason of the cure of this disease by lixivial washes, baths, and ointments made of salts, sulphurs, mercury, &c. these being very powerful in killing the vermin lodged in the cavities of the skin, which scratching will never do; they being too minute to be caught under the nails. And if in practice it is found that this disease, after it seemed to be cured by unction, frequently returns again; this is easily accounted for; since, though the ointment may have killed all the living creatures, yet it may not, possibly, have destroyed all their eggs laid, as it were, in the nests of the skin; from which they afterwards breed again, and renew the distemper.

ITINERANT Judges, or Justices, such as were formerly sent with commissions into divers counties, to hear chiefly those causes called *pleas of the crown*: the same with what is otherwise called *justices in eyre*. See JUSTICE.

ITINERARY, the description a traveller gives of the course of his journey, and of the curiosities, &c. he observed therein.

The *Itinerary* of Antonine shews all the grand Roman roads in the empire, and all the stations of the Roman army.—It was drawn up by order of the emperor Antoninus Pius; but is now very defective, having suffered much under the hands of the copists, and editors.

ITINERARY Column. See the article COLUMN.

ITERATION. REITERATION.

JUBILEE *, among the Jews, denotes every fiftieth year; being that following the revolution of seven weeks of years; at which time all the slaves were made free, and all lands reverted to their ancient owners.

* The word, according to some authors, comes from the Hebrew, *jubil*, which signifies fifty: But this must be a mistake; for the Hebrew *jubil*, does not signify fifty; neither do its letters, taken as cyphers, or according to their numerical power, make that number; being 10, 6, 2, and 3, that is, 48.—Others say, that *jubil* signifies a ram, and that the jubilee was thus called because proclaimed with a ram's horn, in memory of the ram that appeared to Abraham in the thicket.—Mafius chuses to derive the word from *jubil*, the first inventor of musical instruments, which, for that reason, were called by his name; whence the words *jubil* and *jubilee* came to signify the year of deliverance and remission, because, proclaimed with the sound of one of those instruments, which at first was no more than the horn of a ram.

JUBILEE, in a more modern sense, denotes a grand church-solemnity, or ceremony, celebrated at Rome, wherein the pope grants a plenary indulgence to all sinners; at least to as many as visit the churches of S. Peter, and S. Paul at Rome.

The jubilee was first established by Boniface VIII. in 1300, in favour of those who should go ad limina apostolorum; and it was only to return every hundred years. But the first celebration brought in such store of wealth to Rome, that the Germans called this the golden year; which occasioned Clement VI. to reduce the period of the jubilee to fifty years.—Urban VI. appointed it to be held every thirty-five years, that being the age of our Saviour; and Sixtus IV. brought it down to every twenty-five, that every person might have the benefit of it once in his life.

Boniface IX. granted the privilege of holding jubilees to several princes, and monasteries: for instance, to the monks of Canterbury, who had a jubilee every fifty years; when people flocked from all parts to visit the tomb of Thomas a Becket. Jubilees are now become more frequent, and the pope grants them as often as the church, or himself, have occasion for them.—There is usually one at the inauguration of a new pope.

To be entitled to the privileges of the jubilee, the bull enjoins fasting, alms, and prayers. It gives the priests a full power to absolve, in all cases, even those otherwise reserved to the pope; to make commutations of vows, &c. in which it differs from a plenary indulgence. During the time of jubilee all other indulgences are suspended. One of our kings, viz. Edward III. caused his birth-day to be observed in manner of a jubilee, when he became fifty years of age, but never before or after. This he did, by releasing prisoners, pardoning all offences except treason, making good laws, and granting many private privileges to the people.

There are particular jubilees in certain cities, when several of their feasts fall on the same day: at Puy en Velay, for instance, when the feast of the Annunciation happens on Good-Friday; and at Lyons, when the feast of S. John Baptist concurs with the feast of Corpus Christi.

In 1640. the Jesuits celebrated a solemn jubilee at Rome; that being the centenary, or hundredth year from their institution; and the same ceremony was observed in all their houses throughout the world.

JUBILEUS, or JUBILEUS, is used among the Romanists to signify a religious who has been fifty years in a monastery, or an ecclesiastic who has been in orders fifty years.

Such veteran religious are dispensed with in some places from attending mattins, or a strict observation of any other of their rules.

JUBILEUS is also extended to any man a hundred years old; and to a possession, or prescription for fifty years. *Non invenitur in scriptione, inquiratur de jure a. quod in temporis fuit cum altero, & si sub certo jure mansit sine vituperatione maneat in eternum.*

JUDÆ Auricula. See the article AURICULA.

JUDÆICUS Lapis, a small, grey, soft, brittle stone, in form of an olive, having lines drawn regularly on its surface, as if they were formed by art.

It is of some use in physic; being supposed to be endued with a lithontriptic power; and therefore is given to dissolve the stone in the bladder. It is a kind of extraneous fossil, being a spine of an Echinus marinus petrified. See Supplement: article JUDÆICUS LAPIS.

JUDAISM

J U D

JUDAISM, the religious doctrines, and rites of the Jews.

Judaism was warranted by divine authority, being delivered to that people immediately from heaven; it was, however, but a temporary dispensation, and was to give way, at least the ceremonial part of it, at the coming of the Messiah.—For a complete system of *Judaism*, see the books of Moses. *Judaism* was anciently divided into several sects; the principal whereof were the Pharisees, Sadducees, and Essenes.

At present there are but two sects among the Jews, viz. the *Caraites*, who admit of no rule of religion, but the law written by Moses; and the *Rabbinists*, who add to the law, the traditions of the Talmud.

It has been observed, that *Judaism*, of all other religions, is that which is the most rarely abjured.—In the 18th of Edward I. the parliament granted the king a fifteenth for the expulsion of *Judaism*.

In England, formerly, the Jews and all their goods belonged to the chief lord where they lived, and he had such absolute property in them, that he might sell them; for they had not liberty to remove to another lord without leave. Mat. Paris tells us, that Henry III. sold the Jews to earl Richard his brother for a term of years, that *quos rex excoquerat, comes emiserat*.

They were distinguished from the Christians both living and dying, for they had proper judges and courts wherein their causes were tried, and they wore a badge on their breast over their clothes in shape of a table, and they were fined if they stirred abroad without such badges. They were never buried in the country, but always brought up to London, and interred without the walls.

JUDGE, an officer appointed by the sovereign powers of any country, to distribute that justice to their subjects which they cannot administer in person.

The character of *judge* is a part of the regal authority, whereof the king divests himself.

The chief function of *judges* is for the trial of causes both civil and criminal.

The English *judges* are chosen out of the sergeants at law and are constituted by letters patent. Their commissions are bounded with this limitation, *Facturi quod ad justitiam pertinet secundum legem & consuetudinem Angliæ*; and at their creation they take an oath, that they will indifferently minister justice to all them that shall have any suit, or plea before them; and this they will not forbear to do, though the king by his letters, or by express word of mouth, should command the contrary.

The *judges* have salaries from the king, besides many very considerable perquisites; and these salaries granted them, *quamdiu bene se gesserint*, to keep them free and independent of the court.

Itinerant JUDGE. See the article **ITINERANT**.

JUDGE, in scripture, is applied to certain eminent persons chosen by God himself to govern the Jews, from the time of Joshua, till the establishment of the kings.

The Hebrews were governed by fifteen *judges*, for the space of 340 years, viz. from the time of Othniel their first, to that of Heli their last *judg*.

The *judges* were not ordinary magistrates, but were appointed by God on extraordinary occasions, as, to head the armies, to deliver the people from their enemies, &c.—Salian has observed, that they not only presided in the courts of justice, but were also at the head of the councils, the armies, and of every thing that concerned the government of the state; though they never assumed the title either of princes, governors, or the like.

In some respects they resembled kings, viz. 1^o. In that their authority was given them for life, and not for a limited time.

2^o. They ruled alone, and without any dependancy, which see **MONARCH**: Josephus to call their state monarchical.

Salian remarks seven points wherein they differed from kings.

1^o. They were not hereditary. 2^o. They had no absolute power of life and death, but only according to the laws, and dependently of them. 3^o. They never undertook war at their own pleasure, but only when they were commanded by God, or called to it by the people. 4^o. They exacted no tribute.

5^o. They did not succeed each other immediately, but after the death of one there was frequently an interval of several years ere a successor was appointed. 6^o. They did not use the ensigns of sovereignty the scepter or diadem. 7^o. They had no authority to make any laws, but were only to take care of the observation of the laws of Moses.

JUDGES, or *Book of JUDGES*, is a canonical book of the Old Testament, containing the history of the Israelite *judges*, whereof we have been speaking.

The author is not known: It is probable the work did not come from any single hand, being rather a collection of several little histories, which at first were separate, but were afterwards collected by Eldras, or Samuel, into a single volume; and, in all likelihood, were taken from the ancient journals, annals, or memoirs, composed by the several *judges*.

J U D

JUDGMENT, a faculty of the soul, by which it perceives the relation between two, or more, ideas.

Thus when we *judge* that the sun is greater than the moon, the understanding first compares the two ideas of the sun and the moon, and finding the idea of the sun greater than that of the moon, the will perfectly acquiesces in that perception, nor puts the mind upon any farther enquiry.

It is not the understanding then that *judges*, as is ordinarily thought; *judgments* and reasonings, on the part of the understanding, are but mere perceptions; it is the will alone that *judges*, by acquiescing in what is represented to it by the understanding.

The only difference then between *perception*, *judgment*, and *reasoning*, so far as the understanding is concerned in them, is this, that it perceives a thing simply, without any relation to any other thing, in a simple perception; that it perceives the relations between two or more things, in *judgments*; and lastly, that it perceives the relations that are between the relations of things, in reasonings; so that all the operations of the understanding are in effect no more than pure perceptions.

Thus, when we perceive, for instance, twice 2, or 4, this is no more than a simple perception; when we *judge* that twice 2 are 4, or that twice 2 are not 5, the understanding does no more than barely perceive the relation of equality that is between twice 2 and 4, or of inequality between twice 2 and 5. Further, reason consists in perceiving the relation, not between two or more things, for that would be a *judgment*, but of two or more relations of two or more things. Thus, when I conclude, that 4 being less than 6, twice 2 being 4, are by consequence less than 6; I perceive not only the relation of inequality between 2 and 4, and 6, (for this were only a *judgment*) but also the relation of inequality between the relation of twice 2 and 4, and the relation between 4 and 6; which constitutes a reasoning. The understanding therefore only perceives, and it is the will that *judges*, and reasons, in assenting voluntarily to what the understanding represents.

Indeed, when the things which we consider appear clear, and perfectly evident, it seems as if it were not voluntarily that the mind consents to them; whence we are led to think, that it is not properly the will, but the understanding that *judges* of them.—But to clear this point, it must be observed, that the things which we consider, never appear entirely evident till the understanding has examined them on all sides, and has perceived all the relations necessary to *judge* of them; whence it happens, that the will not being able to will any thing without knowledge, cannot act on the understanding; that is, cannot desire it to represent any thing new in its object, as having already viewed it on all sides that have any relation to the question in hand. It is obliged then to rest in what has been already represented, and to cease to agitate and disturb it any farther; in which cessation it is, that *judgment* consists.

This rest or *judgment*, then, not being free when things are in their last evidence, we are apt to imagine, that it is not the effect of the will. So long as there is any thing obscure in the subject that we consider, or that we are not fully satisfied, that we have discovered every thing necessary to resolve the question, as it happens in most of those things that are difficult, and that contain various relations; we remain at liberty not to acquiesce: the will may command the understanding to pursue its enquiries further, and to make new discoveries; whence it is, that we are more ready to allow the *judgments* formed on these subjects to be voluntary.

Most philosophers, however, maintain, that even the *judgments* which we form on obscure things are not voluntary; and will have our consenting to the truth to be an action of the understanding, which they call *assent*, to distinguish it from our consenting to goodness, which they attribute to the will, and call it *consent*.

But their error is owing to this, that in our present state, we frequently see things to be evidently true, without the least reason to doubt of them; in which case the will is not at liberty either to give or refuse her assent: but it is not so in matters of goodness; there being nothing, which we do not know some reason for forbearing to love. So that we here perceive a manifest indifference, and are fully convinced, that when we love any thing, even God, for instance, we use our liberty, and do it voluntarily. But the use we make of our liberty is not so apparent, when we consent to the truth, especially when it appears perfectly evident: And this leads us to think, that our consent to truth, that is, our *judgment*, is not voluntary; as if an action, to be voluntary, must be indifferent; as if the blessed above did not love God voluntarily, because they cannot be diverted from it by any other thing; nor we consent freely to this evident proposition, that twice 2 are 4, because we have no appearance of reason to dissuade us from it.

In a legal sense a sentence or decision pronounced by authority of a king, or other power, either by their own mouth

or by that of their judges and officers, whom they appoint to administer justice in their stead.

Of *Judgments* some are definitive, others only preparatory, provisional or interlocutory. See DEFINITIVE, INTERLOCUTORY, &c.

The ancient words of judgment are very significant, *confideratum est*, &c. because judgment is ever given by the court upon consideration had of the record and matter before them.

—In every judgment there ought to be three persons, *actor*, *reus*, and *judez*; plaintiff, or prosecutor, defendant, and judge.

JUDICIARY Deposit.

JUDICIO Falso. See the article FALSO.

JUDICIUM Dei*, JUDGMENT of God, was a term anciently applied to all extraordinary trials of secret crimes; as those by arms, and single combat, and the ordeals, or those by fire or red-hot plow-shares, by plunging the arm in boiling water, or the whole body in cold water, in hopes God would work a miracle, rather than suffer truth and innocence to perish.

* *Si super defendere non possit, judicio Dei scilicet aqua vel ferro ferret de eo justitia.*

These customs were a long time kept up, even among Christians, and they are still in use in some nations. See ORDEAL, WATER, COMBAT, DUEL, and CHAMPION.

Trials of this sort were usually held in churches, in presence of the bishops, priests and secular judges, after three days fasting, confession, communion, and a world of adjurations and ceremonies, described at large by Du Cange.

JUDICIUM Assise. See the article ASSISE.

JUGULAR, among anatomists, is applied to certain veins of the neck, which terminate in the subclavians. See VEIN.

The *jugular veins* are two on each side; the one *external*, receiving the blood from the face, and the external parts of the head; the other *internal*, which receives the blood from the brain.—See Tab. Anat. (Angeiol.) fig. 6. litt. ii. ll.

JUGULAR is also applied to certain glands of the neck, in the spaces between the muscles.

The *jugular glands* are in number fourteen; they are of different figures, some larger, others less; they are fastened to each other by certain membranes and vessels; and their substance is like that of the maxillaries.

They secrete a lymph, which is conveyed by those vessels to the adjacent muscles.—It is an obstruction in those glands which occasions the kings-evil. *Dionis.*

JUICE, a liquid substance, which makes part of the composition of plants; being diffused among all the solid parts, and serving for their nutriment and growth.

The *juice*, or sap, is that to plants, which blood is to animals.

There are *juices* of divers kinds, *aqueous*, *vinous*, *oleaginous*, *gummy*, *resinous*, and *bituminous*; and of all tastes, and colours.

Dr. Lister observes, that most *juices* of plants coagulate; whether they be such as are drawn from the wounds of a plant, or such as spontaneously exude; and that he has made curds, and cakes of the *juices* of a great number of plants; he adds, that as the *juices* of plants seem to be compounded and mixed of liquors of different kinds; it is probable, if the caustic part be narcotic, for instance, the whey may not be so; or the one may be hurtful, and the other a good and useful medicament.

JUICE is also applied to several, and even to all, the fluids or humours in an animal body.

Nervous JUICE, is a liquor, which, according to some physicians, is found in the canals of the nerves, whence it takes its name. Glisson, Wharton, and Willis, were the first who made mention of the *nervous juice*; they take it to be a kind of vehicle for the animal spirits, serving to prevent their dissipating too hastily; and think it also serves to nourish the parts of the body: but a great part of our modern physicians deny the existence of this *juice*.

Pancreatic JUICE, is a liquor separated in the glands of the pancreas. See PANCREAS, and PANCREATIC.

JUICE is also applied to the vapours, and humidities inclosed in the earth.

Thus crystal is said to be formed of a lapidific *juice*; and metals to be generated of vapours and *juices*, condensed in the earth.

JUJUBS, JUJUBÆ, *Zizyphæ*, the fruit of a tree of the same name, growing very common in Italy, and Provence.

The *jujubs* are about the size of a plumb, oval, red without, yellow within, of a sweet, and commonly vinous taste: they are pectoral and aperitive, soften the acrimony of the humours, and promote a discharge by sputation.

In the general, they have much the same virtues with figs, and are used in much the same intentions.

Pliny tells us, that Sextus Papirius brought the first *jujubs* from Syria, and truffles from Africa, towards the end of Augustus's reign.

JULEP*, or JULAP, JULAPIUM, in pharmacy, an easy, agreeable, extemporaneous potion, prescribed to sick persons; usually composed of distilled waters, or light decoctions, and sweetened with sugar, or proper syrups.

* The word, according to Menage, is derived from the Arabic, *giulep*, or rather from the Greek, *Julapion*. Olearius derives it from *gulep*, a Persian word, signifying *rose-water*.

Juleps are sometimes used as the ordinary drink in certain diseases, but more usually as a vehicle for other forms of medicines; serving chiefly to dilute, to correct the peccant humours, restore the declining force of the heart, and promote sleep.

JULIAN Year*. See the article Julian Year.

* The Julian is the old account of the year, still in use among us in England. It is so called from its founder Julius Cæsar, and by that name is distinguished from the new, or Gregorian account, used in most other parts of Europe.

JULIAN Period. See the article Julian Period.

The Julian period is so called, as being adapted to the Julian year.

It is made to commence before the creation of the world, and that more or less, according to the hypothesis that is followed. Its principal advantage consists in this, that the same years of the cycles of the sun, moon, and indiction, belonging to any year of this *period*, will never fall together again till after the expiration of 7980 years; which, according to the received opinions, will scarce happen before the consummation of all things. The first year of the Christian era, in all our systems of chronology, is always the 4714th of the Julian period.

To find what year of the Julian period any given year of Christ answers to: To the given year of Christ add 4713; (because so many years of the Julian period were expired before A. D. 1.) and the sum gives the year of the Julian period sought.

For instance, I would know what year of the Julian period A. D. 1720 answers to. Now $1720 + 4713 = 6433$, the year sought of the Julian period.

On the contrary, having the year of the Julian period given, to find what year of Christ answers thereto: From the year of the Julian period given, subtract 4713, and the residue will be the year sought.

For instance, I would know what year of Christ answers to the Julian period 6433; wherefore, $6433 - 4713 = 1720$, the year sought.

If the year of the Julian period given be less than 4713, then subtract the same from 4714 (which is the year of the Julian period that answers to the year of Christ 1.) and the residue will shew how long before (the beginning of the common computation from the nativity of) Christ, the given year of the Julian period was.

For instance, the city of Rome is said to have been built 7. P. 3960, I would know how long it was built before Christ? Now $4714 - 3960 = 754$, wherefore Rome was built 754 years before Christ.

JULIAN Calendar. See the article CALENDAR.

JULIAN Epocha. See the article EPOCHA.

JULUS*, IOYAOE, an ancient hymn sung by the Greeks, and after them by the Romans, during the time of their harvest in honour of Ceres and Bacchus; to render those deities propitious.

* The word is derived from the Greek *ιουλος*, whence *ιουλος*, a sheaf.

This hymn was sometimes also called *demetriulus* or *demetriulus*, that is, *Julus* of Ceres.

JULUS is also a name which botanists give to those worm-like tufts, or palms (as they are called in willows) which, at the beginning of the year, grow out, and hang pendulous down from hazels, walnut trees, oaks, chestnut-trees, mulberry-trees, alders, &c. and are by us popularly called *catkins*.

Mr. Ray observes that they are collections of the stamina of the flowers of the tree, because in fertile trees and plants they have abundance of seminal apparatus; which opinion is adopted by Bradley, who makes them to be the male blossoms, and to serve to impregnate the rudiments of the fruit, or female blossoms, which appear on the same trees,

or others of the same sort. See PLANT, and GENERATION.

JULY *, the seventh month of the year; during which the sun enters the sign Leo.

- * The word is derived from the Latin *Julius*, the surname of C. Cæsar the dictator, who was born in it.—Mark Antony first gave this month the name *July*, which before was called *Quintilis*, as being the fifth month of the year, in the old Roman calendar established by Romulus, which began in the month of March.—For the same reason, August was called *Septilis*, and September, October, November, and December, still retain the name of their first rank.

Quæ sequitur, numero turba notata suo. Ovid Fast.

On the 10th day of this month the dog-days are commonly supposed to begin; when, according to Hippocrates and Pliny, the sea boils, wine turns sour, dogs go mad, the bile is increased and irritated, and all animals decline and languish, &c.

JUNCTURE, any joint, or closing of two bodies. See JOINT.

JUNE *, the sixth month of the year; during which the sun enters the sign of Cancer.

- * The word comes from the Latin *Junius*, which some derive à *Junone*. Ovid, in the 6th of his *Fasts*, makes the goddess say,

Junius à nostro nomine nomen habet.

Others rather derive it à *junioribus*, this being for young people, as the month of May was for old ones.

Junius est juvenum, qui fuit ante senum.

In this month is the summer solstice.

JUNIPER Berries, the fruit of the shrub *juniperus*; much used in medicine.

Et Müller had a vast opinion of *juniper berries*: The rob made of the expressed juice of the green berries, has been called by many the *theriacal Germanorum*; so much are they esteemed by that nation for their alexipharmic qualities.

They are certainly carminative; but their most remarkable properties are in scouring the viscera, and particularly the reins and urinary passages, as all things of the turpentine kind do.

The wood of this shrub is also of considerable use in physic: it strengthens the stomach, expels wind, clears the lungs, provokes the menses, and removes obstructions of the viscera: It is further said to be sudorific, cephalic, and hysterical.—From it they draw a spirit, a tincture, an elixir, extract, and a ratafia.

It is said it will last an hundred years without corrupting; the chymists add, that a coal of *juniper*, covered with ashes of the same kind, will keep on fire an entire year.

JUNTA, called also **JUNTO**, and **JUNTO**, a council or company of several persons meeting for the dispatch of any business.

The term is particularly used in the Spanish, and Portuguese affairs.—On the death of Charles II. king of Spain, the kingdom was governed, during the absence of Philip V. by a *junta*.

In Portugal they have three considerable *juntas*; the *junta* of commerce, that of the three estates, and that of tobacco.—The first was established by king John IV. this is a council of marine. The same king also assembled the states of his kingdom to create the tribunal of the *junta* of the three estates. King Peter II. created the *junta* of tobacco in 1675, it consists of a president and six counsellors.

IVORY, the tooth, or tusk of an elephant, growing on each side of his trunk, somewhat in form of an horn.

Ivory is much esteemed for its colour, its polish, and the fineness of its grain when wrought.—Dioscorides says, that by boiling it the space of six hours with the root of mandragoras, it becomes so soft and tractable, that any one may manage it as he pleases.

The *ivory* of the isle of Ceylon, and that of the island of Achem, have this peculiarity, that they never become yellow, as those of the Terra firma and East-Indies do; on which account the former are much dearer.

Black Ivory, is the native *ivory* burnt, and taken out in leaves or shivers when become black. It is then either powdered dry, or ground with water, and made up into little cakes or troches, used by the painters.

JUPITER, in mythology, &c. See the article GOD.

Flamen of JUPITER. See the article FLAMEN and DIALIS.

JUPITER, ♃, in astronomy, one of the superior planets, remarkable for its brightness; and which, by its proper motion, seems to revolve round the earth in about twelve years. See PLANET.

Jupiter is situate between Saturn and Mars: It has a rotation round its own axis in 9 hours, 56 minutes; and a periodical revolution round the sun in 4332 days, 12 hours, 20 $\frac{1}{2}$.

Jupiter is the biggest of all the planets: its diameter to that of the sun appears, by astronomical observations, to be as 1077 is to 10000; to that of Saturn as, 1077 to 839, to that of the earth as 1077 to 104. The force of gravity on its surface is to that on the surface of the sun, as 797,15 is to 10000; to that of Saturn, as 797,15 to 534,337; to that of

the earth, as 797,15 to 407,832. The density of its matter is to that of the sun as 7404 to 10000, to that of Saturn as 7404 to 6011, to that of the earth as 7404 to 3921. The quantity of matter contained in its body, is to that of the sun as 9,248, to 10000, to that of Saturn as 9,248 to 4,223, to that of the earth as 9,248 to 9,0044.

The mean distance of *Jupiter* from the sun is 5201 of those parts, whereof the mean distance of the earth from the sun is 1000, though Kepler only makes it 5196 of those parts.

—M. Cassini calculates *Jupiter's* mean distance from the earth to be 115,000 semi-diameters of the earth.—Gregory computes the distance of *Jupiter* from the sun to be above five times as great as that of the earth from the sun; whence he gathers, that the diameter of the sun, to an eye placed in *Jupiter*, would not be a fifth part of what it appears to us; and therefore his disk would be twenty-five times less, and his light and heat in the same proportion.

The inclination of *Jupiter's* orbit, that is, the angle formed by the plane of its orbit, with the plane of the ecliptic, is 1 deg. 20 min. His excentricity is 250; and Huygens computes his surface to be four hundred times as large as that of our earth.

Jupiter is one of the superior planets, that is, of the three which are above the sun. Hence it has no parallax, its distance from the earth being too great, to have any sensible proportion to the diameter of the earth. See PARALLAX.

Though it be the greatest of the planets, yet its revolution about its axis is the swiftest. Its polar axis is observed to be shorter than its equatorial diameter; and Sir Isaac Newton determines the difference to be as 8 to 9. So that its figure is a spheroid, and the swiftness of its rotation occasions this spheroidism to be more sensible than that of any other of the planets.

Jupiter appears almost as large as Venus, but he is not altogether so bright: He is eclipsed by the moon, by the sun, and even by Mars.—Hevelius is said to have once observed *Jupiter's* diameter seven inches, having inequalities like the moon.

Jupiter has three appendages, called *zones*, or *belts*, which Sir Isaac Newton thinks are formed in his atmosphere.—In these are several *maculae*, or spots; from whose motion, the motion of *Jupiter* round its axis is said to have been first determined. The discovery of which is controverted between Eustachio, P. Gognignies, Cassini and Campani.

The four little stars, or moons, which move round *Jupiter*, were first discovered by Galileo, who called them the *astræ Mediceæ*; but we the satellites of *Jupiter*.

Cassini observed, that the first or innermost of these satellites was five semi-diameters of *Jupiter* distant from *Jupiter* itself, and made its revolution in one day, 18 hours, and 32 minutes. The second, which is somewhat greater, he found eight diameters distant from *Jupiter*, and its revolution 3 days, 13 hours, and 12 minutes. The third, which is the greatest of all, is distant from *Jupiter* 13 semi-diameters, and finishes its course in 7 days, 3 hours, and 50 minutes. The last, which is the least of all, is distant from *Jupiter* 23 semi-diameters; its period is 16 days, 18 hours, and 9 minutes.

These four moons must make an extremely pleasing spectacle to the inhabitants of *Jupiter*, if it be true that there are any; for sometimes they rise all together; sometimes they are all together in the meridian, ranged one under another; and sometimes all appear in the horizon. Add, that they frequently undergo eclipses, the observations whereof are found of especial use in determining the longitude. Cassini has made tables for calculating the immersions and emersions of *Jupiter's* first satellite.

Comparative Astronomy of JUPITER.—The day and night are of the same length in *Jupiter* all over his surface, viz. five hours each: the axis of his diurnal-rotation being nearly at right angles to the plane of his annual orbit. See DAY.

Though there be four primary planets below *Jupiter*, yet an eye placed on his surface would never perceive any of them; unless, perhaps, as spots passing over the sun's disk, when they happen to come between the eye and the sun.—The parallax of the sun, viewed from *Jupiter*, will scarce be sensible, no more than that of Saturn, neither being much above 20 seconds; so that the sun's apparent diameter in *Jupiter* will not be above six minutes. The outermost of *Jupiter's* satellites will appear almost as big as the moon does to us, viz. five times the diameter, and 25 times the disk of the sun.—Dr. Gregory adds, that an astronomer in *Jupiter* would easily distinguish two kinds of planets, four nearer him, viz. the satellites, and two, viz. the Sun and Saturn, more remote. The former, however, will fall vastly short of the sun in brightness, notwithstanding the great disproportion in the distances and apparent magnitude. From these four different moons, the inhabitants of *Jupiter* will have four different kinds of months, and the numbers of moons in their year will not be less than 4500. These moons

moons are eclipsed as often as, being in opposition to the sun, they fall within the shadow of *Jupiter*; and again, as oft as being in conjunction with the sun, they project their shadows to *Jupiter*, they make an eclipse of the sun to an eye placed in that part of *Jupiter* where the shadow falls. But in regard the orbits of these satellites are in a plane which is inclined to, or makes an angle with the plane of *Jupiter's* orbit, their eclipses become central, when the sun is in one of the nodes of these satellites; and when out of this position, the eclipses may be total, though not central, because the breadth of *Jupiter's* shadow is nearly decuple to that of the breadth of any of the satellites; and the apparent diameter of any of these moons is nearly quintuple the apparent diameter of the sun. It is owing to this remarkable inequality of diameters, and the small inclination the plane of the orbits of the satellites has to the plane of *Jupiter's* orbit, that in each revolution their happen eclipses both of the satellites and of the sun; though the sun be at a considerable distance from the nodes. Further, the inferior among these satellites, even when the sun is at its greatest distance from the nodes, will occasionally eclipse and be eclipsed by the sun to an inhabitant of *Jupiter*; though the remotest of them, in this case, escapes falling into *Jupiter's* shadow, and *Jupiter* into his, for two years together. To this it may be added, that one of these satellites sometimes eclipses another; where the phases must be different, may frequently oppose to that of the satellite falling into the shadow of *Jupiter* just mentioned; for in this eastern limb immerses first, and the western immerses last; but in the others it is just the reverse.

The shadow of *Jupiter*, though it reaches far beyond its satellites, yet falls much short of any other planet; nor could any other planet, Saturn alone excepted, be immersed in it, even though it were infinite. Indeed, *Jupiter's* shadow could not reach Saturn, unless *Jupiter's* diameter were half that of the sun; whereas, in effect, it is not one ninth of it.

The courses of *Jupiter's* satellites, and their various eclipses, would render navigation very sure and easy on the globe of *Jupiter*. Even we, at this distance, can make very good use of them; those eclipses being found one of our best means for determining the longitude at sea.

JUPITER, among alchymists, signifies the philosophers gold.

The gentlemen of this profession apply every thing to their art which the mythologists mention of the god *Jupiter*, pretending that the ancient fables are to be understood in a figurative sense: for instance, *Jupiter* is the master of the gods; and gold, say they, is the most precious of metals. Mercury is the ambassador of *Jupiter*; and this shows with how much ease Mercury insinuates into every thing. *Jupiter* holds the thunderbolt as his scepter; which evidently points out the external sulphur used in projection. *Jupiter* has the heavens for his ordinary habitation; this shews him volatile, dry, and hot. The debauches of *Jupiter*, who fought for pleasure in the low, but prolific and fruitful earth, discover, say they, its fecundity; and that gold might be made, were but the way of preparing it discovered. In a word, *Jupiter* is the son of Saturn, which shews some resemblance between the qualities of gold and lead.

JURATAM.—*Assis cadit in juratam*. See **ASSIS**.

JURATI. See the article **JURATS**.

Non ponendo in JURATIS. See the article **NON ponendo**.

JURATS, **JURATI**, magistratus in the nature of aldermen, for the government of several corporations. See **ALDERMAN**.

Thus we meet with the mayor and *jurats* of Maidstone, Rye, Winchelsea, &c.—So also Jersey has a bailiff and twelve *jurats*, or sworn assistants, to govern the island.

JURE.—*De JURE*. See **DE FACTO**, and **POSSESSION**.

Quo JURE. See the article **Quo Jure**.

JURIDICI Dies. See the article **DIES**.

JURISCONSULTUS, or **JURECONSULTUS**, **ICTUS**, among the Romans, was a person learned in the law; a master of the Roman jurisprudence; who was consulted on the interpretation of the laws, and customs, and the difficult points in law-suits.

The fifteen books of the *Digest* were compiled wholly from the answers, or reports of the ancient *jurisconsulti*. Tribonianus, in destroying the two thousand volumes from whence the *Code* and *Digest* were taken, has deprived the public of a world of things, which would have given them light into the office of the ancient *jurisconsulti*.

We should scarce have known any thing beyond their bare names, had not Pomponius, who lived in the second century, taken care to preserve some circumstances of their office.

The Roman *jurisconsulti* seem to have been the same with our chamber-counsellors, who arrived at the honour of being consulted, through age and experience, but never pleaded at the bar. Their pleading advocates, or lawyers, never became *jurisconsulti*.

In the times of the commonwealth, the *advocati* had by much the more honourable employment, as being in the ready way

to attain to the highest preferment. They then despised the *jurisconsulti*, calling them in derision: *jurarii* and *legules*, as having invented certain forms, and monofyllables, in order to give their answers the greater appearance of gravity and mystery. But in process of time they became so much esteemed, that they were called *prudentes* and *sapientes*, and the emperors appointed the judges to follow their advice. Augustus at length advanced them to be public officers of the empire; so that they were no longer confined to the petty counsels of private persons.

Bern. Rutilius has written the lives of the most famous *jurisconsulti*, who have lived within these 2000 years.

JURISDICTION, a power, or authority which a man has to do justice in cases of complaint made before him.

There are two kinds of *jurisdiction*, the one *ecclesiastical*, the other *secular*.

Secular JURISDICTION, belongs to the king and his justices, or delegates. See **JUSTICE**, and **COURT**.

Ecclesiastical JURISDICTION, belongs to bishops, and their deputies. See **BISHOP**, and **OFFICIAL**.

Bishops, &c. have two kinds of *jurisdiction*, the one *internal*, which is exercised over the conscience in things purely spiritual; and this they are supposed to hold immediately of God: The other is *contentious*, which is a privilege some princes have given them of terminating disputes between ecclesiastics, and laymen. See **CONTENTIOUS**.

JURISPRUDENCE, the science of what is just and unjust, or of the laws, rights, customs, statutes, &c. necessary for the doing of justice.

Civil jurisprudence, is that of the Roman law; *canonical*, that of the canon law; and *feudal*, that of fees.

JUROR, **JURATOR**, in a legal sense, is one of those twenty-four, or twelve men, who are sworn to deliver truth upon such evidence as shall be given them touching any matter in question.

The punishment of petty jurors attainted of giving a verdict contrary to evidence, willingly, is very severe. See **ATTAINT**.

Challenge to the JURORS. See the article **CHALLENGE**.

JURY, in common law, signifies twenty-four, or twelve men, sworn to enquire of a matter of fact, and declare the truth, upon such evidence as shall be delivered them touching the matter in question.

The *jury* is to be chosen out of the same class or rank with the accused; and if he be a foreigner, he may demand a *jury* half foreigners and half Englishmen.

There are ordinarily thirty-six impanelled, whereof, in criminal cases, the person accused has the liberty to challenge or set aside twenty-four, and to pick out twelve at his pleasure.

These twelve are present at the trial, after which they withdraw into a chamber by themselves, where they are to be shut up without fire or candle, victuals or drink, till such time as they agree in their verdict, and declare unanimously that the defendant is either guilty of the charge laid against him, or not guilty. Upon which, the judge passes the sentence prescribed by the law.

In England there were formerly three sorts of trials, *viz.* one by *parliament*, another by *battle*, and a third by *assize* or *jury*.

The trial by *assize* (be the action civil or criminal, public or private, personal or real) is referred for the fact to a *jury*, and as they find it, so passes the judgment. See **ASSIZE**.

This *jury* is not only used in circuits of justices errant, but also in other courts and matters of office: But though it appertains to most courts of the common law, yet it is most remarkable in the half year courts of the justices errant, commonly called the *great assizes*, and in the quarter-sessions; and in them it is most ordinarily called a *jury*: In other courts it is usually called an *inquest*, and in the court-baron, a *jury of the homage*.

In the general *assize* there are usually many *juries*, because there are a great many causes, both civil and criminal, commonly to be tried; whereof one is called the *grand jury*, and the rest the *petit juries*; of which, it seems, there should be one in every hundred.

Grand JURY, consists of twenty-four grave and substantial gentlemen, or some of the better sort of yeomen, these are to be chosen indifferently by the sheriff out of the whole shire, to consider of all bills of indictment preferred to the court; which they do either approve, by writing upon them *billas vera*; or disallow, by indorsing *ignoramus*.

Such as they do approve, if they touch life and death, are farther referred to another *jury*, to be considered of, because the case is of much importance; but others of lighter moment are, upon their allowance, without more ado, fined by the bench; except the party traverse the indictment, or challenge it for insufficiency, or remove the cause to a higher court by certiorari; in which two former cases it is referred to another *jury*, and in the latter, transmitted to a higher bar.

bar. And presently upon the allowance of this bill, by the grand inquest, a man is said to be *indicted*. Such as they disallow, are delivered to the bench, by whom they are forthwith cancelled, or torn.

Petit JURY, consists of twelve men at the least, and these are impannelled as well upon criminal as upon civil causes: those that pass upon offences of life and death, bring in their verdict either guilty, or not guilty; whereupon the prisoner, if he be found guilty, is said to be *convicted*, and receives judgment and condemnation, or otherwise he is acquitted, and let free.

Those that pass upon civil causes real, are all, or so many as can conveniently be had, of the same hundred, where the land or tenement in question doth lie, being four at least; and they, upon due examination, bring in their verdict either for the defendant, or tenant.

Clerk of the JURIES. See the article **CLERK**.

JURY-MAST, an appellation given by the seamen to an extemporaneous sort of mast, patched up of yards, or other pieces of timber, and set up in the room of a true mast, which has been lost in a fight, or by a storm.

JUS, and **JURA**. See the article **LAW**, **RIGHT**, &c.

JUS Corona, *Rights of the Crown*, is part of the Law of England, which differs in many things from the general law concerning the subject. *Coke on Litt.*

Quale Jus. } See the article **QUALE jus**.
Jus Togæ. } **TOGA**.

JUST*, a sportive kind of combat on horseback, man against man, armed with lances.

* The word is by some derived from the French *juste*, of the Latin *justa*, because the combatants fought near one another. Salmassius derives it from the modern Greek *zousura*, or rather *zouren*, which is used in this sense by Nicephorus Gregoras. Others derive it from *justa*, which in the corrupt age of the Latin tongue was used for this exercise, by reason it was supposed a more just and equal combat than the tournament.

Antiently, *justs* and tournaments made a part of the entertainment at all solemn feasts, and rejoicings.—The Spaniards borrowed these exercises from the Moors, and call them *juego de cannas*, reed, or cane play.—Some take them to be the same with the *ludus Trojanus*, antiently practised by the youth of Rome.

The Turks use them still, and call them *lancing the gerid*.

The difference between *justs* and tournaments consists in this, that the latter is the genus, of which the former is only a species. Tournaments included all kinds of military sports, and engagements, which were made out of gallantry and diversion.—*Justs* were those particular combats where the parties were near each other, and engaged with lance and sword; add, that the tournament was frequently performed by a number of cavaliers, who fought in a body. The *just* was a single combat of one man against another.—Though the *justs* were usually made in tournaments, after a general rencounter of all the cavaliers, yet they were sometimes singly, and independent of any tournament.

He who appeared for the first time at a *just*, forfeited his helm or calque, unless he had forfeited before at a tournament.

JUST Appui. See the article **Appui**.

JUSTICE, **JUSTITIA**, a constant desire or inclination to give every one his due; or a habit by which the mind is disposed, and determined to give every man his own.

Justice may be divided into *distributive*, *commutative*, and *legal*.

Distributive JUSTICE, is concerned in matters of government, and of beneficence, and is either remuneratory, or punitive: it observes an equality in dealing rewards and punishments, according to each man's condition and merit; for as actions are either good or evil, for the good, rewards must be assigned; and for the evil, punishments: and herein a geometrical proportion is observed.

Commutative JUSTICE, is conversant in matters of commerce, and in the equal commutation or changing of things, and proceeds according to an arithmetical equality, without any regard to persons and circumstances.

Legal JUSTICE, is that which resides in the state, or monarch, by whose power and authority the effects of *commutative* and *distributive justice* are frequently superseded, or suspended; as in a dearth of corn, if a person that has a stock by him will not sell it, it shall be taken from him, and the like.

Hand of JUSTICE. } See the articles **HAND**.
Officers of JUSTICE. } **OFFICE**.
Poetical JUSTICE. } **POETICAL**.

Temperament ad JUSTITIAM. See the article **TEMPERAMENT**.

JUSTICE, **JUSTITIARIUS**, is likewise an officer appointed by the king, or commonwealth, to do right by way of judgment.

He is called *justice*, not *judge*; antiently *justicia*, not *justiciarius*, because he has his authority by deputation, as dele-

gate to the king, and not *jure magistratus*; so that he cannot depute any other in his stead, the *justice* of the forest only excepted.

Of these *justices*, we have various kinds in England: *viz.*

Chief JUSTICE of the King's-bench, is the capital *justice* of Great Britain, and is a lord by his office.—His business is chiefly to hear and determine all pleas of the crown; that is, such as concern offences against the crown, dignity, and peace of the king, as treasons, felonies, &c.

This officer was formerly not only *chief justice*, but also chief baron of the exchequer, and master of the court of wards.—He usually sat in the king's palace, and there executed that office, formerly performed per comitem palatii; he determined, in that place, all the differences happening between the barons and other great men.

He had the prerogative of being vicegerent of the kingdom, whenever the king went beyond sea, and was usually chosen to that office out of the prime nobility; but his power was reduced by king Richard I. and King Henry I.—His office is now divided, and his title changed from *capitalis Angliæ justiciarius*, to *capitalis justiciarius ad placita, coram rege tenenda, or capitalis justiciarius hanc regis*.

Chief JUSTICE of the Common-pleas, he who, with his assistants, hears and determines all causes at the common law; that is to say, all civil causes between common persons, as well personal as real: and he also is a lord by his office.

JUSTICE of the Forest, is a lord by his office, who has power and authority to determine offences committed in the king's forests, &c. which are not to be determined by any other court, or *justice*.

Of these there are two; whereof one has jurisdiction over all the forests on this side Trent; and the other beyond it.

By many antient records, it appears to be a place of great honour and authority, and is never bestowed but on some person of great distinction.—The court where this *justice* sits, is called the *justice-seat of the forest*.

This is the only *justice* who may appoint a deputy; he is also called *justice in eyre of the forest*.

JUSTICES in Eyre, *Justiciarii itinerantes, or Errantes*, were those who were antiently sent with commission into divers counties to hear such causes, especially, as were termed *pleas of the crown*; and that for the ease of the subject; who must else have been hurried to the courts of Westminster, if the cause were too high for the county courts.

According to some, these *justices* were sent once in seven years, but others will have them to have been sent often.—Camden says, they were instituted in the reign of king Henry II. but they appear to be of an older date.

They were somewhat like our *justices* of assize at this day; though for authority, and manner of proceeding, very different.

JUSTICES of Assize, are such as were wont, by special commission, to be sent into this or that county, to take assizes, for the ease of the subjects.

For whereas these actions pass always by jury, so many men might not without great damage and charge, be brought up to London; and therefore *justices*, for this purpose, by commission particularly authorized, were sent down to them.

These continue twice every year to pass the circuit, by two and two, through all England, dispatching their several businesses by several commissions; for they have one commission to take assizes, another to deliver gaols, and another of oyer and terminer, &c.

JUSTICES of Gaol-delivery, those commissioned to hear and determine causes appertaining to such as for any offence are cast into prison.

Their commission is now turned over to the *justices* of assize.

JUSTICES of Nisi-prisus, are now the same with *justices of assize*: It is a common adjournment of a cause in the common-pleas, to put it off to such a day, *Nisi prius justiciarii venerint ad eas partes ad capiendas assisas*: from which clause of adjournment, they are called *justices of nisi prius*, as well as *justices of assize*, by reason of the writ, and actions they have to deal in.

JUSTICES of Oyer and Terminer, were *justices* deputed on some special occasions to hear and determine particular causes.

The commission of oyer and terminer is directed to certain persons, upon any insurrection, heinous demeanor, or trespass committed.

JUSTICES of the Peace, are persons of interest, and credit, appointed by the king's commission to attend the peace of the county where they live.

Of these, some, for special respect, are made of the *quorum*, so as no business of importance may be dispatched without the presence, or assent of them, or one of them. See **QUORUM**. The office of a *justice* of the peace, is to call before him, examine, and commit to prison all thieves, murderers, wandering rogues, those that hold conspiracies, riots, and almost all delinquents, which may occasion the breach of the peace, and quiet of the subject; to commit to prison such as cannot find bail, and to see them brought forth in due time to trial.

The original of *justices* of the peace, is referred to the fourth year

J U S

year of Edward III. They were first called *conservators*, or *wardens of the peace*.

JUSTIFICATION, in theology, that grace which renders a man just in the sight of God, and worthy of eternal happiness.

The Romanists and Reformed are extremely divided about the doctrine of *justification*; the latter contending for *justification* by faith alone, and the former by good works.

JUSTIFYING Grace. See the article **GRACE**.

JUSTNESS, the exactness, or regularity of any thing.

Justness is chiefly used in speaking of thought, language, and sentiments.—The *justness* of a thought consists in a certain precision, or accuracy, by which every part of it is perfectly true, and pertinent to the subject.

Justness of language, consists in using proper, and well-chosen terms; in not saying either too much, or too little.

M. de Mere, who has written on *justness* of mind, distinguishes two kinds of *justness*; the one arising from taste and

J U X

genius; the other, from good sense, or right reason.—There are no certain rules to be laid down for the former, *viz.* to shew the beauty and exactness in the turn, or choice of a thought; the latter consists in the just relation which things have to one another.

JUVENALIA, or **JUVENALES Ludi**, games, exercises of body, and combats, instituted by Nero the first time his beard was shaved.

They were celebrated in private houses, and even the women had a share in them: Probably, they were the same with what were otherwise called *Neroniana*.

JUSTAPOSITION, is used by philosophers to denote that species of growth, which is performed by the apposition of new matter to the surface, or outside of old.

In which sense, it stands opposed to *intus-fusception*: where the growth of a body is performed by the reception of a juice within it, diffused through its canals. See **NUTRITION**.

K.

K A B

K, A double consonant, and the tenth letter of the alphabet. It is borrowed from the Greek *kappa*; and was but little used among the Latins: Priscian looked on it as a superfluous letter, and says, it was never to be used except in words borrowed from the Greek. Dausquius, after Sallust, observes, that it was unknown to the ancient Romans.—Indeed we seldom find it in any Latin authors, excepting in the word *kalende*, where it sometimes stands in lieu of a *c*.—Carthage, however, is frequently spelt on medals with a *K*: SALVIS AUG. ET CAES. FEL. KART. and sometimes the letter *K* alone stood for *Carthage*.—M. Beger has observed, that a capital *K*, on the reverse of the medals of the emperors of Constantinople, signified KONSTANTINUS; and on the Greek medals he will have it to signify ΚΟΙΝΗ ΣΥΡΙΑ, Coele-syria.

Quintilian tells us, that in his time some people had gotten a mistaken notion, that wherever the letter *c* and *a* occurred at the beginning of a word, *k* ought to be used instead of the *c*. See C.

Lipius observes, that *K* was a stigma, anciently marked on the foreheads of criminals with a red-hot iron.

The letter *K* has various significations in old charters, and diploma's; for instance, KR. stood for *chorus*, KR. C. for *cura civilis*, KRM. for *carmen*, KR. AM. N. *earus amicus noster*, KS. *chaos*, KT. *capite tortus*, &c.

The French never use the letter *k*, excepting in a few terms of art, and proper names borrowed from other countries.—Ablancourt, in his dialogue of the letters, brings in *k* complaining, that he has been often in a fair way to be banished out of the French alphabet, and confined to the countries of the North.

In the English, the *k* is used much more than needs be, particularly at the ends of words after *c*, as in publick, physick, &c. where it is of no manner of service.

K is also a numeral letter, signifying 250, according to the verse;

K quoque ducentos et quingaginta tenebit.

When it had a stroke at top, *K*, it stood for 250000.

KABIN, KHABIN, KEBIN, or KUBIN, a temporary kind of marriage, in use among the Mahometans.

The *kabin* is contracted before the *cadi*, in whose presence the man espouses the woman for a certain time, upon condition that if he quits her at the end of that term, she shall be allowed a certain sum of money.

Some authors say, that the *kabin* is only permitted among the Persians, and in the sect of Ali; but others maintain, that it is also practised among the Turks.

KADARI, or KADARITES, a sect among the Mahometans, who deny the favourite tenet of the Mussulmen, predestination; and maintain the doctrine of liberty and free-will in all its latitude.

KALENDAR. See the article {CALENDAR.
KALENDS. {CALENDS.

KALI, a plant growing on the sea-coasts, and, sometimes even in the sand of the sea; whose ashes are of great use in the making of glass, and soap.

The name *kali*, or *alkali*, was given it by the Arabians: among naturalists it is also called *salicornia*, *soda*, &c. and in English, *glass-wort*, and *salt-wort*.

Kali grows in great abundance in Egypt, and Syria; as also in Languedoc, and Provence, where it is cultivated by the farmers, who sow whole fields of it to good effect, and in many other places.

Being burnt, its ashes made into a lye, and boiled with oil, make the best soap.

Out of the same ashes, called also *pulverine*, is extracted a salt, called *alkali salt*; which mixed with a fine sort of sand, make the fine glass called *crystal*.

The manner of preparing, or procuring the ashes, in Languedoc, is this: When the plant is grown up to its pitch, they cut it down, and let it dry; afterwards they burn and calcine it in certain pits like lime-kilns, dug in the ground for that purpose, which are close covered up with earth, so as no air may come at the fire.—The matter by this means is not reduced into ashes only, but is made into a very hard stone, like rock-salt, which they are forced to break with hammers to get it out, and this matter they call *salicor*, or *soda in the stone*.

They make such quantities of it there, that they export it into several other countries, but principally into Italy, where the Venetians manufacture it into those beautiful glasses, which they afterwards return into most countries in Europe. However, the soda made here is inferior to that brought

K E B

from Alicant. The best is in little dry sonorous lumps, of a blueish grey colour, and full of little eyes, or holes.

KALIPH. See the article CALIPH.

KAN, or KHAN, the name of an officer in Persia; answering to that of *governor* in Europe.

There are *kans* of Provinces, countries, and cities, who have different additions to distinguish them.

KAPI, a term in the eastern countries for *gate*.

Thus the chief gate of the palace of the emperor of Persia is called *alla kapi*, the gate of God.—Hence also, the officer who has the command of the grand seignior's palace-gates, is called *kapighi bachi*.

KARABE. See the article CARABE.

KARATA, by some called *caraguata maca*, a kind of aloe growing in America; whose leaves, when boiled, are made into a thread, of good use for making cloth, fishing-nets, &c. Its root, or leaves, thrown into the water, stun the fishes to that degree, that they are easily taken with the hand: Its stalk, when dried and burnt, serves for tinder; and when briskly rubbed on a harder wood, it takes fire, and consumes itself.

KARKRONY, a building where the royal manufactures of Persia are carried on.

Here are made their tapestries, cloth of gold, silk, wool, and brocades, velvets, taffeties, coats of mail, sabres, bows, arrows, and other arms.—There are also in it painters in miniature, goldsmiths, lapidaries, &c.

KARLE, a Saxon word, used in our laws, sometimes simply for a *man*, and sometimes for a *servant*, or *clown*.

Hence the Saxons call a seaman a *buscarle*, and a domestic servant a *buscarle*.

KASI, a term in the East, applied to the fourth pontiff of Persia, who is also the second lieutenant civil, and judges of temporal as well as spiritual affairs.

He has two deputies, who determine matters of less consequence; particularly quarrels arising in coffee-houses, which make a great part of their business.

KAUR-YSAOUL, a body of soldiers who form the last of the five corps of the king of Persia's guards.

They are in number 2000, and are all horse, commanded by the constable, and in his absence by the captain of the watch.—They keep watch in the night around the palace, serve to keep off the crowd when the *sophi* goes on horse-back, keep silence at the audience of ambassadors, seize the *kans* and other officers when disgraced, and cut off their heads when the *sophi* commands it.

KAY*, or KEV, a wharf or place by the water-side, in a sea-port for the loading, and unloading of merchandize.

* The verb *cajare*, in old writers, according to Scaliger, signifies to keep in, or restrain; and hence came our term *kay*; the ground where keys are made being bound in with planks and posts.

KAYAGE, the money, or toll, paid for loading, or unloading wares at *kays*.

KEBER*, the name of a sect among the Persians, who, for the generality, are rich merchants.

* The word signifies *infidel*, formed from the Turkish *kapir*, a renegade; or, rather, they both come from كبر *capbar*; which, in the Chaldee, Syriac, and Arabic, signifies, to deny.

Though they inhabit the middle of Persia, and are found in great numbers in the suburbs of Ispahan, yet it is not known whether or no they are originally Persians, as having nothing in common with the other Persians, but only the language.—They are distinguished by their beard, which they wear very long; and by their dress, which is quite different from that of the rest.

They are, in effect, heathens, but are in great reputation for the regularity of their life.—Some authors say, they adore fire, in imitation of the antient Persians; but this is contradicted by others: They believe the immortality of the soul, and have some things like what the antients taught of hell, and the Elysian fields.

When any of them die, they let loose a cock in his house, and drive it out into a field; if a fox seizes it, and bears it off, they make no doubt but the soul of the deceased is saved. If this first experiment does not satisfy them, they have recourse to a second, which is conclusive; they carry the carcass into the burying-ground, and prop it against the wall with a fork: if the birds peck out the right-eye, they look on him as one of the predestinated, and bury him with a great deal of ceremony, letting him down gently into the grave; but if the birds begin with the left eye, they conclude him a reprobate, and throw him headlong into a ditch.

KEBLA, or KEBLAH, called also KEBLEH, KIBLEH, or ALKEBLA, among the Mussulmen, denotes that point, or

quarter,

KER

quarter, to which they turn themselves when they say their prayers.

Mahomet at first durst not propose any other *kebla*, to his followers, but the temple of Jerusalem, which was the *kebla* of the Jews and Christians.—In course of time, however, being willing to bring his own off from any communication in matters of religion with the Jews and Christians, he appointed them in the *Alcoran*, to turn themselves, at prayer, towards the temple of Mecca; from which time they called those two temples the *keblatan*, or two *keblas*.

Ricaut adds, that it is not the temple of Mecca, properly speaking, that the Turks call *kebla*, but rather the large square tower in the middle of the amphitheatre of that temple.

KEBLA is also used for an altar, or rather a *niche*, as Ricaut calls it, which the Mahometans have in all their churches, and which is placed very exactly on that side towards the temple of Mecca.

Hence also *kebla* comes to be used metaphorically for the object, or end proposed, in doing any thing.

Thus, the *kebla* of kings, is their crown and authority; that of men of business, is money; that of gluttons, good cheer, &c.

KEBLA-NOMA, or **KEBLEH-NOMA**, a name which the Turks and Persians give to a little pocket compass, which they always carry with them, in order to place themselves the more exactly when they go to prayers.

KEDGING, a sea term, used when a vessel is brought up or down a narrow river by the wind, though the tide be contrary to it.

To do this, the seamen let their fore-fail, foretop-fail, and mizen-fail, and let her drive with the tide, that they may flat her about.—If she come too near the shore, they have a little anchor ready, called the *kedger*, or *kedge-anchor*, with a hawser fastened to it from the ship; and this they drop in the midst of the current, by which means they wind her head about; and this done, take up the anchor again.

KEEL, the lowest piece of timber in a ship, placed in the bottom of her hull; one end thereof being let into the stern-post, and the other into the stem.

Into this are all the ground-timbers and hooks fastened, and bolted, fore and aft.

When a ship has a deep *keel*, she is said to have a *rank keel*; and this serves to keep her from rolling.—See *Tab. Ship*, fig. 2. n. 57.

False KEEL. See the article **FALSE**.

KEEPER of the Forest, otherwise called *chief warden of the forest*, is an officer who has the principal government of all things belonging to a royal forest, and the check of all the other officers.

The lord chief justice in eyre of the forest, when he thinks fit to hold his justice seat, sends out his general summons to the *keeper* forty days before, to warn all under-officers to appear before him at a day assigned in the summons. See *JURISDICTICE of the Forest*.

KEEPER of the Great Seal, is a lord by his office, and is styled *lord keeper of the great seal*. He is one of the king's privy council, through whose hands pass all charters, commissions, and grants of the king under the great seal, without which seal, all such instruments, by law, are of no force; for the king is, in the interpretation of the law, a corporation, and passes nothing firmly but under the said seal; which is, as the public faith of the kingdom, in the highest esteem and reputation.

The lord *keeper* has the same place, authority, pre-eminence, jurisdiction, execution of laws, and all other customs, commodities, and advantages as the lord chancellor of England has for the time being.—Both these officers cannot properly subsist at the same time, since the statute of 5 Eliz.

KEEPER of the Privy Seal, is a lord by his office; through whose hands pass all charters signed by the king, before they come to the great seal, and some things which do not pass the great seal at all. He is of the king's privy council, and was antiently called *clerk of the privy seal*, yet reckoned in the number of the great officers of the realm, 12 Ric. II. c. 11. 27 Hen. VIII. c. 11.

KEEPING of Books. See the article **BOOK-KEEPING**.

KEPLER's Problem. See the article **PROBLEM**.

KERAMIAN S, a sect among the Mussulmen, so called from Mohammed Ben Keram, its author.

The *Keramians* maintain, that whatever the *Alcoran* says of the arms, eyes, and ears of God, is to be understood literally; so that they admit the tagiafism, that is, a kind of corporeity in God; which, however they explain very variously.

KERANA, a long sort of trumpet, somewhat in form of a speaking-trumpet; used by the Persians.

To the sound of this, they add a confused noise of hautboys, timbrels, drums, and other instruments, every evening at sunset, and two hours after midnight.

KERMES, a kind of little animal, found in great plenty on an ever-green of the oak kind, and of considerable use both in physic, and dyeing.

The *kermes*, called also *scarlet grain*, and by the Greeks *coc-*

KEY

coc baphica, by the Latins *vermiculus*, by the French sometimes *vermillon*, or *grain de gall*, or *vermeil*, is about the size of a juniper-berry, round, smooth, and glossy; of a beautiful red colour, and full of a mucilaginous juice, of the same dye; it is found adhering to the bark on the stem and branches of this peculiar sort of scarlet oak, called by botanists *ilex aculeata cocci-glandifera*: growing in Spain, Languedoc, and other hot countries.

The *kermes* is of a vinous smell, a bitter, rough, agreeable taste; and its pulp, or juice, is pregnant with numerous minute ova.

The animal retains these ova under her belly, 'till they hatch into a very numerous off-spring.

Hence, when the *kermes* is dried, there comes out of it an infinite number of little insects, and flies, so small that they are scarce visible; inasmuch that the whole inward substance seems converted into them: To prevent this inconvenience, they usually steep the *kermes* in vinegar before it be dry.

They draw the juice, or pulp, from the *kermes*, by pounding it in a mortar, and then straining it through a sieve. Of this they make a syrup, by adding a sufficient quantity of sugar.—Sometimes, they dry the pulp separate, from the husk; which pulp thus dried, they call *pasteil of kermes*.

The *kermes* grain is of great use in physic: it is cardiac, desiccative, and astringent; it fortifies the stomach, and prevents abortion; of this is made that celebrated confection, called *alkermes*.

It is, however, of greater use in dyeing scarlet; for which use, the manner of preparing it is as follows.—The *kermes* being taken when ripe, they spread it on linnen; and at first, while it abounds most in moisture, turn it twice or thrice a day, to prevent its heating; till such time as there appears a red powder among it; this they separate, by passing it through a sieve; and then again spread abroad the grain on the linnen, till they perceive the same redness of powder, when they repeat the sifting: thus they proceed, while they discover any red powder on the surface of the grain, which is still passed through the sieve, till it yield no more.

In the beginning, when the small red grains are found to move, as they will always do, they are sprinkled over with strong vinegar, and rubbed between the hands.—Were not this precaution taken, out of every grain would be formed little insects, which would be of no use in dyeing.

The grain being quite emptied of its pulp, or red powder, by the process above-mentioned, is washed in wine, and then exposed to the sun; after this, it is put up into small bags; and along with it, the proportion of red dust that it had afforded.

According to M. Marfigli's experiments made at Montpellier, the *kermes* has the effect of galls, when mixed with vitriol, and makes a good ink: Mixed with oil of tartar, or lime-water, its colour turns from a vermilion to a crimson colour. In a decoction of turnsole flowers, it retains its proper colour.—They have not been able to get any fixed essential salt from it, but a volatile salt it yields in abundance; which, in M. Marfigli's opinion, would have a better effect in medicine if taken in a liquid, than when inclosed in conferves, and confections, which hinder its action. See *Supplement: article KERMES*.

KERN, or **KERNE**, a term in the ancient Irish militia, signifying a *foot-soldier*.

Camden tells us, the armies of Ireland consisted of cavalry, called *galloglasses*; and infantry, lightly armed, called *kernes*.—The *kernes* bore swords, and darts; to the last were fitted cords, by which they could recover them, after they had been launched out.

KERNES, in our laws, signify idle persons, or vagabonds. See **VAGABOND**.

KETCH, a kind of vessel. See the article **BOMB-KETCH**.

KEY, a little iron instrument, for the opening of locks.

L. Molinus has a treatise of *keys*, *De Clavibus Veterum*, printed at Upsal: he derives the Latin name *clavis*, from the Greek *κλεις*, *claudo*, I shut; or from the adverb *clam*, privately; and adds, that the use of *keys* is yet unknown in some parts of Sweden.

The invention of *keys*, is owing to one Theodore of Samos, according to Pliny and Polydore Vergil: but this must be a mistake, the use of *keys* having been known before the siege of Troy; mention even seems made of them in the nineteenth chapter of Genesis.

Molinus is of opinion, that *keys*, at first, only served for the untying certain knots, wherewith they antiently secured their doors: but the laconic *keys*, he maintains, were nearly akin in use to our own; they consisted of three finger teeth, and made the figure of an E; of which form there are some still to be seen in the cabinets of the curious.

There was also another *key*, called *βασιλική*, made in the manner of a male skrew, which had its corresponding female in a bolt affixed to the door.

KEY is, hence, become a general name for several things serving to shut up, or close others.

KEY, or **KEY-STONE**, of an *Arch*, or *Vault*, is the last stone placed atop thereof; which being wider and fuller at the top than bottom, wedges, as it were, and binds in all the rest.

The *key* is different in the different orders; in the Tuscan and Doric, it is a plain stone, only projecting; in the Ionic, it is cut, and waved somewhat after the manner of consoles; in the Corinthian and Composite, it is a console enriched with sculpture, foliage, &c.—See *Tab. Archit.* fig. 36. lit. c. fig. 50. lit. f.

The name **KEY-STONES**, or *Arch-stones*, is sometimes also given to all the stones which form the sweep of an arch, or vault—answering to what the French more distinctly call *voussoirs*.

KEY, is also used for the ecclesiastical jurisdiction; particularly, for the power of excommunicating, and absolving.

The Romanists say, the pope has the power of the *keys*, and can open and shut paradise as he pleases; grounding their opinion on that expression of Jesus Christ, *I will give thee the keys of the kingdom of heaven*.

In S. Gregory we read, that it was the custom heretofore for the popes to send a golden *key* to princes, wherein they always inclosed a little of the filings of S. Peter's chains, kept with a world of devotion at Rome; and that these *keys* were worn in the bosom, as being supposed to contain some wonderful virtues.

KEY, in polygraphy, and steganography, denotes the alphabet of a cypher; which is a secret known only to the person who writes the letter, and him who decyphers it. See **ALPHABET**.

Some cyphers have a single *key*, where the same characters are used throughout; in other cyphers, the characters are varied, and the *key* is double.

KEY, in music, is a certain fundamental note, or tone, to which the whole piece, be it concerta, sonata, cantata, &c. is accommodated; and with which it usually begins, but always ends.

To get an idea of the use of the *key*, it may be observed, that as in an oration there is a subject, *viz.* some principal person or thing to which the discourse is referred, and which is always to be kept in view, that nothing unnatural and foreign to the subject may be brought in; so in every regular piece of music there is one note, *viz.* the *key*, which regulates all the rest.—The piece begins and ends in this; and this is, as it were, the musical subject, to which a regard must be had in all the other notes of the piece.—Again, as in an oration there are several distinct articles, which refer to different subjects, yet so as they have all a visible connection with the principal subject, which regulates and influences the whole; so in music there may be various subaltern subjects, that is, various *keys*, to which the different parts of the piece may belong; but then they must be all under the influence of the first and principal *key*, and have a sensible connection with it.

To give a more distinct notion of the *key*, we must observe, that the octave contains in it the whole principles of music, both with respect to consonance or harmony, and succession, or melody; and if either scale be continued to a double octave, there will, in that case, be seven different orders of the degrees of an octave, proceeding from the seven different letters with which the terms of the scale are marked.—Any given sound therefore, *i. e.* a sound of any determinate pitch or tune, may be made the *key* of the piece, by applying to it the seven natural notes arising from the division of an octave, and repeating the octave above or below, at pleasure. The given note is applied as the principal note or *key*, of the piece, by making frequent closes, or cadences upon it; and in the progress of the melody, no other but those seven natural notes can be admitted, while the piece continues in that *key*, every other note being foreign to the fundamental, or *key*.

For instance, suppose a song begun in any note, and carried on upwards, or downwards, by degrees and harmonical distances, so as never to touch any notes, but what are referable to that first note as a fundamental, *i. e.* the true notes of the natural scale proceeding from the fundamental; and let the melody be so conducted through those natural notes, as to close and terminate in the fundamental, or any of its octaves above or below; that note is called the *key* of the melody, because it governs all the rest, limiting them so far, as that they must be to it, in the relation to the seven essential notes of an octave; and when any other note is brought in, it is called, *going out of the key*.

From which way of speaking, *viz.* a song's continuing in, or going out of the *key*, it may be observed, that the whole octave, with its natural notes, come under the idea of a *key*; though the fundamental, or principal note is, in a peculiar sense, called the *key*.

In which last sense of the word *key*, (*viz.* where it is applied to one fundamental note) another note is said to be out of the *key*, when it has not the relation to that fundamental of any of the natural notes belonging to the continuous division of the octave.

Here too it must be added, with respect to the two different divisions of the octave, that a note may belong to the same *key*, *i. e.* it may have a just musical relation to the same fundamental in one kind of division, and be out of the *key*, with respect to another.

Now a piece of music may be carried through several *keys*; *i. e.* it may be given in one *key*, and be led out of that into another, by introducing some note foreign to the first, and so on to another: but a regular piece must not only return to the first *key*, but those other *keys*, too, must have a particular connection with the first.—It may be added, that those other *keys* must be some of the natural notes of the principal *key*, though not any of them at pleasure.

As to the distinctions of *keys*, we have already observed, that to constitute any given note or sound, a *key*, or fundamental note, it must have the seven essential or natural notes added to it; out of which, or their octaves, all the notes of the piece must be taken, while it keeps within the *key*, *i. e.* within the government of that fundamental.—It is evident, therefore, there are but two different species of *keys*, which arise according as we join the greater or less third, these being always accompanied with the sixth and seventh of the same species; the third *g*, for instance, with the sixth and seventh *g*; and the third *b*, with the sixth and seventh *b*.

This distinction is expressed under the names of *sharp key*, which is that with the third *g*, &c. and the *flat key*, which is that with the third *b*, &c. whence it is plain, that how many different closes forever there be in a piece, there can be but two *keys*, if we consider the essential difference of *keys*; every *key* being either flat, or sharp, and every sharp *key* being the same, as to melody, as well as every flat one.

It must be observed, however, that in common practice the *keys* are said to be different, when nothing is considered but the different tune, or pitch of the note, in which the different closes are made.—In this sense, the same piece is said to be in different *keys*, according as it is begun in different notes, or degrees of tune.

To prevent any confusion which might arise, from using the same word in different senses, M. Malcolm proposes the word *mode* to be substituted instead of the word *key*, in the former sense; that is, where it expresses the melodious constitution of the octave, as it consists of seven essential, or natural notes, besides the fundamental; and in regard there are two species of it, he proposes, that that with a third *g* be called the *greater mode*; and that with a third *b*, the *lesser mode*; appropriating the word *key* to those notes of the piece in which the cadence is made; all of which may be called *different keys*, in respect of their different degrees of tune.

To distinguish, then, accurately between a *mode* and a *key*, he gives us this definition, *viz.* an octave, with all its natural and essential degrees, is a *mode*, with respect to the constitution, or manner of dividing it; but, with respect to its place in the scale of music, *i. e.* the degree, or pitch of tune, it is a *key*; though that name is peculiarly applied to the fundamental.

Whence it follows, that the same *mode* may be with different *keys*; *i. e.* an octave of sounds may be raised in the same order, and kind of degrees, which makes the same *mode*; and yet be begun higher or lower; *i. e.* be taken at different degrees of tune, with respect to the whole, which makes different *keys*; and, *vice versa*, that the same *key* may be with different *modes*, *i. e.* the extremes of two octaves may be in the same degree of tune, yet the division of them be different.

KEYS also denote those little pieces in the forepart of an organ, spinette, or harpsicord; by means whereof the jacks are played, so as to strike the strings of the instrument, and wind is given to the pipes, by raising and sinking the sucker of the sound-board.

They are in number twenty-eight, or twenty-nine. In large organs, there are several sets of these *keys*; some to play the small second organ, some for the main organ, some for the trumpet, and some for the echoing-trumpet. In some there are but a part that play, the rest being for ornament. There are twenty slits in large *keys*, which make the half notes.

M. Buliofski, of Doulez, pretends to have invented a new kind of *keys*, much preferable to the common ones. With these, he says, he can express sounds, which follow each other in a continual geometrical proportion, and so can furnish all the sounds in music, and by consequence all the imaginary intervals and concords; whereas the common *keys* do but yield some of them.

KEY, in a naval sense. See the article **KAY**.

KHAZINE, the grand seignior's treasury. See **TREASURY**, and **EXCHÉQUER**.

Here are kept registers of receipts, accounts of provinces, in drawers, marked with the years, and the places names: Here also is kept part of the emperor's wardrobe.

Every day of the divan this treasury is opened, either to take out, or put something in: And the principal officers who have the charge of it, are all to assist at this opening. The Tchaouch-Bachi, in their presence, first breaks the wax where-with the key-hole had been sealed up, and carrying it to the grand vizier, that minister first kisses it, and then draws out of his bosom the grand seignior's gold seal; in the mean time he looks narrowly after the officer, who, when he has done his business in the treasury, locks and seals up the place, and returns the seal to the vizier with the same ceremony as before.

Besides this, there are other apartments for the money, where the officers are never allowed to enter with any clothes that have pockets in them.

KIBES. See the article CHILBLAIN.

KIDNEY, *Rein*; a part of an animal, whose use is to separate the urine.

The *kidneys* are two, situate one on each side; one between the liver and musculus lumbaris, on the right side; the other between the spleen and the same muscle, on the left side. In man, the right is lower than the left, but in quadrupeds it is usually the contrary; they are fastened to the loins and the diaphragm by their exterior membrane, and to the bladder by the ureters; the right is also fastened to the intestine cæcum, and the left to the colon: their figure resembles a bean, or rather a crescent, being curve on the side of the vena cava, and on the outside gibbous.

There are ordinarily but two *kidneys*, though sometimes three have been found, and sometimes four, and sometimes on the other hand only one. In men they are commonly about five inches long and three broad, and one and a half thick: their substance is composed of glands, and very small urinary pipes, or canals; the glands form the circumference, and serve to separate the urine; the papillæ, or urinary tubes, form the inner part, they come out of the glands, and carry the urine into a cavity, in the concave part of the *kidney*, called the *pelvis*, whence it passes through the ureters into the bladder. See *PELVIS*.

The *kidneys* are covered with two membranes; they have each of them arteries and veins; the arteries come from the aorta, and the veins terminate in the cava; these are all called *emulgentis*. They have nerves also, which take their origin from the plexus renalis, formed by the ramifications of the intercostal nerve, and the nerves of the loins.

The *kidneys* secrete the urine from the blood, which, by the motion of the heart, is driven through the arteries into the emulgent arteries, and these carry it into the little glands where its serosity, being separated, is received in at the orifices of the urinary pipes, which go from the glands to the pelvis, and thence runs by the ureters into the bladder; the blood, which could not enter the glands, is brought back by the emulgent veins.—See *Tab. Anat. (Splanchn.) fig. 1. lit. II. fig. 4. lit. bb. cc.*

KILDERKIN, a kind of liquid measure, which contains two firkins, or eighteen gallons beer measure, and sixteen ale measure.

Two *kilderkins* make a barrel, and four a hoghead.

KING*, a monarch, or potentate, who rules singly and sovereignly over a people. See *SOVEREIGN*, *PRINCE*, &c.

* Camden derives the word from the Saxon *Cynig*, which signifies the same, and that from *Cyn*, power, or Ken, knowledge, wherewith every monarch is supposed to be invested. The Latin *rex*; the Scythian *reiks*; the Punic, *resch*; the Spanish *rey*; and French *roy*; come all, according to Pottel, from the Hebrew *רֹאשׁ* *rosh*, chief, head.

Kings, both among the antient Greeks and Romans, were priests as well as princes. Virgil, speaking of Anius, king of Delos, says,

Rex Anius, rex idem hominum, Phœbique sacerdos.

As to the Romans, Livy and Dionysius are express; they say, that though Numa instituted a great number of orders of priesthood, yet some he discharged himself, and in person.—After the expulsion of the *kings*, they were obliged to create a *rex sacrorum*, a king of the sacrifices, for the administration of the priestly part of the royalty.

Lawyers say, the king of England is a mixed person, a priest as well as a prince: At his coronation he is anointed with oil, as the priests and *kings* of Israel were, to intimate, that his person is sacred.

Among the Greeks, the king of Persia had antiently the appellation of the great king; the king of France now has that of the most christian king, and the king of Spain has that of catholic king. See *CATHOLIC*.

The king of the Romans is a prince chosen by the emperor, as a coadjutor in the government of the empire.

The kings of England, by the L. iteran council, under pope Julius II. had the title of *christianissimus* conferred on them; and that of *defender of the faith*, was added by pope Leo X. though it had been used by them some time before.

VOL. I.

The title of *grace* was first given to our *kings* about the time of Henry IV. and that of *highness* and *majesty* first to Henry VIII.

In all public instruments and letters, the king styles himself *not*, yet, though till the time of king John, he spoke in the singular number.

The Hungarians formerly gave the name *king* to their queen Mary, to avoid the infamy which the laws of that country cast upon those who are governed by women: Accordingly, she bore the title of *king* Mary, till her marriage with Sigismund, at which time she laid aside her kingship, and took up the quality of queen.

The laws make it high treason barely to imagin or intend the death of the *king*; and, because the destruction of the *king* may ensue that of his great counsellors or officers, it is felony in any of the *king's* servants to conspire even that; though in other capital cases, it is a rule, that *voluntas non reputabitur pro facto*; and an Englishman shall not, in any other case be put to death, unless the deed follow the intent. The *king's* office, (as he promises at his coronation) is to preserve the rights and privileges of the church, the prerogative of the crown, the laws and customs of the realm, &c. or as Fortescue has it, he is *pugnare bella populi sui & eos rectissime judicare*. He acknowledges no precedence in any other prince but the emperor.

He has the supreme right of patronage, called *patronage parramont*, over all the ecclesiastical benefices in England.

He has power, by his prerogative, without any act of parliament to make war or peace, conclude leagues and treaties, give commissions for impressing soldiers, dispose of magazines, castles, ships, public monies, &c. He convokes, adjourns, prorogues, and dissolves parliaments, and may refuse his assent to any bill passed by both houses, without giving his reasons for it.

He may encrease the number of members of either house at pleasure, by creating new peers, and bestowing privileges on other towns for sending burgesses to parliament. He has also power to enfranchise an alien, and make him a denizen.

Debts due to him are always to be satisfied in the first place, in case of executorialship, &c. and till his debt is discharged, he may protect the creditor from the arrests of others. He may distrain for the whole debt on a tenant that holds but part of the land, is not obliged to demand his rent as others are, may sue in what court he pleases, and distrain where he lists. In all doubtful cases, *semper præsumitur pro rege*: no statute restrains him, unless he be particularly named. In all cases where the *king* is plaintiff, his officers may enter with an arrest; and if entrance be denied, break open a house, and seize the party; though in other cases a man's house is his castle, and has a privilege to protect him against all arrests.

He has custody of the persons and estates of idiots and lunatics: he is *ultimus hæres regni*, and to him revert all estates, when no heir appears. All treasure trove (*i. e.* money, plate, or bullion found, and the owners not known) belongs to him; so all waifs, strays, wrecks, lands recovered from the sea, gold and silver mines, royal fishes, &c. belong to him. He can unite, separate, enlarge or contract the limits of bishopricks, or ecclesiastical benefices, and by his letters erect new bishopricks, colleges, &c. See *REGALIA*.

He can dispense with the rigor of the ecclesiastical laws, except those which have been confirmed by an act of parliament, or declared by the bill of rights; as, for a bastard to be a priest, for a bishop to hold a benefice in commendam, &c. He has also power to dispense with several acts of parliament and penal statutes, by a non-obstante, where himself is alone concerned; to moderate the rigour of the law, according to equity; to pardon a man condemned by law, except in appeals of murder; and to interpret by his judges, in statutes, and cases not defined by law.

The laws esteem him God's vicegerent on earth, and ascribe various perfections to him, not belonging to any other man. No flaw or weakness is found in him: no injustice or error; no negligence, infamy, stain, or corruption of blood. By his crown he is, ipso facto, cleared of all attainder: no non-age, or minority are allowed in him, and his very grants of lands, though held in his natural capacity, cannot be avoided by non-age. Nay more, the law ascribes a kind of perpetuity, or immortality, to him; *Rex Angliæ non moritur*. His death is termed his *demise*, because the crown is thereby demised to another.

He is said not to be liable to death, as being a corporation of himself, that lives for ever. There is no interregnum, but the minute one *king* dies, his heir is *king*, fully and absolutely, without any coronation, ceremony, &c.—To these it may be added, that the law attributes a kind of ubiquity to the *king*; he is in a manner every where, in all his courts, and therefore cannot be suited.

Some things, however, there are which the *king* cannot do, *viz.* he cannot do wrong, nor can he divest himself, or successors of any part of his regal prerogative, authority, &c.

—There are several things also which he cannot do *salvo jure, salvo jureamento, & salvo conscientia sua*: In particular, there are two things which he cannot do without the consent of parliament, viz. make new laws, or raise new taxes.

WIDOW.

KING of the sacrifices, *Rex sacrificulus*, or *sacerdos*, was a title of an ancient priest, or minister of Religion at Rome; who was superior to the *flamines*, but inferior to the *pontifex maximus*.

He was created at the *comitia centuriata*, or assembly of the centuries, and was at first chosen out of the number of the patricians. He could not, during his office, hold any magistracy, nor harangue the people. He presided at all the sacrifices, proclaimed the feasts, &c.

His wife bore the title of *queen of the sacrifices*, *regina sacerdotum*, and had herself a part in the sacred ceremonies.

KING at arms, or *of arms*, is an officer of great antiquity, and antiently he was of great authority, his business is to direct the heralds, preside at their chapters, and have the jurisdiction of armory.

In England we have three kings of arms, viz. *garter*, *clarenceux*, and *Norroy*.

Garter, principal **KING at arms**, See the article **GARTER**.

This officer was instituted by Henry V. His business is to attend the knights of the garter at their assemblies, to marshal the solemnities at the funerals of the highest nobility, and to carry the garter to kings and princes beyond the sea; on which occasion he used to be joined in commission with some principal peer of the kingdom.

Clarenceux KING at arms, is so called from the duke of Clarence to whom he first belonged. His office is to marshal and dispose the funerals of all the inferior nobility, as baronets, knights, esquires, and gentlemen, on the south-side of the Trent.

Norroy KING at arms, is to do the same on the north-side of the river Trent.

These two last are also called *provincial heralds*, in regard they divide the kingdom between them into two provinces.

These, by charter, have power to visit noblemen families, to set down their pedigrees, distinguish their arms, appoint persons their arms, and, with *garter*, to direct the other heralds.

Antiently, *the kings at arms* were created, and solemnly crowned by the kings of England themselves; but of later days the earl marshal has a special commission, at every creation, to personate the king,

To these may be added, *Lyon KING at arms*, for Scotland, who is the second king at arms for Great Britain; he is invested and crowned with great solemnity. To him belong the publishing the king's proclamations, marshalling funerals, reversing arms, &c.

KINGDOM, among chymists, is a term which they apply to each of the three orders, or classes of natural bodies; *animal*, *vegetable*, and *mineral*.

KING'S Bench, *hancus regius*, a court, or judgment-seat, so called, in regard the king is supposed to sit in person as judge of the court, and may do so whenever he pleases; for which reason all writs, and other process in this court, are made returnable coram nobis, that is, before the king himself, and not coram iudiciariis nostris, as is the form in the common pleas.

The judges of this court are the lord chief justice, and three other petty justices.

In this court are principally determined matters relating to the crown, and the peace.—When any person is aggrieved by an order of justices, or quarter-sessions, they have recourse hither; the rights of elections of mayors, bailiffs, constables, &c. are often upon mandamus's, brought before this court to be settled, and prohibitions are hence issued out to stay proceedings in the ecclesiastical, admiralty, or any inferior court, where the matters appear to be triable at common law. The subject has also a right to sue in this court for any debt or contract, as well as in any other court, and may as advantageously and expeditiously proceed.

The chief justice is constituted by writ, and he is to hold, *quandiu se bene gesserit*, and so cannot be displaced without some great misdemeanor; though formerly the chief justice, and other inferior judges, were made only *durante beneplacito*, and accordingly were turned out at the king's pleasure. The salary of the lord chief justice used to be but 1500l. per ann. but it is now 500l. per term.—He presides under his majesty in this court; but when the court divides, in giving judgment upon any special argument, he hath but one voice; so that if the opinion of the court should be equally divided, the

matter must rest till one of the judges shall see just reason to alter his opinion.—He is to attend the lords in parliament, though he has no vote, unless he be a peer himself, but is to give his opinion and advice to the house by virtue of a writ of assistance; and is frequently therefore consulted by them, both in making and repealing laws, and in altering or explaining them.—He makes a return of all writs of error in parliament directed to this court, and with his own hand delivers the writ of error, and a transcript of the proceedings in the cause into the house of lords.

The three petty, or *inferior judges* of this court go the circuits, and are in commission of oyer and terminer at the Old-Baily. Their salary is 375l. per term, to which they, as well as the chief justice, are entitled, though they happen not to sit one day in court in the term, unless they give their assent so slightly, as, on a *seire facias*, to be charged with negligence: these also hold by *quandiu se bene gesserit*.

There are several *officers* belonging to this court, as two chief clerks, or prothonotaries, who are supposed to enter all the pleadings and judgments between party and party; although this is in reality done by an entering-clerk under them; and all writs of latitat, non omittas, bills of Middlesex, habeas corpus, &c. are subscribed with the names of these chief clerks.

The *secondary* acts as master of the office on the pleas side, and is the chief clerk's deputy; his business is to examine any person, who is to be sworn an entering-clerk, or attorney at large, whether he be duly qualified, and to present him to the chief justice.—He also signs all judgments, and gives costs upon them; and the court, upon any motion, in relation to the irregular practice of any clerk or attorney, generally refers the examination thereof to him.—He also takes all affidavits in court (unless on the crown-side) and the acknowledgment of all deeds in court.

KING'S Evil.

See the article **EVIL**.

KING'S Exchange. See the article **EXCHANGE**.

KING'S Household. See **HOUSEHOLD**, **GREENCLOTH**, **COFFERER**, &c.

KING'S Privy Council. See the article **COUNCIL**.

KING'S Silver, the money due to the king in the court of common pleas, pro licentia concordandi, in respect of a licence there granted to any man for levying a fine of lands, or tencements to another person.

KING'S Thames. See the article **THANE**.

KING'S War. See the article **WAR**.

KING'S Wardrobe. See the article **WARDROBE**.

KINTAL, or **QUINTAL**, a weight of one hundred pounds, more or less, according to the different usage of divers nations. The *kintal* of Smyrna is 123 pounds, 3 ounces, 9 drams; or 120 pounds, 7 ounces, 12 drams; but that of Aleppo is 465 pounds, 11 ounces, 15 drams.

KIPPER-TIME, a space of time between the festival of the finding of the Holy Cross, May the third, and Twelfth-day; during which, salmon-fishing in the river Thames, from Gravesend to Henley, is forbidden by *Rat. Parl.* 50 Edw. III.

KIRK-MOTE, a synod. See the article **SYNOD**.

Sometimes the word is also taken for a meeting in the church, or vestry. See **MOTE**.

KIRK-SESSIONS, the name of a petty ecclesiastical judicatory in Scotland. Each parish, according to its extent, is divided into several particular districts, every one of which has its own elder and deacon to oversee it. A consistory of the ministers, elders, and deacons of a parish, form a *kirk-sessions*.

These meet once a week, the minister being their moderator, but without a negative voice. It regulates matters relating to public worship, elections, catechizing, visitations, &c. It judges in matters of less scandal; but greater, as adultery, are left to the presbytery, and in all cases an appeal lies from it to the presbytery.

KIZILBASCH, or **KEZELBASCH**, a Turkish term, signifying *red-head*: applied by way of obloquy to the Persians, ever since Ishmael Sophi, founder of the family last reigning in Persia, who ordered his soldiers to wear a red cap, round which is a scarf or turban with a dozen plaits in it, in memory of the twelve imams, successors of Ali, from whom he pretended to descend.

Vignere writes the word, *kneelbasch*, and adds, that according to the vulgar interpretation among the Persians, the twelve plaits signify the twelve sacraments of their law. Vignere, not contented with this, looks out for another original, and tells us there is a mystery in it, derived from the antient Paganism, when the Persians adored fire, whose heat is denoted by the red colour, which in some measure symbolizes with the sun, held by them in the highest veneration. He adds, that the twelve plaits shew the twelve months of the year, and the twelve signs in which that luminary performs his course.

KNAVE*, an old appellation for a man-servant, and so used in 14 E. III. stat. 1. cap. 3.

* The word is formed from the Saxon *cnepa*, or Flemish *knappe*, which signify the same.

KNAVE, also signifies a male-child or boy; in which sense, *knaves*.

knave-child has been frequently used, in contradistinction to a *girl*; and in this sense Wickliff uses the word in his translation of Exod. i. 16. and other places of the Bible. In the old Saxon translation of Mat. viii. 6. *Puer meus jacet in domo paralyticus*, was turned, *Myn knapa*.

KNAVE has sometimes also been used as an addition; as, Wilhelmus Cowper de Denbigh, *knave*, &c.

It is a common opinion that Rom. i. 1. was translated, *Paul a knave of Jesus Christ*. This mistake was occasioned by a Bible in the duke of Lauderdale's library, where the word *knave* is inserted in less characters than the others, and a rasure might be easily discerned.

KNEELING. See the article **GENUFLEXION**.

KNEES.—*Carling KNEES*. See **CARLING**.

KNIGHT*, properly signifies a person, who for his virtue and martial prowess, is, by the king, raised above the rank of gentlemen, into an higher class of dignity and honour.

* The word *knicht*, in its original German, *knecht*, signifies a *servant*; and has since been used for a soldier, or man of war.—We have but one instance among us where *knights* is used in the first sense, and that is in *knicht of the five*, who properly *serves* in parliament for such a county.—In the Latin, French, Spanish, Italian, and Dutch languages, *knicht* is expressed by a word which properly signifies a *houseman*, as being usually employed on horseback. Indeed our common law calls them *milites*, soldiers, because they usually held lands in *knicht*-service, to serve the king as soldiers in his wars; in which sense the word *miles* was used *pro* *knicht*.

Knighthood was the first degree of honour in the ancient armies, and was usually conferred with a great deal of ceremony on those who had distinguished themselves by some notable exploit in arms. They were originally said to be adopted, which we now call *dubbed*; as being supposed, in some measure, the sons of him who knighted them.

The ceremonies at the creation of a *knicht* have been various. The principal were a box on the ear, and a stroke with a sword on the shoulder. Then they put on him a shoulder-belt, and gilt sword, spurs, and the other military accoutrements; after which, being armed as a *knicht*, he was led in great pomp to the church.

The manner of making a *knicht* with us, is described by Camden in a few words: *Qui equestrem dignitatem suscipit, flexis genibus leviter in humero percutitur, princeps bis verbis affatur, sui vel suis Chevalier au nom de Dieu, jure vel si equus in nomine Dei*. This is meant of *knights-bachelors*, which is the lowest, though the most ancient order of knighthood among us.

Knights grew so very numerous, that the dignity became of much less repute. Charles V. is said to have made five hundred in a single day: on which account, therefore, new orders of knighthood were instituted, in order to distinguish the more deserving from the crowd.—For the several kinds of *knights* among us, see **BACHELOR**, **BANNERET**, **BARONET**, **BATH**, **GARTER**, &c.

KNIGHT, is also understood of a person admitted into any order, either purely military, or military and religious, instituted by some king or prince, with certain marks and tokens of honour and distinction.

Such are the *knights of the garter*, of the elephant, of the holy Ghost, of Malta, &c. All which see under their proper names, **GARTER**, **ELEPHANT**, &c.

KNIGHT, Equus, among the Romans, was the second degree of the nobility; following immediately that of the senators.

At the time of building the city of Rome, the whole army of Romulus consisted of 3000 foot and 300 horse; which 300 horse were the original of the Roman *equites*, or *knights*. These made the second order that had places in the senate.

Manutius and Sigonius are of opinion that besides the equestrian order, and those *knights* immediately below the senators, Romulus instituted a military order, whereof the Roman cavalry was composed. But no ancient author takes notice of any order of knighthood instituted on purpose for the war, nor any other *knights* but those 300, which, as we have observed, were the first foundation of the equestrian order.

The *knights* had a horse kept them at the public charge; but when they were taken in among the senators, they resigned that privilege: To be a *knicht*, it was necessary they should have a certain revenue, that their poverty might not disgrace the order; and when they failed of the prescribed revenue, they were expunged out of the list of *knights*, and thrust down among the plebeians. Ten thousand crowns is computed to have been the revenue required.

The *knights* grew so very powerful, that they became a balance between the power of the senate and the people. They neglected the exercises of war, and betook themselves principally to civil employments in Rome; insomuch that Pliny observes, in his time, they had no longer a horse kept at the public expence.

Some say, that the order of *knights*, as distinct from the people, did not begin before the time of the Gracchi; others say the privilege was then first granted them, that no judge

should be chosen, but out of their order; some time after which, they took them into the senate. This, however, is certain, it was only from that time that a certain revenue was necessary, and that this entitled them to the knighthood, without being defended from ancient *knights*.

KNIGHTHOOD, a military order, or honour; or a mark or degree of ancient nobility, or reward of personal virtue, and merit.

There are four kinds of *knighthood*; *military*, *regular*, *honorary*, and *social*.

Military KNIGHTHOOD, is that of the ancient knights, who acquired it by high feats of arms.

These are called *milites*, in ancient charters, and titles, by which they were distinguished from bare *bachelors*, &c. These knights were girt with a sword and a pair of gilt spurs, whence they were called *equites aurati*.

Knighthood is not hereditary, but acquired. It does not come into the world with a man, like nobility; nor can it be revoked. The sons of kings and kings themselves, with all other sovereigns, heretofore had *knighthood* conferred on them as a mark of honour. They were usually knighted at their baptism or marriage, at their coronation, before or after a battle, &c.

Regular KNIGHTHOOD, is applied to all military orders, which profess to wear some particular habit, to bear arms against the infidels, to succour and assist pilgrims in their passage to the holy land, and to serve in hospitals where they should be received; such were the knights templars, and such still are the knights of Malta, &c.

Honorary KNIGHTHOOD, is that which princes confer on other princes, and even on their own great ministers, and favourites; such are knights of the garter, S. Michael, &c.

Social KNIGHTHOOD, is that which is not fixed, not confirmed by any formal institution, nor regulated by any lasting statutes; of which kind there have many orders been erected on occasion of factions, of tilts and tournaments, masquerades, and the like.

The abbot Bernardo Justiniani, at the beginning of his history of *knighthood*, gives us a complete catalogue of the several orders: according to this computation they are in number 92. Favin has given us two volumes of them under the title of *Theatre d'Honneur & de Chevalerie*. Menenius has published *Deliciae Equestrium Ordinum*, and Andr. Mendo has written *de ordinibus Militaribus*. Beloi has traced their original, and Geliot, in his *Armorial Index*, has given us their institutions. To these may be added Father Menutier, *de la Chevalerie Ancienne & Moderne*; Micheli's *Treasure Militaire*, Caramuel's *Theologia Regularis*, Miraeus's *Origines Equestrium sive Militarum Ordinum*: But above all, Justinian's *Historie Chronologiche dell' Origine de gl' Ordine Militari, e di tutte le Religioni Cavaleresche*: The edition which is fullest, is that of Venice in 1692, in 2 vols. fol.

KNIGHTS of S. Catherine of Mount Sina. See **CATHERINE**.

KNIGHTS of the Chapel. } See the article } **CHAPEL**.

KNIGHTS of the Collar. } See the article } **COLLAR**.

KNIGHTS-ERRANT, a pretended order of chivalry, whereof ample mention is made in the old romances.

They were a kind of heroes, who travelled the world in search of adventures, redressing wrongs, rescuing damsels, and taking all occasions of signalizing their prowess.

This romantic bravery of the old *knights* was heretofore the chimæra of the Spaniards; among whom there was no cavalier but had his mistress, whose esteem he was to gain by some heroic action. The duke of Alva, for all his age and gravity, is said to have vowed the conquest of Portugal to a young lady.

KNIGHTS of S. George. } See the article } **GEORGE**.

KNIGHTS of Honour. } See the article } **HONOUR**.

KNIGHT-MARSHAL, an officer in the king's house, who has jurisdiction, and cognizance of any transgression within the king's house, and verge; as also of contracts made there, whereof one of the house is party.

KNIGHTS of the Mine. See the article **MINE**.

KNIGHTS of Mary.

KNIGHTS of Mount Carmel.

Rad KNIGHTS.

KNIGHTS of the round Table.

KNIGHTS of the Shire, or **KNIGHTS of Parliament**, are two gentlemen of worth, chosen on the king's writ in pleno comitatu, by such of the freeholders of every county as can expend 40s. per ann. to represent such county in parliament.

These, when every man who had a knights-fee was customarily constrained to be a *knicht*, were of necessity to be *milites gladio cincti*, for so the writ runs to this day; but now custom admits esquires to be chosen to this office.

They must have at least 500 l. per ann. and their expences properly are to be defrayed by the county, though this is seldom, now, required.

KNIGHTS, in a ship, two thick, short pieces of timber usually

ally carved in the figure of some head, having in each four thivers, three for the halliards, and one for the top-ropes to run in.

One of them stands abaft the main-mast, and for that reason is called the *main-knight*.—The other stands abaft the fore-mast, on the second deck, and is called the *fore-knight*.

KNIGHTS-FEE, an ancient law term, signifying so much land of inheritance as was esteemed sufficient to maintain a knight with suitable retinue; which, in Henry the Third's days, was reckoned at 15 *l.* per ann. And by a stat. 1 Edward II. such as had 20 *l.* per ann. in fee, or for life, might be compelled to be knights.—But this statute is repealed 17 Car. I. Sir T. Smith rates a *knights-fee* at 40 *l.* yearly.—According to Coke, a *knights-fee* contained twelve carucates, or plow-lands.—Stow says, that there were found in England, at the time of the conqueror, 60211 *knights-fees*; according to others, there were 60,215: whereof the religious houses, before their suppression, were possessed of 28,015. See *FEE*.

KNIGHTS-SERVICE, *Servitium Militare*, a tenure whereby several lands in this nation were anciently held of the king; which drew after it homage, service in war, escuage, wardship, marriage, &c. But taken away by the statute 12 Car. II. c. 24.

KNIT Stockings. See the article *STOCKINGS*.

KNOCKING Mill. See the article *STAMPING*.

KNOT, properly denotes a part of a tree from whence it shoots out branches, roots, or even fruit.

The wood is harder and closer in the *knots* than in any other part, but it is also more subject to split there. Vines and dwarf fruit-trees are pruned at the second *knot* of the new shoot.

The use of the *knots* of plants is to strengthen the stem: They serve also as fearces to filtrate, purify, and refine the juice raised up for the nourishment of the plant.

KNOTS of the log-line, at sea, are the divisions of it. See *LOG*.

There are usually seven fathoms or forty-two feet asunder, but they should be fifty feet; and then, as many *knots* as the log-line runs out in half a minute, so many miles doth the ship sail in an hour, supposing her to keep going at an equal rate, and allowing for yaws, lee-way, &c.

KNOT, in medicine, a protuberance in the joints of old gouty people: consisting of a thick, viscid, crude, indigested pituita, accompanied with a bilious humour, hot and acrimonious; the grossest and most terrestrial part whereof clogs and converts into a stony substance like chalk.

Knots appear to be generated like stones in the bladder.

Physicians sometimes also call them *nodus*, and *tophi*. See *TOPHUS*, and *NODE*.

KNOT is also used for the intrigue of a romance, or dramatic piece; being that part where the persons are the most embarrassed, by a conjuncture of affairs whose end it is not easy to foresee.

Aristotle, under this term, includes all the incidents of a tragedy, from its beginning to the place where it begins to unravel. The *knot* holds as long as the mind is kept suspended about the event. The *knot* ought always to last to the middle of the fifth act, otherwise the rest of the piece languishes.

Order of the KNOT, is the name of a military order in the kingdom of Naples, instituted in 1352, by queen Jane I. on occasion of the peace established between her and the king of Hungary, by means of her marriage with Louis, Prince of Tarentum.

The order consisted of sixty knights: Clement VI. approved this order, and gave it the rule of S. Basil: It chose S. Nicholas for its protector, but it dwindled away after the death of its founders.

KNOWING, *Principles, and Rules of*. See *PRINCIPLE*, and *RULE*.

KNOWLEDGE, according to Mr. Locke, consists in the perception of the connection and agreement, or disagreement and repugnancy, of our ideas. See *IDEA*. In which sense, *knowledge* stands opposed to *ignorance*. See *IGNORANCE*.

To *know* that white is not black, is only to perceive that these two ideas do not agree. So, in *knowing* that the three angles of a triangle are equal to two right ones; what do we more than perceive, that equality to two right ones necessarily agrees to, and is inseparable from, the three angles of a triangle?

Kinds of KNOWLEDGE.—For what relates to the agreement or disagreement of ideas, we may reduce the whole doctrine, and consequently the whole stock of our *knowledge*, to four heads; viz. identity or diversity, relation, co-existence, and real existence.

As to the identity, or diversity of our ideas, we may observe, that it is the first act of the mind to perceive its own ideas; and so far as it perceives them, to *know* each what it is, and thereby to perceive their difference; that is, the one not to

be the other: by this the mind clearly perceives each idea to agree with itself, and to be what it is; and all distinct ideas to disagree.—This it does without any pains, or deduction, by its natural power of perception, and distinction; and for doing this, men of art have established certain general rules, or principles; as, that what is, is; and that it is impossible for the same thing to be, and not to be.—But no maxim can make a man *know* clearer, that round is not square, than the bare perception of the two ideas, which the mind, at first sight, perceives to disagree.

The next kind of agreement, or disagreement, the mind perceives, in any of its ideas, may be called *relative*, and is nothing but the perception of the relation between any two ideas, of what kind soever; that is, their agreement, or disagreement, one with another, in the several ways, or respects, the mind takes of comparing them.

The third sort of agreement, or disagreement to be found in our ideas, is co-existence, or non co-existence, in the same subject; and this belongs particularly to substances.—Thus, when we pronounce concerning gold that it is fixed, it amounts to no more but this; that fixedness, or a power to remain in the fire unconsumed, is an idea which always accompanies that particular sort of yellowness, weight, fulbility, &c. which make our complex idea signified by the word *gold*.

The fourth sort, is that of actual and real existence, agreeing to any idea.

Within these four sorts of agreement, or disagreement, seems contained all the *knowledge* we have, indeed all we are capable of; for all that we *know*, or can affirm concerning any idea, is, that it is, or is not the same with some other; as, that blue is not yellow: that it does or does not co-exist with another in the same subject; as, that iron is susceptible of magnetical impressions: that it hath that or this relation to some other ideas; as, that two triangles upon equal bases, between the same parallels, are equal: or, that it has a real existence without the mind; as, that God is.

The mind becomes possessed of truth, in several manners, which constitute so many different species of *knowledge*.—Thus, when the mind has a present view of the agreement, or disagreement of any of its ideas, or of the relation they have one with another, it is called *actual knowledge*.

Secondly, a man is said to *know* any proposition, when having once evidently perceived the agreement, or disagreement, of the ideas whereof it consists, and so lodged it in his memory, that whenever it comes to be reflected on again, the mind assents to it without doubt, or hesitation, and is certain of the truth of it: this may be called *habitual knowledge*.—And thus a man may be said to *know* all those truths which are lodged in his memory, by a foregoing, clear, and full perception.

Of *habitual knowledge*, there are two sorts; the one consists of such truths, laid up in the memory, as whenever they occur to the mind, it actually perceives the relation that is between their ideas; and this is in all those truths where the ideas themselves, by an immediate view, discover their agreement, or disagreement, one with another.—The other is of such truths, whereof the mind having been convinced, it retains the memory of the conviction, without the proofs.—Thus a man that remembers certainly, that he once perceived the demonstration, that the three angles of a triangle are equal to two right ones, *knows* it to be true, when that demonstration is gone out of his mind, and cannot possibly be recollected: but he *knows* it in a different way from what he did before; namely, not by the intervention of those intermediate ideas; whereby the agreement, or disagreement, of those in the proposition, was at first perceived; but by remembering, that is, *knowing* that he was once certain of the truth of this proposition. That the three angles of a triangle are equal to two right ones.—The immutability of the same relations between the same immutable things, is now the idea, that shews him, that if the three angles of a triangle were once equal to two right ones, they will always be so.—And hence he comes to be certain, that what was once true, is always true; what ideas once agreed, will always agree; and consequently, what he once *knew* to be true, he will always *know* to be true, as long as he can remember that he once *knew* it.

Degrees of KNOWLEDGE.—As to the different degrees, or clearness of our *knowledge*, it seems to lie in the different way which the mind has of perceiving the agreement, or disagreement, of any of its ideas.—When the mind perceives this agreement, or disagreement, of two ideas immediately by themselves, without the intervention of any other, we may call it *intuitive knowledge*; in which case the mind perceives the truth, as the eye doth light, only by being directed towards it.—Thus the mind perceives, that white is not black; that three are more than two, and equal to one and two.—This part of *knowledge* is irrefragable; and, like the bright sun-shine, forces itself immediately to be perceived, as soon as ever the mind turns its view that way.—It is on this intuition that depends all the certainty, and evidence of our

our other *knowledge*; which certainty, every one finds to be so great, that he cannot imagine, and therefore cannot require a greater.

The next degree of *knowledge* is, where the mind perceives not this agreement or disagreement immediately, or by the juxtaposition, as it were of the ideas; because those ideas, concerning whose agreement or disagreement, the enquiry is made, cannot by the mind be so put together, as to shew it. — In this case, the mind is obliged to discover the agreement, or disagreement, which it searches for, by the intervention of other ideas: and this is that which we call *reasoning*.

Thus, if we would *know* the agreement, or disagreement, in bigness, between the three angles of a triangle, and two right angles, we cannot do it by an immediate view, and comparison of them, because the three angles of a triangle cannot be brought together at once, and compared with any other one or two angles; and so of this the mind has no immediate, or intuitive *knowledge*. — But we must find out some other angles, to which the three angles of a triangle have equality; and finding those equal to two right ones, we come to *know* the equality of these three angles to two right ones.

Those intervening ideas, which serve to shew the agreement of any two others, are called *proofs*; and where the agreement, or disagreement is by this means plainly and clearly perceived, it is called *demonstration*: and a quickness in the mind to find those proofs, and to apply them right, is that which is called *sagacity*.

This *knowledge*, though it be certain, is not so clear and evident as intuitive *knowledge*; it requires pains and attention, and steady application of mind, to discover the agreement, or disagreement, of the ideas it considers; and there must be a progression by steps, and degrees, before the mind can, in this way, arrive at any certainty. — Before demonstration, there was a doubt, which, in intuitive *knowledge*, cannot happen to the mind that has its faculty of perception left in a degree capable of distinct ideas, no more than it can be a doubt to the eye, (that can distinctly see white, and black) whether this ink, and paper, be all of a colour. — Now, in every step that reason makes in demonstrative *knowledge*, there is an intuitive *knowledge* of that agreement, or disagreement it seeks with the next intermediate idea, which it uses as a proof; for if it were not so, that yet would need a proof, since without the perception of such agreement, or disagreement, there is no *knowledge* produced.

By which it is evident that every step in reasoning, that produces *knowledge*, has intuitive certainty; which, when the mind perceives, there is no more required, but to remember it, to make the agreement, or disagreement of the ideas concerning which we enquire, visible and certain. — This intuitive perception of the agreement, or disagreement, of the intermediate ideas in each step, and progression of the demonstration, must also be exactly carried in the mind; and a man must be sure that no part is left out, which, because in long deductions, the memory cannot easily retain; this *knowledge* becomes more imperfect than intuitive, and men often embrace fallhoods for demonstrations.

It has been generally taken for granted, that mathematics alone are capable of demonstrative certainty: but to have such an agreement or disagreement, as may be intuitively perceived, being, as we imagine, not the privilege of the ideas of number, extension, and figure alone; it may, possibly, be the want of due method and application in us, and not of sufficient evidence in things, that demonstration has been thought to have so little to do in other parts of *knowledge*. For in whatever ideas the mind can perceive the agreement or disagreement immediately, there it is capable of intuitive *knowledge*; and where it can perceive the agreement or disagreement of any two ideas, by the intuitive perception of the agreement or disagreement they have with any intermediate ideas, there the mind is capable of demonstration, which is not limited to the ideas of figure, number, extension, or their modes.

The reason why it has been generally supposed to belong to these only, is because, in comparing their equality or excess, the modes of numbers have every, the least difference, very clear and perceivable: And in extension, though every the least excess is not so perceptible, yet the mind has found out ways to discover the just equality of two angles, extensions, or figures; and both numbers and figures can be set down by visible and lasting marks. — But in other simple ideas, whose modes and differences are made, and counted by degrees, and not quantity, we have not so nice and accurate a distinction of their differences, as to perceive or find ways to measure their just equality, or their least differences. For, those other simple ideas being appearances, or sensations produced in us, by the size, figure, motion, or circumstance of corpuses, singly insensible; their difference is not so dependent on the variation of some, or all of these qualities; which since

it cannot be observed by us in particles of matter, whereof each is too subtle to be perceived, it is impossible for us to have any exact measure of the different degrees of these simple ideas.

Thus, not knowing what number of particles, nor what motion of them is fit to produce any precise degree of whiteness, because we have no certain standard to measure them by, nor means to distinguish every, the least difference; the only help we have, is from our senses, which in this point fail us. But where the difference is so great as to produce in the mind ideas clearly distinct, these ideas, as we see in colours of different kinds, blue and red for instance, are as capable of demonstration, as ideas of number and extension. — And what is here said of colours, holds true in all secondary qualities.

These two then, *intuition* and *demonstration*, are the degrees of our *knowledge*; and whatever comes short of one of these, is only *faith*, or *opinion*, not *knowledge*; at least in all general truths.

There is indeed another perception of the mind, employed about the particular existence of finite beings without us, which going beyond probability, but not reaching to either of the foregoing degrees of certainty, passes under the name of *knowledge*.

Nothing can be more certain, than that the idea we receive from an external object, is in our minds: This is intuitive *knowledge*; but whether we can thence certainly infer the existence of any thing without us, corresponding to that idea, is that whereof some men think there may be a question made; because men may have such an idea in their minds, when no such thing exists, nor any such object affects their senses.

But it is evident, that we are invincibly conscious to ourselves of a different perception, when we look on the sun in the day, and when we think on it by night; when we actually taste wormwood, or smell a rose, or only think on that flavour, or odour: so that we may add to the two former sorts of *knowledge*, this also of the existence of particular external objects, by that perception and consciousness we have of the actual entrance of ideas from them, and allow these three degrees of *knowledge*, viz. *intuitive*, *demonstrative*, and *sensitive*.

But since our *knowledge* is founded on, and employed about our ideas only, will it follow thence, that it must be conformable to our ideas, and that where our ideas are clear and distinct, obscure and confused, there our *knowledge* will be so too? — We answer, no; for our *knowledge* consisting in the perception of the agreement or disagreement of any two ideas, its clearness, or obscurity, consists in the clearness, or obscurity of that perception, and not in the clearness or obscurity of the ideas themselves. — A man, (for instance) who has a clear idea of the angles of a triangle, and of equality to two right ones, may yet have but an obscure perception of their agreement, and so have but a very obscure *knowledge* of it: but obscure, and confused ideas, can never produce any clear or distinct *knowledge*; because, as far as any ideas are obscure, or confused, so far the mind can never perceive clearly, whether they agree, or disagree: or, to express the same thing in other words, he that has not determined ideas to the words he uses, cannot make propositions of them, of whose truth he can be certain.

From all this it follows; 1^o. That we can have no *knowledge* farther than we have ideas.

2^o. That we have no *knowledge* farther than we can have perception of the agreement, or disagreement of our ideas, either by intuition, demonstration, or sensation.

3^o. We cannot have an intuitive *knowledge*, that shall extend itself to all our ideas, and all that we would *know* about them; because we cannot examine, and perceive all the relations they have one to another by juxtaposition, or an immediate comparison one with another. — Thus we cannot intuitively perceive the equality of two extensions, the difference of whose figures makes their parts incapable of an exact immediate application.

4^o. Our rational *knowledge* cannot reach to the whole extent of our ideas, because between two different ideas which we would examine, we cannot always find such proofs whereby we can connect one to another, with an intuitive *knowledge* in all the parts of the deduction.

5^o. Sensitive *knowledge*, reaching no farther than the existence of things, actually present to our senses, is yet much narrower than either of the former.

6^o. From all which it is evident, that the extent of our *knowledge* comes not only short of the reality of things, but even of the extent of our own ideas. — We have the ideas of a square, a circle, and equality, and yet perhaps shall never be able to find a circle equal to a square. See CIRCLE.

Extent, and Limits of KNOWLEDGE. — The affirmations, or negations we make concerning the ideas we have, being reduced to the four sorts abovementioned, viz. identity, co-existence, relation, and real existence, let us enquire how far our *knowledge* extends in each of these: 1^o. As to identity, and di-

verify, or intuitive *knowledge* is as far extended, as our ideas themselves; and there can be no idea in the mind, which it does not presently, by an intuitive *knowledge*, perceive to be what it is, and to be different from any other.

2°. As to the agreement, or disagreement of our ideas of co-existence, our *knowledge* herein is very defective, though it is in this that the greatest and most material parts of our *knowledge*, concerning substances, consists: for our ideas of substances being nothing but certain collections of simple ideas, co-existing in one subject, (our idea, of flame, for instance, is a body hot, luminous, and moving upwards.) When we would know any thing farther, concerning this or any other sort of substance, what do we but enquire what other qualities, or powers, these substances have, or have not? which is nothing else but to *know* what other simple ideas do, or do not exist with those that make up such complex idea.—The reason of this is, that the simple ideas which make up our complex ideas of substances, have no visible necessary connection, or inconsistency, with other simple ideas, whose co-existence with them we would inform ourselves about.—These ideas being likewise, for the most part, secondary qualities, which depend upon the primary qualities of their minute or insensible parts, or on something yet more remote than these from our comprehension; it is impossible we should *know* which have a necessary union, or inconsistency, one with another, since we *know* not the root from whence they spring, or the size, figure, and texture of parts on which they depend, and from which they result.—Besides this, there is no discoverable connection between any secondary quality, and those primary qualities that it depends on.—We are so far from *knowing* what figure, size, or motion produces, (for instance) a yellow colour, or sweet taste, or sharp sound; that we can by no means conceive how any size, figure, or motion, can possibly produce in us the idea of any colour, taste, or sound, whatsoever; there being no conceivable connection between the one and other.

Our *knowledge*, therefore, of co-existence, reaches little farther than experience. Some few, indeed, of the primary qualities have a necessary dependence, and visible connection, one with another: as figure necessarily supposes extension; receiving or communicating motion by impulse, supposes solidity: but qualities co-existent in any subject, without this dependence and connection, cannot certainly be *known* to co-exist, any farther than experience by our senses informs us.—Thus though, upon trial, we find gold yellow, weighty, malleable, fusible, and fixed; yet because none of these have any evident dependence, or necessary connection with the other, we cannot certainly *know*, that where any four of these are, the fifth will be there also, how highly probable soever it may be. But the highest degree of probability amounts not to certainty, without which there can be no true *knowledge*: for this co-existence can be no farther *known*, than it is perceived; and it cannot be perceived but either in particular subjects, by the observation of our senses, or, in general, by the necessary connection of the ideas themselves.

As to incompatibility, or repugnancy to co-existence, we *know* that no subject can have of each sort of primary qualities, more than one particular at once, as one extension, or one figure; and so of sensible ideas peculiar to each sense: for whatever, of each kind, is present in any subject, excludes all other of that sort; for instance, one subject cannot have two smells, or two colours at the same time.

As to powers of substances, which makes a great part of our enquiries about them, our *knowledge* reaches a little farther than experience; because they consist in a texture and motion of parts, which we cannot by any means come to discover, and, I doubt whether, with those faculties we have, we shall ever be able to carry our general *knowledge* much farther in this part. Experience is that which in this part we must depend on, and it were to be wished that it were more improved.—We find the advantages some mens generous pains have this way brought to the stock of natural *knowledge*; and if others, especially the philosophers by fire, had been so wary in their observations, and sincere in their reports, as those who call themselves *philosophers* ought to have been, our acquaintance with the bodies here about us, and our insight into their powers and operations, might have been yet much greater.

As to the third sort, the agreement, or disagreement of our ideas in any other relation; this is the largest field of *knowledge*, and it is hard to determine how far it may extend: this part depending on our sagacity, in finding intermediate ideas, that may shew the habitudes and relations of ideas, it is an hard matter to tell when we are at an end of such discoveries.—They who are ignorant of algebra, cannot imagine the wonders of this kind that are to be done by it: and what farther improvements, and helps, advantageous to other parts of *knowledge*, the sagacious mind of man may yet find out, is not easy to determine.

This, at least, we may believe, that the ideas of quantity are

not the only ones capable of demonstration, and *knowledge*; and that other, and perhaps more useful parts of contemplation would afford as certainty, if vices, passions, and domineering interest did not oppose, or menace endeavours of this kind.

As to the fourth sort of *knowledge*, viz. of the real actual existence of things, we have an intuitive *knowledge* of our own existence, a demonstrative *knowledge* of the existence of God, and a sensitive *knowledge* of the objects that present themselves to our senses.

Hitherto we have examined the extent of our *knowledge*, in respect of the several sorts of beings that are: there is another extent of it, in respect of universality, which will also deserve to be considered; and this in regard our *knowledge*: follows the nature of our ideas.—If the ideas, whose agreement, or disagreement we perceive, are abstract, our *knowledge* is universal; for what is *known* of such general ideas, will be true of every particular thing in which that essence, that is, that abstract idea is found: and what is once *known* of such ideas, will be perpetually, and for ever true; so that, as to all general *knowledge*, we must search, and find it only in our own minds; and it is only the examining our own ideas, that furnishes us with it.—Truths belonging to essences of things, (that is, to abstract ideas) are eternal, and are to be found out by the contemplation only of those essences; as the existence of things is to be *known* only from experience.

Reality of Knowledge.—It is evident, that the mind *knows* not things immediately, but by the intervention of the ideas it has of them.—Our *knowledge*, therefore, is real only so far, as there is a conformity between our ideas, and the reality of things. But how shall we *know* when our ideas agree with things themselves? it is answered, There are two sorts of ideas, that we may be assured agree with things; these are,

1°. Simple ideas, which, since the mind can by no means make to itself, must be the effect of things operating upon the mind in a natural way, and producing therein those perceptions, which, by the will of our maker, they are ordained, and adapted to.—Hence it follows that simple ideas are not fictions of our fancies, but the natural and regular productions of things without us, really operating upon us; which carry with them all the conformity our state requires, which is to represent things under those appearances they are fittest to produce in us.—Thus the idea of whiteness, as it is in the mind, exactly answers that power which is in any body to produce it there; and this conformity between our simple ideas, and the existence of things is sufficient for real *knowledge*.

2°. All our complex ideas, except only those of substances, being archetypes of the mind's own making, and not referred to the existence of things, as to their originals, cannot want any conformity necessary to real *knowledge*; for that which is not designed to represent any thing but itself, can never be capable of a wrong representation.—Here the ideas themselves are considered as archetypes, and things are no otherwise regarded, than as conformable to them.—Thus the mathematician considers the truth, and properties belonging to a rectangle, or circle, only as they are ideas in his own mind, which possibly he never found existing mathematically, that is, precisely true; yet his *knowledge* is not only certain, but real, because real things are no farther concerned, nor intended to be meant by any such propositions, than as things really agree to those archetypes in the mind.

3°. But the complex ideas, which we refer to archetypes without us, may differ from them, and so our *knowledge* about them may come short of being real; and such are our ideas of substances.—These must be taken from something, that does, or has existed, and not be made up of ideas arbitrarily put together, without any real pattern.—Herein, therefore, is founded the reality of our *knowledge* concerning substances, that all our complex ideas of them must be such, and such only, as are made up of such simple ones, as have been discovered to co-exist in nature: and our ideas being thus true, though not perhaps very exact copies, are the subject of real *knowledge* of them.—Whatever ideas we have, the agreement we find they have with others, will be *knowledge*.—If those ideas be abstract, it will be general *knowledge*; but to make it real, concerning substances, the ideas must be taken from the real existence of things.—Wherever, therefore, we perceive the agreement, or disagreement of our ideas, there is certain *knowledge*; and wherever we are sure those ideas agree with the reality of things, there is certain real *knowledge*.

Method of improving or enlarging Knowledge.—It being the received opinion amongst men of letters, that maxims are the foundation of all *knowledge*, and that sciences are each of them built upon certain præcognita, from whence the understanding is to take its rise, and by which it is to conduct itself in its inquiries in the matters belonging to that science; the beaten road of the schools has been to lay down, in the beginning, one or more general propositions, called *principles*, as foundations whereon to build the *knowledge* that was to be had of that subject.

That

KNO

That which gave occasion to this way of proceeding, was the good success it seemed to have in mathematics; which, of all other sciences, have the greatest certainty, clearness, and evidence in them. But if we consider it, we shall find that the great advancement, and certainty, of real knowledge men arrived to in these sciences, was not owing to the influence of those principles; but to the clear, distinct, and compleat ideas their thoughts were employed about; and to the relation of equality and excess, so clear between some of them, that they had an intuitive knowledge, and by that a way to discover it in others, and this without the help of those maxims. For is it not possible for a lad to know, that his whole body is bigger than his little finger, but by virtue of this axiom, 'The whole is bigger than a part,' nor be assured of it, till he has learned that maxim? Let any one consider which is known first and clearest by most people, the particular instance, or the general rule; and which it is that gives life and birth to the others; these general rules are but the comparing our more general, and abstract ideas, which ideas are made by the mind, and have names given them, for the easier dispatch in its reasonings: but knowledge began in the mind, and was founded on particulars, though afterwards perhaps no notice be taken thereof; it being natural for the mind to lay up those general notions, and make the proper use of them, which is to disburthen the memory of the cumbersome load of particulars. — The way to improve in knowledge, is not to swallow principles with an implicit faith, and without examination, which would be apt to mislead men, instead of guiding them into truth; but to get, and fix in our minds, clear and compleat ideas, as far as they are to be had, and to annex to them proper and constant names: and thus barely by considering our ideas, and comparing them together, observing their agreement, or disagreement, their habits, and relations, we shall get more true and clear knowledge, by the conduct of this one rule; than by taking up principles, and thereby putting our minds into the disposal of others.

We must therefore, if we will proceed as reason advises us, adapt our methods of inquiry to the nature of the ideas we examine, and the truth we search after. — General and certain truths are only founded in the habits and relations of abstract ideas; therefore a sagacious methodical application of our thoughts for the finding out these relations, is the only way to discover all, that can with truth and certainty be put into general propositions. By what steps we are to proceed in these, is to be learned in the schools of the mathematicians, who from very plain and easy beginnings, by gentle degrees, and a continued chain of reasonings, proceed to the discovery, and demonstration of truths, that at first sight appeared beyond human capacity. — This may reasonably be said, that if other ideas that are real, as well as nominal essences of their species, were pursued in the way familiar to mathematicians, they would carry our thoughts farther, and with greater evidence, and clearness, than possibly we are apt to imagine. — This is reason sufficient to advance that conjecture above-mentioned, viz. 'That morality is capable of demonstration, as well as mathematics;' for moral ideas being real essences, which have a discoverable connection, and agreement one with another, so far as we can find their habits and relations, so far we shall be possessed of real and general truths.

In our knowledge of substances, we are to proceed after a quite different method; the bare contemplation of their abstract ideas, (which are but nominal essences) will carry us but a very little way in the search of truth and certainty. — Here experience must teach us what reason cannot; and it is by trying alone, that we can certainly know what other qualities co-exist with those of our complex idea; for instance, whether that yellow, heavy, fusible body, I call gold, be malleable or no; which experience (however it prove in that particular body we examine) makes us not certain that it is so in all, or any other yellow, heavy, fusible bodies, but that which we have tried; because it is no consequence, one way or other, from our complex idea. The necessity, or inconsequence of malleability, has no visible connection with the combination of that colour, weight, and fusibility in any body. — What is here said of the nominal essence of gold, supposed to consist of a body of such a determinate colour, weight, and fusibility, will hold true, if other qualities be added to it. — Our reasonings from those ideas will carry us but a little way, in the certain discovery of the other properties in those masses of matter wherein all those are to be found. As far as our experience reaches, we may have certain knowledge, and no farther. — It is not denied, but that a man, accustomed to rational and regular experiments, shall be able to see farther into the nature of bodies, and their unknown properties, than one that is a stranger to them: but this is but judgment, and opinion, not knowledge, and certainty.

This would make it suspected, that natural philosophy is not capable of being made a science. From experiments, and historical observations, we may draw advantages of ease, and health, and thereby increase our stock of conveniences for this life; but beyond this, it is to be feared, our talents reach

KUL

not, nor are our faculties able to advance farther. See *PHYSICS*.

From whence it is obvious to conclude, that since our faculties are not permitted to penetrate the real essences of bodies, but yet plainly to discover to us the being of a God; and the knowledge of ourselves, enough to give us a clear discovery of our duty, and great concernment, it will become us, as rational creatures, to employ our faculties about what they are most adapted to, and follow the direction of nature, where it seems to point us out the way. For it is rational to conclude, that our proper employment lies in those enquiries, and that sort of knowledge which is most suited to our natural capacities, and carries in it our greatest interest; and therefore it is that morality is the proper science, and business of mankind in general, (who are both concerned, and fitted to search out their summum bonum) as several arts conversant about the several parts of nature, are the lot, and private talent of particular men, for the common use of human life, and their own particular subsistence in this world.

The ways to enlarge our knowledge as far as we are capable, seem to be those two: The first is, to get and settle in our minds, as far as we can, clear, distinct, and constant ideas of those things we would consider, and know; for it being evident that our knowledge cannot exceed our ideas, where they are either imperfect, confused, or obscure, we cannot expect to have certain, perfect, or clear knowledge. — The other art is, of finding out the intermediate ideas, which may shew us the agreement or repugnancy of other ideas, which cannot be immediately compared.

That these two (and not relying on maxims, and drawing consequences from some general propositions) are the right method of improving our knowledge in the ideas of other modes, besides those of quantity, the consideration of mathematical knowledge will easily inform us; where, first, we shall find, that he who has not clear and perfect ideas of those angles, or figures, of which he desires to know any thing, is utterly thereby incapable of any knowledge about them. — Suppose a man not to have an exact idea of a right angle, scalenum, or trapezium, and it is clear that he will in vain seek any demonstration about them.

And farther it is evident, that it was not the influence of maxims, or principles, that led the masters of this science into those wonderful discoveries they have made: let a man of good parts know all the maxims of mathematics never so well, and contemplate their extent, and consequences, as much as he pleases, he will, by their assistance, scarce ever come to know, that the square of the hypotenuse, in a right-angled triangle, is equal to the squares of the two other sides. This, and other mathematical truths have been discovered by the thoughts otherwise applied. The mind had other objects, other views before it, far different from those maxims, which men well enough acquainted with those received axioms, but ignorant of their method who first made those demonstrations, can never sufficiently admire.

Our knowledge, as in other things, so in this also, has so great a conformity with our sight, that it is neither wholly necessary, nor wholly voluntary. Men, who have senses, cannot chuse but receive some ideas by them; and if they have memory, they cannot but retain some of them; and if they have any distinguishing faculty, cannot but perceive the agreement or disagreement of some of them one with another. As he that has eyes, if he will open them by day, cannot but see some objects, and perceive a difference in them; yet he may chuse whether he will turn his eyes towards an object, curiously survey it, and observe accurately all that is visible in it. But what he doth see, he cannot see otherwise than he doth; it depends not on his will to see that black, which appears yellow. Just thus it is with our understanding: All that is voluntary in our knowledge, is the employing or withholding any of our faculties from this or that sort of objects, and a more or less accurate survey of them; but they being employed, our will hath no power to determine the knowledge of the mind one way or other; that is done only by the objects themselves, as far as they are clearly discovered. Thus, he that has got the ideas of numbers, and has taken the pains to compare one, two, and three, to six, cannot chuse but know they are equal. He also that hath the idea of an intelligent, but weak and frail being, made by, and depending on another, who is eternal, omnipotent, and perfectly wise, and good, will as certainly know that man is to honour, fear, and obey God, as that the sun shines when he sees it. But yet, be these truths never so certain, never so clear, he may be ignorant of either, or both of them, who will not take the pains to employ his faculties as he should, to inform himself about them.

KOPPA. See the article *Numerical CHARACTERS*.

KûL, or Kool, a Turkish term, properly signifying a *slave*, or *servant*.

Meninsky tells us, the name is given to all the soldiers in the Ottoman empire, particularly to those of the grand seignior's guard, and the infantry. — The captains of the infantry, and those who command the guards, are called *kûl zâbylers*, and the soldiers of the guard *kapu kûlleri*, i. e. *slaves of the Court*. — Others inform us, that all who hold any places depending

K Y P

on the crown, or receive wages from it, in a word, all who are in any measure the grand seignior's servants, take the title of *kül*, or *kool*, i. e. *slave*, as more creditable than that of subject; even the grand vizier and the bashaws value themselves upon it. A *kül*, or slave, of the grand seignior, has authority to abuse any who are only his servants; but a subject who should affront a *kül*, or slave, would be severely punished. The *küls* are entirely devoted to the will of the grand seignior, and look on it as a kind of martyrdom that merits heaven when they die either by his order, or in the execution of his commands.

KURTCHI, an order of soldiery among the Persians.

The word, in its original, signifies *army*, and is applied to a body of cavalry consisting of the nobility of the kingdom of Persia, and the posterity of those conquerors, who placed Ismael sophi on the throne. They are in number about 18000 men.

Their commander is called *kurtchi bashi*, which was formerly the first post in the kingdom; equivalent to a constable of France.

KYPHONISM*, **KYPHONISMUS**, or **CYPHONISMUS**, an ancient punishment, which was frequently undergone by the martyrs in the primitive times; wherein the body of the person

K Y S

to suffer was anointed with honey, and so exposed to the sun, that the flies and wasps might be tempted to torment him. This was performed in three manners; sometimes they only tied the patient to a stake; sometimes they hoisted him up into the air, and suspended him in a basket; and sometimes they stretched him out on the ground, with his hands tied behind him.

* The word is originally Greek, and comes from *κρυψω*, which signifies either the *stake* to which the patient was tied, the *collar* fitted to his neck, or an *instrument* wherewith they tormented him: The scholiast on Aristophanes says, it was a wooden lock, or cage, and that it was so called from *κρυψω*, to crook, or bend, because it kept the tortured in a crooked, bowing posture: Others take the *κρυψω* for a log of wood laid over the criminal's head, to prevent his standing upright: Hieronymus describes the *κρυψω*, as a piece of wood whereon criminals were stretched and tormented. In effect, it is probable, the word might signify all these several things. It was a general name, whereof these were the species.

Suidas gives us the fragment of an old law, which punished those who treated the laws with contempt, with *kyphonism* for the space of twenty days, after which they were to be precipitated from a rock, dressed in women's habit.

KYSTIS, **ΚΥΣΤΙΣ**, in medicine. See the article **CYSTIS**.
